ELSEVIER

High Alert header highlights drugs that pose the greatest risk if administered improperly
Easily confused drug names located beneath header
Black Box Warnings easily identify serious and life-threatening FDA warnings
Subheadings indicate various administration routes
Common and life-threatening adverse effects grouped by body system
amiodarone 51
A
• Monitor for impending hepatic coma: asterixis, confusion, fetor, lethargy
• Hyperammonemia: nausea, vomiting, malaise, tremors, anorexia, seizures; increased ammonia, ketone levels may occur
Patient/family education
• Teach reason for use of amino acids as part of nutrition (TPN), how to care for tubing/site
• Instruct patient to report at once to prescriber if chills, sweating are experienced, elevation is higher
Therapeutic outcome
Resolution of jaundice in liver disorders
Improved LOC
HIGH ALERT
amiodarone (Rx)
(a-mee-oh'da-rone)
Cordarone, Nexterone, Pacerone
Func. class.: Antidysrhythmic (Class III)
Chem. class.: Iodinated benzofuran derivative
Do not confuse: amiodarone/amantadine
ACTION: Prolongs action potential duration and effective refractory period, noncompetitive α- and β-adrenergic inhibition; increases PR and QT intervals, decreases sinus rate, decreases peripheral vascular resistance
Therapeutic outcome: Decreased amount and severity of ventricular dysrhythmias
USES: Hemodynamically unstable ventricular tachycardia, supraventricular tachycardia, ventricular fibrillation not controlled by 1st-line agents
CONTRAINDICATIONS
Pregnancy, breastfeeding, neonates, infants, severe sinus node dysfunction, hypersensitivity to this product/iodine/benzyl alcohol, cardiogenic shock
BLACK BOX WARNING: 2nd-3rd degree AV block, bradycardia
Precautions: Goiter, Hashimoto's thyroiditis, electrolyte imbalances, HF, severe respiratory disease, children, torsades de pointes
BLACK BOX WARNING: Cardiac arrhythmias, pneumonitis, pulmonary fibrosis, severe hepatic disease, requires a specialized setting
DOSAGE AND ROUTES
Prevention of recurrent life-threatening ventricular dysrhythmias
Adult: PO loading dose 800-1600 mg/day for 1-3 wk; then 600-800 mg/day × 1 mo; maintenance 400 mg/day; IV loading dose (first rapid) 150 mg over the first 10 min then slow 360 mg over the next 6 hr; maintenance 540 mg given over the remaining 18 hr, decrease rate of the slow infusion to 0.5 mg/min
Available forms: Tabs 100, 200, 400 mg; inj 50 mg/ml
Implementation
Start with patient hospitalized and monitored
PO route
• Give reduced dosage slowly with ECG monitoring only
• Loading dose with food to decrease nausea
IV, direct route
• Peripheral: max 2 mg/ml for longer than 1 hr; preferred through central venous line with in-line filter; concentration >2 mg/ml should be given by central line
• Cardiac arrest: give 300 mg IV bol diluted to a total volume of 20 ml D5W; may repeat 150 mg after 3-5 min
Intermittent IV INF route
• Rapid loading: add 3 ml (150 mg), 100 ml D5W (1.5 mg/ml), give over 10 min
• Slow loading: add 18 ml (900 mg), 500 ml D5W (1.8 mg/ml), give over next 6 hr
Continuous IV infusion route
• After 24 hr, dilute 50 ml to 1-6 mg/ml, give 1-6 mg/ml at 1 mg/ml for the first 6 hr, then 0.5 mg/min
Y-site compatibilities: Amikacin, bretylium, clindamycin, DOBUTamine, DOPamine, doxycycline, erythromycin, esmolol, gentamicin, insulin (regular), isoproterenol, labetalol, lidocaine, metaraminol, metroNIDAZOLE, azolam, morphine, nitroglycerin, norepinephrine, penicillin G potassium, phentolamine, phenylephrine, potassium chloride, procainamide, tobramycin, vancomycin
Solution compatibilities: D5W, 0.9
ADVERSE EFFECTS
CNS: Headache, dizziness, involuntary movement, tremors, peripheral neuropathy, malaise, fatigue, ataxia, paresthesias, insomnia
CV: Hypotension, bradycardia, sinus arrest, HF, dysrhythmias, SA node dysfunction, AV block, increased defibrillation energy requirement
EENT: Blurred vision, halos, photophobia, corneal microdeposits, dry eyes
Canada only
Genetic Warning
Adverse effects: italics = common; red = life-threatening

CYP3A4 inhibitors (barbiturates, protease inhibitors, rifamycins): decreased effect of chlordiazePOXIDE

### Drug/lab test

Increased: LFTs
False increase: 17-OHCS
False positive: pregnancy test (some methods)

## NURSING CONSIDERATIONS

### Assessment

- Assess **anxiety reaction:** inability to sleep, apprehension, dread, foreboding, or uneasiness related to unidentified source of danger
- Assess for previous **product dependence** or tolerance; if product dependent or tolerant, amount of medication should be restricted
- Monitor B/P (with patient lying, standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
- Monitor hepatic studies: AST, ALT, bilirubin, creatinine, LDH, alkaline phosphatase during long-term therapy
- **Monitor mental status:** mood, sensorium, affect, sleeping patterns, drowsiness, dizziness, suicidal tendencies, paradoxical reactions such as excitement, stimulation, acute rage
- Assess for pregnancy, product should not be used during pregnancy or breastfeeding

### Patient/family education

- Instruct patient that product may be taken with food; if dose is missed take as soon as remembered; do not double doses
- Tell patient to avoid OTC preparations unless approved by prescriber; to avoid alcohol ingestion or other psychotropic medications unless directed by a prescriber, tolerance occurs
- Caution patient to avoid driving and activities requiring alertness, since drowsiness may occur; until medication response is known, tell patient that drowsiness may worsen at beginning of treatment
- Instruct patient not to discontinue medication abruptly after long-term use; product should be tapered over 1 wk
- Caution patient to rise slowly or fainting may occur, especially in geriatric
- Advise patient that product should be avoided during pregnancy
- Advise patient to report immediately suicidal thoughts/behaviors

### Evaluation

**Positive therapeutic outcome**

- Increased well being
- Decreased anxiety, restlessness, sleeplessness, dread
- Successful alcohol withdrawal

## TREATMENT OF OVERDOSE:

Lavage, VS, supportive care

## chloroquine (Rx)

(klor'oh-kwin)

**Aralen**

*Func. class.:* Antimalarial
*Chem. class.:* Synthetic 4-aminoquinoline derivative

**ACTION:** Inhibits parasite replications, transcription of DNA to RNA by forming complexes with DNA of parasite

**Therapeutic outcome:** Decreased symptoms of malaria, amebiasis

**USES:** Malaria caused by *P. vivax*, *Plasmodium malariae*, *P. ovale*, *Plasmodium falciparum* (so amebiasis

## CONTRAINDICATIONS

Hypersensitivity, retinal field changes

**Precautions:** Pregnancy, breastfeeding, children, blood dyscrasias, severe GI, neurologic disease, alcoholism, cardiac/hepatic disease, G6PD deficiency, psoriasis, eczema, seizures, preexisting auditory damage, infection, torsades de pointes, infection

## DOSAGE AND ROUTES

### Acute malaria attacks

**Adult:** **PO** 1000 mg (600 mg base), then 500 mg (300 mg base) in 6-8 hr, then 500 mg (300 mg base) q day × 2 days for a total of 2.5 g (1.5 g base) in 3 days

**Adult/adolescent of low body weight, child/infant:** **PO** 16.5 mg (10 mg base)/kg, max 600 mg base, then 8.3 mg (5 mg base)/kg max 300 mg base, 6 hr after 1st dose, then 8.3 mg (5 mg base)/kg, max 300 mg base 24 hr after 1st dose, then 8.3 mg (5 mg base)/kg max 300 mg base 36 hr after 1st dose

### Malaria prophylaxis (in areas with chloroquine–sensitive *P. falciparum*)

**Adult:** **PO** 500 mg (300 mg base) q wk on same day of each wk, starting 2 wk before travel and 8 wk after leaving

### Extraintestinal amebiasis

**Adult:** **PO** 1 g (600 mg base) q day × 2 days, then 500 mg (300 mg base) for ≥2-3 wk
**Child (unlabeled):** **PO** 16.6 mg (10 mg base)/kg (max 300 mg base) q day × 2-3wk

**Available forms:** Tabs 250 mg (150 mg base), 500 mg (300 mg base) phosphate

Canadian drugs identified with a maple-leaf icon

New genetic warning icon highlights drugs with genetic contraindications

Pediatric, geriatric, and other special dosages included throughout

**Notices**

Knowledge and best practice in this field are constantly changing. As new research and experience broaden our understanding, changes in research methods, professional practices, or medical treatment may become necessary.

Practitioners and researchers must always rely on their own experience and knowledge in evaluating and using any information, methods, compounds, or experiments described herein. In using such information or methods they should be mindful of their own safety and the safety of others, including parties for whom they have a professional responsibility.

With respect to any drug or pharmaceutical products identified, readers are advised to check the most current information provided (i) on procedures featured or (ii) by the manufacturer of each product to be administered, to verify the recommended dose or formula, the method and duration of administration, and contraindications. It is the responsibility of practitioners, relying on their own experience and knowledge of their patients, to make diagnoses, to determine dosages and the best treatment for each individual patient, and to take all appropriate safety precautions.

To the fullest extent of the law, neither the Publisher nor the authors, contributors, or editors, assume any liability for any injury and/or damage to persons or property as a matter of products liability, negligence or otherwise, or from any use or operation of any methods, products, instructions, or ideas contained in the material herein.

## Preface

*Mosby's Drug Guide for Nursing Students,* thirteenth edition, is the most in-depth handbook available for nursing students! Since its first publication in 1996, more than 100 U.S. and Canadian pharmacists and consultants have reviewed the book's content closely. Today, *Mosby's Drug Guide for Nursing Students* is more up-to-date than ever—with features that make it easy to find critical information fast!

### NEW FEATURES

- Over 20 recent FDA-approved drugs for 2018 are located throughout the book and in Appendix A.

### NEW FACTS

This edition features thousands of new drug facts, including:

- New drugs and new dosage information
- Newly researched adverse effects
- Updated Black Box Warnings
- The latest precautions, interactions, and contraindications
- IV therapy updates
- Revised nursing considerations
- Updated patient/family education guidelines
- Updates on key new drug research

### ORGANIZATION

This handbook is organized into four main sections:

- Individual drug monographs (in alphabetical order by generic name)
- Drug Categories
- Appendixes
- Illustrated mechanisms and sites of action

The guiding principle behind this book is to provide fast, easy access to drug information and nursing considerations. Every detail—from the cover, binding, and paper to the typeface, four-color design, and appendixes—has been carefully chosen with the user in mind. Here's what you'll find in each section of the handbook:

#### Individual Drug Monographs

This book includes monographs for more than 4000 generic and trade medications—those most commonly administered by students. Common trade names are given for all drugs regularly used in the United States and Canada, with drugs available only in Canada identified by a maple leaf icon (🍁). Select monographs, important to learn and know for the NCLEX examination, have been identified by a ✳. You'll see drug-specific information within monographs identified with a >>. New icon highlights drugs that may have genetic contraindications 🧬.

Each monograph provides the following information, whenever possible, for safe, effective administration of each drug:

**High-alert status:** Identifies drugs with the most potential to cause harm to patients if administered incorrectly.

**"Tall Man" lettering:** Uses the capitalization of distinguishing letters to avoid medication errors and is required by the FDA for drug manufacturers.

**Pronunciation:** Helps the nurse master complex generic names.

**Rx, OTC:** Identifies prescription or over-the-counter drugs.

**Functional and chemical classifications:** Helps the nurse recognize similarities and differences among drugs in the same functional but different chemical classes.

**Do not confuse:** Presents drug names that might easily be confused within each appropriate monograph.

**Action:** Describes pharmacologic properties concisely.

**Therapeutic outcome:** Details all possible results of medication use.

**Uses:** Lists the conditions the drug is used to treat.

**Unlabeled uses:** Describes drug uses that may be encountered in practice but are not yet FDA approved.

**Dosages and routes:** Lists all available and approved dosages and routes for adult, pediatric, and geriatric patients.

**Available forms:** Includes tablets, capsules, extended release, injectables (IV, IM, SUBCUT), solutions, creams, ointments, lotions, gels, shampoos, elixirs, suspensions, suppositories, sprays, aerosols, and lozenges.

**Adverse effects:** Groups these reactions by alphabetical body system, with common side effects *italicized* and life-threatening reactions in red type for emphasis.

**Contraindications:** Lists conditions under which the drug absolutely should not be given.

**Precautions:** Lists conditions that require special consideration when the drug is prescribed.

**Black Box Warnings:** Identifies FDA warnings that highlight serious and life-threatening adverse effects.

**Pharmacokinetics/pharmacodynamics:** Features a quick-reference chart of concise facts of pharmacokinetics (absorption, distribution, metabolism, excretion, half-life) and pharmacodynamics (onset, peak, duration).

**Interactions:** Lists confirmed drug, food, herb, and lab test interactions.

**Nursing considerations:** Identifies key nursing considerations for each step of the nursing process: Assessment, Implementation, Patient/Family Education, and Evaluation, including positive therapeutic outcomes. Instructions for giving drugs by various routes (e.g., **IV**, PO, IM, SUBCUT, topically, rectally) appear under Implementation, with route subheadings in bold.

**Compatibilities:** Lists syringe, Y-site, and additive compatibilities and incompatibilities. If no compatibilities are listed for a drug, the necessary compatibility testing has not been done and that compatibility information is unknown. To ensure safety, assume that the drug may not be mixed with other drugs unless specifically stated.

**Treatment of overdose:** Lists drugs and treatments for overdoses where appropriate.

### Drug Categories

The Drug Categories section, following the individual drug monographs, provides general information about the various functional classes to promote learning about the similarities and differences among drugs in the same functional class. It summarizes action, uses, adverse effects, contraindications, precautions, pharmacokinetics, interactions, and nursing considerations for each functional class.

### Appendixes

**Selected new drugs:** Includes comprehensive information on 20+ key drugs approved by the FDA during the last 12 months.

**Ophthalmic, nasal, topical, and otic products:** Provides essential information for 140 ophthalmic, nasal, topical, and otic products commonly used today, grouped by chemical drug class.

**Vaccines and toxoids:** Features an easy-to-use table with generic and trade names, uses, dosages and routes, and contraindications for 39 key vaccines and toxoids.

**Abbreviations and pregnancy categories:** Lists abbreviations alphabetically with their meanings and explains the five FDA pregnancy categories.

**Immunization schedule:** Recommended childhood and adolescent immunization schedules.

**Standard Precautions:** Used in the care of all patients regardless of their diagnosis or disease.

**Illustrated mechanisms and sites of action:** These 13 detailed, full-color illustrations are added to help enhance the understanding of the mechanism or site of action for the following drugs and drug classes:

- Anticholinergic bronchodilators
- Antidepressants
- Antidiabetic agents
- Antifungal agents
- Antiinfective agents
- Antiretroviral agents
- Benzodiazepines
- Diuretics
- Laxatives
- Narcotic agonist-antagonist analgesics
- Narcotic analgesics
- Phenytoin
- Sympatholytics

**Photo atlas of drug administration:** This practical resource for students and practitioners lists standard precautions and provides more than 20 full-color illustrations depicting the physical landmarks and administration techniques used for IV, IM, SUBCUT, and ID drug delivery.

The following sources were consulted in the preparation of this edition:

Blumenthal M: *The Complete German Commission E Monographs: Therapeutic Guide to Herbal Medicines,* Austin, 1998, American Botanical Council.

Brunton L, Lazo J, Parker K: *Goodman and Gilman's The Pharmacological Basis of Therapeutics,* ed 12, New York, 2011, McGraw-Hill.

*Clinical Pharmacology* powered by ClinicalKey [database online], Tampa Florida, 2016, Elsevier. https://www.clinicalkey.com/pharmacology/. Updated March 2018.

## Acknowledgments

I am indebted to the nursing and pharmacology consultants who reviewed the manuscript and pages and thank them for their criticism and encouragement. I would also like to thank Laurie Gower and Elizabeth Kilgore, my editors, whose active encouragement and enthusiasm have made this book better than it might otherwise have been. I am likewise grateful to Lisa Bushey at Elsevier, and Evelyn Dayringer and Cassie Carey at Graphic World Inc., for the coordination of the production process and assistance with the development of the new edition, and to Craig Roth for his editorial assistance.

**Linda Skidmore-Roth**

Content Changes
Drug Monographs—Additional Monographs
Drug Monographs—Recently Approved

This page intentionally left blank

A

⚠ HIGH ALERT

# abacavir (Rx)

(a-ba-ka'veer)

**Ziagen**

*Func. class.:* Antiretroviral

*Chem. class.:* Nucleoside reverse transcriptase inhibitor (NRTI)

**ACTION:** Inhibitory action against HIV; inhibits replication of HIV by incorporating into cellular DNA by viral reverse transcriptase, thereby terminating the cellular DNA chain

**Therapeutic outcome:** Decreased symptoms of HIV

**USES:** In combination with other antiretroviral agents for HIV-1 infection

## CONTRAINDICATIONS

**BLACK BOX WARNING:** Hypersensitivity, moderate to severe hepatic disease, lactic acidosis

**Precautions:** Pregnancy, breastfeeding, child <3 mo, granulocyte count <1000/mm$^3$ or Hgb <9.5 g/dl, severe renal disease, impaired hepatic function, HLA B5701 (Black, Caucasian, Asian patients), abrupt discontinuation; Guillain-Barré syndrome, immune reconstitution syndrome, MI, obesity, polymyositis

## DOSAGE AND ROUTES

**Adult/adolescent ≥16 hr:** PO 300 mg bid or 600 mg daily with other antiretrovirals

**Adolescent <16 yr/child ≥3 mo:** PO 8 mg/kg bid or 16mg/kg q day, max 300 mg bid with other antiretrovirals

### Hepatic dose

**Adult:** (Child-Pugh A 5-6) PO oral/sol 200 mg bid; moderate to severe hepatic disease, do not use

**Available forms:** Tabs 300 mg; oral sol 20 mg/ml

### Implementation

**PO route**

- Reduce dose in hepatic disease, use oral solution
- May give without regard to food q12hr around the clock
- Give in combination with other antiretrovirals with or without food; do not use triple therapy as a beginning treatment, resistance may occur
- Store in cool environment; protect from light, oral solution stored at room temperature; do not freeze

## ADVERSE EFFECTS

**CNS:** *Fever, headache, malaise, insomnia,* paresthesia

**GI:** *Nausea, vomiting, diarrhea, anorexia,* cramps, abdominal pain, *increased AST, ALT,* hepatotoxicity, hepatomegaly with steatosis

**HEMA:** Granulocytopenia, anemia, lymphopenia

**INTEG:** *Rash,* urticaria, hypersensitivity reactions

**META:** Lactic acidosis

**MISC:** Fatal hypersensitivity reactions, fat redistribution, immune reconstitution, decreased bone density

**RESP:** Dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid/extensive (PO) |
| **Distribution** | 50% protein binding, extravascular space, then erythrocytes |
| **Metabolism** | Extensively, to inactive metabolite |
| **Excretion** | Kidneys, feces |
| **Half-life** | 1½-2 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Do not coadminister with abacavir-containing products, ribavirin, interferon

Alcohol: increased abacavir levels; do not use with alcohol

**Ribavirin:** possible lactic acidosis

Methadone: decreased levels of methadone

Tipranavir: decreased abacavir levels

### Drug/lab test

Increased: glucose, triglycerides, AST, ALT, amylase, CK

## NURSING CONSIDERATIONS

### Assessment

- Assess for symptoms of HIV and possible infection, increased temp

**BLACK BOX WARNING: Assess for lactic acidosis** (elevated lactate levels, increased liver function tests) and severe hepatomegaly with steatosis; discontinue treatment and do not restart, women are at greater risk for lactic acidosis, those obese may be at greater risk

**BLACK BOX WARNING: Assess for fatal hypersensitivity reactions:** fever, rash, nausea, vomiting, fatigue, cough, dyspnea, diarrhea, abdominal discomfort; those with HLA-B 5701 are at greater risk, obtain genetic testing for HLA-B 5701 before beginning treatment; treatment should be discontinued and not restarted, register at the Abacavir Hypersensitivity Registry (800-270-0425)

- Autoimmune disorders: Monitor for Guillain-Barre's, Grave's disease, or polymyositis during treatment
- **Pregnancy/breastfeeding:** Register pregnant patients with the Antiretroviral Pregnancy Registry 1-800-258-4263, use only if benefits outweigh fetal risk, identify if pregnancy is planned or suspected, avoid breastfeeding
- Fat distribution: May occur during treatment, buffalo hump, breast growth, moon face, trunk obesity

**BLACK BOX WARNING:** Assess for pancreatitis: abdominal pain, nausea, vomiting, elevated liver enzymes; product should be discontinued because condition can be fatal

- Monitor CBC, differential, platelet count qmo; withhold product if WBC is $<4000/mm^3$ or platelet count is $<75{,}000/mm^3$; notify prescriber of results; monitor viral load and CD4 counts during treatment, perform hepatitis B virus (HBr) screening to confirm correct treatment
- Monitor renal function studies; BUN, serum uric acid, urine CCr before, during therapy; these may be elevated throughout treatment
- Monitor temp q4hr; may indicate beginning of infection

**BLACK BOX WARNING: Hepatotoxicity:** Monitor liver function tests before, during therapy (bilirubin, AST, ALT, amylase, alkaline phosphatase, creatine phosphokinase, creatinine prn or qmo)

- **Immune reconstitution syndrome:** may occur anytime during treatment; response to CMV, mycobacterium avium infection

## Patient/family education

- **Advise patient to report signs of infection:** increased temp, sore throat, flulike symptoms; to avoid crowds and those with known infections, to carry emergency ID with condition, products taken, do not take other products that contain abacavir
- Instruct patient to report signs of anemia: fatigue, headache, faintness, shortness of breath, irritability
- Advise patient to report bleeding; avoid use of razors or commercial mouthwash
- Inform patient that product is not a cure but will control symptoms
- Inform patient that major toxicities may necessitate discontinuing product
- Consider the use of contraception during treatment, if patient is pregnant, register with the Antiretroviral Pregnancy Registry, that body fat redistribution may occur, not to share product
- Caution patient to avoid OTC products or other medications without approval of prescriber, that other products may be necessary to prevent infections, and that product is taken with other products for HIV
- Caution patient not to have any sexual contact without use of a condom; needles should not be shared; blood from infected individual should not come in contact with another's mucous membranes
- Give Medication Guide and Warning Card; discuss points on guide
- Advise patient to notify prescriber if skin rash, fever, cough, shortness of breath, GI symptoms occur; advise all health care providers that allergic reactions have occurred with this product
- To use exactly as prescribed, not to drink alcohol, not to stop or change dose

## Evaluation

**Positive therapeutic outcome**

- Increased CD4 count
- Decreased viral load

## abatacept (Rx)

(ab-a-ta'sept)

**Orencia, Orencia ClickJet**

*Func. class.:* Antirheumatic agent (disease modifying)

*Chem class.:* immunomodulator

**Do not confuse:** Orencia/Oracea

**ACTION:** A selective costimulation modulator, inhibits production of T lymphocytes, inhibits tumor necrosis factor (TNF-α), interferon-γ, interleukin-2, which are involved in immune and inflammatory reactions

**Therapeutic outcome:** Decreased pain, inflammation in joints

**USES:** Polyarticular juvenile rheumatoid arthritis; acute chronic rheumatoid arthritis that has not responded to other disease-modifying agents; may use in combination with DMARDs; do not use with TNF antagonists (adalimumab, etanercept, infliximab) or anakinra

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric, recurrent infections, COPD, immunosuppression, neoplastic disease, respiratory infection, TB, viral hepatitis

## DOSAGE AND ROUTES

### Rheumatoid arthritis

**Adult: SUBCUT** 125 mg within a day after single IV loading dose, then 125 mg weekly, weekly subcut may be initiated without IV loading dose for those unable to receive an infusion

**Adult >100 kg (220 lb): IV** INF 1 g over 30 min; give at 2, 4 wk after first infusion, then q4wk

**Adult 60-100 kg (132-220 lb): IV** INF 750 mg over 30 min; give at 2, 4 wk after first infusion, then q4wk

**Adult <60 kg (132 lb): IV** INF 500 mg over 30 min; give at 2, 4 wk after first infusion, then q4wk

### Juvenile rheumatoid arthritis (JRA)/ juvenile idiopathic arthritis (JIA)

**Child/adolescent ≥6 yr >100 kg: IV** 1000 mg over 30 min q2wk × 3 doses, then 1 g over 30 min q4wk starting at wk 8

**Child/adolescent >6 yr >75 kg: IV** INF 750 mg over 30 min q2wk × 3 doses, then 750 mg over 30 min q4wk starting at wk 8

**Child/adolescent ≥6 yr <75 kg: IV** INF 10 mg/kg over 30 min q2wk × 2 doses, then 10 mg/kg q4wk starting at wk 8

### Moderate/severe polyarticular juvenile idiopathic arthritis as monotherapy with or without methotrexate

**Child/adolescent >2 yr and ≥ 50 kg:** SUBCUT 125 mg q wk

**Child/adolescent >2 yr and 25-50 kg:** SUBCUT 87.5 mg q wk

**Child/adolescent >2 yr and 10-25 kg:** SUBCUT 50 mg q wk

**Available forms:** Lyophilized powder, single-use vials 250 mg, sol for subcut injection 125 mg/ml

### Implementation

- Store in refrigerator; do not use expired vials, protect from light, do not freeze

**Intermittent IV infusion route**

- To **reconstitute,** use 10 ml of sterile water for injection; insert syringe needle into vial and direct stream of sterile water for inj on the wall of vial; rotate vial until mixed; vent with needle to rid foam after reconstitution 25 mg/ml; **further dilute** in 100 ml from a 100 ml NS infusion bag/bottle; withdraw the needed volume (2 vials remove 20 ml; 3 vials remove 30 ml, 4 vials remove 40 ml); slowly add the reconstituted sol from each vial into the infusion bag/bottle using the same disposable syringe supplied; mix gently, discard unused portions of vials; do not use if particulate is present or if discolored; **give** over 30 min; use non–protein binding filter (0.2-1.2 mcg)
- Do not admix with other sol or medications
- Store in refrigerator; do not use expired vials; protect from light

**Subcut route**

- Use prefilled syringe for subcut only, do not use for IV; allow syringe to warm to room temperature (30-60 min) do not speed up warming process; the amount of liquid should be between the two lines on the barrel, do not use the syringe if there is more or less liquid; use front of thigh, outer area of the upper arm, or abdomen except 2-inch area around the navel, do not inject into tender, bruised area
- Gently pinch skin and hold firmly, insert needle at 45-degree angle, inject full amount in 125 mg syringe, rotate injection sites
- Use ClickJet for SUBCUT only, let warm for 30 min after removal from refrigerator, do not use if damaged or past expiration date, pull cap straight off, push down on skin to unlock, push button and hold for 15 sec. A click will be heard, keep holding until blue indicator stops moving in the window, remove, tip will lock over needle

## ADVERSE EFFECTS

**CNS:** Headache, asthenia, dizziness

**CV:** *Hypertension, hypotension*

**GI:** Abdominal pain, dyspepsia, nausea, diarrhea, diverticulitis

**INTEG:** Rash, *inj site reaction,* flushing, urticaria, pruritus

**RESP:** *Pharyngitis, cough, URI,* non-URI, *rhinitis*, wheezing

**SYST:** Anaphylaxis, malignancies, angioedema, serious infections, antibody development

**GU:** Urinary tract infection, pyelonephritis

**MS:** Back pain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown; steady state 60 days |
| **Metabolism** | Increased clearance in obesity (subcut); clearance increases with increased body weight |
| **Excretion** | Unknown |
| **Half-life** | Terminal IV 13 days, subcut 14.3 days |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual drugs
Anakinra: do not use
Atropine, scopolamine, halothane: avoid concurrent use
Nitrous oxide: avoid concurrent use

### Drug classifications
Corticosteroids, immunosuppressives: avoid concurrent use, nitrous oxide
TNF antagonists (adalimumab, etanercept, inFLIXimab): do not use, infection may occur
Vaccines: do not give concurrently; immunizations should be brought up to date before treatment

## NURSING CONSIDERATIONS
### Assessment
- **RA:** Assess for pain, stiffness, ROM, swelling of joints during treatment
- Assess for latent/active TB before beginning treatment
- Assess for inj site pain, swelling
- Monitor patient's overall health on each visit; product should not be given with active infections; parenteral product contains maltose; glucose monitoring must be done with glucose-specific testing
- **Infection:** sinusitis, urinary tract infection, influenza, bronchitis, serious infections have occurred, notify provider, therapy may need to be changed
- **Pregnancy/breastfeeding:** Assess if pregnancy is planned or suspected, if pregnant, register by calling 877-311-8972, use only if benefits outweigh fetal risk, do not breastfeed

### Patient/family education
- Teach patient that product must be continued for prescribed time to be effective
- Advise patient to use caution when driving; dizziness may occur
- Advise patient not to have vaccinations while taking this product or use alcohol, TNF antagonists, other immunosuppressants; bring vaccinations up to date before use of this product
- Discuss with patient information included in packaging
- How to inject and rotate injection sites
- **Pregnancy/breastfeeding:** Teach patient to advise provider if pregnancy is suspected, if pregnant, enroll in registry, do not breastfeed
- Infection: report immediately, temperature, flulike symptoms, urinary burning/stinging, sinusitis; to avoid persons with known infections

### Evaluation
**Positive therapeutic outcome**
- Decreased inflammation, pain in joints; decreased erythrocyte sedimentation rate (ESR)

**⚠ HIGH ALERT**

# abiraterone
**Zytiga**
(a-bir-a'ter-one)
*Func Class.:* Antineoplastic
*Chem Class.:* Androgen inhibitor

**ACTION:** Converted to abiraterone, which inhibits CYP17, the enzyme required for androgen biosynthesis; androgen-sensitive prostate cancer responds to treatment that decreases androgens

**Therapeutic outcome:** Decreases spread of malignancy

**USES:** Metastatic castration-resistant prostate cancer in combination with prednisone in patients who have received prior chemotherapy containing docetaxel

## CONTRAINDICATIONS
Pregnancy, women, children

### Precautions
Adrenal insufficiency, cardiac disease, MI, heart failure, hepatic disease, hypertension, hypokalemia, infection, surgery, ventricular dysrhythmia

## DOSAGE AND ROUTES
**Adult Males: PO** 1000 mg q day with predniSONE 5 mg bid

### Hepatic dose
**Adult Males:** (Child-Pugh B, 7-9) PO 250 mg qday with predniSONE, permanently discontinue if AST/ALT >5 times of the upper normal limit (ULN) or total bilirubin >3 times (ULN); (Child-Pugh C, >10) do not use

**Available forms:** Tab 250 mg

### Implementation
**PO route**
- Give whole, on empty stomach two hrs before or 1 hr after meals with full glass of water
- Women who are pregnant or may become pregnant should not touch tabs without gloves
- Storage of tabs at room temperature

## ADVERSE EFFECTS
**CV:** Angina, dysrhythmia exacerbation, atrial flutter/fibrillation/tachycardia, AV block, chest pain, edema, heart failure, MI, hypertension, QT prolongation, sinus tachycardia, supraventricular tachycardia, ventricular tachycardia
**ENDO:** Hot flashes

**GI:** Diarrhea, dyspepsia, hepatotoxicity
**GU:** Increased urinary frequency, nocturia, urinary tract infection
**META:** Adrenocortical insufficiency, hyperbilirubinemia, hypertriglyceridemia, hypokalemia, hypophosphatemia
**MS:** Arthralgia, myalgia
**RESP:** Cough, upper respiratory infection
**SYST:** Infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Food increases effect; give on empty stomach; increased effect in hepatic disease |
| **Distribution** | 99% protein binding |
| **Metabolism** | Converted to abiraterone (active metabolite) |
| **Excretion** | 88% (feces), 5% (urine) |
| **Half-life** | Mean terminal half-life 12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

CYP3A4 inducers (carBAMazepine, phenytoin, rifampin, rifabutin, rifapentine, PHENobarbital): decreased abiraterone effect
CYP2D6 substrates (dextromethorphan, thioridazine): increased action, dose of these products should be reduced, avoid concurrent use if possible

### Drug/Lab

Increase: ALT, AST, bilirubin, triglycerides
Decrease: Potassium, phosphate, testosterone, lymphocytes

### Drug/Food

Must be taken on an empty stomach, increased product effect if taken with food

## NURSING CONSIDERATIONS

### Assessment

- Prostate cancer: Monitor prostate-specific antigen (PSA), serum potassium, serum bilirubin
- Monitor liver function tests (AST/ALT) baseline and every 2 wk for 3 mo and monthly thereafter in those with no known hepatic disease; interrupt treatment in patients without known hepatic disease at baseline who develop ALT/AST >5 times ULN or total bilirubin >3 times ULN; in baseline moderate hepatic disease, measure ALT, AST, and bilirubin before the start of treatment, every week for the first month, every 2 weeks for the following 2 months, and monthly thereafter; if elevations in ALT and/or AST >5 times ULN or total bilirubin >3 times ULN occur in patients with baseline moderate hepatic impairment, discontinue and do NOT restart. Measure serum total bilirubin, AST, and ALT if hepatotoxicity is suspected. Elevations of AST, ALT, bilirubin from baseline should prompt more frequent monitoring.
- **Monitor musculoskeletal pain, joint swelling, discomfort:** Assess for arthritis, arthralgia, joint swelling, and joint stiffness, some severe. Muscle discomfort that included muscle spasms, musculoskeletal pain, myalgia, musculoskeletal discomfort, and musculoskeletal stiffness may be relieved with analgesics.
- Assess for signs and symptoms of adrenocorticoid insufficiency (anorexia, nausea, vomiting, fatigue, weight loss), corticosteroids may be needed during times of stress, surgery, trauma; monthly for hypertension, hypokalemia, and fluid retention
- **QT prolongation:** Monitor ECG for QT prolongation, ejection fraction in those with cardiac disease, small increases in the QTc interval such as <10 ms have occurred; monitor for arrhythmia exacerbation such as sinus tachycardia, atrial fibrillation, supraventricular tachycardia (SVT), atrial tachycardia, ventricular tachycardia, atrial flutter, bradycardia, AV block complete, conduction disorder, and bradyarrhythmia
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Teach patient that women must not come in contact with tabs, wear gloves if product needs to be handled, males need to wear condoms if partner is pregnant
- Instruct patient to report chest pain, swelling of joints, burning/pain when urinating
- Teach patient to take 2 hr before or 1 hr after meals, swallow whole, take with water, to use with predniSONE
- Advise patient not to stop abruptly without prescriber's consent
- Teach patient not to use with other medications, herbs, supplements without prescriber approval

**HIGH ALERT**

## acarbose (Rx)

(a-kar'bose)
**Glucobay, Prandase, Precose**
*Func. class.:* Oral antidiabetic
*Chem. class.:* α-Glucosidase inhibitor

**Do not confuse:** Precose/PreCare

**ACTION:** Delays the digestion/absorption of ingested carbohydrates by inhibiting α-glucosidase, results in a smaller rise in blood glucose after meals; does not increase insulin production

**Therapeutic outcome:** Decreased blood glucose levels in diabetes mellitus

**USES:** Type 2 diabetes mellitus, alone or in combination with a sulfonylurea, metformin, insulin

## CONTRAINDICATIONS

Hypersensitivity, breastfeeding, diabetic ketoacidosis, cirrhosis, inflammatory bowel disease, ileus, colonic ulceration, partial intestinal obstruction, chronic intestinal disease, serum creatinine >2 mg/dl

**Precautions:** Pregnancy, children, renal/hepatic disease

## DOSAGE AND ROUTES

### Initial dose

**Adult >60 kg (>132 lb):** PO 25 mg tid with first bite of meal

### Maintenance dose

**Adult:** PO May be increased to 50-100 mg tid; dosage adjustment at 4-8 wk intervals, individualized

**Adult <60 kg (<132 lb):** PO Max 50 mg tid

**Available forms:** Tabs 25, 50, 100 mg

### Implementation

- Give tid with first bite of each meal
- Provide storage in tight container in cool environment

## ADVERSE EFFECTS

**GI:** *Abdominal pain, diarrhea, flatulence*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poor systemic |
| **Distribution** | Unknown |
| **Metabolism** | GI tract |
| **Excretion** | Kidneys as intact drug |
| **Half-life** | Elimination 2 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr |
| **Duration** | 2-4 hr |

## INTERACTIONS

### Individual drugs

Acetaminophen: increased toxicity combined with alcohol, avoid concurrent use

Digoxin: decreased acarbose effect, monitor glucose level

Gatifloxacin: do not use concurrently

Phenytoin: increased hypoglycemia

Baclofen, cycloSPORINE, tacrolimus, isoniazid: increased hyperglycemia, monitor blood glucose

### Drug classifications

Androgens, quinolones: increased or decreased glycemic control

Calcium channel blockers, corticosteroids, diuretics, estrogens, oral contraceptives, phenothiazines, progestins, sympathomimetics: digestive enzymes, intestinal absorbents, thiazide diuretics, loop diuretics, corticosteroids, protease inhibitors, atypical antipsychotics, carbonic anhydrase inhibitors: increased hyperglycemia, decreased effect of acarbose, monitor for glucose control

MAOIs, salicylates, fibric acid derivatives, bile acid sequestrants, ACE inhibitors, angiotensin II receptor antagonists, β-blockers, sulfonylureas, insulins: increased hypoglycemia

### Drug/herb

Chromium, garlic, horse chestnut: increased hypoglycemia

### Drug/lab test

Increased: ALT

Decreased: calcium, vit $B_6$, Hgb , Hct

## NURSING CONSIDERATIONS

### Assessment

- **Assess for hypoglycemia** (weakness, hunger, dizziness, tremors, anxiety, tachycardia, sweating), hyperglycemia; even though this product does not cause hypoglycemia, if on a sulfonylurea or insulin, hypoglycemia may be additive; if hypoglycemia occurs, treat with glucose or if severe, **IV** dextrose or IM glucagon
- Monitor 1 hr postprandial glucose for establishing effectiveness, then glycosylated Hgb q3mo, 1 hr PP throughout treatment
- Monitor AST, ALT q3mo × 1 yr, and periodically thereafter, if elevated dose, may need to be reduced or discontinued, usually increased with doses ≥ 300 mg/day; dose-related elevations may occur, and patients are usually asymptomatic; if symptomatic, dosage reduction or withdrawal is needed; obtain glycosylated Hgb periodically
- Assess for stress, surgery, or other trauma that may require change in dose
- Assess for GI side effects, compliance
- **Pregnancy/breastfeeding:** Use in pregnancy only if needed, avoid breastfeeding

### Patient/family education

- Teach patient the symptoms of hypoglycemia, hyperglycemia, and what to do about each
- Instruct that medication must be taken as prescribed; must be taken with food; explain consequences of discontinuing the medication

abruptly; that insulin may need to be used during stress such as trauma, surgery, fever
• Tell patient to avoid OTC medications, herbal products unless approved by prescriber
• Teach patient that diabetes is a lifelong illness; product will not cure condition; that diet and exercise regimen must be followed
• Instruct patient to carry/wear emergency ID as diabetic
• Teach patient to avoid breastfeeding if using acarbose with other antidiabetics
• Inform that GI side effects may occur
• **Pregnancy/breastfeeding:** Notify provider if pregnancy is planned or suspected or if breast-feeding

### Evaluation

**Positive therapeutic outcome**
• Improved signs, symptoms of diabetes mellitus (decreased polyuria, polydipsia, polyphagia; clear sensorium, absence of dizziness, stable gait)

## acetaminophen (OTC) (Paracetamol)

(a-seat-a-mee′noe-fen)
**222AF, Abenol, ACET, Aceta, Acetab, Aminofen, Apacet, APAP, Apra, Atasol, Children's Feverall, Equaline Children's Pain Relief, Equaline Infant's Pain Relief, Exdol, Fortolin, Genapap, Good Sense Acetaminophen, Good Sense Children's Pain Relief, Infantaire, Leader Children's Pain Reliever, Mapap, Maranox, Meda, Neopap, Novo-Gesic, Ofirmev, Oraphen-PD, Pediaphen, Pediatrix, Q-Pap, Q-Pap Children's, Rapid Action Relief, Redutemp, Ridenol, Robigesic, Rounox, Silapap, Taminol, Tapanol, Tempra, T-Painol, Tylenol, Uni-Ace, Vick's Custom Care Body Aches, Walgreen's Acetaminophen, Walgreen's Non-Aspirin, XS Pain Reliever**
*Func. class.:* Nonopioid analgesic
*Chem. class.:* Nonsalicylate, paraaminophenol derivative

**Do not confuse:** Anacin Aspirin 3/Anacin-3

**ACTION:** May block pain impulses peripherally that occur in response to inhibition of prostaglandin synthesis; does not possess antiinflammatory properties; antipyretic action results from inhibition of prostaglandins in the CNS (hypothalamic heat-regulating center)

**Therapeutic outcome:** Decreased pain, fever

**USES:** Mild to moderate pain or fever; arthralgia, dental pain, dysmenorrhea, headache, myalgia, osteoarthritis

## CONTRAINDICATIONS

Hypersensitivity to this product or phenacetin

**Precautions:** Pregnancy, breast-feeding, geriatric, anemia, renal/hepatic disease, chronic alcoholism

**BLACK BOX WARNING:** Hepatotoxicity

## DOSAGE AND ROUTES

**Adult and child >12 yr:** PO/RECT 325-650 mg q4-6hr prn, max 4 g/day; weight ≥50 kg IV 1000 mg q6hr or 650 mg q4hr prn, max single dose 1000 mg, minimum dosing interval 4 hr; weight <50 kg IV 15 mg/kg/dose q6hr or 12.5 mg/kg/dose q4hr, max single dose 15 mg/kg minimum dosing interval 4 hr, max 75 mg/kg/day from all sources, ext rel 650-1300 mg q8hr as needed, max 4 g/day
**Child ≥2 yr and <50 kg:** IV 15 mg/kg/dose q6hr or 12.5 mg/kg/dose q4hr, max single dose 15 mg/kg, minimum dosing interval 4 hr, max 75 mg/kg/day from all sources

### Renal dose

**Adult:** IV CCr <30 ml/min reduce dose and prolong interval; CCr <10 ml/min PO/IM/IV minimal interval q8h

**Available forms:** Rectal supp 120, 325, 650 mg; chewable tabs 80 mg; caps 500 mg; elix 120, 160, 325 mg/5 ml; tabs 160, 325, 500, 650 mg; sol for injection 1000 mg/100 ml; disintegrating tab 80, 160 mg; oral drops 80 mg/10.8 ml; liquid 500 mg/5 ml, 160 mg/5 ml, 1000 mg/30 ml, 80 mg/ml; ext rel tabs 650 mg

### Implementation

**PO route**
• **Do not confuse:** 2 × 325 (650 mg), with 650 mg ER tab
• Administer to patient crushed or whole; chewable tabs may be chewed; do not crush or chew EXT REL product
• Give with food or milk to decrease gastric symptoms; give 30 min before or 2 hr after meals; absorption may be slowed
• Shake susp well; check all product concentrations carefully; check elixir, liquid, suspension concentration carefully; susp and cups are bioequivalent

**Intermittent IV infusion route**
• No further dilution needed, do not add other medications to vial or infusion device

- For doses equal to single vial, a vented IV set may be used to deliver directly from vial; for doses less than a single vial, withdraw dose and place in an empty sterile syringe, plastic IV container, or glass bottle, infuse over 15 mins
- Discard unused portion, once seal is broken or vial penetrated or transferred to another container, give within 6 hr
- Check IV dose carefully to prevent dosing errors

**Rectal route**

- Store suppositories <80° F (27° C)

## ADVERSE EFFECTS

**GI:** Nausea, vomiting, abdominal pain; hepatotoxicity, hepatic seizure (overdose), GI bleeding
**GU:** Renal failure (high, prolonged doses)
**HEMA:** Leukopenia, neutropenia, hemolytic anemia (long-term use), thrombocytopenia, pancytopenia
**INTEG:** Rash, urticaria, injection site pain
**SYST:** Stevens-Johnson syndrome, toxic epidermal necrolysis
**TOXICITY:** Cyanosis, anemia, neutropenia, jaundice, pancytopenia, CNS stimulation, delirium followed by vascular collapse, seizures, coma, death

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO), variable (RECT) |
| **Distribution** | Widely distributed; crosses placenta in low concentrations |
| **Metabolism** | Liver 85%-95%; metabolites are toxic at high levels |
| **Excretion** | Kidneys—metabolites, breast milk |
| **Half-life** | 3-4 hr |

### Pharmacodynamics

| | PO | RECT | IV |
|---|---|---|---|
| **Onset** | ½-1 hr | ½-1 hr | Unknown |
| **Peak** | 1-3 hr | 1-3 hr | 30-120 min |
| **Duration** | 3-4 hr | 3-4 hr | 3-4 hr |

## INTERACTIONS

### Individual drugs

Alcohol, carBAMazepine, dasatinib mipomersen, diflunisal, imatinib, isoniazid, lamoTRIgine, rifabutin, rifampin, zidovudine: increased hepatotoxicity
Colestipol, cholestyramine: decreased absorption of acetaminophen
Lomitapide: increase effect of lomitapide, consider a lower dose
Nitric oxide, pilocarpine: increased methoglobinemia, avoid concurrent use
Decrease: zidovudine, lamoTRIgine effect
Avoid use with salicylates
Warfarin: hypoprothrombinemia; long-term use, high doses of acetaminophen

### Drug classifications

Barbiturates, hydantoins: decreased effect; increased hepatotoxicity, monitor for hepatotoxicity
NSAIDs, salicylates: increased renal adverse reactions

### Drug/herb

St. John's wort: increased hepatotoxicity due to acetaminophen metabolism

### Drug/lab test

Interference: urinary 5-HIAA
Increased: LFTs, potassium, bilirubin, LDH, pro-time
Decreased: Hgb/Hct, WBC, RBC, platelets; albumin, magnesium, phosphate (pediatrics)

## NURSING CONSIDERATIONS

### Assessment

- **Monitor liver function studies:** AST, ALT, bilirubin, creatinine before therapy if long-term therapy is anticipated; may cause hepatic toxicity at doses >4 g/day with chronic use
- Monitor renal function studies: BUN, urine creatinine, occult blood; albumin indicates nephritis
- Monitor blood studies: CBC, PT if patient is on long-term therapy
- Check I&O ratio; decreasing output may indicate renal failure (long-term therapy)
- Assess for fever and pain: type of pain, location, intensity, duration, temp, diaphoresis
- **Assess for chronic poisoning:** rapid, weak pulse; dyspnea; cold, clammy extremities; report immediately to prescriber

**BLACK BOX WARNING: Assess hepatotoxicity:** dark urine, clay-colored stools, yellowing of skin and sclera; itching, abdominal pain, fever, diarrhea if patient is on long-term therapy; doses > 4 gm/day, may require liver transplant

- Stevens-Johnson syndrome, toxic epidermal necrolysis may occur when beginning treatment or any other dose
- Pregnancy/breastfeeding: Use cautiously in pregnancy, breastfeeding (PO), use only if clearly needed (IV)

A

### Patient/family education

**BLACK BOX WARNING:** Teach patient not to exceed recommended dosage; the elixir, liquid, and suspension come in several concentrations, read label carefully; acute poisoning with liver damage may result; acute toxicity includes symptoms of nausea, vomiting, and abdominal pain; prescriber should be notified immediately

- Inform patient that toxicity may occur when used with other combination products
- Advise patient not to use with alcohol, OTC products, or herbals without prescriber approval
- **Teach patient to recognize signs of chronic overdose:** bleeding, bruising, malaise, fever, sore throat
- Inform patient that urine may become dark brown as a result of phenacetin (metabolite of acetaminophen)
- Tell patient to notify prescriber for pain or fever lasting more than 3 days, not to be used in <2 yr unless approved by prescriber
- Hypersensitivity: Teach patient to stop product, notify provider if rash occurs

### Evaluation

**Positive therapeutic outcome**

- Decreased pain, use pain scoring
- Decreased fever

## TREATMENT OF OVERDOSE:

Product level q4hr, gastric lavage; administer oral acetylcysteine to prevent hepatic damage (*see acetylcysteine monograph*)

## acetaZOLAMIDE (Rx)

(a-set-a-zole'-a-mide)

**Diamox** 🍁, **Novo-zolamide** 🍁

*Func. class.:* Diuretic carbonic anhydrase inhibitor; antiglaucoma agent, antiepileptic

*Chem. class.:* Sulfonamide derivative

**Do not confuse:** acetaZOLAMIDE/ acetoHEXAMIDE, Diamox/Dobutrex/ Trimox

**ACTION:** Decreases the aqueous humor in the eye, which lowers intraocular pressure by the inhibition of carbonic anhydrase; also inhibits carbonic anhydrase activity in proximal renal tubules to decrease reabsorption of water, sodium, potassium, bicarbonate; decreases carbonic anhydrase in CNS, increasing seizure threshold; prevents uric acid or cysteine buildup in the renal system by the decrease in pH, causing increased urine volume and alkaline urine

**Therapeutic outcome:** Decreased intraocular pressure; control of seizures; prevention and treatment of acute mountain sickness; prevention of uric acid/cysteine renal stones; decreased edema in lung tissue and peripherally; decreased B/P

**USES:** Open-angle glaucoma, angle closure glaucoma (preoperatively if surgery delayed), mixed, tonic-clonic, myclonic, refractory, epilepsy (petit mal, grand mal, absence), edema in HF, product-induced edema, acute altitude sickness

## CONTRAINDICATIONS

Hypersensitivity to sulfonamides, severe renal/hepatic disease, electrolyte imbalances (hyponatremia, hypokalemia), hyperchloremic acidosis, Addison's disease, long-term use in closed-angle glaucoma, adrenalcortical insufficiency, metabolic acidosis, acidemia, anuria

**Precautions:** Pregnancy, breastfeeding, hypercalciuria, COPD, respiratory acidosis, pulmonary obstruction/emphysema

## DOSAGE AND ROUTES

### Angle closure glaucoma

**Adult:** PO/IV 250 mg q4hr or 250 mg bid, to be used for short-term therapy

### Chronic open-angle glaucoma

**Adult:** PO/IV 250 mg/day in divided doses for amounts over 250 mg or 500 mg EXT REL bid, max 1 g/day

**Child:** PO 8-30 mg/kg/day in divided doses tid or qid, or 300-900 mg/m$^2$/day, max 1 g/day; IV 5 to 10 mg/kg q6hr, max 1 g/day

### Edema in HF, drug-induced edema

**Adult:** PO/IV 250-375 mg/day or 5 mg/kg in AM, give for 2 days, then 1-2 days drug-free

**Child:** PO/IV 5 mg/kg/day or 150 mg/m$^2$ in AM

### Adjunct for epilepsy and myoclonic refractory generalized tonic-clonic absence or mixed seizures

**Adult:** PO/IV 8-30 mg/kg/day in 1-4 divided doses, usual range 375-1000 mg/day; EXT REL not recommended in seizures

### Altitude sickness

**Adult 125 mg bid/Child ≥ 12 yrs:** PO (Ext Rel) 500-1000 mg q12hr, start therapy 24-48 hr prior to ascent and ≥48 hr after arrival at high altitude

**Geriatric:** PO 250 mg bid; use lowest effective dose

### Renal dose

**Adult:** PO/IV CCr 50-80 ml/min, give dose ≥q6hr regular release of IV; CCr 10-50 ml/min, give dose q12hr; CCr <10 ml/min, avoid use

**Available forms:** Tabs 125, 250 mg; ext rel caps 500 mg; inj 500 mg

### Implementation

- Give in AM to avoid interference with sleep
- Administer fluids 2-3 L/day to prevent renal calculi, unless contraindicated
- Potassium replacement if potassium level is <3.0 ml/dl

**PO route**

- Do not crush or chew ext rel caps; caps may be opened and sprinkled on food; store at room temperature
- Give with food; if nausea occurs, crush tabs and mix with sweet substance to counteract bitter taste

**IV route**

- Do not use solution that is yellow or has a precipitate or crystals
- **Reconstitute with** 500 mg of product/5 ml or more sterile water for inj: use within 24 hr, **give** at 100-500 mg/min

**IV, direct route**

- Give at 100-500 mg/min or more
- Store in cool, dark area, use reconstituted solution within 24 hr

**Additive compatibilities:** Cimetidine, ranitidine

**Additive incompatibilities:** Multivitamins

## ADVERSE EFFECTS

**CNS:** Drowsiness, paresthesia, anxiety, depression, headache, dizziness, confusion, stimulation, fatigue, seizures

**EENT:** Myopia, tinnitus

**ENDO:** Hyperglycemia, hypoglycemia

**GI:** Nausea, vomiting, anorexia, diarrhea, melena, weight loss, hepatic insufficiency, cholestatic jaundice, fulminant hepatic necrosis, taste alterations, bleeding

**GU:** Frequency, polyuria, uremia, glucosuria, hematuria, dysuria, crystalluria, renal calculi

**HEMA:** Aplastic anemia, hemolytic anemia, leukopenia, thrombocytopenia purpura, pancytopenia

**INTEG:** Rash, pruritus, urticaria, fever, Stevens-Johnson syndrome, photosensitivity, flushing, toxic epidermal necrolysis

**META:** *Hypokalemia, hyperchloremic acidosis,* hyponatremia, sulfonamide-like reactions, metabolic acidosis, growth inhibition in children, hyperuricemia, hypercalcemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | GI tract—65% if fasting, 75% with food; **IV**—complete |
| **Distribution** | Crosses placenta; widely distributed |
| **Metabolism** | None |
| **Excretion** | Kidneys, unchanged (80% within 24 hr); breast milk |
| **Half-life** | 2½-5½ hr |

### Pharmacodynamics

| | PO | PO—ext rel | IV |
|---|---|---|---|
| **Onset** | 1 hr | 2 hr | 2 min |
| **Peak** | 8-12 hr | 3-6 hr | 15 min |
| **Duration** | 8-12 hr | 18-24 hr | 4-5 hr |

## INTERACTIONS

### Individual drugs

Amphotericin B, corticotropin, ACTH: increased hypokalemia

Arsenic trioxide, levomethadyl: increased cardiac toxicity if hypokalemia develops

CarBAMazepine, ethotoin: increased osteomalacia

CycloSPORINE: increased toxicity

Diflunisal: increased side effects

Lithium: increased excretion of lithium, monitor drug level

Increase: acidosis (respiratory disorders) beta blockers

Methenamine: decreased acetaZOLAMIDE effect

Primidone: decreased primidone level, monitor drug level

Topiramate: increased renal stone formation, heat stroke, avoid concurrent use

### Drug classifications

Alpha blockers, beta blockers, antihypertensives: increased hypotensive effect

Amphetamines: increased action

Anticholinergics, folic acid antagonists: increased action of each product

Cardiac glycosides: increased cardiac toxicity if hypokalemia develops

Corticosteroids: increased hypokalemia

Flecainide, memantine, phenytoin, procainamide, quiNIDine, mecamylamine, mexiletine: increased effect of each product

Salicylates: increased toxicity

### Drug/lab test

Increased: glucose, bilirubin, calcium, uric acid

Decreased: thyroid iodine uptake, sodium, Hct/Hgb

False positive: urinary protein, 17-hydroxysteroids

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for tinnitus, hearing loss, ear pain; periodic testing of hearing is needed when high doses of this product are given by **IV** route
- **Assess for seizures:** type, location, duration; provide seizure precautions

• Assess fluid volume status: I&O ratio and record, count or weigh diapers as appropriate, distended neck veins, crackles in lung, color, quality, and specific gravity of urine, skin turgor, adequacy of pulses, moist mucous membranes, bilateral lung sounds, peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth, and mucous membranes should be reported
• Monitor electrolytes: potassium, sodium, calcium, magnesium; also include BUN, blood pH, ABGs, uric acid, CBC, blood glucose
• Assess B/P before and during therapy with patient lying, standing, and sitting as appropriate; orthostatic hypotension can occur rapidly
• Monitor blood, urine glucose in diabetic patients; glucose levels may be increased
• Assess for eye pain, change in vision when using product for intraocular pressure
• Assess neurologic status when using product for seizures
• **Assess for decreased symptoms of acute mountain sickness:** headache, nausea, vomiting, dizziness, fatigue, drowsiness, shortness of breath, insomnia
• **Beers:** Avoid in older adults unless safer alternative is not available; may cause ataxia, impaired psychomotor function
• **Pregnancy/breastfeeding:** Women who are pregnant should enroll in the AED Pregnancy Registry 888-233-2334; assess if pregnancy is planned or suspected or if breastfeeding, use in pregnancy only if benefits outweigh fetal risk

### Patient/family education

• Teach patient to take the medication early in the day to prevent nocturia
• Instruct patient to take with food or milk if GI symptoms of nausea and anorexia occur, not to crush, chew, or open capsules
• Teach patient to maintain a record of weight on a weekly basis and notify prescriber of weight loss of >5 lb
• Caution patient that this product causes a loss of potassium, so food rich in potassium should be added to the diet; refer to a dietitian for assistance in planning
• Advise patient to wear protective clothing and sunscreen in the sun to prevent photosensitivity
• Teach patient not to use alcohol or any OTC medications without prescriber's approval; serious product reactions may occur
• Emphasize the need to contact prescriber immediately if muscle cramps, weakness, nausea, dizziness, or numbness, rapid weight changes, change in stools, rash, sore throat, bleeding/bruising, Stevens-Johnson syndrome, toxic epidermal necrolysis (red rash that spreads, blistering) occur
• Avoid prolonged sun exposure
• Teach patient to take own B/P and pulse and record
• Teach patient to continue taking medication even if feeling better; this product controls symptoms but does not cure the condition
• Teach patient to see ophthalmologist periodically; glaucoma is a slow process
• Pregnancy/breastfeeding; Teach patient to notify prescriber if pregnancy is planned or suspected, avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**
• Decreased intraocular pressure (glaucoma)
• Decreased edema in feet, legs, sacral area daily (HF)
• Decreased frequency of seizures
• Prevention of altitude sickness

**TREATMENT OF OVERDOSE:** Lavage if taken orally, monitor electrolytes, administer dextrose in saline, monitor hydration, CV, renal status

## acetylcholine ophthalmic

*See Appendix B*

## acetylcysteine (Rx)

(a-se-teel-sis'tay-een)
**Acetadote, Airbron, Cetylev, Mucomyst, Parvolex**
*Func. class.:* Mucolytic; antidote—acetaminophen
*Chem. class.:* Amino acid L-cysteine

**Do not confuse:** Mucomyst/Mucinex

**ACTION:** Decreases viscosity of secretions in respiratory tract by breaking disulfide links of mucoproteins; serves as a substrate of glutathione, which is necessary to inactivate toxic metabolites in acetaminophen overdose

**Therapeutic outcome:** Decreased hepatotoxicity from acetaminophen overdose (PO); decreased viscosity of mucus in respiratory disorders (inh)

**USES:** Acetaminophen toxicity, bronchitis, cystic fibrosis, COPD, atelectasis, meconium ileus

**CONTRAINDICATIONS**
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, hypothyroidism, Addison's disease, CNS depression, brain tumor, asthma, renal/hepatic disease,

COPD, psychosis, alcoholism, seizure disorders, bronchospasms, asthma, anaphylactoid reactions, fluid restriction, weight <40 kg, increased intracranial pressure, status asthmaticus

## DOSAGE AND ROUTES

### Mucolytic

**Adult and child:** Instill 1-2 ml (10%-20% sol) q2-8hr prn, or 3-5 ml (20% sol) or 6-10 ml (10% sol) tid or qid; nebulization (face, mask, mouthpiece, tracheostomy) 1-10 ml of a 20% sol or 2-20 ml of a 10% sol q2-6hr; nebulization (tent, croupette) may require large dose, up to 300 ml/ contrast-induced nephrotoxicity (unlabeled) Adult PO 600-1200 mg bid × 2 days (beginning the day before the procedure)

### Diagnostic bronchial lab studies

**Adult/child:** Nebulizer 2-3 uses of 1-2 ml or a 20% solution or 2-4 ml of a 10% solution

### Tracheostomy care

**Adult/child:** Instill 1-2 ml of a 10% or 20% solution directly into the tracheostomy q1-4hr

### Acetaminophen toxicity

**Adult and child >40 kg:** PO 140 mg/kg, then 70 mg/kg q4hr × 17 doses to total 1330 mg/kg; **>40 kg IV** loading dose 150 mg/kg over 60 min (dilution 150 mg/kg in 200 ml $D_5W$); then 1:50 mg/kg over 4 hr (dilution 50 mg/kg in 500 ml $D_5$); then 2:100 mg/kg over 16 hr (dilution 100 mg/kg in 1000 ml $D_5W$)

**Child/Adolescents 21-40 kg:** IV 150 mg/kg in 100 ml of diluent over 1 hr, then 50 mg/kg in 250 ml over 4 hr, then 100 mg/kg in 500 mg over 16 hr

**Infants/Child 5-20 kg:** IV 150 mg/kg in 3 ml/kg diluent over 1 hr, then 50 mg/kg in 7 ml/kg diluent over 4 hr, then 100 mg/kg in 14 ml/kg diluent over 16 hr.

**Available forms:** Oral sol 10%, 20%; inj 20% (200 mg/ml); effervescent tab for solution 500, 2500 mg

### Implementation

- Give decreased dosage to geriatric patients; their metabolism may be slowed; give gum, hard candy, frequent rinsing of mouth for dryness of oral cavity
- Use only if suction machine is available

**PO route (Antidotal use)**

- Give within 24 hr; dilute 10% or 20% sol to a 5% sol with diet soda; may use water if giving via gastric tube; dilution of 10% sol 1:1, 20% sol 1:3; use within 1 hr, store open undiluted solution refrigerated ≤96 hr, repeat dose if vomited within 1 hr

**Direct intratracheal INSTILL**

- Use ½-1 hr before meals for better absorption to decrease nausea; only after patient clears airway by deep breathing, coughing
- Give by syringe 2-3 doses of 1-2 ml of 10%-20% sol up to q1hr
- Store in refrigerator: use within 96 hr of opening
- Provide assistance with inhaled dose: bronchodilator if bronchospasm occurs; wash face and rinse mouth after use to remove sticky feeling
- Use decreased dose in geriatric, metabolism may be slowed
- Use mechanical suction if cough insufficient to remove excess bronchial secretions
- Store in refrigerator; use within 96 hr of opening

**IV route**

**21-hr regimen:**

- **Loading dose: dilute** 150 mg/kg in 200 ml $D_5W$; maintenance dose no. 1 **dilute** 50 mg/kg in 500 ml $D_5W$; maintenance dose no. 2 **dilute** 100 mg/kg in 1000 ml $D_5W$
- **Give** loading over 15 min; **give** maintenance dose no. 1 over 4 hr; **give** maintenance dose no. 2 over 16 hr; **give** sequentially without time between doses

**Incompatibilities:** Rubber, metals, stability with other products unknown

## ADVERSE EFFECTS

**CNS:** Chills, *dizziness, drowsiness,* fever, headache
**CV:** Flushing, hypotension, tachycardia
**EENT:** *Rhinorrhea,* tooth damage
**GI:** Anorexia, constipation, diarrhea, hepatotoxicity, *nausea,* stomatitis, vomiting
**INTEG:** Clamminess, fever, pruritus, rash, urticaria
**MISC:** Anaphylaxis, angioedema, unpleasant odor
**RESP:** Bronchospasm, burning, chest tightness, cough, hemoptysis, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Extensive (PO), locally (inh) |
| **Distribution** | Protein binding 83%<br>Peak ½-1 hr |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 5.6 hr (adult), 11 hr (newborn) |

## INTERACTIONS

### Individual drugs

Do not use with acetylcysteine

## NURSING CONSIDERATIONS

### Assessment

**Mucolytic use**

- **Assess cough:** type, frequency, character, including sputum; bronchospasm
- **Assess characteristics, rate, rhythm of respirations,** increased dyspnea, sputum; discontinue if bronchospasm occurs; ABGs for increased $CO_2$ retention in asthma patients
- Monitor VS, cardiac status including checking for dysrhythmias, increased rate, palpitations

**Antidotal use**

- Use within 24 hr of acetaminophen toxicity, give within 10 hr of acetaminophen to minimize hepatotoxicity
- Assess liver function tests, acetaminophen levels, PT, glucose, electrolytes, BUN, creatinine; inform prescriber if dose is vomited or vomiting is persistent; 150 mg/kg may be toxic, check acetaminophen level q4hr; provide adequate hydration; decrease dosage in hepatic encephalopathy
- Assess for nausea, vomiting, rash; notify prescriber if these occur
- **Hypersensitivity:** Anaphylaxis may occur with IV dose; if present, stop infusion, treat, restart
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding, excretion unknown

### Patient/family education

**Mucolytic use**

- Inform patient that foul odor and smell may be unpleasant
- Instruct patient to clear airway for inhalation
- Teach patient to report vomiting, as dose may need to be repeated

### Evaluation

**Positive therapeutic outcome**

- Absence of purulent secretions when coughing (mucolytic use)
- Clear lung sounds bilaterally (mucolytic use)
- Absence of hepatic damage (acetaminophen toxicity)
- Decreasing blood toxicology (acetaminophen toxicity)

## acyclovir (Rx)

(ay-sye'kloe-veer)

**Avirat, Sitavig, Zovirax**

*Func. class.:* Antiviral

*Chem. class.:* Acyclic purine nucleoside analog

**Do not confuse:** Zovirax/Zyvox/Valtrex/Zostrix

**ACTION:** Converted to acyclovir monophosphate by virus-specific thymidine kinase, then further converted to acyclovir triphosphate by other cellular enzymes

**Therapeutic outcome:** Decreased amount and time of healing of lesions

**USES:** Mucocutaneous herpes simplex virus, herpes genitalis (HSV-1, HSV-2), varicella infections, herpes zoster, herpes simplex encephalitis

## CONTRAINDICATIONS

Hypersensitivity to this product or valacyclovir

**Precautions:** Pregnancy, breastfeeding, renal/hepatic disease, electrolyte imbalance, dehydration, neurologic disease; hypersensitivity to famciclovir, ganciclovir, penciclovir, valganciclovir, obesity

## DOSAGE AND ROUTES

Base dose in obese patients on ideal body weight, not actual weight

### Renal dose

**Adult and child:** PO/IV CCr >50 ml/min 100% dose q8hr; CCr 25-50 ml/min 100% dose q12hr; CCr 10-24 ml/min 100% dose q24hr; CCr 0-10 ml/min 50% of dose q24hr

Base dose in obese patients on ideal body weight, not actual body weight

### Herpes simplex (recurrent)

**Adult:** PO 400 mg 3 ×/day for 5 days or 200 mg 5 ×/day × 5 days

**Adult and child >12 yr (use ideal weight in obesity): IV** INF 5 mg/kg over 1 hr q8hr × 5 days

**Infant >3 mo/child <12 yr: IV** INF 10 mg/kg q8hr × 7 days; if HIV infected 5-10 mg/kg q8hr (moderate to severe)

**Neonate:** IV infusion 10mg/kg q8hr × 10 days, may use higher dose

### Genital herpes initial episode

**Adult:** PO 400 mg tid or 200 mg 5 times per day × 7-10 days, may extend treatment if healing is not complete after 10 days; topical 5 times per day

### Genital herpes, episodic treatment

**Adult:** PO 400 mg tid or 800 bid × 5 days or 800 mg × 2 days, initiate within 1 day of lesion onset

### Genital herpes, suppression therapy

**Adult:** PO 400 mg bid for up to 12 mo

### Genital herpes, initial limited, mucocutaneous HSV in immunocompromised patients, non-life-threatening

**Adult and child ≥12 yr:** TOP cover lesions q3hr 6 times/day

### Herpes simplex encephalitis
**Adult: IV** 10 mg/kg over 1 hr q8hr × 10 days
**Child 3 mo-12 yr: IV** 20 mg/kg q8hr × 10 days
**Child birth-3 mo: IV** 20 mg/kg q8hr × 21 days

### Herpes labialis, recurrent
**Adult and child ≥12 yr:** TOP apply cream 5 times a day × 4 days, start as soon as symptoms appear

### Herpes, labialis, recurrent in immunocompetent patients:
**Adult:** buccal 50 mg as a single dose in upper gum region within 1 hr after prodromal symptoms and before cold sore formation

### Herpes zoster (shingles): immunocompromised patients
**Adult and adolescent:** PO 800 mg q4hr 5 times/day × 7-10 days; **IV** 10 mg/kg q8hr × 7 days
**Child ≥12 yr: IV** 10 mg/kg q8hr × 7 days
**Infant and child <12 yr: IV** 20 mg/kg q8hr × 7-10 days

### Herpes zoster (shingles): immunocompetent patient
**Adult:** PO 800 mg q4hr 5 times/day × 7-10 days; start within 48-72 hr of rash onset; IV 10 mg/kg q8hr × 7 days

### Varicella (chickenpox): immunocompetent patient
**Adult, adolescent, and child:** PO 800 mg 4 times/day × 5 days
**Child ≥2 yr:** PO 20 mg/kg (max 800 mg) PO 4 times per day × 5 days

### Mucosal/cutaneous herpes simplex infections in immunosuppressed patients
**Adult and child >12 yr: IV** 5 mg/kg q8hr × 7 days
**Infant >3 mo/child <12 yr: IV** 10 mg/kg q8hr × 7 days

### Recurrent ocular herpes, prevention (unlabeled)
**Adult and child ≥12 yr:** PO 600-800 mg/day × 8-12 mo

**Available forms:** Caps 200 mg; tabs 400, 800 mg; powder for inj 500, 1000 mg; sol for inj 50 mg/ml; oral susp 200 mg/5 ml; ointment/cream 5%; buccal tab 50 mg

### Implementation
**PO route**
- Do not break, crush, or chew caps
- Give with food to lessen GI symptoms; may give without regard to meals with 8 oz of water
- Store at room temperature in dry place
- May be taken orally before infection occurs or when itching or pain occurs, usually before eruptions
- Must be taken at equal intervals around the clock
- Shake susp before use
- Buccal: use on the same side at the herpes labialis lesion, after removing tab from blister, place rounded side of tab to the upper gum above incisor tooth, hold in place for 30 sec, once adhered, the tab will dissolve, if tab fell off within 6 hr, reposition the same tab

**IV route**
- Provide increased fluids to 3 L/day to decrease crystalluria, most critical during first 2 hr after IV infusion

**Intermittent IV infusion route**
- Reconstitute with 10 ml sterile water for injection/500 mg of product (50 mg/ml); shake; **further dilute** in 50-125 ml compatible sol, use within 12 hr; **give** over at least 1 hr (constant rate) by infusion pump to prevent nephrotoxicity; do not reconstitute with sol containing benzyl alcohol or parabens; check infusion site for redness, pain, induration; rotate sites
- Lower dosage in acute or chronic renal failure
- Store at room temp for up to 12 hr after reconstitution; if refrigerated, sol may show a precipitate that clears at room temperature; yellow discoloration does not affect potency

**Y-site compatibilities:** Alemtuzumab, allopurinol, amikacin, aminophylline, amphotericin B cholesteryl, amphotericin B liposome, ampicillin, anidulafungin, argatroban, atracurium, bivalirudin, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, ceFAZolin, cefonicid, cefotaxime, cefOXitin, ceftAZidime, ceftizoxime, ceftRIAXone, cefuroxime, chloramphenicol, cholesteryl sulfate complex, cimetidine, clindamycin, dexamethasone sodium phosphate, dimenhyDRINATE, DOXOrubicin, doxycycline, erythromycin, famotidine, filgrastim, fluconazole, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, HYDROmorphone, imipenem-cilastatin, LORazepam, magnesium sulfate, melphalan, methylPREDNISolone sodium succinate, metoclopramide, metroNIDAZOLE, multivitamin, nafcillin, oxacillin, PACLitaxel, penicillin G potassium, PENTobarbital, perphenazine, piperacillin, potassium chloride, propofol, ranitidine, remifentanil, sodium bicarbonate, teniposide, theophylline, thiotepa, ticarcillin, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vasopressin, voriconazole, zidovudine

**Y-site incompatibilities:** DOBUTamine, DOPamine, ondansetron, verapamil

**Topical route**
- Use finger cot or glove to cover all lesions completely, do not get in eye, wash hands after use

## ADVERSE EFFECTS

**CNS:** Tremors, confusion, lethargy, hallucinations, seizures, *dizziness, headache,* encephalopathic changes
**EENT:** Gingival hyperplasia
**GI:** Nausea, vomiting, diarrhea, increased ALT, AST, abdominal pain, glossitis, colitis
**GU:** Oliguria, proteinuria, hematuria, vaginitis, moniliasis, glomerulonephritis, acute renal failure, changes in menses, polydipsia
**HEMA:** Thrombotic thrombocytopenia purpura, hemolytic uremic syndrome (immunocompromised patient)
**INTEG:** Rash, urticaria, pruritus, pain or phlebitis at **IV** site, unusual sweating, alopecia, Stevens-Johnson syndrome
**MS:** Joint pain, leg pain, muscle cramps

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Minimal (PO) |
| **Distribution** | Widely distributed, crosses placenta; CSF concentration 50% plasma; protein binding 9%-33% |
| **Metabolism** | Liver, minimal |
| **Excretion** | Kidneys, 95% unchanged |
| **Half-life** | 2.0-3.5 hr, increased in renal disease |

### Pharmacodynamics

| | PO | IV | Buccal |
|---|---|---|---|
| **Onset** | Unknown | Rapid | |
| **Peak** | 2.5-3.3 hr | Infusion's end | 8 hr |
| **Duration** | Unknown | Unknown | |

## INTERACTIONS

### Individual drugs

Aminoglycosides: increased nephrotoxicity
Entecavir, PEMEtrexed, tenofovir, theophylline: increased concentration of each product
Probenecid: increased neurotoxicity, nephrotoxicity
Valproic acid: decreased action of valproic acid, monitor drug level
Zidovudine, IT methotrexate: increased CNS side effects

### Drug classifications

Hydantoins: decreased actions of hydantoins

## NURSING CONSIDERATIONS

### Assessment

- **Monitor for signs of infection,** type of lesions, area of body covered, purulent drainage
- Check I&O ratio; report hematuria, oliguria, fatigue, weakness; may indicate nephrotoxicity; check for protein in urine during treatment
- **Toxicity:** monitor any patient with compromised renal system, since product is excreted slowly in poor renal system function; toxicity may occur rapidly
- Monitor liver studies: AST, ALT
- **Monitor renal studies:** urinalysis, protein, BUN, creatinine, CCr; increased BUN, creatinine indicates renal failure and nephrotoxicity
- Monitor bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued
- Assess allergies before treatment, reaction of each medication; place allergies on chart in bright red letters; allergic reaction: burning, stinging, swelling, redness, rash, vulvitis, pruritus
- Assess neurologic status in herpes encephalitis
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, use cautiously in pregnancy, avoid breastfeeding if lesions are around breasts

### Patient/family education

**PO route**

- Teach patient that product may be taken orally before infection occurs or when itching or pain occur, usually before eruptions; that partners need to be told that patient has herpes; they can become infected, so condoms must be worn to prevent reinfections
- Tell patient to report sore throat, fever, fatigue; may indicate superinfection; that product must be taken at equal intervals around the clock to maintain blood levels for duration of therapy
- Tell patient to notify prescriber of side effects: bruising, bleeding, fatigue, malaise; may indicate blood dyscrasias
- Adequate intake of fluids (2 L) to prevent deposits in kidneys, more likely to occur with rapid administration or in dehydration
- Tell patient to seek dental care during treatment to prevent gingival hyperplasia
- Teach female patients with genital herpes to have regular Pap smears to prevent undetected cervical cancer
- **Pregnancy/breastfeeding:** Teach patient to advise prescriber if pregnancy is planned or suspected or if breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Absence of itching, painful lesions
- Crusting and healed lesions
- Decreased symptoms of chicken pox

## TREATMENT OF OVERDOSE:

Discontinue product, hemodialysis, resuscitate if needed

## acyclovir topical

*See Appendix B*

## adalimumab (Rx)

(add-a-lim'yu-mab)

**Humira, Humira Pen**

*Func. class.:* Antirheumatic agent (disease modifying), immunomodulator, anti-TNF

**Do not confuse:** Humira/Humalin/Humalog/Humira Pen/Humapen Memoir

**ACTION:** A form of human IgG1 monoclonal antibody specific for human tumor necrosis factor (TNFα); elevated levels of TNFα are found in patients with rheumatoid arthritis

**Therapeutic outcome:** Decreased pain, inflammation in joints, better ROM

**USES:** Reduction in signs and symptoms and inhibiting progression of structural damage in patients with moderate to severe active rheumatoid arthritis in patients ≥18 years of age who have not responded to other disease-modifying agents, JRA, psoriatic arthritis, Crohn's disease, moderate-severe plaque psoriasis, ankylosing spondylitis, noninfectious uveitis

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric, CNS demyelinating disease, lymphoma, latent TB, HF, hepatitis B carriers, mannitol hypersensitivity, latex allergy, neoplastic disease, TB

**BLACK BOX WARNING:** Active infections, risk of lymphomas/leukemias

## DOSAGE AND ROUTES

### Rheumatoid arthritis, ankylosing spondylitis, psoriatic arthritis

**Adult:** SUBCUT 40 mg every other wk or every week if not combined with methotrexate

### Juvenile rheumatoid arthritis (JRA)

**Child ≥2 yr/adolescent ≥30 kg:** SUBCUT 40 mg every other wk

**Child ≥2 yr/adolescent ≥15 kg to <30 kg:** SUBCUT 20 mg every other wk

**Child ≥2 yr/adolescent 10 kg to <15 kg:** SUBCUT 10 mg every other wk

### Crohn's disease

**Adult:** SUBCUT 160 mg given as 4 inj on day 1, or 2 inj on days 1 and 2, then 80 mg at wk 2 and 40 mg every other wk, starting at wk 4

**Child > 6 yr and ≥40 kg (88 lb)** SUBCUT 160 mg day 1 (as 4 injections 40 mg or 40 mg as 2 injections) × 2 days then 80 mg after 2 wk (day 15 then 40 mg q other wk, day 29

**Child > 6 yr and 17-40 kg (37-88 lb)** SUBCUT 80 mg day 1 (as 2 injections then 40 mg after 2 wk (day 15) then 20 mg q other week (day 29)

### Plaque psoriasis/noninfectious uveitis

**Adult:** SUBCUT 80 mg baseline as 2 inj, then 40 mg every other week starting 1 wk after initial dose × 16 wk (plaque psoriasis)

**Available forms:** Inj 40 mg/0.8 ml; 20 mg/0.4 ml (pediatric)

### Implementation

**SUBCUT route**

- Do not admix with other sol or medications, do not use filter, protect from light
- Don't inject in bruised, red, tender areas

## ADVERSE EFFECTS

**CNS:** Headache, Guillain-Barré syndrome
**CV:** Hypertension, HF
**EENT:** Sinusitis
**GI:** Abdominal pain, nausea, hepatic damage, GI bleeding
**HEMA:** Leukopenia, pancytopenia, aplastic anemia, agranulocytopenia, thrombocytopenia
**INTEG:** Rash, *inj site reaction*
**MISC:** Flulike symptoms, UTI, hypertension, back pain, lupuslike syndrome, risk of cancer, antibody development to this drug, risk of infection (TB, invasive fungal infections, other opportunistic infections); may be fatal, Stevens-Johnson syndrome, anaphylaxis, hypercholesterolemia, hyperlipidemia
**RESP:** *URI,* pulmonary fibrosis, bronchitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Terminal 2 wk |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Anakinra: do not use together, serious infections may occur
Rilonacept: increase serious infections

### Drug classifications

Live-virus vaccines: do not give concurrently; immunization should be brought up to date before treatment

**BLACK BOX WARNING:** Other TNF blockers: increased serious infections

### Drug/lab test
Increased: ALT, cholesterol, lipids

## NURSING CONSIDERATIONS
### Assessment
- **Rheumatoid arthritis:** assess for pain, stiffness, ROM, swelling of joints during treatment
- Check for inj site pain, swelling, redness; usually occur after 2 inj (4-5 days) use cold compress to relieve pain/swelling
- Crohn's disease/ulcerative colitis: assess bowel pattern, cramping, abdominal pain, bleeding

**BLACK BOX WARNING:** Check for infections, fever, flulike symptoms, dyspnea, change in urination, redness/swelling around wounds, stop treatment if present, some serious infections, including sepsis, may occur; patients with active infections should not be started on this product

- May reactivate hepatitis B in chronic carriers, may be fatal

**BLACK BOX WARNING:** Assess for latent TB prior to therapy; treat before starting this product

- Assess for anaphylaxis, latex allergic; stop therapy if lupuslike syndrome develops
- Assess for blood dyscrasias: CBC, differential periodically

**BLACK BOX WARNING:** Assess for neoplastic disease (lymphomas/leukemia); in children, adolescents, hepatosplenic T-cell lymphoma is more likely in adolescent males with Crohn's disease or ulcerative colitis

- **Pregnancy/breastfeeding:** Use only if clearly needed, no well-controlled studies, cautious use in breastfeeding, excreted in breast milk

### Patient/family education
- Teach patient about self-administration if appropriate: inj should be made in thigh, abdomen, upper arm; rotate sites at least 1 inch from old site; do not inject in areas that are bruised, red, hard
- Advise patient that if medication is not taken when due, inject next dose as soon as remembered and inject next dose as scheduled
- Advise patient not to take any live-virus vaccines during treatment
- Instruct patient to report signs of infection, allergic reactions, lupuslike syndrome, immediately
- Teach patient to refrigerate the product, to dispose of needles and equipment as instructed

### Evaluation
**Positive therapeutic outcome**
- Decreased inflammation, pain in joints, decreased joint destruction

# adefovir (Rx)
(add-ee-foh'veer)
**Hepsera**
*Func. class.:* Antiviral Nucleoside

**ACTION:** Inhibits hepatitis B virus DNA polymerase by competing with natural substrates and by causing DNA termination after its incorporation into viral DNA; causes viral DNA death

**Therapeutic outcome:** Improving liver function tests, lessening symptoms of chronic hepatitis B

**USES:** Chronic hepatitis B

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric, dialysis, females, labor, obesity, organ transplant

**BLACK BOX WARNING:** Severe renal disease, impaired hepatic disease, lactic acidosis, HIV, hepatitis B exacerbation

## DOSAGE AND ROUTES
**Adult/adolescent:** PO 10 mg daily, optimal duration unknown

### Renal dose
**Adult:** PO CCr ≥50 ml/min 10 mg q24hr; CCr 30-49 ml/min 10 mg q48hr; CCr 10-29 ml/min 10 mg q72hr; hemodialysis 10 mg q7 days following dialysis

**Available forms:** Tabs 10 mg

### Implementation
- Give by mouth without regard to food
- Store in cool environment; protect from light
- Take with full glass of water

## ADVERSE EFFECTS
**CNS:** *Headache*
**GI:** *Dyspepsia,* abdominal pain, nausea, vomiting, diarrhea, hepatomegaly, flatulence, pancreatitis
**GU:** Hematuria, glycosuria, nephrotoxicity, Fanconi syndrome, renal failure
**MISC:** Fever, rash, weight loss, cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly from GI tract |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys 45% |
| **Half-life** | 7.48 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1¾ hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

AMILoride, cimetidine, cycloSPORINE, digoxin, dofetilide, efavirenz, emtricitabine, memantine, metformin, midodrine, morphine, PEMEtrexed, procainamide, quiNIDine, quinine, ranitidine, tacrolimus, tenofovir, triamterene, trospium, vancomycin: increased serum concentrations, nephrotoxicity

Do not use in combination with emtricitabine/tenofovir, emtricitabine/rilpivirine, emtricitabine/efavirenz/tenofovir, hepatotoxicity/lactic acidosis may occur

### Drug classifications

Benzodiazepines, nucleoside analogs (experimental), NSAIDs, sulfonamides: increased serum concentrations, toxicity

**BLACK BOX WARNING:** Lactic acidosis, severe hepatomegaly, NNRTIs, NRTIs, antiretroviral protease-inhibitors, aminoglycosides

### Drug/lab test

Increased: ALT, AST, amylase, creatine kinase
Decreased: Phosphorus

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess **nephrotoxicity:** increasing CCr, BUN

**Pregnancy:** Pregnant women should call the Antiretroviral Pregnancy Registry (800-258-4263) for monitoring fetal outcome, use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown

**BLACK BOX WARNING:** Assess for HIV antibody testing before beginning treatment because HIV resistance may occur in chronic hepatitis B patients

**BLACK BOX WARNING:** Assess **lactic acidosis,** severe hepatomegaly with stenosis, more common in females, obesity, and prolonged nucleoside use

- Assess geriatric patients more carefully; may develop renal, cardiac symptoms more rapidly

**BLACK BOX WARNING:** Assess exacerbations of **hepatitis** after discontinuing treatment, monitor liver function tests, hepatitis B serology

### Patient/family education

- Advise patient that optimal duration of treatment is unknown, that drug is not a cure; transmission may still occur
- Advise patient to avoid use with other medications unless approved by prescriber
- Advise patient to notify prescriber of decreased urinary output
- Teach patient not to stop abruptly unless directed, worsening of hepatitis may occur
- Teach patient to report immediately dyspnea, nausea, vomiting, abdominal pain, weakness, dizziness, cold extremities
- Teach patient to notify prescriber if pregnancy is planned or suspected, avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Decreased symptoms of chronic hepatitis B, improving liver function tests

**⚠ HIGH ALERT**

## adenosine (Rx)

(ah-den'oh-seen)
**Adenocard, Adenoscan**
*Func. class.:* Antidysrhythmic—miscellaneous
*Chem. class.:* Endogenous nucleoside

**ACTION:** Slows conduction through AV node, can interrupt reentry pathways through AV node, and can restore normal sinus rhythm in patients with paroxysmal supraventricular tachycardia (PSVT), decreases cardiac oxygen demand decreasing hypoxia

**Therapeutic outcome:** Normal sinus rhythm in patients diagnosed with SVT or diagnosis of perfusion defect

**USES:** PSVT, as a diagnostic aid to assess myocardial perfusion defects in CAD; Wolff-Parkinson-White (WPW) syndrome

## CONTRAINDICATIONS

Hypersensitivity, 2nd- or 3rd-degree heart block, AV block, sick sinus syndrome, bradycardia

**Precautions:** Pregnancy, breastfeeding, children, geriatric, asthma, atrial flutter, atrial fibrillation, ventricular tachycardia, bronchospastic lung disease, symptomatic bradycardia, bundle branch block, heart transplant, unstable angina, COPD, hypotension, hypovolemia, vascular heart disease, CV disease

## DOSAGE AND ROUTES

### Converting paroxysmal supraventricular tachycardia to sinus rhythm

**Adult and child >50 kg:** **IV** BOL 6 mg; if conversion to normal sinus rhythm does not occur within 1-2 min, give 12 mg by rapid **IV** BOL; may repeat 12 mg dose again in 1-2 min

**Infant and child <50 kg:** **IV** BOL 0.05 mg/kg; if not effective, increase dose by 0.05-0.1 mg/kg q2min to a max of 0.3 mg/kg/dose

**Neonate:** **IV** BOL: 0.05 mg/kg by rapid **IV** BOL, may increase by 0.05 mg/kg q2min, max 0.3 mg/kg/dose

**Available forms:** 3 mg/ml solution for injection

### Implementation

**IV, direct (bolus) route**

- Give **IV** BOL undiluted; give 6 mg or less by rapid inj; if using an **IV** line, use port near insertion site, flush with 0.9% NaCl (20 ml), then elevate arm
- Store at room temperature; sol should be clear; discard unused product

**Solution compatibilities:** $D_5LR$, $D_5W$, LR, 0.9% NaCl

## ADVERSE EFFECTS

**CNS:** Light-headedness, dizziness, arm tingling, numbness, headache

**CV:** Chest pain/pressure, atrial tachydysrhythmias, sweating, palpitations, hypotension, *facial flushing*, AV block, cardiac arrest, ventricular dysrhythmias, atrial fibrillation

**GI:** *Nausea,* metallic taste

**RESP:** *Dyspnea, chest pressure,* hyperventilation, bronchospasm (asthmatics)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability |
| **Distribution** | Erythrocytes, cardiovascular endothelium |
| **Metabolism** | Liver, converted to inosine and adenosine monophosphate |
| **Excretion** | Kidneys |
| **Half-life** | 10 sec |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | Unknown |
| **Duration** | 1-2 min |

## INTERACTIONS

### Individual drugs

Caffeine, theophylline: decreased effects of adenosine, dose may need to be increased

CarBAMazepine: increased heart block

Digoxin, verapamil: increased ventricular fibrillation, monitor ECG

Dipyridamole: increased effects of adenosine, dose may need to be reduced

Smoking: increased tachycardia

### Drug/herb

Ginger: increased effect

Green tea, guarana: decreased effect

## NURSING CONSIDERATIONS

### Assessment

- **Assess cardiopulmonary status:** pulse, respiration, ECG intervals (PR, QRS, QT); check for transient dysrhythmias (PVCs, PACs, sinus tachycardia, AV block)
- Assess respiratory status: rate, rhythm, lung fields for crackles, watch for respiratory depression; bilateral crackles may occur in HF patient; if increased respiration, increased pulse occurs, product should be discontinued
- Assess CNS effects: dizziness, confusion, paresthesias; product should be discontinued
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding, use only if benefits outweigh fetal risk

### Patient/family education

- Tell patient to report facial flushing, dizziness, sweating, palpitations, chest pain, IV discomfort
- **Pregnancy/breastfeeding:** Teach patient to advise prescriber if pregnancy is planned or suspected or if breastfeeding, do not breastfeed

### Evaluation

**Positive therapeutic outcome**

- Normal sinus rhythm
- Diagnosis of perfusion defect

**⚠ HIGH ALERT**

## ado-trastuzumab (Rx)

(a'doe-tras-tooz'ue-mab)

**Kadcyla**

*Func. class.:* Antineoplastic-biologic response modifier

*Chem. class.:* Signal transduction inhibitor (STI), humanized anti-HER2 antibody

**Do not confuse:** ado-trastuzumab/trastuzumab

**ACTION:** Humanized anti-HER2 monoclonal antibody that is linked to DM1, a small molecule microtubular inhibitor. Once the antibody

is bound to the HER2 receptor, the complex is internalized and the DM1 is released to bind with tubulin to lead to apoptosis

**Therapeutic outcome:** Decrease in size of tumors

**USES:** Breast cancer, metastatic with overexpression of HER2, in patients who previously received trastuzumab and a taxane separately or in combination

## CONTRAINDICATIONS

Hypersensitivity to this product, Chinese hamster ovary cell protein, pregnancy

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Breastfeeding, children, acute bronchospasm, anticoagulants, Asian patients, asthma, cardiomyopathy/HF, COPD, extravasation, fever, hepatitis, human anti-human antibody, hypotension, neuropathy, hepatotoxicity, interstitial lung disease/pneumonitis; pulmonary disease, thrombocytopenia

**BLACK BOX WARNING:** Heart failure, hepatotoxicity

## DOSAGE AND ROUTES

**Adult: IV** 3.6 mg/kg over 30-90 min q3wk; give first infusion over 90 min; if tolerated, give over 30 min

### Dosage adjustments for toxicities

**Hepatotoxicity**

AST/ALT >5 to ≤20× ULN: withhold, resume at a reduced dose when AST/ALT is ≤5× ULN

- **First dose reduction:** reduce the dose to 3 mg/kg
- **Second dose reduction:** reduce the dose to 2.4 mg/kg
- **Requirement for further dose reduction:** discontinue

AST/ALT >20× ULN: discontinue

Total bilirubin >3 to ≤10× ULN: withhold; resume treatment at a reduced dose when total bilirubin recovers to ≤1.5

- **First dose reduction:** reduce the dose to 3 mg/kg
- **Second dose reduction:** reduce the dose to 2.4 mg/kg
- **Requirement for further dose reduction:** discontinue treatment

Total bilirubin >10× ULN: permanently discontinue

- Permanently discontinue treatment in patients with AST/ALT > 3× ULN and total bilirubin > 2× ULN
- Permanently discontinue treatment in patients diagnosed with nodular regenerative hyperplasia (NRH)
- **Left ventricular ejection fraction (LVEF) 40%-45% and decrease is <10% points from baseline:** continue treatment; repeat LVEF assessment within 3 wk
- **LVEF 40%-45% and decrease is ≥10% points from baseline:** withhold; repeat LVEF assessment within 3 wk; if LVEF remains ≥10% points from baseline, discontinue
- **LVEF < 40%:** withhold; repeat LVEF assessment within 3 wk; if LVEF remains <40%, discontinue
- **Symptomatic congestive heart failure (HF):** discontinue

**Thrombocytopenia**

Platelet count 25,000/mm³ to <50,000/mm³: withhold; resume treatment at same dose when platelet count recovers to ≥75,000/mm³

Platelet count <25,000/mm³: withhold; resume treatment at a reduced dose when platelet count recovers to ≥75,000/mm³

- **First dose reduction:** reduce the dose to 3 mg/kg
- **Second dose reduction:** reduce the dose to 2.4 mg/kg
- **Requirement for further dose reduction:** discontinue

**Pulmonary toxicity**

- Permanently discontinue in patients diagnosed with interstitial lung disease or pneumonitis

**Peripheral neuropathy**

- Withhold in patients experiencing grade 3 or 4 peripheral neuropathy; resume treatment upon resolution to ≤ grade 2

**Available forms:** Lyophilized powder 100, 160 mg

### Implementation

**IV route**

- Visually inspect for particulate matter and discoloration prior to use
- Give as IV infusion with a 0.22-micron in-line filter; do not administer as an IV push or bolus
- Use cytotoxic handling procedures; do not mix with, or administer as an infusion with, other IV products

**Reconstitution**

- Slowly inject 5 ml of sterile water for injection into each 100 mg vial, or 8 ml of sterile water for injection into each 160 mg vial, to yield a single-use solution of 20 mg/ml
- Direct the stream of sterile water toward the wall of the vial and not directly at the cake or powder

• Gently swirl the vial to aid in dissolution; do not shake
• After reconstitution, withdraw desired amount from the vial and dilute immediately in 250 ml of 0.9% sodium chloride; do not use dextrose 5% solution; gently invert the bag to mix the solution in order to avoid foaming
• The reconstituted single-use product does not contain a preservative. Use the diluted solution immediately or store at 2-8 °C (36-46 °F) for up to 24 hr after reconstitution; discard any unused drug after 24 hr. Do not freeze.

**IV infusion**

• Closely monitor for possible subcutaneous infiltration during drug administration
• First infusion: Give over 90 min. The infusion rate should be slowed or interrupted if the patient develops an infusion-related reaction. Patients should be observed for at least 90 min following the initial dose for fever, chills, or other infusion-related reactions. Permanently discontinue for life-threatening infusion-related reactions.
• Subsequent infusions: Administer over 30 min if prior infusions were well tolerated. The infusion rate should be slowed or interrupted if the patient develops an infusion-related reaction. Patients should be observed for at least 30 min after the infusion. Permanently discontinue for life-threatening infusion-related reactions

## ADVERSE EFFECTS

**CNS:** Dizziness, insomnia, neuropathy, chills, fatigue, fever, flushing, headache
**CV:** Heart failure, tachycardia
**EENT:** Blurred vision, conjunctivitis, stomatitis
**GI:** Diarrhea, nausea, vomiting, abdominal pain, constipation, dyspepsia, hepatotoxicity
**HEMA:** Anemia, bleeding, thrombocytopenia
**INTEG:** Rash
**MISC:** Elevated LFTs, hand-foot syndrome
**MS:** Arthralgia
**RESP:** Cough, dyspnea, bronchospasm, pneumonitis, interstitial lung disease
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 93% Protein binding |
| **Metabolism** | Liver |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Anticoagulants, 5% dextrose, platelets: avoid concurrent use
CYP3A4 inhibitors (clarithromycin, ketoconazole, ritonavir, saquinavir, atazanavir): Increased: ado-trastuzumab effect, avoid concurrent use
Do not give with other IV products

## NURSING CONSIDERATIONS

### Assessment

• Monitor liver function tests; CBC
• **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding, this product is contraindicated in pregnancy, do not breastfeed; enroll pregnant patient in Mother Pregnancy Registry 800-690-6720
• Monitor, HER2 overexpression, pregnancy test

**BLACK BOX WARNING:** HF, other cardiac symptoms: assess for dyspnea, coughing; gallop; obtain full cardiac workup including ECG, echo, MUGA, ejection fraction

• Monitor for symptoms of infection; may be masked by product
• CNS reaction: monitor LOC, mental status, dizziness, confusion

**BLACK BOX WARNING:** Monitor hypersensitive reactions, anaphylaxis

• **Infusion reactions that may be fatal:** monitor fever, chills, nausea, vomiting, pain, headache, dizziness, hypotension; discontinue product, monitor for infusion reactions during and for 1-1/2 hr after conclusion of infusion, slowing of infusion may be needed
• **Pulmonary toxicity:** monitor dyspnea, interstitial pneumonitis, pulmonary hypertension, ARDs: can occur after infusion reaction; those with lung disease may have more severe toxicity in those with pneumonitis, interstitial lung disease
• **Bleeding:** Monitor for bleeding, grade 3 or 4 bleeding with fatalities has occurred, check platelets baseline and before each dose
• **Hepatotoxicity:** Monitor LFTs baseline and before each dose, fatal liver damage may occur, reduced dose or discontinuing treatment may be required

**BLACK BOX WARNING:** Hepatic disease: may be fatal

### Patient/family education

- Teach patient to take acetaminophen for fever
- Teach patient to avoid hazardous tasks because confusion, dizziness may occur
- Teach patient to report signs of infection: sore throat, fever, diarrhea, vomiting, bleeding, decreased heart function/SOB with exertion, neuropathy, liver toxicity, to report weight gain, swelling of extremities, fatigue, coughing, bleeding
- Teach patient that emotional lability is common: to notify prescriber if severe or incapacitating
- Teach patient to use contraception while taking this product; and for additional 7 months after discontinuing this drug; to avoid breastfeeding
- Teach patient to report pain at infusion site

### Evaluation

**Positive therapeutic outcome**

- Decrease in size of tumors

## RARELY USED

## afatinib (Rx)

(a-fat'i-nib)

**Gilotrif**

*Func. class.:* Antineoplastic biologic response modifiers

*Chem. class.:* Signal transduction inhibitors (STIs), epidermal growth factor receptor tyrosine kinase inhibitor

**USES:** Treatment of non-small cell lung cancer whose tumors have epidermal growth factor receptor Exon 19 deletions or 21 substitution mutations

## CONTRAINDICATIONS

Pregnancy, hypersensitivity

## DOSAGE AND ROUTES

**Adult: PO** 40 mg/day

### Dosage adjustments for toxicities

**Hepatotoxicity**

AST/ALT >5 to ≤20×ULN: withhold; resume at a reduced dose when AST/ALT is ≤5× ULN:

- **First dose reduction:** reduce the dose to 3 mg/kg
- **Second dose reduction:** reduce the dose to 2.4 mg/kg
- **Requirement for further dose reduction:** discontinue

AST/ALT >20× ULN: discontinue

**Total bilirubin > 3 to ≤103 ULN:** withhold; resume treatment at a reduced dose when total bilirubin recovers to ≤1.5:

- **First dose reduction:** reduce the dose to 3 mg/kg
- **Second dose reduction:** reduce the dose to 2.4 mg/kg
- **Requirement for further dose reduction:** discontinue

Total bilirubin >10× ULN: permanently discontinue

- Permanently discontinue treatment in patients with AST/ALT >3× ULN and total bilirubin >2× ULN
- Permanently discontinue treatment in patients diagnosed with nodular regenerative hyperplasia (NRH)

Left ventricular ejection fraction *(LVEF) 40%-45% and decrease is <10% points from baseline:* continue treatment. Repeat LVEF assessment within 3 wk.

LVEF 40%-45% and decrease is ≥10% points from baseline: withhold; repeat LVEF assessment within 3 wk; if LVEF remains ≥10% points from baseline, discontinue

LVEF <40%: withhold; repeat LVEF assessment within 3 wk; if LVEF remains <40%, discontinue

Symptomatic congestive heart failure (HF): discontinue

**Thrombocytopenia**

Platelet count 25,000/mm³ to <50,000/mm³: withhold; resume treatment at same dose when platelet count recovers to $75,000 /mm³

Platelet count <25,000/mm³: withhold; resume treatment at a reduced dose when platelet count recovers to ≥75,000/mm³.

- **First dose reduction:** reduce the dose to 3 mg/kg
- **Second dose reduction:** reduce the dose to 2.4 mg/kg
- **Requirement for further dose reduction:** discontinue

**Pulmonary toxicity**

- Permanently discontinue in patients diagnosed with interstitial lung disease or pneumonitis

**Peripheral neuropathy**

- Withhold in patients experiencing grade 3 or 4 peripheral neuropathy. Resume treatment upon resolution to ≤ grade 2

## albiglutide

(al'-bi-gloo'-tide)

**Tanzeum**

*Func. class.:* Antidiabetic

*Chem. class.:* Incretin mimetic

**ACTION:** Binds and activates known human GLP-1 receptor, mimics natural physiology for self-regulating glycemic control

**USES:** Type 2 diabetes mellitus; once-weekly dosing

**Therapeutic outcome:** Decreasing blood glucose level, A1C; decreasing polydipsia, polyphagia

## CONTRAINDICATIONS

Hypersensitivity

**BLACK BOX WARNING:** Medullary thyroid carcinoma, multiple endocrine neoplasia syndrome type 2 (MEN-2), thyroid cancer

**Precautions:** Geriatric patients, severe renal/hepatic/GI disease, pancreatitis, vit D deficiency, breastfeeding, burns, children, colitis, diabetic ketoacidosis, infection, pseudomembranous colitis, surgery, thyroid disease, smoking, trauma, type 1 diabetes mellitus, vomiting

## DOSAGE AND ROUTES

**Adult: SUBCUT** 30 mg q7days at any time of day; may increase to 50 mg q7days if needed

**Available forms:** Prefilled pen powder for inj 30, 50 mg

### Implementation

• Store in refrigerator for unopened pen; may store at room temperature after opening for up to 30 days

**SUBCUT route**

• Give every 7 days (weekly); the dose can be given at any time of day without regard to meals

**Reconstitution of the pen:**

• The powder contained within the pen must be reconstituted before administration

• Twist the clear cartridge on the pen in the direction of the arrow until a "click" is heard. (You will also see a number "2" appear in the number window.) This action mixes the diluent with the powder

• Slowly and gently rock the pen side to side 5 times to mix. Do NOT shake the pen. Shaking the pen will cause foaming

• Patients using the product at home must wait 15 min for the 30-mg pen or 30 min for the 50-mg pen to ensure that the medicine is properly mixed and to avoid clogging the pen needle. In health care environments, a health care professional may have to wait up to 10 min after adding the diluent to see complete dissolution

• As long as the needle has not been attached, the pen can be used within 8 hr of reconstitution with the diluent

**Preparing the pen for injection:**

• Prime the pen before use

• Slowly rock the pen side to side 5 times. Do NOT shake; inspect for particulate matter; sol will be yellow in color and free of particles. A small amount of foam is normal

• Holding the pen upright, attach the supplied needle to the pen

• Tap the cartridge to bring bubbles to the top, remove bubbles by twisting until a number "3" appears in window. At the same time, the inj button will be automatically released from the bottom of the pen

• Once the needle is attached, the product must be administered immediately. The product can clog the needle if allowed to dry in the primed pen

**SUBCUT administration using the pen:**

• Inject SUBCUT into the thigh, abdomen, or upper arm. Once the needle is inserted, press the inj button until you hear a "click" and then hold the button for 5 additional sec to deliver the full dose.

• Inject SUBCUT into the thigh, abdomen, or upper arm, rotate sites to prevent lipodystrophy

## ADVERSE EFFECTS

**GI:** Nausea, vomiting, diarrhea, dyspepsia, gastroesophageal reflux, pancreatitis

**INTEG:** Serious injection-site reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Steady state 4-5 wk |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 5 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3-5 days, increased in renal disease |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Digoxin: decreased action of digoxin

Niacin, dextrothyroxine, triamterene: decreased efficacy

Disopyramide, alcohol: increased hypoglycemia

Tacrolimus, cycloSPORINE: increased hyperglycemia

### Drug classifications

ACE inhibitors, sulfonylureas, androgens, fibric acid derivatives: increased hypoglycemia

Phenothiazines, corticosteroids, anabolic steroids: increased hyperglycemia

Thiazide diuretics, estrogens, progestins, oral contraceptives, MAOIs: decreased efficacy

## NURSING CONSIDERATIONS

### Assessment

• Monitor blood glucose, A1C, during treatment to determine diabetes control
• Monitor CBC, renal studies (urinalysis, creatinine), baseline and periodically during treatment, report decreased blood counts, abnormal renal studies

**BLACK BOX WARNING:** Medullary thyroid carcinoma, multiple endocrine neoplasia syndrome 2 (MEN-2), thyroid cancer: Monitor patient closely

• **Pancreatitis:** Assess for severe abdominal pain, with or without vomiting, product should be discontinued
• Assess for Hypo/hyperglycemic reaction that can occur soon after meals; for severe hypoglycemia, give **IV** D50W, then **IV** dextrose sol
• Monitor for nausea, vomiting, diarrhea, ability to tolerate product; may cause dehydration

### Patient/family education

• Teach patient the symptoms of hypo/hyperglycemia and what to do about each; to have glucagon emergency kit available, carry sugar packets
• Advise patient that product must be continued on a weekly basis, explain consequences of discontinuing product abruptly; to take only as directed
• Direct patient to avoid OTC products unless approved by prescriber
• Teach patient that diabetes is a life-long illness; product will not cure diabetes
• Advise patient to carry emergency ID with prescriber, condition, and medications taken
• **Pancreatitis:** If severe abdominal pain with or without vomiting occurs seek medical attention immediately
• Advise patient to continue weight control, dietary restrictions, exercise, hygiene
• Teach patient that regular blood glucose monitoring and A1C testing is needed
• Teach patient to notify prescriber if pregnant or intending to become pregnant (**C**)
• Advise patient that it is important to read "Information for the Patient" and "Pen User Manual"; about self-injection
• Teach patient to review inj procedure before use, dispose of pen appropriately

### Evaluation

**Positive therapeutic outcome**

• Improving blood glucose level, A1C; decreasing polydipsia, polyphagia, polyuria, clear sensorium, absence of dizziness

## RARELY USED

## albumin, human 5% (Rx)

(al-byoo'min)
**Albumarc, Albuminar-5, Albutein 5%, Buminate 5%, Plasbumin-5**

## albumin, human 25% (Rx)

Albuminar-25, Albutein 25%, Buminate 25%, Plasbumin-25
*Func. class.:* Blood derivative—plasma volume expander

**USES:** Restores plasma volume in burns, hyperbilirubinemia, shock, hypoproteinemia, prevention of cerebral edema, cardiopulmonary bypass procedures, ARDS, hemorrhage; also replacement in nephrotic syndrome

## CONTRAINDICATIONS

Hypersensitivity, HF, severe anemia, renal insufficiency, pulmonary edema

## DOSAGE AND ROUTES

### Burns

**Adult:** **IV** dose to maintain plasma albumin at 3-4 mg/dl

### Hypovolemic shock

**Adult:** **IV** Rapidly give 5% sol; when close to normal, infuse at ≤2-4 ml/min; 25% sol ≤1 ml/min
**Child:** 0.5-1 g/kg/dose, 5% sol, may repeat as needed; max 6 g/kg/day

### Nephrotic syndrome

**Adult:** **IV** 100-200 mg of 25% and loop diuretic × 7-10 days

### Hypoproteinemia

**Adult:** **IV** 25 g, may repeat in 15-30 min, or 50-75 g of 25% albumin infused at ≤2 ml/min
**Child/infant:** **IV** 0.5-1 g/kg/dose over 2-4 hr, may repeat q1-2days

### Hyperbilirubinemia/erythroblastosis fetalis

**Child:** **IV** 1 g/kg 1-2 hr before transfusion

## albuterol (Rx)

(al-byoo'ter-ole)
**AccuNeb, Salbutamol, Airomir, ProAir HFA, ProAir RespiClick, Proventil, Proventil HFA, ReliOn, Ventolin HFA, Vospire ER**
*Func. class.:* Bronchodilator
*Chem. class.:* Adrenergic $\beta_2$-agonist, sympathomimetic, bronchodilator

**Do not confuse:** albuterol/atenolol/Albutein, Proventil/Prinivil, Ventolin/Vantin

**ACTION:** Causes bronchodilation by action on $\beta_2$ (pulmonary) receptors by increasing levels of cyclic AMP, which relaxes smooth muscle; produces bronchodilatation; CNS, cardiac stimulation, increased diuresis, and increased gastric acid secretion; longer acting than isoproterenol

**Therapeutic outcome:** Increased ability to breathe because of bronchodilation

**USES:** Prevention of exercise-induced asthma, acute bronchospasm, bronchitis, emphysema, bronchiectasis, reversible airway obstruction

**Unlabeled uses:** Hyperkalemia in dialysis patients, COPD, emphysema

## CONTRAINDICATIONS

Hypersensitivity to sympathomimetics

**Precautions:** Pregnancy, breastfeeding, exercise-induced bronchospasm (aerosol) in children <12 yr, cardiac/renal disease, hyperthyroidism, diabetes mellitus, hypertension, prostatic hypertrophy, closed-angle glaucoma, seizures, hypoglycemia, tachydysrhythmias, severe cardiac disease, heart block

## DOSAGE AND ROUTES

### Bronchospasm, prophylaxis/treatment

**Adult and child ≥4 yr:** INH (metered dose inhaler) 2 puffs (180 mcg) q4-6hr prn; Powdered inhaler (ProAir RespiClick) >12 yrs 180 mcg (2 INH) q4-6hr as needed

**Adult/child ≥ 13 yr:** PO-EXT REL 4-8 mg q12h, max 32 mg/day; PO 2-4 mg tid, max 32 mg/day

**Child 6-13 yr:** PO- EXT REL 4 mg q12h, max 24 mg/day; PO 2 mg tid-qid, max 24 mg/day

**Child 2-5 yr:** PO 0.1 mg/kg tid, max 23 mg/day

**Adult/child ≥ 15 yr:** PO- Syrup 2-4 mg (1-2 tsp) tid-qid, max 32 mg/day

**Child 6-14 yr:** PO-Syrup 2 mg (1 tsp) tid-qid, max 24 mg /day

**Child 2-5 yr:** PO-Syrup 0.1 mg/kg tid, max 12 mg/day

### To prevent exercise-induced bronchospasm (not ProAir RespiClick)

**Adult/child ≥ 4 yr:** INH 2 inhalations before exercise, max 12 INH/24 hr; ProAir RespiClick INH 2 inhalations 15-30 min before exercise

### Other respiratory conditions

**Adult and child ≥12 yr:** INH (metered dose inhaler) 1 puff q4-6hr; PO 2-4 mg tid-qid, max 32 mg/day, depending on formulation; NEB/IPPB 2.5 mg tid-qid

**Geriatric:** PO 2 mg tid-qid, may increase gradually to 8 mg tid-qid

**Child 2-12 yr:** INH (metered dose inhaler) 0.1 mg/kg tid (max 2.5 mg tid-qid); NEB/IPPB 0.1-0.15 mg/kg/dose tid-qid or 1.25 mg tid-qid for child 10-15 kg or 2.5 mg tid-qid >15 kg

**Available forms:** INH aerosol 108 mcg/actuation; tabs 2, 4 mg; oral syr 2 mg/5 ml; ext rel 4, 8 mg; inh sol 0.083, 0.5, 0.042%, 0.02%; powder inhaler 90 mcg/actuation

### Implementation

**PO route**

- Do not break, crush, or chew ext rel tabs
- Give PO with meals to decrease gastric irritation; oral sol for children (no alcohol, sugar)
- In geriatric patients, a spacing device is advised

**Aerosol route**

- Give after shaking metered dose inhaler; have patient exhale and place mouthpiece in mouth, inhale slowly while depressing inhaler, hold breath, remove inhaler, exhale slowly; allow at least 1 min between inhalations; avoid using near flames or source of heat
- Track number of inhalations used and discard when labeled inhalations have been used
- Store in light-resistant container; do not expose to temperatures >86° F (30° C)

### Albuterol Administration

- ProAir RespiClick: Before using for the first time, check the dose counter window that the number 200 is in the window. The dose counter only displays even numbers; hold the inhaler upright while opening the cap fully; when the cap is opened, a dose will be activated for delivery; make sure a "click" is heard; do not open the cap unless ready to give dose; the patient should breathe out through the mouth be careful that the patient does not breathe out into the inhaler mouthpiece; put the mouthpiece in the mouth and have patient close lips around it; the patient should breathe in deeply through the mouth; ensure that the vent above the mouthpiece is not blocked by the patient's lips or fingers; hold breath for about 10 sec; remove the inhaler; check dose counter on the back of the inhaler to make sure the dose was received; close the cap over the mouthpiece after each use of the inhaler; make sure the cap closes firmly into place; to inhale another dose, close the cap and then repeat inhaler steps; do not wash or put any part of the inhaler in water; if the mouthpiece needs cleaning, gently wipe with a dry cloth or tissue; when there are 20 doses left, the counter will change to red; refill

**Nebulizer/IPPB route**

- **Dilute** 5 mg/ml sol/2.5 ml 0.9% NaCl for inhalation; other solutions do not require dilution for nebulizer $O_2$ flow or compressed air 6-10 L/min

## ADVERSE EFFECTS

**CNS:** *Tremors, anxiety,* insomnia, headache, dizziness, stimulation, *restlessness,* hallucinations, flushing, irritability
**CV:** *Palpitations, tachycardia, hypertension,* angina, hypotension, dysrhythmias
**EENT:** Dry nose, irritation of nose and throat
**GI:** *Heartburn, nausea, vomiting*
**MISC:** Flushing, sweating, anorexia, bad taste/smell changes, hypokalemia
**MS:** Muscle cramps
**RESP:** Cough, wheezing, dyspnea, paradoxical bronchospasm, dry throat

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO) |
| **Distribution** | Unknown |
| **Metabolism** | Liver extensively, tissues |
| **Excretion** | Unknown, breast milk |
| **Half-life** | 3-4 hr |

### Pharmacodynamics

| | PO | PO–ext rel | INH |
|---|---|---|---|
| **Onset** | ½ hr | ½ hr | 5-15 min |
| **Peak** | 2½ hr | 2-3 hr | 1½-2hr |
| **Duration** | 2 hr | 12 hr | 4-6 hr |

## INTERACTIONS

### Individual drugs

Arsenic trioxide, chlorproMAZINE, droperidol, melfloquine, mesoridazine, tacrolimus: Increased: QTc prolongation, monitor QTc carefully
Atomoxetine, selegiline: increased CV effects
Digoxin: increased digoxin level

### Drug classifications

Adrenergics: increased action of albuterol; do not use together
β-Adrenergic blockers: block therapeutic effect
Bronchodilators (aerosol): increased action of bronchodilator
Class III/IV antidysrhythmics (amiodarone, disopyramide, dofetilide, procainamide, quiNIDine, sotalol); Increased: QTc prolongation; monitor QT carefully
CNS stimulants: increased CNS stimulation
Diuretics (potassium-losing): increased ECG changes/hypokalemia
MAOIs, tricyclics: increased chance of hypertensive crisis; do not use together
Oxytocics: severe hypotension; do not use together
Theophylline: toxicity

### Drug/herb

Black tea, green tea, kola nut, guarana, yerba maté: increased stimulation

### Drug/food

Caffeine products, chocolate: increased stimulation

### Drug/lab test

Decreased: potassium

## NURSING CONSIDERATIONS

### Assessment

- Assess respiratory function: vital capacity, forced expiratory volume, ABGs, lung sounds; heart rate, rhythm; B/P, sputum (baseline and during therapy)
- Determine that patient has not received theophylline therapy before giving dose, to prevent additive effect; client's ability to self-medicate
- Monitor for evidence of allergic reactions; paradoxic bronchospasm; withhold dose; notify prescriber if bronchospasm occurs
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, use only if benefits outweigh fetal risk; avoid use in breastfeeding

### Patient/family education

- Tell patient not to use OTC medications before consulting prescriber; excess stimulation may occur; instruct patient to use this medication before other medications and allow at least 5 min between each to prevent overstimulation; to limit caffeine products such as chocolate, coffee, tea, and cola
- Teach patient to use inhaler; review package insert with patient; to avoid getting aerosol in eyes or blurring may result; to wash inhaler in warm water and dry daily; to rinse mouth after using; to avoid smoking, smoke-filled rooms, persons with respiratory infections, about when to empty and when to renew
- Teach patient that if paradoxic bronchospasm occurs to stop product immediately and notify prescriber
- Instruct patient on administration of dose, not to use more than prescribed; serious side effects may occur; if taking PO regularly and dose is missed, take when remembered; space other doses on new time schedule; do not double doses
- In geriatric patients, a spacing device is advised
- **Pregnancy/breastfeeding:** teach patient to notify provider if pregnancy is planned or suspected, or if breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Absence of dyspnea and wheezing after 1 hr
- Improved airway exchange
- Improved ABGs

## TREATMENT OF OVERDOSE:
Administer a $\beta_1$-adrenergic blocker, **IV** fluids

**⚠ HIGH ALERT**

**RARELY USED**

### alemtuzumab
(al′em-tooz′ue-mab)
**Lemtrada**
*Func. class.:* Biologic response modifier

**USES:** Reserved for those with multiple sclerosis with inadequate response to ≥2 drugs because of severe adverse reactions

## CONTRAINDICATIONS: HIV

## DOSAGE AND ROUTES
**Adult: IV** 12 mg/day for 5 consecutive days (total 60 mg) for a first treatment course; follow 12 mo later with 12 mg/day for 3 consecutive days (total 36 mg) for a second treatment course

### alendronate (Rx)
(al-en′droe-nate)
**Binosto, Fosamax, Fosamax plus D**
*Func. class.:* Bone-resorption inhibitor
*Chem. class.:* Bisphosphonate

**Do not confuse:** Fosamax/Flomax

**ACTION:** Decreases rate of bone resorption and may directly block dissolution of hydroxyapatite crystals of bone; inhibits osteoclast activity

**Therapeutic outcome:** Decreased symptoms of osteoporosis, Paget's disease

**USES:** Treatment and prevention of osteoporosis in postmenopausal women, treatment of osteoporosis in men, Paget's disease, treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving estrogen, or in men who are continuing corticosteroid treatment with low bone mass

## CONTRAINDICATIONS
Hypersensitivity to bisphosphonates, delayed esophageal emptying, inability to sit or stand for 30 min, hypocalcemia

**Precautions:** Pregnancy, breastfeeding, children, CCr <35 ml/min, esophageal disease, increased esophageal cancer risk, ulcers, gastritis, poor dental health

## DOSAGE AND ROUTES
### Osteoporosis in postmenopausal women
**Adult and geriatric:** PO 10 mg daily or 70 mg qwk

### Paget's disease
**Adult and geriatric:** PO 40 mg daily × 6 mo, consider retreatment for relapse

### Prevention of osteoporosis in postmenopausal women (excluding Binosto and oral solution)
**Adult (postmenopausal females):** PO 5 mg daily or 35 mg qwk

### Glucocorticoid-induced osteoporosis in those receiving glucocorticoids (daily dose >7.5 mg or predniSONE) and low bone density (excluding Binosto and oral solution)
**Adult:** PO 5 mg qday, those not receiving estrogen 10 mg qday

### Renal dose
**Adult:** PO CCr ≤35 ml/min, not recommended

**Available forms:** Tabs 5, 10, 35, 40, 70 mg, tabs 70 mg with 2800 IU Vit $D_3$, 70 mg with 5600 IU Vit $D_3$; oral sol 70 mg/75 ml, effervescent tab 70 mg

### Implementation
- Give PO for 6 mo to be effective in Paget's disease; take with 8 oz of water 30 min before 1st food, beverage, or medication of the day
- Patient to remain upright for 30 min after dose to prevent esophageal irritation
- Store in cool environment out of direct sunlight

**Tablet:**
- Do not lie down for ≥30 min after dose, do not take at bedtime

**Liquid:**
- Use oral syringe or calibrated device; give in AM with ≥2 oz of water ≥30 min before food, beverage, or medication

## ADVERSE EFFECTS
**CNS:** Headache
**GI:** Abdominal pain, constipation, nausea, vomiting, esophageal ulceration, acid reflux, dyspepsia, esophageal perforation, diarrhea, esophageal cancer
**META:** Hypophosphatemia, hypocalcemia
**MS:** Bone pain, osteonecrosis of the jaw, bone fractures
**SYST:** Angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Distribution** | Mainly to bones; protein binding 78% |
| **Metabolism** | Unknown |
| **Excretion** | Via kidneys after bound to bone |
| **Half-life** | >10 yrs |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

Antacids, calcium supplements: decreased absorption give alendronate at least 30-60 min before other products

$H_2$ blockers, proton pump inhibitors (PPIs), gastric mucosal agents, NSAIDs, salicylates: adverse GI reactions, monitor for GI reactions

### Drug/food

Caffeine, food, orange juice: decreased product absorption, take food at least 30 min after this product

### Drug/lab test

Decreased: calcium, phosphate

## NURSING CONSIDERATIONS

### Assessment

- **Assess for serious reactions:** angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis, atrial fibrillation
- Assess dental status, regular dental exams should be done; dental extractions (cover with antiinfectives) prior to procedure
- Hormonal status if a woman, prior to treatment
- Assess for **osteoporosis:** bone density testing baseline and during treatment, history of fractures
- For **Paget's disease:** increased skull size, bone pain, headache
- Monitor renal studies and electrolytes (calcium, potassium, magnesium, phosphorous) BUN/creatinine
- Assess for **hypercalcemia:** paresthesia, twitching, laryngospasm, Chvostek's, Trousseau's signs, correct before use
- Monitor alkaline phosphatase; level of 2 × upper limit of normal is indicated for Paget's disease
- **Pregnancy/breastfeeding:** Use in pregnancy only if benefits outweigh fetal risk, use cautiously in breastfeeding
- MS or bone pain: may occur in a few days after start of treatment to years later, usually pain resolves after stopping treatment

### Patient/family education

- Teach patient to remain upright for 30 min after dose to prevent esophageal irritation; if dose is missed, skip dose, do not double doses or take later in day
- Teach patient to take in AM, only before food, other meds, to take with 6-8 oz of water (not mineral water)
- Teach patient to take calcium, vit D if instructed by provider
- Teach patient to use weight-bearing exercise to increase bone density
- Teach patient to let provider know if pregnancy is planned or suspected or if nursing
- Advise to maintain good oral hygiene

### Evaluation

**Positive therapeutic outcome**

- Increased bone mass, absence of fractures

## alfuzosin (Rx)

(al-fyoo'zoe-sin)

**Uroxatral, Xatral**

*Func. class.:* Urinary tract, antispasmodic, $\alpha_1$-agonist

*Chem. class.:* Quinazolone

**ACTION:** Binds preferentially to $\alpha_{1A}$-adrenoceptor subtype located mainly in the prostate, relaxing smooth muscles

**Therapeutic outcome:** Resolution of symptoms of benign prostatic hyperplasia

**USES:** Symptoms of benign prostatic hyperplasia

## CONTRAINDICATIONS

Hypersensitivity, moderate to severe hepatic impairment, not indicated for use in women or children, breastfeeding (but not used in women)

**Precautions:** Pregnancy, geriatric, coronary artery disease, coronary insufficiency, mild hepatic disease, mild/moderate/severe renal disease, history of QT prolongation or coadministration with medications known to prolong QT interval, torsades de pointes, syncope, surgery, prostate cancer, orthostatic hypotension, ocular surgery, CAD, dysrhythmias, angina

## DOSAGE AND ROUTES

**Adult:** PO EXT REL 10 mg daily, taken after same meal each day

**Available forms:** EXT REL tabs 10 mg

### Implementation

- Swallow tabs whole; do not break, crush, or chew tabs
- Store in tight container in cool environment

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache,* fatigue, flushing

**CV:** Postural hypotension (dizziness, light-headedness, fainting) within a few hours of administration, chest pain, tachycardia, angina

**GI:** Nausea, abdominal pain, dyspepsia, constipation, diarrhea, liver injury, jaundice

**GU:** Impotence, priapism

**HEMA:** Thrombocytopenia

**INTEG:** Rash, urticaria, angioedema, pruritus, toxic epidermal necrolysis
**MISC:** Body pain in general, xerostomia, rhinitis
**RESP:** Upper respiratory tract infection, pharyngitis, bronchitis, sinusitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Moderately protein bound (82%-90%) |
| **Metabolism** | Liver (by CYP3A4 enzyme) |
| **Excretion** | Urine |
| **Half-life** | 10 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol: possible increased effects of alfuzosin
Doxazosin, itraconazole, ketoconazole, prazosin, ritonavir, terazosin: do not take concurrently

### Drug classifications

b-Blockers, nitrates, antihypertensives, phosphodiesterase 5 inhibitors: increased hypotension
Class IA/III antidysrythmics: QT prolongation (slight)
CYP3A4 inhibitors, cimetidine (ketoconazole, itraconazole, ritonavir): do not take concurrently, toxic epidermal necrolysis

## NURSING CONSIDERATIONS

### Assessment

- Assess for prostatic hyperplasia: change in urinary patterns, baseline and throughout treatment
- Monitor CBC with differential and liver function tests; B/P and heart rate; QT prolongation
- Monitor BUN, uric acid, urodynamic studies (urinary flow rates, residual volume)
- Monitor I&O ratios, weight daily, edema; report weight gain or edema
- **Serious skin reactions:** Assess for angioedema, toxic epidermal necrolysis, notify prescriber immediately, stop product

### Patient/family education

- Advise not to drive or operate machinery for 4 hr after first dose or after dosage increase, meds, herbs
- Teach patient to take at the same time of the day with food; do not double doses
- Advise patient about orthostatic hypotension, to rise slowly from sitting or lying

### Evaluation

**Positive therapeutic outcome**

- Decreased symptoms of benign prostatic hyperplasia

# alirocumab (Rx)

(al′-i- rok′-ue-mab)
**Praluent**
*Func. class.:* Antilipemic

**ACTION:** Binds to low-density lipoproteins, a human monoclonal antibody (IgG1)

**Therapeutic outcome:** Decreased cholesterol levels

**USES:** Heterozygous, familial hypercholesterolemia, atherosclerotic disease

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding

## DOSAGE AND ROUTES

**Adult: SUBCUT** 75 mg q2wk, may increase to 150 mg q2wk if needed

**Available forms:** Prefilled pen 75 mg/1 ml, 150 mg/1 ml

### Implementation

- If dose is missed give within 7 days of next dose; if over 7 days, wait until next scheduled dose
- Visually inspect for particulate matter and discoloration, solution is clear, colorless to pale yellow
- Warm to room temperature for 30-40 min before use. Use as soon as possible after warming
- Do NOT use the pre-filled pen or syringe if it has been at room temperature for ≥24 hr
- Give by SUBCUT inj into the thigh, abdomen, or upper arm. Rotate inj site with each inj.
- Do NOT inject into areas of active skin disease or injury (sunburn, rash, inflammation, skin infection)
- Do NOT administer with other injectable drugs at the same inj site

## ADVERSE EFFECTS

**CNS:** Memory impairment, confusion
**GI:** Diarrhea
**INTEG:** Pruritus, injection-site reaction, erythema, ecchymosis
**MISC:** Edema
**MS:** Myalgia
**RESP:** Pharyngitis, sinusitis, cough
**SYST:** Infection, antibody formation

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | At steady state 17-20 days |

### Pharmacodynamics

| | |
|---|---|
| **Peak** | 3-7 days |

## INTERACTIONS

None known

### Drug/lab test

Increased: LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Hypercholesterolemia:** Obtain diet history: fat content, lipid levels (triglycerides, LDL, LDL-C 4-8 wk after start of titration, HDL, cholesterol); LFTs at baseline, periodically during treatment

### Patient/family education

- Teach patient that compliance is needed
- Advise that risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
- Advise patient to notify prescriber if pregnancy suspected, planned, or if breastfeeding
- Inform patient to report confusion, injection-site reactions

### Evaluation

- Therapeutic response: decreased cholesterol, LDL; increased HDL

## aliskiren (Rx)

(a-lis'kir-en)

**Tekturna, Rasilez**

*Func. class.:* Antihypertensive

*Chem. class.:* Direct renin inhibitor

**ACTION:** Renin inhibitor that acts on the renin-angiotensin system (RAS)

**Therapeutic outcome:** Decrease in B/P

**USES:** Hypertension, alone or in combination with other antihypertensives

## CONTRAINDICATIONS

Hypersensitivity

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Breastfeeding, children, geriatric, angioedema, aortic/renal artery stenosis, cirrhosis, CAD, dialysis, hyper/hypokalemia, hyponatremia, hypotension, hypovolemia, renal/hepatic disease, surgery, diabetes

## DOSAGE AND ROUTES

**Adult:** PO 150 mg/day, may increase to 300 mg/day if needed, max 300 mg/day

**Available forms:** Tabs 150, 300 mg

### Implementation

- May use with other antihypertensives
- PO; do not use with a high-fat meal
- Give daily with a full glass of water, titrate up to achieve correct dose
- Do not discontinue abruptly; correct electrolyte/volume depletion prior to treatment
- Store in tight container at room temperature

## ADVERSE EFFECTS

**CNS:** Headache, dizziness, seizures
**CV:** Orthostatic hypotension, hypotension
**GI:** *Diarrhea*
**GU:** Renal stones, increased uric acid
**INTEG:** Rash
**META:** Hyperkalemia
**MISC:** Angioedema, cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poor, bioavailability 2.5% |
| **Distribution** | Steady state 7-8 days |
| **Metabolism** | Unknown |
| **Excretion** | 91% unchanged in the feces |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Atorvastatin, cycloSPORINE, itraconazole, ketoconazole: increased aliskiren levels, concurrent use is not recommended
Warfarin: decreased levels of warfarin

### Drug classifications

Do not use with ACE inhibitors, angiotensin II receptor antagonists, potassium-sparing diuretics, potassium supplements: increased potassium levels
Diuretics, other antihypertensives: increased hypotension
Do not use ACE inhibitors, angiotensin II receptor antagonists in diabetes mellitus

### Drug/food

High-fat meal: aliskiren effect, grapefruit

### Drug/lab test

Increased: uric acid, BUN, serum creatinine, potassium

## NURSING CONSIDERATIONS

### Assessment

- Monitor renal tests: uric acid, serum creatinine, BUN may be increased; hyperkalemia may occur, correct salt depletion, hyperkalemia, volume depletion before starting this product
- **Assess for allergic reactions:** angioedema may occur
- Monitor daily dependent edema in feet, legs; weight, B/P, orthostatic hypotension
- **Diabetes:** Identify the use of ACE inhibitors, angiotensin II receptor antagonists, do not use with aliskiren

### Patient/family education

**BLACK BOX WARNING:** Teach patient to notify prescriber if pregnancy is planned or suspected; if pregnant, product will need to be discontinued

- Teach patient the importance of complying with dosage schedule even if feeling better
- Teach patient how to take B/P and normal reading for age-group
- Advise patient that if dose is missed, take as soon as possible; if it is almost time for the next dose, take only that dose; do not double dose, do not take with a high-fat meal or grapefruit
- Instruct patient not to use OTC products, including herbs, supplements unless approved by prescriber
- **Advise patient to report to prescriber immediately:** dizziness, faintness, chest pain, palpitations, uneven or rapid heart beat, headache, severe diarrhea, swelling of tongue or lips, trouble breathing, difficulty swallowing, tightening of the throat
- Caution patient not to operate machinery or perform hazardous tasks if dizziness occurs
- Advise patient to rise slowly in order to avoid faintness

### Evaluation

**Positive therapeutic outcome**

- Decrease in B/P

## allopurinol (Rx)

(al-oh-pure'i-nole)

**Alloprin, Purinol 1, Aloprim, Zyloprim**

*Func. class.:* Antigout drug, antihyperuricemic

*Chem. class.:* Xanthine enzyme inhibitor

**Do not confuse:** Zyloprim/Zovirax/ZORprin/zolpidem

**ACTION:** Inhibits the enzyme xanthine oxidase, reducing uric acid synthesis

**Therapeutic outcome:** Decreasing serum uric acid levels, decreasing joint pain

**USES:** Chronic gout, hyperuricemia associated with malignancies, recurrent calcium oxalate calculi, uric acid calculi

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, renal/hepatic disease

## DOSAGE AND ROUTES

### Increased uric acid levels in malignancies

**Adult:** PO 600-800 mg/day in divided doses, for 2-3 days; start up to 1-2 days prior to chemotherapy; **IV** INF 200-400 mg/m$^2$/day, max 600 mg/day 24-48 hr prior to chemotherapy, may be divided at 6-, 8-, 12-hr intervals

**Child 6-10 yr:** PO 300 mg/day, adjust dose after 48 hr

**Child <6 yr:** PO 150 mg/day, adjust dose after 48 hr

**Child:** **IV** INF 200 mg/m$^2$/day, initially as a single dose or divided q6-12hr

### Gout (mild)

**Adult:** PO 200-300 mg/day, increase qwk based on uric acid levels, max 800 mg/day

### Gout (moderate-severe)

**Adult:** PO 400-600 mg/day in a single dose or divided bid-tid, max 800 mg/day, doses >300 mg should be given in divided doses, may start during an acute attack as long as antiinflammatories are being used

### Recurrent calculi

**Adult:** PO 200-300 mg/day in a single dose or divided bid-tid

### Uric acid nephropathy prevention

**Adult and child >10 yr:** PO 600-800 mg daily × 2-3 days

### Renal dose

**Adult:** PO/IV CCr 81-100 ml/min 300 mg/day; CCr 61-80 ml/min 250 mg/day; CCr 41-60 ml/min 200 mg/day; CCr 21-40 ml/min 150 mg/day; CCr 10-20 ml/min 100-200 mg/day; CCr 3-9 ml/min 100 mg/day or 100 mg every other day; CCr <3 ml/min 100 mg q24hr or longer or 100 mg every third day

**Available forms:** Tabs, scored, 100, 300 mg; powder for inj 500 mg/vial

## Implementation

### PO route

- Give with meals to prevent GI symptoms; crush and mix with food or fluids for patients with swallowing difficulties
- Increase fluid intake to 2 L/day
- Begin 1-2 days before antineoplastic therapy if using for hyperuricemia associated with malignancy

### Intermittent IV infusion route

- Use in tumor lysis before starting chemotherapy (24-48 hr)
- Reconstitute 30-ml vial with 25 ml of sterile water for inj; dilute to desired conc (≤6 mg/ml) with 0.9% NaCl for inj or $D_5$ for inj, begin inf within 10 hr

**IV compatibilities:** Acyclovir, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, atenolol, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, caspofungin, ceFAZolin, cefoTEtan, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, CISplatin, cyclophosphamide, DACTINomycin, DAUNOrubicin liposome, dexamethasone, dexmedetomidine, DOCEtaxel, DOXOrubicin liposomal, enalaprilat, etoposide, famotidine, fenoldopam, filgrastim, fluconazole, fludarabine, fluorouracil, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, granisetron, heparin, hydrocortisone phosphate, hydrocortisone succinate, HYDROmorphone, ifosfamide, linezolid, LORazepam, mannitol, mesna, methotrexate, metroNIDAZOLE, milrinone, mitoXANtrone, morphine, nesiritide, octreotide, oxytocin, PACLitaxel, pamidronate, pantoprazole, PEMEtrexed, piperacillin, piperacillin-tazobactam, plicamycin, potassium chloride, ranitidine, sodium, sulfamethoxazole-trimethoprim, teniposide, thiotepa, ticarcillin, ticarcillin clavulanate, tigecycline, tirofiban, vancomycin, vasopressin, vinBLAStine, vinCRIStine, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**GI:** *Nausea, vomiting, malaise,* cramps, diarrhea
**INTEG:** rash
**MS:** Acute gouty attack

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 80% |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver to oxypurinol |
| **Excretion** | Kidneys |
| **Half-life** | 1-2 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Unknown | Unknown |
| **Peak** | 1½ hr | Up to 30 min |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Ammonium chloride, potassium/sodium phosphate, vit C: increased kidney stone formation
Ampicillin, amoxicillin: increased risk of rash, avoid concurrent use
AzaTHIOprine: increased bone marrow depression
Mercaptopurine: increased bone marrow depression
Rasburicase: increased xanthine nephropathy, calculi
Theophylline: increased action of theophylline

### Drug classifications

ACE inhibitors: increased hypersensitivity, toxicity
Anticoagulants (oral): increased action of oral anticoagulants
Antidiabetics (oral): increased action of antidiabetics
Antineoplastics: increased bone marrow suppression
Diuretics (thiazide): increased hypersensitivity

## NURSING CONSIDERATIONS

### Assessment

- Assess for **pain** including location, characteristics, onset/duration, frequency, quality, intensity or severity of pain, precipitating factors; **gout:** joint pain, swelling, may use with NSAIDs for acute gouty attacks
- Monitor uric acid levels q2wk; normal uric acid levels are 6 mg/dl or less; effect may take several wk; check I&O ratio, increase fluids to 2 L/day to prevent stone formation, toxicity
- Monitor CBC, AST, BUN, creatinine before starting treatment, monthly; check blood glucose in diabetic patients receiving oral antidiabetic agents
- Assess for rash, hypersensitivity reactions, if present discontinue this product immediately
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Tell patient to increase fluid intake to 2 L/day; to avoid taking large doses of vit C; kidney stone formation may occur; to maintain a diet enhancing urine alkalinity (e.g., milk, other dairy products); if taking for calcium oxalate stones, reduce dairy products, refined sugar, sodium, meat

• Tell patient to report skin rash, stomatitis, malaise, fever, aching; product should be discontinued
• Advise patient to avoid hazardous activities if drowsiness or dizziness occurs; response may take several days to determine
• Tell patient to avoid alcohol, caffeine; these substances increase uric acid levels and decrease allopurinol levels
• Teach patient to report side effects and adverse reactions to prescriber, including rash, itching, nausea, vomiting

### Evaluation

**Positive therapeutic outcome**
• Decreased pain in joints
• Decreased stone formation in kidney
• Decreased uric acid level to 6 mg/dl

## almotriptan (Rx)

(al-moh-trip'tan)
**Axert**
*Func. class.:* Antimigraine agent
*Chem. class.:* 5-$HT_1$ receptor agonist, triptan

**Do not confuse:** Axert/Antivert

**ACTION:** Binds selectively to the vascular 5-$HT_{1B/1D/1F}$ receptor subtype, exerts antimigraine effect; causes vasoconstriction in cranial arteries

**Therapeutic outcome:** Absence of migraines

**USES:** Acute treatment of migraine with or without aura (Adults/adolescents/children ≥12 yr)

## CONTRAINDICATIONS

Hypersensitivity, acute MI, angina, CV disease, CAD, stroke, vasospastic angina, ischemic heart disease or risk for, peripheral vascular syndrome; uncontrolled hypertension, basilar or hemiplegic migraine

**Precautions:** Pregnancy, breastfeeding, children <18 yr, geriatric, postmenopausal women, men >40 yr, risk factors for coronary artery disease, MI, hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function, sulfonamide hypersensitivity, cardiac dysrhythmias, Raynaud's disease, tobacco smoking, Wolff-Parkinson-White syndrome

## DOSAGE AND ROUTES

**Adult/adolescent/child ≥12 yr:** PO 6.25-12.5 mg, may repeat dose after 2 hr; max 2 doses/24 hr, 25 mg/day, or 4 treatment cycles within any 30-day period

**Renal/hepatic dose (CCr 10-30 ml/hr)**
**Adult:** PO 6.25 mg initially, max 12.5 mg

**Available forms:** Tabs 6.25 or 12.5 mg

### Implementation

• Swallow tabs whole; do not break, crush, or chew tabs, without regard to food 2 times/24 hr
• Provide quiet, calm environment with decreased stimulation from noise, bright light, excessive talking

## ADVERSE EFFECTS

**CNS:** *Dizziness,* headache, seizures, paresthesias
**CV:** *Flushing,* palpitations, tachycardia, coronary artery vasospasm, MI, ventricular fibrillation, ventricular tachycardia
**EENT:** Throat, mouth, nasal discomfort; vision changes
**GI:** Nausea, xerostomia
**INTEG:** Sweating, rash
**MS:** *Weakness, neck stiffness,* myalgia
**RESP:** Chest tightness, pressure

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (~70%) |
| **Distribution** | 35% protein bound |
| **Metabolism** | Liver (metabolite); metabolized by MAO-A, CYP2D6, CYP3A4 |
| **Excretion** | Urine 40%, feces 13% |
| **Half-life** | 3-4 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-3 hr |
| **Duration** | 3-4 hr |

## INTERACTIONS

### Individual drugs

Ergot: increased vasospastic effects, avoid concurrent use
Erythromycin, itraconazole, ketoconazole, ritonavir: increased plasma concentration of almotriptan, avoid concurrent use in renal/hepatic disease

### Drug classifications

5-$HT_1$ agonists, ergot derivatives: increased vasospastic effects, avoid concurrent use
CYP2D6 inhibitors: increased almotriptan effect; do not use together
MAOIs: increased almotriptan effect; do not use together
SSRIs, SNRIs, serotonin-receptor agonists, sibutramine: increased serotonin syndrome

### Drug/herb
Feverfew: avoid use
St. John's wort: increased serotonin syndrome

## NURSING CONSIDERATIONS
### Assessment
- Assess for **migraine:** pain, location, aura, duration, intensity, nausea, vomiting
- Assess B/P, signs/symptoms of coronary vasospasms
- Assess for tingling, hot sensation, burning, feeling of pressure, numbness, flushing
- Assess for stress level, activity, recreation, coping mechanisms
- Assess neurologic status: LOC, blurring vision, nausea, vomiting, tingling in extremities preceding headache
- Assess for ingestion of **tyramine-containing foods** (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches
- **Assess for serotonin syndrome:** occurs in those taking SSRIs, SNRIs; agitation, confusion, hallucinations, diaphoresis, hypertension, diarrhea, fever, tremor, usually occurs when dose is increased
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, use only if benefits outweigh fetal risk, use cautiously in breastfeeding

### Patient/family education
- Instruct patient to use contraception while taking product, notify prescriber if pregnancy is planned or suspected, avoid breastfeeding
- Advise patient to have dark, quiet environment available
- Inform patient that product does not prevent or reduce number of migraine attacks, max 4 doses/30 days, do not take MAOIs for ≥ 24 hr
- Advise patient to report chest pain, drowsiness, dizziness, tingling, flushing

### Evaluation
**Positive therapeutic outcome**
- Decrease in severity of migraine

## TREATMENT OF OVERDOSE:
Gastric lavage; clinical and ECG monitoring for ≥20 hr after overdose

**⚠ HIGH ALERT**

# alogliptin
(al'oh glip'tin)
**Nesina**
*Func. class.:* Antidiabetic
*Chem. class.:* Dipeptidyl peptidase-4 (DPP-4) inhibitor

**ACTION:** A dipeptidyl peptidase-4 (DPP-4) inhibitor for the treatment of type 2 diabetes mellitus (monotherapy or in combination with other antidiabetic agents), potentiates the effects of the incretin hormones by inhibiting their breakdown by DPP-4

**Therapeutic outcome:** Decrease in polyuria, polydipsia, polyphagia; clear sensorium, absence of dizziness; improvement in A1c, daily blood glucose monitoring

**USES:** Type 2 diabetes mellitus (T2DM)

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, hepatic disease, burns, ketoacidosis, diarrhea, fever, GI obstruction, hyper/hypoglycemia, hyper/hypothyroidism, type 1 diabetes, hypercortisolism, children, ileus, malnutrition, pancreatitis, surgery, trauma, vomiting, kidney disease, adrenal insufficiency, angioedema

## DOSAGE AND ROUTES
**Adult: PO** 25 mg/day; when used in combination, a lower dose of the other antidiabetic may be needed

### Renal dose
**Adult:** PO CCr 30-59 ml/min: 12.5 mg/day; CCr 30 ml/min: 6.25 mg/day; intermittent hemodialysis: 6.25 mg/day; give without regard to the timing of hemodialysis

**Available forms:** Tab 6.25, 12.5, 25

### Implementation
Give without regard to food

## ADVERSE EFFECTS
**CNS:** Headache
**GI:** Pancreatitis
**META:** Hypoglycemia
**RESP:** Upper respiratory infection, nasopharyngitis
SYST: Rash, hypersensitivity, angioedema, Stevens–Johnson syndrome, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unchanged (urine) |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr |
| **Duration** | Effect decreased (liver disease), increased (kidney disease), half-life 21 hr |

## INTERACTIONS

**Increase:** Hypoglycemia-insulin, sulfonylureas, androgens; dose adjustment may be needed
**Thiazides:** decrease; hypoglycemia, adjust dose if needed

### Drug/lab test

Increased: LFTs
Decrease: Glucose

## NURSING CONSIDERATIONS

### Assessment

- Diabetes: monitor blood glucose, glycosylated hemoglobin (A1c), LFTs, serum creatinine/BUN baseline and throughout treatment
- **Assess for pancreatitis:** can occur anytime during use, severe abdominal pain with or without vomiting
- **Monitor for hypersensitivity reactions:** angioedema
- Assess for Stevens-Johnson syndrome
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education

- Inform patient that diabetes is a life-long condition; product does not cure disease
- Advise patient to consume all food on diet plan, to continue other medical and lifestyle regimens
- Teach patient to carry emergency ID with prescriber, medications, and condition listed
- Teach patient to test blood glucose using a blood glucose meter
- Teach patient to test blood glucose using a blood glucose meter
- Advise patient to report allergic reactions, nausea, vomiting, abdominal pain, dark urine

### Evaluation

**Positive therapeutic outcome**

- Decrease in polyuria, polydipsia, polyphagia, clear sensorium, absence of dizziness, improvement in A1c, daily blood glucose monitoring

# alosetron

(ah-loss'a-tron)
**Lotronex**
*Func. class.:* Anti-IBS agent; serotonin receptor antagonist 5-HT3

**Do not confuse:** Lotronex/Lovenox/Protonix

**ACTION:** A potent and selective antagonist at serotonin 5-HT3 receptors; 5-HT3 receptors are extensively distributed on enteric neurons in the GI tract; antagonism at these receptors in the GI tract modulate the regulation of visceral pain, colonic transit, and GI secretions

**Therapeutic outcome:** Decreased irritable bowel syndrome (IBS) symptoms

**USES:** Severe-diarrhea-predominant IBS

## CONTRAINDICATIONS

Crohn's disease, severe hepatic disease, toxic megacolon, GI adhesions/strictures/obstruction, thrombophlebitis, ulcerative colitis

**BLACK BOX WARNING:** Ischemic colitis, severe constipation

**Precautions:** Pregnancy, breastfeeding, child <18 yr, mild to moderate hepatic disease

## DOSAGE AND ROUTES

**Adult (woman): PO** 0.5 mg bid, may increase to 1 mg bid after 4 wk if well tolerated; discontinue if symptoms are not controlled after 4 wk

**Available forms:** Tab 0.5 mg

### Implementation

- Give without regard to meals with full glass of water
- Store at room temperature, protect from light and moisture

**BLACK BOX WARNING:** Use only after Physician- "Patient Acknowledgement Form" is signed and patient receives official medication guide

## ADVERSE EFFECTS

**GI:** Constipation, abdominal pain, distention, reflux, nausea, obstruction, impaction, ischemic colitis, ileus perforation, small-bowel mesenteric ischemia
**CNS:** Fatigue, headache
**GU:** Urinary tract infection
**MS:** Muscle spasm
**RESP:** Cough, nasopharyngitis, upper respiratory tract infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Extensively in the liver |
| **Excretion** | Unknown, mainly excreted in urine |
| **Half-life** | 1½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Tricyclic antidepressants, H1-blockers: increased serious reactions

CYP3A4, CYP1A2, CYP2C9 inhibitors, hydrALAZINE, procainamide: decreased alosetron metabolism

CYP3A4 inducers: increased alosetron metabolism

### Individual drugs

Orphenadrine, OLANZapine, maprotiline, disopyramide, cyclobenzaprine, cloZAPine, buPROPion, amoxapine, amantadine: increased serious reactions

### Drug/lab test

Increased: ALT

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Irritable bowel syndrome: Assess for constipation, diarrhea, abdominal pain, fecal incontinence; discontinue immediately if bloody diarrhea, severe constipation, rectal bleeding, or severe abdominal pain occur, ischemic colitis has occurred and can be fatal

**BLACK BOX WARNING:** Only clinicians enrolled in the Lotronex prescribing program should use this product; call 888-423-5227

- Geriatric women: assess for more severe side effects

### Patient/family education

**BLACK BOX WARNING:** Ischemic colitis: Teach patient to report immediately, severe constipation, bloody diarrhea, rectal bleeding or worsening abdominal pain; stop product, resume only if approved by prescriber

- Instruct patient not to double doses; if a dose is missed, it should be skipped, do not take with other meds or herbs without prescriber approval
- Advise patient that product may be taken without regard to food
- Advise patient that product does not cure disorder, but only controls symptoms
- Provide medication guide and clarify if needed, improvement in symptoms can take 1-4 wk, symptoms will occur if product is stopped
- Teach patient that product is used only for women with IBS
- Advise patient to report if pregnancy is planned or suspected; product should not be used during pregnancy—effects are unknown

### Evaluation

**Positive therapeutic outcome**

- Decreasing symptoms of IBS

## ALPRAZolam (Rx)

(al-pray'zoe-lam)

**Apo-Alpraz, Apo-Alpraz TS, Novo-Alprazol, Nu-Alpraz, Xanax, Xanax XR**

*Func. class.:* Antianxiety/sedative/hypnotic

*Chem. class.:* Benzodiazepine, short/intermediate acting

**Controlled substance schedule IV**

**Do not confuse:** ALPRAZolam/LORazepam, Xanax/Lanoxin/Tylox/Zantac

**ACTION:** Depresses subcortical levels of CNS, including limbic system, reticular formation

**Therapeutic outcome:** Decreased anxiety

**USES:** Anxiety, panic disorders with or without agoraphobia, anxiety with depressive symptoms

**Unlabeled uses:** Premenstrual dysphoric disorder, insomnia, PMS, alcohol withdrawal syndrome

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to benzodiazepines, closed-angle glaucoma, psychosis, addiction

**Precautions:** Geriatric, debilitated, hepatic disease, obesity, severe pulmonary disease

## DOSAGE AND ROUTES

### Anxiety disorder

**Adult:** PO 0.25-0.5 mg tid, may increase q3-4days if needed, max 4 mg/day in divided doses

**Geriatric:** PO 0.125-0.25 mg bid; increase by 0.125 mg prn

### Panic disorder

**Adult:** PO 0.5 mg tid, may increase up to 1 mg/day q3-4days, max 10 mg/day; EXT REL TABS (Xanax XR) give daily in AM 0.5-1 mg initially, maintenance 3-6 mg daily

### Premenstrual dysphoric disorder (unlabeled)

**Adult:** PO 0.25 mg tid-qid, starting on day 16-18 of menses cycle, taper over 2-3 days when menses occurs, max 4 mg/day

### Hepatic dose

Reduce dose by 50%

**Available forms:** Tabs 0.25, 0.5, 1, 2 mg; ext rel tabs (Xanax XR) 0.5, 1, 2, 3 mg; orally disintegrating tabs 0.25, 0.5, 1, 2 mg; oral sol, 1 mg/ml

### Implementation

- Give with food or milk for GI symptoms; high-fat meal decreases absorption; tab may be crushed, if patient is unable to swallow medication whole, and mixed with foods or fluids; may divide total daily dose into more times/day, if anxiety occurs between doses, conversion from regular release tab to extended release is at same dose
- Give sugarless gum, hard candy, frequent sips of water for dry mouth
- Discontinue, decrease by 0.5 mg q3days
- **Orally disintegrating tabs:** Place orally disintegrating tabs on tongue to dissolve and swallow, protect from moisture, discard unused portion of tab if split
- Give ext rel tab in AM
- **Oral solution: mix with water, applesauce or other soft foods, use calibrated dropper supplied**

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, fatigue, depression, insomnia, hallucinations, memory impairment, poor coordination, suicide
**CV:** *Orthostatic hypotension,* ECG changes, tachycardia, hypotension
**EENT:** *Blurred vision,* tinnitus, mydriasis
**GI:** Constipation, dry mouth, nausea, vomiting, anorexia, diarrhea, weight gain/loss, increased appetite, ileus perforation, ischemic colitis
**GU:** Decreased libido
**INTEG:** Rash, dermatitis, itching, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Slow, complete |
| **Distribution** | Widely distributed; crosses placenta; crosses blood-brain barrier, protein binding 80% |
| **Metabolism** | Liver, to active metabolites |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 12-15 hr immediate release, 11-16 hr extended release |

### Pharmacodynamics

| | PO | Oral Disintegrating |
|---|---|---|
| **Onset** | 1 hr | |
| **Peak** | 1-2 hr | 1.5-2 hr |
| **Duration** | 4-6 hr, therapeutic response 2-3 days | |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Levodopa: decreased action of levodopa
Rifampin: decreased action of ALPRAZolam

### Drug classifications

Anticonvulsants, antihistamines, opioids, sedatives/hypnotics: increased CNS depression
CYP3A4 inducers (barbiturates): decreased action of ALPRAZolam
CYP3A4 inhibitors (cimetidine, disulfiram, erythromycin, fluoxetine, isoniazid, itraconazole, ketoconazole, metoprolol, propranolol, valproic acid): increased action of ALPRAZolam
Xanthines: decreased sedation

### Drug/herb

Chamomile, kava, melatonin, St. John's wort, valerian: increased CNS depression

### Drug/food

Grapefruit juice: increased product level, avoid concurrent use

### Drug/lab test

Increased: ALT, AST, alkaline phosphatase

## NURSING CONSIDERATIONS

### Assessment

- **Assess mental status:** mood, sensorium, anxiety, affect, sleeping pattern, drowsiness, dizziness, especially geriatric; physical dependency, withdrawal symptoms: anxiety, panic attacks, agitation, seizures, headache, nausea, vomiting, muscle pain, weakness;

suicidal tendencies; withdrawal seizures may occur after rapid decrease in dose or abrupt discontinuation; short duration of action makes it the product of choice in the geriatric, suicidal thoughts, behaviors
• Monitor B/P (with patient lying, standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
• Monitor blood studies: CBC during long-term therapy; blood dyscrasias have occurred rarely; decreased hematocrit, neutropenia may occur
• Monitor hepatic studies: AST, ALT, bilirubin, creatinine LDH, alkaline phosphatase, if on long-term treatment
• Monitor I&O; indicate renal dysfunction if on long-term treatment
• **Pregnancy:** Assess if planned or suspected, not to use in pregnancy, to avoid breastfeeding
• Beers: Avoid in older adults, increased risk of cognitive impairment

### Patient/family education
• Tell patient that product may be taken with food or fluids and tabs may be crushed or swallowed whole
• Tell patient not to use for everyday stress or longer than 4 mo unless directed by prescriber; not to take more than prescribed amount; may be habit forming; not to double doses or skip doses; memory impairment is a sign of long-term use
• Tell patient to avoid OTC preparations unless approved by prescriber; alcohol and CNS depressants increase CNS depression
• **Pregnancy/breastfeeding:** Teach patient not to use during pregnancy, avoid breastfeeding
• Tell patient to avoid driving, activities that require alertness, since drowsiness may occur; to avoid alcohol ingestion or other psychotropic medications; to rise slowly, or fainting may occur, especially geriatric; that drowsiness may worsen at beginning of treatment
• Tell patient not to discontinue medication abruptly after long-term use; withdrawal symptoms include vomiting, cramping, tremors, seizures
• **Oral disintegrating:** Place on tongue and allow to dissolve, swallow, if only half of the tab is required, discard the other half
• **Oral solution:** Mix with water, soft food, juice, use measuring device supplied

### Evaluation
**Positive therapeutic outcome**
• Decreased anxiety, restlessness, sleeplessness (short-term treatment only)

## TREATMENT OF OVERDOSE:
Lavage, VS, supportive care, flumazenil

**⚠ HIGH ALERT**

## alteplase (Rx)
(al-ti-plaze′)
**Activase, Cathflo**
*Func. class.:* Thrombolytic enzyme
*Chem. class.:* Tissue plasminogen activator (TPA)

**Do not confuse:** alteplase/Altace, Activase/Cathflo Activase/TNKase

**ACTION:** Produces fibrin conversion of plasminogen to plasmin; able to bind to fibrin, convert plasminogen in thrombus to plasmin, which leads to local fibrinolysis, limited systemic proteolysis

**Therapeutic outcome:** Lysis of thrombi in MI, pulmonary emboli (life threatening)

**USES:** Lysis of obstructing thrombi associated with acute MI; conditions requiring thrombolysis (e.g., PE, unclotting arteriovenous shunts, acute ischemic CVA); central venous catheter occlusion (Cathflo)

## CONTRAINDICATIONS
Active internal bleeding, recent CVA, severe uncontrolled hypertension, intracranial/intraspinal surgery/trauma (within 3 mo), aneurysm, brain tumor, platelets $<100{,}000$ mm$^3$, bleeding diathesis including INR $>1.7$ or PT $>15$ sec, arteriovenous malformation, subarachnoid hemorrhage, intracranial hemorrhage, uncontrolled hypertension, seizure at onset of stroke

**Precautions:** Pregnancy, breastfeeding, children, geriatric, neurologic deficits, mitral stenosis, recent GI/GU bleeding, diabetic retinopathy, subacute bacterial endocarditis, arrhythmias, diabetic hemorrhage retinopathy, CVA, recent major surgery, hypertension, acute pericarditis, hemostatic defects, significant hepatic disease, septic thrombophlebitis, occluded AV cannula at seriously infected site

## DOSAGE AND ROUTES
### Pulmonary embolism (Activase)
**Adult: IV** 100 mg over 2 hr, then heparin

### Acute ischemic stroke (Activase)
**Adult: IV** 0.9 mg/kg, max 90 mg; give as INF over 1 hr, give 10% of dose **IV** BOL over 1st min

### Myocardial infarction (standard infusion)
**Adult >65 kg: IV** a total of 100 mg, given over 3 hr; 6-10 mg given **IV** BOL over 1-2 min, then the remaining 50-54 mg over the remainder of the hr, during 2nd, 3rd hr 20 mg is given by cont **IV** INF (20 mg/hr)

**Adult <65 kg: IV** 1.25 mg/kg over 3 hr; 60% in first 1 hr (10% as a bolus), remaining 40% over next 2 hr

### Myocardial infarction (accelerated infusion) (Activase)

**Adult >67 kg:** 100 mg total dose: give 15 mg **IV** BOL, then 50 mg over 30 min, then 35 mg over 60 min

**Adult <67 kg:** 15 mg **IV** BOL: then 0.75 mg/kg over 30 min (max 50 mg); 0.5 mg/kg over the next 60 min (max 35 mg)

### Occlusion prophylaxis (unlabeled) (Cathflo, Activase)

**Adult ≥30 kg:** Max 2 mg in 2 ml; may use up to 2 doses (120 min apart)

**Available forms:** Powder for inj 50 mg (29 million international units/vial), 100 mg (58 million international units/vial); Cathflo Activase: lyophilized powder for injection 2 mg

### Implementation

**Intermittent IV infusion route**

- Give after reconstituting with provided diluent; add appropriate amount of sterile water for inj (no preservatives); 20-mg vial/20 ml or 50-mg vial/50 ml (1 mg/ml); mix by slow inversion or dilute with 0.9% NaCl, $D_5W$ to a concentration of 0.5 mg/ml further dilution; 1.5 to <0.5 mg/ml may result in precipitation of product; use 18-G needle; flush line with 0.9% NaCl after administration; use reconstituted **IV** sol within 8 hr or discard, within 6 hr of coronary occlusion for best results
- Do not use 150 mg or more total dose; intracranial bleeding may occur
- Give heparin therapy after thrombolytic therapy is discontinued and when thrombin time, ACT, and APTT <2 times control (about 3-4 hr), treatment can be initiated before coagulation study results, infusion should be discontinued if pretreatment is INR >1.7, PT >15 sec, or an elevated APPT is identified
- Avoid invasive procedures, inj, rect temp; apply pressure for 30 sec to minor bleeding sites; 30 min to sites of arterial puncture, followed by pressure dressing; inform prescriber if this does not attain hemostasis; apply pressure dressing
- **Cathflo Activase:** Use this product after other options used for declotting a line; reconstitute by using 2.2 ml of sterile water provided and injecting in vial, direct flow into powder (1 mg/ml), foam will disappear after standing, swirl, do not shake, sol will be pale yellow or clear, use sol within 8 hr, instill 2 ml of reconstituted sol into occluded catheter, try to aspirate after ½ hr, if unable to remove allow 2 hrs; a second dose may be used; aspirate 5 ml of blood to remove clot and product; irrigate with normal saline
- Store powder at room temperature or refrigerate; protect from excessive light
- Avoidance of invasive procedures, inj, rectal temp
- Pressure for 30 sec to minor bleeding sites; 30 min to sites of atrial puncture followed by pressure dressing; inform prescriber if this does not attain hemostasis; apply pressure dressing

**Y-site compatibilities:** Eptifibatide, lidocaine, metoprolol, propranolol

**Y-site incompatibilities:** DOBUTamine, DOPamine, heparin, nitroglycerin

## ADVERSE EFFECTS

**CV:** Sinus bradycardia, ventricular tachycardia, accelerated idioventricular rhythm, bradycardia, recurrent ischemic stroke, cholesterol microembolization, hypotension
**EENT:** Orolingual angioedema
**INTEG:** Urticaria, rash
**SYST:** GI, GU, intracranial, retroperitoneal bleeding, *surface bleeding*, anaphylaxis, fever

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Unknown |
| **Metabolism** | >80% liver |
| **Excretion** | Kidneys |
| **Half-life** | 35 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Immediate |

## INTERACTIONS

### Individual drugs

Abciximab, clopidogrel, dipyridamole, eptifibatide, plicamycin, ticlopidine, tirofiban, valproic acid: increased bleeding
ACE inhibitors: increased orolingual angioedema
Nitroglycerin: decreased effect, avoid concurrent use

### Drug classifications

Anticoagulants (oral), cephalosporins (some), NSAIDs, salicylates: increased bleeding

### Drug/herb

Feverfew, garlic, ginger, ginkgo, ginseng, green tea: increased risk of bleeding

### Drug/lab test

Increased: PT, APTT, TT

## NURSING CONSIDERATIONS

### Assessment

• Treatment is not recommended in patient with acute ischemic stroke >3 hr after symptom onset, with minor neurologic deficit, or with rapidly improving symptoms

• Monitor VS q15min, B/P, pulse, respirations (including peripheral), neurologic signs, temp at least q4hr; temp >104° F (40° C) indicates internal bleeding; monitor rhythm closely; ventricular dysrhythmias may occur with hyperfusion; monitor heart, breath sounds, neurologic status, and peripheral pulses, those with severe neurologic deficit (NIHSS >22) at presentation (increased risk of hemorrhage)

• **Assess for bleeding during first hr of treatment and 24 hr after procedure:** hematuria, hematemesis, bleeding from mucous membranes, epistaxis, ecchymosis, puncture sites; guaiac all body fluids and stools; obtain blood studies (Hct, platelets, PTT, PT, TT, APTT) before starting therapy; PT or APTT must be <2 times control before starting therapy; TT or PT q3-4hr during treatment; obtain CPK-MB to identify product effectiveness; do not use in severe uncontrolled hypertension, aneurysm, head trauma, for MI, pulmonary embolism

• **Assess hypersensitivity:** fever, rash, facial swelling, dyspnea, itching, chills; mild reaction may be treated with antihistamines; report to prescriber

• **Occlusion:** have patient exhale then hold breath when connecting/disconnecting syringe to prevent air embolism

• **Cholesterol embolism:** assess for purple toe syndrome, acute renal failure, gangrenous digits, hypertension, livedo reticularis, pancreatitis, MI, cerebral infarction, spinal cord infarction, retinal artery occlusion, bowel infarction, rhabdomyolysis

• **Myocardial infarction:** monitor ECG; on monitor, watch for segment changes, changes in rhythm: sinus bradycardia, ventricular tachycardia, accelerated idioventricular rhythm may occur due to reperfusion, cardiac enzymes, radionuclide myocardial scanning/coronary angiography

• **Pulmonary embolism:** monitor pulse, B/P, ABGs, rate/rhythm of respirations; symptoms include dyspnea, tachypnea, chest pain, cough, hemoptysis

• **Pregnancy/breastfeeding:** Usually considered contraindicated in pregnancy except in serious conditions, use cautiously in breastfeeding

### Patient/family education

• Teach patient reason for alteplase, signs and symptoms of bleeding, allergic reactions, when to notify prescriber

### Evaluation

**Positive therapeutic outcome**

• Lysis of pulmonary thrombi
• Adequate hemodynamic state
• Absence of congestive heart failure

## aluminum hydroxide (OTC)

**Alugel, Alu-Tab, Amphojel, Basaljel**

*Func. class.:* Antacid, hypophosphatemic, antiulcer

*Chem. class.:* Aluminum product, phosphate binder

**ACTION:** Neutralizes gastric acidity, binds phosphates in GI tract; these phosphates are excreted

**Therapeutic outcome:** Decreased acidity, healing of ulcers; decreased phosphate levels in chronic renal failure

**USES:** Antacid, adjunct in peptic, gastric, duodenal ulcers; hyperphosphatemia in chronic renal failure; reflux esophagitis, hyperacidity, heartburn, stress ulcer prevention in critically ill, GERD

**Unlabeled uses:** GI bleeding

## CONTRAINDICATIONS

Hypersensitivity to this product or aluminum products

**Precautions:** Pregnancy, breastfeeding, geriatric, fluid restriction, decreased GI motility, GI obstruction, dehydration, renal disease, sodium-restricted diets, GI bleeding, hypokalemia

## DOSAGE AND ROUTES

### Antacid

**Adult:** SUSP PO 500-1500 mg 3-6 times/day; max 6 times/day

### Hyperphosphatemia

**Adult:** PO 300-600 mg tid
**Child:** PO 50-150 mg/kg/day in 4-6 divided doses

**Available forms:** SUSP 320 mg/5 ml, 600 mg/5 ml

### Implementation

• 2 tsp (10 ml) neutralizes 20 mEq of acid

**PO route**

• Give laxatives or stool softeners if constipation occurs, especially geriatric

• Give after shaking suspension; follow with water to facilitate passage
• Tab may be chewed if patient is unable to swallow, drink 8 oz of water after chewing; or by nasogastric tube if patient unable to swallow
• Give with 8 oz of water for hyperphosphatemia unless contraindicated
• Give 1 hr before or after other medications to prevent poor absorption
• Give 15 ml 30 min after meals and at bedtime (esophagitis)

**NG tube route**

• May be given as prescribed q1-2hr and given by gastric tube after diluting with water (peptic ulcer)

## ADVERSE EFFECTS

**GI:** *Constipation,* anorexia, obstruction, fecal impaction
**META:** *Hypophosphatemia,* hypercalciuria, hypomagnesemia, aluminum toxicity

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Not usually absorbed |
| **Distribution** | Widely distributed if absorbed; crosses placenta |
| **Metabolism** | Unknown |
| **Excretion** | Feces, kidneys (small amounts), breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 20-40 min |
| **Peak** | ½ hr |
| **Duration** | 1-3 hr |

## INTERACTIONS

### Individual drugs

Allopurinol, amprenavir, delavirdine, digoxin, gabapentin, gatifloxacin, isoniazid, ketoconazole, penicillamine, phenytoin, quiNIDine, ticlopidine: decreased effect of each of these drugs

### Drug classifications

Anticholinergics, cephalosporins, corticosteroids, $H_2$ antagonists, iron salts, phenothiazines, quinolones, tetracyclines, thyroid hormones: decreased effect of each of these drug classifications

### Drug/food

High-protein meal: decreased product effect

### Drug/lab test

Decreased: Phosphate Interference: Tc-99m

## NURSING CONSIDERATIONS

### Assessment

• Assess pain symptoms: location, duration, intensity, alleviating/precipitating factors
• Monitor phosphate levels, since product is bound in GI system; urinary pH, calcium, electrolytes; hypophosphatemia: anorexia, weakness, fatigue, bone pain, hyperreflexia
• Monitor constipation; increase bulk in diet if needed, may use stool softeners or laxatives; record amount and consistency of stools
• **Monitor aluminum toxicity:** severe renal disease; may also be used for hyperphosphatemia
• **Pregnancy/breastfeeding:** Usually considered safe if used occasionally at recommended dose in pregnancy, breastfeeding

### Patient/family education

• Instruct patient to avoid phosphate-containing foods (most dairy products, eggs, fruits, carbonated beverages) during product therapy; to add cheese, corn, pasta, plums, prunes, lentils after product (hypophosphatemia)
• Instruct patient not to use for prolonged periods if serum phosphate is low or if on a low-sodium diet, shake liquid well; HF patients should check for sodium content and use sodium-reduced products
• Instruct patient that stools may appear white or speckled; constipation may result; to report black tarry stools, which indicate gastric bleeding
• Instruct patient to check with prescriber after 2 wk of self-prescribed antacid use; may be used for 4-6 wk after symptoms subside or as prescribed
• Instruct patient to separate other medications by 2 hr
• Teach patient to notify prescriber of black tarry stools, which may indicate bleeding

### Evaluation

**Positive therapeutic outcome**

• Absence of pain, decreased acidity
• Increased pH of gastric secretions
• Decreased phosphate levels

## alvimopan (Rx)

(al-vi′moe-pan)
**Entereg**
*Func. class.:* Functional GI disorder agent
*Chem. class.:* Peripheral μ-opioid receptor antagonist

**ACTION:** Acts within the GI tract, antagonizes opioid-induced GI dysfunction

**Therapeutic outcome:** Resolution of ileus

**USES:** Ileus, postoperative

## CONTRAINDICATIONS

Hypersensitivity, those who have taken therapeutic doses of opioids for 7 consecutive days immediately before starting this product

**Precautions:** Pregnancy, breastfeeding, renal/hepatic disease, children, GI obstruction, complete GI obstruction surgery, risk of MI

**BLACK BOX WARNING:** MI, requires a specialized care setting

## DOSAGE AND ROUTES

### Ileus, postoperative

**Adult:** PO 12 mg given ½-5 hr before surgery, then 12 mg bid beginning the day after surgery, max 7 days (15 doses)

### Renal/hepatic dose

**Adult:** PO Do not use in end-stage renal disease or Child-Pugh

**Available forms:** Caps 12 mg

### Implementation

- Use in hospital only; therapeutic doses of opiates should not be used for >7 consecutive days
- Must register in EASE program
- Do not give >15 doses (short-term hospital only)
- Give without regard to food
- Store at room temperature

**BLACK BOX WARNING:** Use only in hospital setting approved for ENTEREG Access Support and Education (EASE) Program

## ADVERSE EFFECTS

**CV:** MI
**GI:** *Dyspepsia,* flatulence, *constipation,* diarrhea, abdominal pain, cramping
**GU:** Urinary retention
**MISC:** Anemia, hypokalemia
**MS:** Back pain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | High-fat meal decreases absorption |
| **Distribution** | Protein binding 80%-94% |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys (35%) |
| **Half-life** | Terminal 10-18 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Amiodarone, bepridil, cycloSPORINE, diltiazem, itraconazole, quiNIDine, quinine, spironolactone, verapamil: increased alvimopan effect
Methylnaltrexone: duplicate therapy

### Drug classifications

**BLACK BOX WARNING:** Opiate agonists: increased GI adverse reactions; do not give if opiate agonists were taken for ≥7 days

Opiate antagonists: duplicate therapy, do not use concurrently

## NURSING CONSIDERATIONS

### Assessment

- Monitor Hgb, Hct, serum potassium; hyperkalemia occurs

**BLACK BOX WARNING:** Opiate use for chronic pain; MI is more common in this population

- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Instruct the patient in the reason for the product
- **Pregnancy/breastfeeding:** To notify provider if pregnancy is planned or suspected, to avoid breastfeeding
- Advise patient that product is only used for a limited time (<7 days) in a hospital setting
- Advise patient to report constipation, abdominal pain, cramping, nausea, vomiting

### Evaluation

**Positive therapeutic outcome**

- Resolution of postoperative ileus

## amantadine (Rx)

(a-man'ta-deen)
**Endantadine, Gocovri, Symmetrel**
*Func. class.:* Antiviral, antiparkinsonian agent
*Chem. class.:* Tricyclic amine

**Do not confuse:** amantadine/ranitidine/rimantadine/amiodarone

**ACTION:** Prevents uncoating of nucleic acid in viral cell, preventing penetration of virus to host; causes release of dopamine from neurons

**Therapeutic outcome:** Resolution of infection, lessening of parkinsonism symptoms

**USES:** Prophylaxis or treatment of influenza type A, extrapyramidal reactions, parkinsonism, Parkinson's disease

## CONTRAINDICATIONS

Breastfeeding, child <1 yr, hypersensitivity, eczematic rash

**Precautions:** Pregnancy, geriatric, epilepsy, HF, orthostatic hypotension, psychiatric disorders, renal/hepatic disease, peripheral edema, CV disease

## DOSAGE AND ROUTES

### Parkinson's disease

**Adult:** PO 100 mg bid (monotherapy) if other antiparkinson's products are used in high doses, start at 100 mg qday, increase to 100 mg bid after 7 days, may increase to 400 mg in divided doses per day

### Influenza type A

Begin within 24-48 hr of symptoms and continue for 24-48 hr after symptoms disappear

**Adult and child ≥13 yr:** PO 200 mg/day in single dose or divided bid

**Geriatric:** PO no more than 100 mg/day

**Child 9-12 yr:** PO 100 mg bid

**Child 1-8 yr:** PO 4.4-8.8 mg/kg/day divided bid-tid, max 150 mg/day

### Drug-induced EPS

**Adult:** PO 100 mg bid up to 300 mg/day in divided doses

### Amantadine dose addition

For the treatment of dyskinesia associated with Parkinson's disease in patients receiving levodopa-based therapy, with or without concomitant dopaminergic medications

**Adults (Gocovri ER Cap only):** PO 137 mg qday at bedtime initially, then after 1 wk, increase to 274 mg qday at bedtime.

### Renal dose

**Adult:** PO CCr 30-50 ml/min 200 mg first day, then 100 mg/day; CCr 15-29 ml/min 100 mg first day, then 100 mg on alternate days; CCr 15 ml/min reduce dose and interval to 200 mg q7days

**Available forms:** Caps 100 mg; oral sol 50 mg/5 ml, tab 100 mg; ER capsule (Gocovri) 68.5, 137 mg

### Implementation

- **Prophylaxis:** give before exposure to influenza; continue for 10 days after contact; **treatment:** initiate within 24-48 hr after onset of symptoms, continue for 24-48 hr after symptoms disappear
- Give at least 4 hr before bedtime to prevent insomnia
- Give after meals for better absorption, to decrease GI symptoms
- Give in divided doses to prevent CNS disturbances: headache, dizziness, fatigue, drowsiness
- Store in tight, dry container
- Caps may be opened and mixed with food
- For the treatment of dyskinesia associated with Parkinson's disease in patients receiving levodopa-based therapy, with or without concomitant dopaminergic medications
- Adults (Gocovri ER Cap only): PO 137 mg qday at bedtime initially, then after 1 wk, increase to 274 mg qday at bedtime.

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness*, drowsiness, fatigue, *anxiety,* psychosis, *depression, hallucinations,* tremors, seizures, confusion, *insomnia*

**CV:** *Orthostatic hypotension,* HF

**EENT:** Blurred vision

**GI:** *Nausea, vomiting,* constipation, dry mouth, anorexia

**GU:** *Frequency, retention*

**HEMA:** Leukopenia, agranulocytosis

**INTEG:** Photosensitivity, dermatitis, livedo reticularis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Crosses placenta |
| **Metabolism** | Not metabolized |
| **Excretion** | Urine unchanged (90%), breast milk |
| **Half-life** | 11-15 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 48 hr |
| **Peak** | 2-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Atropine: increased anticholinergic response

H1N1 influenza A virus vaccine: decreased effect of vaccine; avoid use 2 wk before or 48 hr after amantadine

Metoclopramide: decreased amantadine effect

Triamterene, hydrochlorothiazide: decreased excretion of amantadine

### Drug classifications

Anticholinergics (other): increased anticholinergic response

CNS stimulants: increased CNS stimulation

Phenothiazines: decreased amantadine effect

### Drug/lab test

Increase: BUN, creatinine, alk phos, CK, LDH, bilirubin, AST, ALT, GGT

## NURSING CONSIDERATIONS

### Assessment

- Mental status: may cause increased psychiatric disorders, especially in the elderly
- Assess **HF,** confusion, mottling of skin
- Assess bowel pattern before, during treatment
- Assess skin eruptions, photosensitivity after administration of product

- Serum creatinine, BUN in renal impairment
- Assess signs of infection
- Assess for **livedo reticularis:** mottling of the skin, usually red, edema, itching in lower extremities, usually in Parkinson's disease
- Assess for **Parkinson's disease:** gait, tremors, akinesia, rigidity, may be effective if anticholinergics have not been effective
- **Assess for toxicity:** confusion, behavioral changes, hypotension, seizures

### Patient/family education

- Advise patient to change body position slowly to prevent orthostatic hypotension
- Teach about aspects of product therapy: need to report dyspnea, weight gain, dizziness, poor concentration, dysuria, complex sleep behaviors
- Advise patient to avoid hazardous activities if dizziness, blurred vision occurs
- Advise patient to take product exactly as prescribed; parkinsonian crisis may occur if product is discontinued abruptly; do not double dose; if a dose is missed, do not take within 4 hr of next dose
- Teach to avoid alcohol

### Evaluation

**Positive therapeutic outcome**

- Absence of fever, malaise, cough, dyspnea in infection; tremors, shuffling gait in Parkinson's disease

## TREATMENT OF OVERDOSE:

Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, $O_2$, **IV** corticosteroids, physostigmine

## ambrisentan (Rx)

(am-bri-sen'tan)
**Letairis, Volibris**
*Func. class.:* Antihypertensive
*Chem. class.:* Vasodilator/endothelin receptor antagonist

## ACTION:

Endothelin-1A receptor antagonist; endothelin-1A is vasoconstrictor

**Therapeutic outcome:** Decreased shortness of breath, dizziness

## USES:

Pulmonary arterial hypertension, alone or in combination with other antihypertensives in WHO class II (significant exertion), III (mild exertion)

## CONTRAINDICATIONS

Breastfeeding, hypersensitivity

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Children, women, geriatric, hepatitis, anemia, heart failure, jaundice, peripheral edema, hepatic disease, pulmonary edema

## DOSAGE AND ROUTES

**Adult:** PO 5 mg/day; may increase q4wk to 10 mg if needed

### Hepatic dose

**Adult:** Discontinue if AST/ALT >5 or if elevations are accompanied by bilirubin >2 ULN or other signs of liver dysfunction

**Available forms:** Tabs 5, 10 mg

### Implementation

- Do not break, crush, or chew tabs
- Give daily with a full glass of water without regard to food
- Do not discontinue abruptly

**BLACK BOX WARNING:** Only those facilities enrolled in the LEAP program (866-664-5327) may administer this product

- Store in tight container at room temperature

## ADVERSE EFFECTS

**CNS:** Headache, fever, flushing, fatigue
**CV:** Orthostatic hypotension, hypotension, peripheral edema, palpitations
**EENT:** Sinusitis, rhinitis
**GI:** Abdominal pain, constipation, anorexia, hepatotoxicity
**GU:** Decreased sperm counts
**HEMA:** Anemia
**INTEG:** Rash, angioedema
**RESP:** Pharyngitis, dyspnea, pulmonary edema, venoocclusive disease (VOD)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid |
| **Distribution** | Protein binding 99% |
| **Metabolism** | By CYP3A4, CYP2C19, UGTa |
| **Excretion** | Unknown |
| **Half-life** | Terminal 15 hr, effective half-life 9 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Cimetidine, clopidogrel, efavirenz, felbamate, FLUoxetine, modafinil, OXcarbazepine, ticlopidine: possibly increased ambrisentan
Mefloquine, niCARdipine, propafenone, quiNIDine, ranolazine, tacrolimus, testosterone: decreased ambrisentan absorption

### Drug classifications

Antihypertensives (other), diuretics, MAOIs: increased hypotension
Barbiturates: need for ambrisentan dosage change
CYP3A4 inhibitors (amprenavir, aprepitant, atazanavir, clarithromycin, conivaptan, cyclosporine, dalfopristin, danazol, darunavir, erythromycin, estradiol, imatinib, itraconazole, ketoconazole, nefazodone, nelfinavir, propoxyphene, quinupristin, ritonavir, RU-486, saquinavir, tamoxifen, telithromycin, troleandomycin, zafirlukast), CYP2C19/CYP3A4 (chloramphenicol, delavirdine, fluconazole, fluvoxaMINE, isoniazid, voriconazole): increased ambrisentan
CYP3A4 inducers (carBAMazepine, PHENobarbitol, phenytoin, rifampin): decreased ambrisentan

### Drug/herb

Ephedra (ma huang), St. John's wort: need for ambrisentan dosage change

### Drug/food

Grapefruit products: avoid use

### Drug/lab test

Decreased: Hct, Hgb
Increased: LFTs

## NURSING CONSIDERATIONS

### Assessment

- Assess pulmonary status: improvement in breathing, ability to exercise; pulmonary edema that may indicate venoocclusive disease
- Monitor blood studies: CBC with differential; Hct, Hgb may be decreased
- Monitor liver function tests: AST, ALT, blirubin

**BLACK BOX WARNING:** Assess pregnancy status before giving this product and monthly

- **Hepatotoxicity:** assess for nausea, vomiting, pain/cramping, jaundice, anorexia, itching
- Beers: Use in older adults cautiously, may exacerbate syncope

### Patient/family education

- Teach patient the importance of complying with dosage schedule even if feeling better
- Advise patient that if a dose is missed, take as soon as possible; if it is almost time for the next dose, take only that dose; do not double dose
- Instruct patient not to use OTC products, including herbs, supplements unless approved by prescriber
- **Advise patient to report to prescriber immediately:** dizziness, faintness, chest pain, palpitations, uneven or rapid heart rate, headache, edema, weight gain
- Caution patient not to operate machinery or perform hazardous tasks if dizziness occurs
- Advise patient to avoid faintness; do not get up or stand up rapidly

**BLACK BOX WARNING:** To notify if pregnancy is planned or suspected; if pregnant, product will need to be discontinued, pregnancy test done monthly, to use two contraception methods while taking this product

- To report hepatic dysfunction: nausea/vomiting, anorexia, fatigue, jaundice, right upper quadrant abdominal pain, itching, fever, malaise
- Advise patient of importance of follow-up with labs

### Evaluation

**Positive therapeutic outcome**

- Decrease in B/P
- Decreased shortness of breath

## amikacin (Rx)

(am-i-kay'sin)
*Func. class.:* Antibiotic
*Chem. class.:* Aminoglycoside

**Do not confuse:** Amikacin/Anakinra

**ACTION:** Interferes with protein synthesis in bacterial cell by binding to ribosomal subunit, which causes misreading of genetic code; inaccurate peptide sequence forms in protein chain, causing bacterial death

**Therapeutic outcome:** Bactericidal effects for the following organisms: *Pseudomonas aeruginosa, Escherichia coli, Enterobacter, Acinetobacter, Providencia, Citrobacter, Staphylococcus, Serratia, Proteus*

**USES:** Severe systemic infections of CNS, respiratory, GI, urinary tract, bone, skin, soft tissues caused by *Staphylococcus aureus (MSSA), Pseudomonas aeruginosa, Escherichia coli, Enterobacter, Acinetobacter, Providencia, Citrobacter, Serratia, Proteus, Klebsiella pneumoniae*

**Unlabeled uses:** *Mycobacterium avium* complex (intrathecal or intraventricular) in combination; actinomycotic mycetoma, cystic fibrosis

## CONTRAINDICATIONS

Pregnancy, hypersensitivity to aminoglycosides, sulfites

**Precautions:** Neonates, breastfeeding, geriatric, myasthenia gravis, Parkinson's disease, dehydration, mild to moderate infections

**BLACK BOX WARNING:** Hearing impairment, renal/neuromuscular disease

## DOSAGE AND ROUTES

**Severe systemic infections:** *(Pseudomonas aeruginosa, Escherichia coli, Proteus, Klebsiella, Staphylococcus)*

**Adult and child: IV** INF 10-15 mg/kg/day in 2-3 divided doses q8-12hr in 100-200 ml $D_5W$ over 30-60 min, not to exceed 1.5 g/day; **pulse dosing** (once-daily dosing) may be used with some infections; IM 10-15 mg/kg/day in divided doses q8-12hr; or extended internal dosing as an alternative dosing regimen

**Neonate:** IM/**IV** 10 mg/kg initially, then 7.5 mg/kg q12hr

### Severe urinary tract infections

**Adult:** IM 10-15 mg/kg/day divided q8-12hr

### Hemodialysis

**Adult:** IM/**IV** 7.5 mg/kg followed by 5 mg/kg 3 ×/wk after each dialysis session (for TIW dialysis)

### Mycobacterium avian complex (unlabeled)

**Adult and adolescent: IV** 7.5-15 mg/kg divided q12-24hr as part of a multiple-drug regimen

**Child: IV** 15-30 mg/kg/day divided q12-24hr as part of a multiple-drug regimen, max 1.5 g/day

### Renal dose (extended interval dosing)

**Adult:** IV/IM CCr 40-59 ml/min 15 mg/kg IV q36hr; CCr 20-39 ml/min 15 mg/kg IV q48hr; <20 ml/min adjust based on serum concentrations and MIC (use traditional dosing)

### Traditional dosing

- Decrease dose and maintain interval or maintain dose and decrease interval

**Available forms:** Inj IM, **IV** 50, 250 mg/ml

### Implementation

- Obtain C&S before administration, begin treatment before results

**IM route**

- Give deeply in large muscle mass, rotate inj sites
- Obtain peak 1 hr after IM, trough before next dose

**Intermittent IV INF route**

- **Dilute** 500 mg of product/100-200 ml of **IV** $D_5W$, 0.9% NaCl and **give** over ½-1 hr; dilute insufficient volume to allow inf over 1-2 hr (infants); **flush** after administration with $D_5W$ or 0.9% NaCl; solution is clear or pale yellow; discard if precipitate or dark color develops
- In children, amount of fluid depends on ordered dose; in infants infuse over 1-2 hr
- Give in evenly spaced doses to maintain blood level

**Y-site compatibilities:** Acyclovir, alatrofloxacin, aldesleukin, alemtuzumab, alfentanil, amifostine, aminophylline, amiodarone, amsacrine, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefepime, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, IL-2, imipenem-cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoXANtrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pantoprazole, papaverine, PEMEtrexed, penicillin G, pentazocine, perphenazine, PHENobarbital, phenylephrine, phytonadione, piperacillin-tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinupristin-dalfopristin, ranitidine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, warfarin, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Confusion, depression, numbness, tremors, seizures, muscle twitching, neurotoxicity, dizziness, vertigo, tinnitus, neuromuscular blockade with respiratory paralysis

**CV:** Hypotension or hypertension

**EENT:** Ototoxicity, deafness
**GI:** *Nausea, vomiting, anorexia,* bilirubin
**GU:** Oliguria, hematuria, renal damage, azotemia, renal failure, nephrotoxicity
**HEMA:** Eosinophilia, anemia
**INTEG:** *Rash,* burning, urticaria, dermatitis, alopecia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM), completely absorbed (**IV**) |
| **Distribution** | Widely distributed in extracellular fluids, poor in CSF; crosses placenta |
| **Metabolism** | Minimal; liver |
| **Excretion** | Mostly unchanged (79%) in kidneys, removed by hemodialysis |
| **Half-life** | 2-3 hr, prolonged up to 7 hr in infants; increased in renal disease |

### Pharmacodynamics

| | IM | IV |
|---|---|---|
| **Onset** | Rapid | Rapid |
| **Peak** | 15-30 min | 1-2 hr |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** Acyclovir, amphotericin B, cidofovir, cycloSPORINE, vancomycin: nephrotoxicity

**BLACK BOX WARNING:** DimenhyDRINATE, ethacrynic acid: increased masking of ototoxicity

### Drug classifications

**BLACK BOX WARNING:** Anesthetics, nondepolarizing neuromuscular blockers: increased neuromuscular blockade, respiratory depression

**BLACK BOX WARNING:** Increased: Ototoxic-to-IV loop diuretics

**BLACK BOX WARNING:** Cephalosporins: inactivation of amikacin, nephrotoxicity

NSAIDs: increased serum trough and peak

### Drug/lab test

Increased: BUN, creatinine, urea levels (urine)

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction
- Assess patient for signs and symptoms of infection, including characteristics of wounds, sputum, urine, stool, WBC $>10{,}000/mm^3$, earache, temp; obtain baseline information before and during treatment
- Assess for allergic reactions: rash, urticaria, pruritus

**BLACK BOX WARNING:** Nephrotoxicity: Assess renal impairment; obtain urine for CCr, BUN, serum creatinine; lower dosage should be given in renal impairment; nephrotoxicity may be reversible if product is stopped at first sign

- Notify prescriber of increased BUN and creatinine, urine CCr $<80$ ml/min; urinalysis daily for protein, cells, casts
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase; Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride, magnesium monthly if patient is on long-term therapy
- Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- Assess for **overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- Obtain weight before treatment; calculation of dosage is usually based on ideal body weight but may be calculated on actual body weight, in those underweight and nonobese, use total body weight (TBW) instead of ideal body weight
- Monitor VS during infusion, watch for hypotension, change in pulse
- Assess **IV** site for thrombophlebitis including pain, redness, swelling q30min; change site if needed; apply warm compresses to discontinued site

**BLACK BOX WARNING:** Ototoxicity: Deafness by audiometric testing, ringing, roaring in ears, vertigo; assess hearing before, during, after treatment

- **Dehydration:** high specific gravity, decrease in skin turgor, dry mucous membranes, dark urine
- **Vestibular dysfunction:** nausea, vomiting, dizziness, headache; product should be discontinued if severe

• **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding; do not use in pregnancy or breastfeeding

### Patient/family education

• Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
• Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection
• Advise patient to report hypersensitivity: rash, itching, trouble breathing, facial edema and notify prescriber

**BLACK BOX WARNING:** Neuromuscular blockade; respiratory paralysis may occur, more common in those receiving anesthetics, neuromuscular blockers, use of calcium salts may reverse effect

### Evaluation

**Positive therapeutic outcome**

• Absence of signs/symptoms of infection: WBC $<10{,}000/mm^3$, temp WNL; absence of red draining wounds; absence of earache
• Reported improvement in symptoms of infection

## TREATMENT OF OVERDOSE:

Withdraw product; administer EPINEPHrine, $O_2$, hemodialysis, exchange transfusion in the newborn; monitor serum levels of product; may give ticarcillin or carbenicillin

## aMILoride (Rx)

(a-mill'oh-ride)
**Apo-Amilzide, Midamor, Moduretic, Novamilor, Nu-Amilzide**
*Func. class.:* Potassium-sparing diuretic
*Chem. class.:* Pyrazine

**Do not confuse:** aMILoride/amLODIPine/amiodarone

**ACTION:** Inhibits sodium, potassium ATPase ion exchange in the distal tubule, cortical collecting duct resulting in inhibition of sodium reabsorption and decreasing potassium secretion

**Therapeutic outcome:** Diuretic and antihypertensive effect while retaining potassium

**USES:** Edema in HF in combination with other diuretics; for hypertension, adjunct with other diuretics to maintain potassium

**Unlabeled uses:** Ascites

## CONTRAINDICATIONS

Anuria, hypersensitivity, diabetic neuropathy, renal failure

**BLACK BOX WARNING:** Hyperkalemia

**Precautions:** Pregnancy, breastfeeding, children, geriatric, dehydration, diabetes, acidosis, respiratory hyponatremia, impaired renal function

## DOSAGE AND ROUTES

**Adult:** PO 5-10 mg daily in 1-2 divided doses; may be increased to 10-20 mg daily if needed
**Infant/child (6-20 kg):** PO 0.625 mg/kg/day

### Renal dose

**Adult:** PO CCr 10-50 ml/min reduce dose by 50%; however, avoid if possible, CCr <10 ml/min contraindicated

**Available forms:** Tabs 5 mg

### Implementation

• Give in AM to avoid interference with sleep
• With food; if nausea occurs, absorption may be increased

## ADVERSE EFFECTS

**CNS:** *Headache,* dizziness, fatigue, weakness, paresthesias, tremor, depression, anxiety, encephalopathy
**CV:** Orthostatic hypotension, dysrhythmias, angina
**EENT:** Blurred vision, increased intraocular pressure
**ELECT:** Hyperkalemia, dehydration, hyponatremia, hypochloremia
**GI:** *Nausea, diarrhea,* dry mouth, *vomiting, anorexia,* cramps, constipation, abdominal pain, jaundice
**GU:** *Polyuria,* dysuria, frequency, impotence
**HEMA:** Aplastic anemia, neutropenia
**INTEG:** *Rash, pruritus,* alopecia, urticaria
**MS:** *Cramps*
**RESP:** *Cough, dyspnea,* shortness of breath

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Variable (10%-50%) |
| **Distribution** | Widely distributed |
| **Metabolism** | Unchanged in urine (50%), in feces (40%) |
| **Excretion** | Renal; breast milk |
| **Half-life** | 6-9 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 2 hr |
| **Peak** | 6-10 hr |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** CycloSPORINE, tacrolimus: increased hyperkalemia

Lithium: increased lithium toxicity, monitor lithium levels

### Drug classifications

**BLACK BOX WARNING:** Hyperkalemia: ACE inhibitors, diuretics (potassium-sparing), potassium products, salt substitutes: increased hyperkalemia. Avoid concurrent use; if using together, monitor K level

Antihypertensives: increased action
NSAIDs: decreased effectiveness of aMILoride, avoid concurrent use

### Drug/herb

Hawthorn, horse chestnut: increased aMILoride effect

### Drug/food

Potassium foods: increased hyperkalemia, potassium-based salt substitutes

### Drug/lab test

**BLACK BOX WARNING:** Interference: GTT

Increased: LFTs, BUN, potassium, sodium

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Monitor for **hyperkalemia:** *MS:* fatigue, muscle weakness; *CARDIAC:* dysrhythmias, hypotension; *NEURO:* paresthesias, confusion; *RESP:* dyspnea, monitor potassium level baseline and each dosage change, hyperkalemia is more common in renal disease, geriatrics, diabetes, if potassium ≥ 5.5 mEq/L immediately notify prescriber

- Monitor for **hypokalemia:** weakness, polyuria, polydipsia, fatigue, ECG U wave
- Assess fluid volume status: distended red veins, crackles in lung, color, quality, and specific gravity of urine, skin turgor, adequacy of pulses, moist mucous membranes, bilateral lung sounds, peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth and mucous membranes should be reported
- Monitor electrolytes: potassium, sodium, calcium, magnesium; also include BUN, ABGs, uric acid, CBC, blood glucose
- Assess B/P before, during therapy with patient lying, standing, and sitting as appropriate; orthostatic hypotension can occur rapidly
- **Beers:** Avoid in older adults, may decrease sodium, increase potassium, decrease creatinine clearance; use with caution may exacerbate or cause inappropriate antidiuretic hormone secretion/hyponatremia, monitor sodium levels often
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding, use only if clearly needed.

### Patient/family education

- Teach patient to take medication early in the day to prevent nocturia, to avoid alcohol
- Instruct patient to take with food or milk if GI symptoms of nausea and anorexia occur
- Teach patient to maintain a weekly record of weight and notify prescriber of weight loss >5 lb
- Caution patient that this product causes an increase in potassium levels, so foods high in potassium and potassium supplements should be avoided; refer to dietitian for assistance, planning
- Caution patient not to exercise in hot weather or stand for prolonged periods since orthostatic hypotension is enhanced
- Teach patient not to use alcohol or any OTC medications without prescriber's approval; serious product reactions may occur
- Emphasize the need to contact prescriber immediately if muscle cramps, weakness, nausea, dizziness, or numbness occurs
- Teach patient to take own B/P and pulse and record
- Advise patient that dizziness and confusion may occur; avoid driving or other hazardous activities if alertness is decreased
- Teach patient to continue taking medication even if feeling better; this product controls symptoms but does not cure the condition
- Advise patient with hypertension to continue other medical treatment (exercise, weight loss, relaxation techniques, cessation of smoking)
- Teach patient to avoid hazardous activities if dizziness occurs

### Evaluation

**Positive therapeutic outcome**

- Prevention of hypokalemia (diuretic use)
- Decreased edema
- Decreased B/P
- Increased diuresis

## TREATMENT OF OVERDOSE:

Lavage if taken orally; monitor electrolytes; administer **IV** fluids; monitor hydration, CV, renal status

## amino acid (Rx)

(a-mee′noe)

**Injection: FreAmine, HepatAmine**
**Solution: Aminess, Aminosyn, Branch Amin, FreAmine III, NephrAmine, Novamine, ProcalAmine, Ren Amin, Travasol, TrophAmine**

*Func. class.:* Caloric agent
*Chem. class.:* Nitrogen product

**ACTION:** Needed for anabolism to maintain structure; decreases catabolism, promotes healing

**Therapeutic outcome:** Positive nitrogen balance, decreased catabolism

**USES:** Hepatic encephalopathy, cirrhosis, hepatitis, nutritional support in cancer, burn, or solid organ transplant patients; to prevent nitrogen loss when adequate nutrition by mouth, gastric, or duodenal tube cannot be used; intestinal obstruction, short bowel syndrome, severe malabsorption

## CONTRAINDICATIONS

Hypersensitivity, severe electrolyte imbalances, anuria, severe liver damage, maple syrup urine disease, PKU, azotemia, genetic disease of amino acid metabolism

**Precautions:** Pregnancy, children, renal disease, diabetes mellitus, HF, breastfeeding, sulfite sensitivity

## DOSAGE AND ROUTES

### Amino acid injection

**Adult: IV** 80-120 g/day; 500 ml of amino acids/500 ml $D_{50}$ given over 24 hr

### Amino acid solution

**Adult: IV** 1-1.5 g/kg/day titrated to patient's needs
**Child: IV** 2-3 g/kg/day titrated to patient's needs

**Available forms:** Inj; many strengths, types

### Implementation

**Continuous IV route**

- Give up to 40% protein and dextrose (up to 12.5%) via peripheral vein; stronger solutions require central **IV** administration; TPN only mixed with dextrose to promote protein synthesis
- Use immediately after mixing in pharmacy under strict aseptic technique using laminar flowhood; use infusion pump, in-line filter (0.22 μm) unless mixed with fat emulsion and dextrose (3 in 1)
- Use careful monitoring technique; do not speed up infusion; pulmonary edema, glucose overload will result
- Storage depends on type of solution; consult manufacturer
- Change dressing and **IV** tubing to prevent infection q24-48hr or q5-7days if transparent dressing is used

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache,* confusion, loss of consciousness
**CV:** Hypertension, HF, pulmonary edema
**ENDO:** *Hyperglycemia, rebound hypoglycemia, electrolyte imbalances, hyperosmolar syndrome, hyperosmolar hyperglycemic nonketotic syndrome,* alkalosis, acidosis, hypophosphatemia, hyperammonemia, dehydration, hypocalcemia
**GI:** Nausea, vomiting, liver fat deposits, abdominal pain, jaundice, cholestasis
**GU:** Glycosuria, osmotic diuresis, diuresis
**INTEG:** Chills, flushing, warm feeling, rash, urticaria, extravasation necrosis, phlebitis at inj site

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability |
| **Distribution** | Widely distributed |
| **Metabolism** | Anabolism |
| **Excretion** | Kidney to urea nitrogen |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

Tetracycline: decreased protein-sparing effects (inj only)

## NURSING CONSIDERATIONS

### Assessment

- Monitor electrolytes (potassium, sodium, calcium, chloride, magnesium), blood glucose, ammonia, phosphate, ketones; renal, liver function studies: BUN, creatinine, ALT, AST, bilirubin; urine glucose q6hr using Chemstrips, which are not affected by infusion substances; if BUN increases over 15%, therapy may need to be discontinued
- Check inj site for extravasation: redness along vein, edema at site, necrosis, pain; for a hard, tender area
- Monitor respiratory function q4hr: auscultate lung fields bilaterally for crackles; monitor respirations for quality, rate, rhythm that indicates fluid overload
- Monitor temp q4hr for increased fever, indicating infection; if infection is suspected, infusion is discontinued and tubing, bottle, catheter tip cultured; blood catheter may be obtained

• **Monitor for impending hepatic coma:** asterixis, confusion, fetor, lethargy
• **Hyperammonemia:** nausea, vomiting, malaise, tremors, anorexia, seizures; increased ammonia, ketone levels may occur

### Patient/family education

• Teach reason for use of amino acids as part of nutrition (TPN), how to care for tubing/site
• Instruct patient to report at once to prescriber if chills, sweating are experienced, risk of infection is higher

### Evaluation

**Positive therapeutic outcome**
• Weight gain
• Decreased jaundice in liver disorders
• Increased LOC

**⚠ HIGH ALERT**

## amiodarone (Rx)

(a-mee-oh'da-rone)
**Cordarone, Nexterone, Pacerone**
*Func. class.:* Antidysrhythmic (Class III)
*Chem. class.:* Iodinated benzofuran derivative

**Do not confuse:** amiodarone/amantadine

**ACTION:** Prolongs action potential duration and effective refractory period, noncompetitive α- and β-adrenergic inhibition; increases PR and QT intervals, decreases sinus rate, decreases peripheral vascular resistance

**Therapeutic outcome:** Decreased amount and severity of ventricular dysrhythmias

**USES:** Hemodynamically unstable ventricular tachycardia, supraventricular tachycardia, ventricular fibrillation not controlled by 1st-line agents

## CONTRAINDICATIONS

Pregnancy, breastfeeding, neonates, infants, severe sinus node dysfunction, hypersensitivity to this product/iodine/benzyl alcohol, cardiogenic shock

**BLACK BOX WARNING:** 2nd-3rd degree AV block, bradycardia

**Precautions:** Goiter, Hashimoto's thyroiditis, electrolyte imbalances, HF, severe respiratory disease, children, torsades de pointes

**BLACK BOX WARNING:** Cardiac arrhythmias, pneumonitis, pulmonary fibrosis, severe hepatic disease, requires a specialized setting

## DOSAGE AND ROUTES

### Prevention of recurrent life-threatening ventricular dysrhythmias

**Adult:** PO loading dose 800-1600 mg/day for 1-3 wk; then 600-800 mg/day × 1 mo; maintenance 400 mg/day; **IV** loading dose (first rapid) 150 mg over the first 10 min then slow 360 mg over the next 6 hr; maintenance 540 mg given over the remaining 18 hr, decrease rate of the slow infusion to 0.5 mg/min

**Available forms:** Tabs 100, 200, 400 mg; inj 50 mg/ml

### Implementation

Start with patient hospitalized and monitored
**PO route**
• Give reduced dosage slowly with ECG monitoring only
• Loading dose with food to decrease nausea

**IV, direct route**
• **Peripheral:** max 2 mg/ml for longer than 1 hr; preferred through central venous line with in-line filter; concentration >2 mg/ml should be given by central line
• **Cardiac arrest:** give 300 mg IV bol diluted to a total volume of 20 ml $D_5W$; may repeat 150 mg after 3-5 min
**Intermittent IV INF route**
• **Rapid loading:** add 3 ml (150 mg), 100 ml $D_5W$ (1.5 mg/ml), give over 10 min
• **Slow loading:** add 18 ml (900 mg), 500 ml $D_5W$ (1.8 mg/ml), give over next 6 hr
**Continuous IV infusion route**
• After 24 hr, dilute 50 ml to 1-6 mg/ml, give 1-6 mg/ml at 1 mg/ml for the first 6 hr, then 0.5 mg/min

**Y-site compatibilities:** Amikacin, bretylium, clindamycin, DOBUTamine, DOPamine, doxycycline, erythromycin, esmolol, gentamicin, insulin (regular), isoproterenol, labetalol, lidocaine, metaraminol, metroNIDAZOLE, midazolam, morphine, nitroglycerin, norepinephrine, penicillin G potassium, phentolamine, phenylephrine, potassium chloride, procainamide, tobramycin, vancomycin

**Solution compatibilities:** $D_5W$, 0.9% NaCl

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* involuntary movement, tremors, peripheral neuropathy, malaise, fatigue, ataxia, paresthesias, insomnia
**CV:** *Hypotension,* bradycardia, sinus arrest, HF, dysrhythmias, SA node dysfunction, AV block, increased defibrillation energy requirement
**EENT:** Blurred vision, halos, photophobia, *corneal microdeposits,* dry eyes

**ENDO:** Hyper/hypothyroidism
**GI:** Nausea, vomiting, diarrhea, abdominal pain, anorexia, constipation, hepatotoxicity
**GU:** Epididymitis, ED
**INTEG:** Rash, photosensitivity, blue-gray skin discoloration, alopecia, spontaneous ecchymosis, toxic epidermal necrolysis, urticaria, pancreatitis, phlebitis (IV)
**MISC:** Flushing, abnormal taste or smell, edema, abnormal salivation, coagulation abnormalities
**MS:** Weakness, pain in extremities
**RESP:** Pulmonary fibrosis/toxicity, pulmonary inflammation, ARDS, gasping syndrome in neonates

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Slow, variable (PO) up to 65% |
| **Distribution** | Body tissues; crosses placenta |
| **Metabolism** | Liver, an inhibitor of CYP1A2, CYP3A4, CYP2C8, CYP2C9, CYP2C19, CYP2A6, CYP2B6, CYP2D6, P-glycoprotein, organic cation transporter |
| **Excretion** | Bile, kidney (minimal) |
| **Half-life** | 15-100 days, increased in geriatrics |

### Pharmacodynamics

| | PO |
|---|---|
| **Onset** | 1-3 wk |
| **Peak** | 3-7 hr |
| **Duration** | Up to several months |

## INTERACTIONS

### Individual drugs

CycloSPORINE, dextromethorphan, digoxin, disopyramide, flecainide, methotrexate, phenytoin, procainamide, quiNIDine, theophylline: increased blood levels, increased toxicity
Loratadine, trazodone: Increased QT prolongation
Warfarin: increased bleeding, dabigatran

### Drug classifications

Azoles, fluoroquinolones, macrolides: increased QT prolongation
β-Adrenergic blockers, calcium channel blockers: increased bradycardia, sinus arrest, AV block
Class I antidysrhythmics: increased levels
HMG-CoA reductase inhibitors: increased myopathy
Protease inhibitors: increased amiodarone concentrations, possible serious dysrhythmias, reduce dose

### Drug/herb

St. John's wort: decreased amiodarone effect

### Drug/food

Grapefruit juice: toxicity

### Drug/lab test

Increased: $T_4$, ALT, AST, GGT, alk phos, cholesterol, lipids, PT, INR
Decrease: $T_3$

## NURSING CONSIDERATIONS

### Assessment

- Monitor electrolytes: potassium, sodium, chloride
- Monitor chest x-ray, thyroid function tests
- Monitor liver function studies: AST, ALT, bilirubin, alkaline phosphatase

**BLACK BOX WARNING: Cardiac dysrhythmias:** Monitor ECG continuously to determine product effectiveness; measure PR, QRS, QT intervals; check for PVCs, other dysrhythmias; monitor B/P continuously for hypo/hypertension; check for rebound hypertension after 1-2 hr

- Monitor for dehydration or hypovolemia, monitor PT, INR if using warfarin
- Assess for CNS symptoms: confusion, psychosis, numbness, depression, involuntary movements; if these occur, product should be discontinued
- Assess for hypothyroidism: lethargy, dizziness, constipation, enlarged thyroid gland, edema of extremities, cool, pale skin
- Monitor hyperthyroidism: restlessness, tachycardia, eyelid puffiness, weight loss, frequent urination, menstrual irregularities, dyspnea, warm, moist skin, may cause fatal thyrotoxicosis, cardiac dysrhythmias, product may need to be reduced or discontinued

**BLACK BOX WARNING:** Assess for pulmonary toxicity including ARDS, pulmonary fibrosis: dyspnea, fatigue, cough, fever, chest pain; product should be discontinued if these occur, increased at higher doses (400 mg/day), toxicity is common

- Monitor cardiac rate, respiration: rate, rhythm, character, chest pain, ventricular tachycardia, supraventricular tachycardia or fibrillation
- Assess sight and vision before treatment and throughout therapy; microdeposits on the cornea may cause blurred vision, halos, and photophobia, to prevent corneal deposits use methylcellulose
- Beers: Avoid as first-line therapy for atrial fibrillation in older adults unless heart failure

- Stevens-Johnson syndrome, toxic epidermal necrolysis; monitor for rash, blistering, discontinue immediately, notify prescriber
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Instruct patient to report side effects immediately to prescriber; more common at high dose NO
- Instruct patient that skin discoloration is usually reversible, but skin may turn bluish on neck, face, arms when used for long periods
- Advise patient that dark glasses may be needed for photophobia
- Instruct patient to use sunscreen and protective clothing to prevent burning associated with photosensitivity
- Instruct patient to take medication as prescribed, not to double doses, do not discontinue abruptly, not to use other drugs, herbs without prescriber approval, many interactions
- Instruct patient to complete follow-up appointment with health care provider, including pulmonary function studies, chest x-ray, ophthalmic examinations
- Teach patient to report vision changes, weight change, rash, blistering, numbness, temperature intolerance
- **Pregnancy/breastfeeding:** Teach patient product is not to be used during pregnancy or breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Decreased ventricular tachycardia
- Decreased supraventricular tachycardia or fibrillation

## TREATMENT OF OVERDOSE:

Administer $O_2$, artificial ventilation, ECG, DOPamine for circulatory depression, diazepam or thiopental for seizures, isoproterenol

## amitriptyline (Rx)

(a-mee-trip′ti-leen)

**Elavil, Levate, Novo-Triptyn**

*Func. class.:* Antidepressant—tricyclic

*Chem. class.:* Tertiary amine

**Do not confuse:** amitriptyline/nortriptyline/aminophylline

**ACTION:** Blocks reuptake of norepinephrine, serotonin into nerve endings that increase action of norepinephrine, serotonin in nerve cells

**Therapeutic outcome:** Decreased symptoms of depression after 2-3 wk

**USES:** Major depression

**Unlabeled uses:** Neuropathic pain, fibromyalgia

## CONTRAINDICATIONS

Hypersensitivity to tricyclics, recovery phase of MI

**Precautions:** Pregnancy, breastfeeding, geriatric, seizure disorders, prostatic hypertrophy, schizophrenia, psychosis, severe depression, increased intraocular pressure, closed-angle glaucoma, urinary retention, cardiac disease, renal/hepatic disease, hyperthyroidism, electroshock therapy, elective surgery

**BLACK BOX WARNING:** Child <12 yr, suicidal patients

## DOSAGE AND ROUTES

### For the treatment of major depression

**Adults:** PO Initially, 75 mg/day in divided doses or 50-100 mg qday at bedtime. Titrate if needed to 150 mg/day by increasing the daily dose 25-50 mg at weekly intervals

- **Geriatric:** PO 10-25 mg at bedtime initially. Titrate as needed and tolerated
- **Adolescents:** PO Begin at a low daily dosage, usually at bedtime, and titrate as needed and tolerated
- Children ≥ 9 yr (unlabeled) PO 1 mg/kg/day given in three divided doses, then increased after 3 days to 1.5 mg/kg/day

### For the treatment of social phobia (social anxiety disorder) or panic disorder (unlabeled)

**Adults:** PO 25 mg tid initially. Titrate up to 200 mg/day as tolerated or needed by increasing the daily dose 25-50 mg at weekly intervals

### For the treatment of postherpetic neuralgia (unlabeled)

**Adults:** PO A median dose of 75 mg/day PO at bedtime (range 25 mg/day to 137.5 mg/day) after titration has provided good-to-excellent responses; patients rated as having a poor response took a median dose of 50 mg/day PO at bedtime (range 25 mg/day to 125 mg/day)

### For the treatment of fibromyalgia (unlabeled)

**Adults:** PO In one trial, amitriptyline 10 mg PO once daily at bedtime and titrated up to 50 mg PO at bedtime was superior to placebo at 1 month but not significantly better at 3 or 6 months. In another small study comparing amitriptyline to FLUoxetine, placebo, or the combination of amitriptyline with FLUoxetine, amitriptyline 25 mg PO once daily alone was superior to placebo

### For the treatment of persistent singultus (hiccups) (unlabeled)
**Adults:** PO 10 mg PO tid

### For the treatment of primary nocturnal enuresis (unlabeled)
**Children and adolescents ≥11 yr:** PO 50 mg at bedtime
**Children 6 to 10 yr:** PO 25 mg at bedtime

### For the adjunct treatment of bulimia nervosa (unlabeled)
**Adults:** PO Initially, 25 mg PO tid. Titrate to 150 mg/day qday at bedtime by increasing the daily dose by 25 to 50 mg at weekly intervals, as tolerated or needed

### Therapeutic drug monitoring
The suggested therapeutic plasma concentration range for amitriptyline is 120-150 ng/ml. Plasma concentration monitoring should be considered in patients with an inadequate response or excessive adverse effects

**Available forms:** Tabs 10, 25, 50, 75, 100, 150 mg

### Implementation
- Give with food or milk for GI symptoms
- Crush if patient is unable to swallow medication whole
- Give dose at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric may not tolerate once/day dosing
- Store at room temperature; do not freeze

## ADVERSE EFFECTS
**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, weakness, *insomnia,* nightmares, EPS (geriatric), increased psychiatric symptoms, seizures, suicidal thoughts, anxiety
**CV:** *Orthostatic hypotension,* ECG changes, tachycardia, hypertension, palpitations, dysrhythmias
**EENT:** *Blurred vision,* tinnitus, mydriasis, ophthalmoplegia, amblyopia
**GI:** *Constipation, dry mouth,* weight gain, nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis
**GU:** *Urinary retention,* sexual dysfunction
**HEMA:** Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia, aplastic anemia
**INTEG:** Rash, urticaria, sweating, pruritus, photosensitivity
**RESP:** Asthma exacerbation, rhinitis
**SYST:** Neuroleptic malignant syndrome, serotonin syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 10-46 hr |

### Pharmacodynamics

| | PO |
|---|---|
| **Onset** | 45 min |
| **Peak** | 2-12 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Alcohol: increased CNS depression
Amiodarone, procainamide, quiNIDine: increased QT prolongation
CarBAMazepine: increased amitriptyline levels, increased toxicity
Cimetidine, fluoxetine: increased levels, increased toxicity, may need dosage reduction
CloNIDine: decreased effects
Guanethidine: decreased effects
Linezolid, methylene blue: increased serotonin syndrome, use cautiously

### Drug classifications
Antidepressants, antidysrhythmics (class IC), phenothiazines: increased amitriptyline levels, toxicity
Antidysrhythmics (class IA, III), tricyclic antidepressants: increased QT prolongation
Antithyroid agents: increased risk of agranulocytosis
Barbiturates, benzodiazepines, CNS depressants, opioids, sedative/hypnotics, sympathomimetics (direct acting): increased CNS effects
MAOIs: hypertensive crisis, seizures, hyperpyretic crisis, do not use 14 days of MAOIs
Oral contraceptives: increased effects, toxicity
Sympathomimetics (indirect acting): decreased effects

### Drug/herb
Chamomile, hops, kava, lavender, valerian: increased CNS depression
SAM-e, St. John's wort, yohimbe: serotonin syndrome, avoid concurrent use

### Drug/lab test
Increased: serum bilirubin, blood glucose, alkaline phosphatase, LFTs
Decreased: WBCs, platelets, granulocytes, blood glucose

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P (with patient lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with cardiovascular disease
- Monitor blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy, thyroid function tests
- Monitor hepatic studies: AST, ALT, bilirubin
- Check weight weekly; appetite may increase with product
- Assess ECG for flattening of T wave, bundle branch block, AV block, prolongation of QTc interval, dysrhythmias in cardiac patients, avoid use immediately after MI
- Assess for EPS primarily in geriatric: rigidity, dystonia, akathisia

**BLACK BOX WARNING:** Assess mental status: mood, sensorium, affect, suicidal tendencies; increase in psychiatric symptoms: depression, panic; suicidal tendencies are higher in those ≤ 24 yr, restrict amount of product available, not to use in child <12 yr

- **Assess for serotonin syndrome:** may occur with other serotonergic products (hyperthermia, hypertension, rigidity, delirium)
- Monitor urinary retention, constipation; constipation is more likely to occur in children or geriatric
- Assess for paralytic ileus, glaucoma exacerbation
- Assess for **withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; do not usually occur unless product was discontinued abruptly
- Identify alcohol consumption; if alcohol is consumed, hold dose until morning
- Assess for sexual dysfunction: erectile dysfunction, decreased libido; usually resolves after discontinuing product
- Beers: Avoid in older adults, highly anticholinergic, sedating, causes orthostatic hypotension
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, or if breastfeeding, use only if benefits clearly outweigh fetal risk

### Patient/family education

- Teach patient that therapeutic effects may take 2-3 wk, to take as directed, usually at bedtime, not to discontinue quickly after long-term use
- Instruct patient to use caution in driving or other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing, especially geriatric; management of anticholinergic effects
- Teach patient the symptoms of serotonin syndrome, to report immediately fever, muscle twitching diarrhea, sweating, mental changes
- Advise patient to avoid alcohol ingestion, other CNS depressants; overheating
- Teach patient not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise
- Advise patient to wear sunscreen or large hat, since photosensitivity occurs; hyperthermia can occur
- Teach patient to increase fluids, bulk in diet if constipation, urinary retention occur, especially geriatric
- Teach patient to use gum, hard sugarless candy, or frequent sips of water for dry mouth
- Instruct patient to use contraception during treatment

**BLACK BOX WARNING:** Teach patient to watch for suicidal ideation

### Evaluation

**Positive therapeutic outcome**

- Decreased depression
- Absence of suicidal thoughts

## TREATMENT OF OVERDOSE:

ECG monitoring, lavage, administer anticonvulsant, sodium bicarbonate

## amLODIPine (Rx)

(am-loe'di-peen)

**Norvasc**

*Func. class.:* Antianginal, calcium channel blocker, antihypertensive

*Chem. class.:* Dihydropyridine

**Do not confuse:** amLODIPine/aMILoride
Norvasc/Navane

**ACTION:** Inhibits calcium ion influx across cell membrane during cardiac depolarization; produces relaxation of coronary vascular smooth muscle and peripheral vascular smooth muscle; dilates coronary vascular arteries; increases myocardial oxygen delivery in patients with vasospastic angina

**Therapeutic outcome:** Decreased angina pectoris, dysrhythmias, B/P

**USES:** Chronic stable angina pectoris, hypertension, variant angina (Prinzmetal's angina); may coadminister with other antihypertensives, antianginals

## CONTRAINDICATIONS

Hypersensitivity to this product, severe aortic stenosis, severe obstructive CAD

**Precautions:** Pregnancy, breastfeeding, children, geriatric, HF, hypotension, hepatic injury, GERD

## DOSAGE AND ROUTES

### Coronary artery disease

**Adult:** PO 5-10 mg daily
**Geriatric:** PO 5 mg daily, may increase; max 10 mg/day

### Hypertension

**Adult:** PO 5 mg daily initially, max 10 mg/day
**Geriatric:** PO 2.5 mg/day; may increase to 5 mg/day, max 10 mg/day

### Hepatic dose

**Adult:** PO 2.5 mg/day, may increase to 10 mg/day (antihypertensive); 5 mg/day, may increase to 10 mg/day (antianginal)

**Available forms:** Tabs 2.5, 5, 10 mg

### Implementation

- Give once a day, without regard to meals

## ADVERSE EFFECTS

**CNS:** Headache, fatigue, dizziness, asthenia, anxiety, depression, insomnia, paresthesia, somnolence
**CV:** Peripheral edema, bradycardia, hypotension, palpitations, syncope, chest pain
**GI:** Nausea, vomiting, diarrhea, gastric upset, constipation, flatulence, anorexia, gingival hyperplasia, dyspepsia
**GU:** Nocturia, polyuria, sexual difficulties
**INTEG:** Rash, pruritus, urticaria, alopecia
**MISC:** Flushing, muscle cramps, cough, weight gain, tinnitus, epistaxis, pulmonary edema, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed up to 90% |
| **Distribution** | Crosses placenta, protein binding 93% |
| **Metabolism** | Liver, extensively by CYP3A4 |
| **Excretion** | Kidneys to metabolites (90%) |
| **Half-life** | 30-50 hr; increased in geriatric, hepatic disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 6-10 hr |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Diltiazem: increased amLODIPine level; Conivapton; CYP3A4 inhibitors

### Drug classifications

Antihypertensives, nitrates: increased hypotension
Increase: level of cyclosporine
Increase: myopathy simvastatin

## NURSING CONSIDERATIONS

### Assessment

- Assess fluid volume status: distended red veins, crackles in lung; color, quality, and specific gravity of urine, skin turgor, adequacy of pulses, moist mucous membranes, bilateral lung sounds, peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth and mucous membranes should be reported
- Assess for angina: intensity, location, duration of pain
- Monitor B/P and pulse; if B/P drops, call prescriber
- Monitor ALT, AST, bilirubin daily; if these are elevated, hepatotoxicity is suspected
- Monitor platelet count: if $<150{,}000/mm^3$, product is usually discontinued and another product started
- Monitor cardiac status: B/P, pulse, respiration, ECG
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding, data are limited on pregnancy or breastfeeding

### Patient/family education

- Advise patient to avoid hazardous activities until stabilized on product, dizziness is no longer a problem
- Instruct patient to avoid alcohol and OTC products unless directed by prescriber
- Advise patient to comply in all areas of medical regimen: diet, exercise, stress reduction, smoking cessation, product therapy; to notify prescriber of irregular heartbeat, shortness of breath, swelling of feet, face, and hands, severe dizziness, constipation, nausea, hypotension; use nitroglycerin when angina is severe
- Teach patient to use as directed even if feeling better; may be taken with other cardiovascular products (nitrates, β-blockers)
- Advise to avoid large amounts of grapefruit juice or alcohol

### Evaluation

#### Positive therapeutic outcome

- Decreased anginal pain
- Decreased B/P
- Increased exercise tolerance

## TREATMENT OF OVERDOSE:

Defibrillation, β-agonists, **IV** calcium inotropic agents, diuretics, atropine for AV block, vasopressor for hypotension

## amoxicillin (Rx)

(a-mox-i-sill'in)

**Amoxil, Apo-Amoxi, Lin-Amox, Moxatag, Novamoxin, Nu-Amoxi**

*Func. class.:* Antiinfective, antiulcer

*Chem. class.:* Aminopenicillin

**ACTION:** Interferes with cell wall replication of susceptible organisms by binding to the bacterial cell wall; the cell wall; bactericidal, lysis mediated by bacterial cell wall autolysis

**Therapeutic outcome:** Bactericidal effects for the following organisms: effective for gram-positive cocci *(Staphylococcus aureus, Streptococcus pyogenes, Streptococcus faecalis, Streptococcus pneumoniae)*, gram-negative cocci *(Neisseria gonorrhoeae, Neisseria meningitidis)*, gram-negative bacilli *(Haemophilus influenzae, Proteus mirabilis, Escherichia coli, Salmonella)*, in combination for *Helicobacter pylori*, gram-positive bacilli *(Corynebacterium diphtheriae, Listeria monocytogenes)*; gastric ulcer, β-lactamase-negative organisms

**USES:** Infections of respiratory tract, skin, GI tract, GU tract, otitis media, meningitis, septicemia, sinusitis

**Unlabeled uses:** Lyme disease, anthrax treatment and prophylaxis, and bacterial endocarditis prophylaxis in combination with other products used for treatment of *Helicobacter pylori*

## CONTRAINDICATIONS

Hypersensitivity to penicillins

**Precautions:** Pregnancy, breastfeeding, neonates, hypersensitivity to cephalosporins, carbapenems; severe renal disease, mononucleosis, phenylketonuria, diabetes, geriatrics, asthma, child, colitis, dialysis, eczema, pseudomembranous colitis, syphilis

## DOSAGE AND ROUTES

### For the treatment of upper respiratory tract infections (pharyngitis, tonsillitis)

**Adults:** PO (immediate-release) 500 mg q1hr or 250 mg q8hr for mild/moderate infections and 875 mg q12hr or 500 mg q8hr for severe infections

**Infants >3 mo, children, and adolescents:** PO (immediate release) 20 mg/kg/day in divided doses every 8 hr (max: 250 mg/dose) or 25 mg/kg/day PO in divided doses every 12 hr (max: 500 mg/dose) for mild to moderate infections and 40 mg/kg/day PO in divided doses every 8 hr (max: 500 mg/dose) or 45 mg/kg/day PO in divided doses every 12 hr (max: 875 mg/dose) for severe infections

**Neonates and infants 3 mo and younger:** 30 mg/kg/day PO given in divided doses every 12 hr

### For the treatment of tonsillitis and/or pharyngitis (rheumatic fever prophylaxis) secondary to *Streptococcus pyogenes*

- Adults, adolescents, and children 12 yr and older PO (Moxatag 775-mg extended-release tablets) 775 mg qday, given within 1 hr of completing a meal, for 10 days

**Adults:** PO (immediate-release) 1 g qday or 500 mg bid for 10 days

- Infants, children, and adolescents PO (immediate-release) 25 mg/kg/dose (max: 500 mg/dose) bid for 10 days

### For the treatment of sinusitis

**Children and adolescents 2 yr and older (standard-dose therapy):** PO (immediate-release) 45 mg/kg/day divided q12hr

**Children and adolescents 2 yr and older (high-dose therapy):** PO (immediate-release) 80 to 90 mg/kg/day divided q12hr (max: 2 g/dose)

**Children younger than 2 yr:** PO Children younger than 2 yr should be treated with amoxicillin plus clavulanic acid, not amoxicillin alone

### For the treatment of acute otitis media

**Adults:** PO (immediate-release) 500 mg q12hr or 250 mg q8hr for mild/moderate infections and 875 mg q12hr or 500 mg q8hr for severe infections

- Infants ≥ 6 mo, children, and adolescents PO (immediate-release) 80 to 90 mg/kg/day divided q12hr
- Infants 4 to 5 mo PO (immediate-release) 80 to 90 mg/kg/day divided q12hr for 10 days
- Infants ≤ 3 mo PO (immediate-release) 30 mg/kg/day divided q12hr
- For the treatment of skin and skin structure infections (cellulitis):

### For mild to moderate infections caused by highly susceptible organisms

**Adults:** PO (immediate-release) 500 mg q12hr or 250 mg q8hr

**Infants > 3 mo, children, and adolescents:** PO (immediate-release) 20 mg/kg/day divided q8hr (max: 250 mg/dose) or 25 mg/kg/day divided q12hr (max: 500 mg/dose)

- Neonates and infants ≤ 3 mo PO (immediate-release) 30 mg/kg/day divided q12hr

### For severe infections or infections caused by less susceptible organisms

**Adults:** PO (immediate-release) 875 mg q12hr or 500 mg q8hr
**Infants > 3 mo, children, and adolescents:** PO (immediate-release) 40 mg/kg/day divided q8hr (max: 500 mg/dose) or 45 mg/kg/day divided q12hr (max: 875 mg/dose)
**Neonates and infants ≤ 3 mo:** PO (immediate-release) 30 mg/kg/day divided q12hr

### For the treatment of lower respiratory tract infections (e.g., pneumonia, community-acquired pneumonia, bronchitis)

**Adults:** PO (immediate-release) 875 mg q12hr or 500 mg q8hr
**Infants > 3 mo, children, and adolescents:** PO (immediate-release) 45 mg/kg/day divided q12hr or 40 mg/kg/day divided q8hr (max: 1750 mg/day)
**Neonates and infants ≤ 3 mo:** PO (immediate-release) 30 mg/kg/day divided q12hr
For the treatment of urinary tract infection (UTI) including cystitis

### For mild to moderate infections caused by highly susceptible organisms

**Adults:** PO (immediate-release) 500 mg q12hr or 250 mg q8hr
**Infants > 3 mo, children, and adolescents:** PO (immediate-release) 20 mg/kg/day divided q8hr (max: 250 mg/dose) or 25 mg/kg/day divided q12hr (max: 500 mg/dose)
**Neonates and infants ≤ 3 mo:** PO (immediate-release) 30 mg/kg/day divided q12hr

### For severe infections or infections caused by less susceptible organisms

**Adults:** PO (immediate-release) 875 mg q12hr or 500 mg q8hr
- Infants > 3 mo, children, and adolescents PO (immediate-release) 40 mg/kg/day divided q8hr (max: 500 mg/dose) or 45 mg/kg/day divided q12hr (max: 875 mg/dose)

**Neonates and infants ≤ 3 mo:** PO (immediate-release) 30 mg/kg/day divided q12hr

### Renal disease

**Adult:** PO CCr 10-30 ml/min 250-500 mg q12hr; CCr <10 ml/min 250-500 mg q24hr; do not use 775, 875 mg strength if CCr <30 ml/min

**Available forms:** Caps 250, 500 mg; chewable tabs 125, 200, 250, 400 mg; tabs 250, 500, 875 mg; ext rel tab (Moxatag) 775 mg; susp 125, 200, 250, 400 mg/5 ml

## Implementation

### PO route

- Identify allergies before use
- Give in even doses around the clock without regard to food; if GI upset occurs, give with food; product must be given for 10-14 days to ensure organism death and prevent superinfection; store in tight container
- The caps may be opened and contents taken with fluids
- **Suspension:** shake well before each dose, may be used alone or mixed in drinks, use immediately; susp may be stored in refrigerator for 14 days
- **Extended release:** do not crush, chew, or break; take with food

## ADVERSE EFFECTS

**CNS:** Headache, seizures, agitation, confusion, dizziness, insomnia
**GI:** *Nausea, vomiting, diarrhea,* increased AST, ALT, abdominal pain, glossitis, colitis, pseudomembranous colitis, jaundice, cholestasis
**HEMA:** Anemia, increased bleeding time, bone marrow depression, granulocytopenia, hemolytic anemia, eosinophilia, thrombocytopenia, agranulocytosis
**INTEG:** *Urticaria, rash*
**SYST:** Anaphylaxis, respiratory distress, serum sickness, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (90%) |
| **Distribution** | Readily in body tissues, fluids, CSF; crosses placenta |
| **Metabolism** | Liver (30%) |
| **Excretion** | Breast milk, kidney, unchanged (70%) |
| **Half-life** | 1-1.3 hr, extended in renal disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½ hr |
| **Peak** | 1-2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Methotrexate: increased methotrexate levels, monitor for toxicity
Probenecid: increased amoxicillin levels, decreased renal excretion, used for this reason
Warfarin: increased anticoagulant effects

### Drug classifications

Contraceptives (hormonal): may decrease contraceptive effectiveness

### Drug/lab test

Decreased: Hgb, WBC, platelets
Increase: AST/ALT, alk phos, LDH, eosinophils
Interference: urine glucose test (Clinitest, Benedict's reagent, cupric $SO_4$)

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction to penicillins or other cephalosporins; cross-sensitivity between penicillin products and cephalosporins is common
- Assess patient for signs and symptoms of **infection**, including characteristics of wounds, sputum, urine, stool, WBC >10,000/$mm^3$, earache, fever; obtain baseline information and monitor symptoms during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for allergic reactions during treatment:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reactions, rash is more common if allopurinol is taken concurrently
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also, increased BUN, creatinine, urinalysis, protein, blood
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test baseline and monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- Assess bowel pattern daily; diarrhea, cramping, blood in stools; if severe diarrhea occurs, notify prescriber; product should be discontinued; pseudomembranous colitis may occur
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- Assess for overgrowth of infection: perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- Pregnancy/breastfeeding: Identify if pregnancy is planned or suspected, or if breastfeeding, usually considered safe in pregnancy, use cautiously in breastfeeding

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, diarrhea, sore throat, fever, fatigue, furry tongue occur; may indicate superinfection or agranulocytopenia
- Instruct patient to take all medication prescribed for the length of time ordered; not to double dose; chew form is available
- Advise patient to notify prescriber of diarrhea with blood or pus, abdominal pain, which may indicate pseudomembranous colitis

### Evaluation

**Positive therapeutic outcome**

- Absence of signs/symptoms of infection (WBC <10,000/$mm^3$, temp WNL, absence of red draining wounds or earache)
- Prevention of endocarditis
- Resolution of ulcer symptoms

## TREATMENT OF ANAPHYLAXIS:

Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, $O_2$, **IV** corticosteroids

## amoxicillin/clavulanate (Rx)

(a-mox-i-sill'in)
**Apo-Amoxi Clav ✱, Augmentin, Augmentin ES, Augmentin XR, Clavulin ✱**
*Func. class.:* Broad-spectrum antiinfective (extended spectrum)
*Chem. class.:* Aminopenicillin-β-lactamase inhibitor

**ACTION:** Interferes with cell wall replication of susceptible organisms; lysis mediated by bacterial cell wall autolytic enzymes, combination increases spectrum of activity against β-lactamase resistance organisms

**Therapeutic outcome:** Bactericidal effects for *Actinomyces, Bacillus anthracis, Bacteroides, Bordetella pertussis, Borrelia burgdorferi, Brucella, Burkholderia pseudomallei, Clostridium perfringens, Clostridium tetani, Corynebacterium diphtheriae, Eikenella corrodens, Enterobacter, Enterococcus faecalis, Erysipelothrix rhusiopathiae, Escherichia coli, Eubacterium, Fusobacterium, Haemophilus ducreyi, Haemophilus parainfluenzae* (positive/negative beta-lactamase), *Helicobacter pylori, Klebsiella, Lactobacillus, Listeria monocytogenes, Moraxella catarrhalis, Neisseria gonorrhoeae, Neisseria meningitis, Nocardia brasiliensis, Peptococcus, Peptostreptococcus, Prevotella melaninogenica, Propionibacterium, Salmonella, Shigella, Staphylococcus*

*aureus* (MSSA), *Staphylococcus epidermidis, Staphylococcus saprophyticus, Streptococcus agalactiae* (group B Streptococci), *Streptococcus dysgalactiae, Streptococcus pneumoniae, Streptococcus pyogenes* (group A Streptococci), *Treponema pallidium, Vibrio cholerae,* viridans streptococci

**USES:** Infections of lower respiratory tract, skin, GU tract; impetigo; otitis media, sinusitis, pneumonia, and endocarditis prophylaxis

## CONTRAINDICATIONS

Hypersensitivity to penicillins, severe renal disease, dialysis, jaundice

**Precautions:** Pregnancy, breastfeeding, neonates, children, hypersensitivity to cephalosporins, GI/renal disease, asthma, colitis, diabetes, eczema, leukemia, mononucleosis, viral infections, phenylketonuria

## DOSAGE AND ROUTES

### Recurrent/persistent otitis media *(Streptococcus pneumoniae, Haemophilus influenzaem, Moreaxella catarrhalis)* in those exposed to antiinfectives within the past 3 mo (≤ 2 yr or in daycare)

**Child >3 mo** PO 90 mg/kg/day (600 mg amoxicillin/42.9mg clavulanate) q12hr × 10 days

### Lower respiratory infections, otitis media, sinusitis, skin/skin structure infections; UTIs (gram positive/negative)

**Adult:** PO 250-500 mg q8hr or 500-875 mg q12hr depending on severity of infection
**Child ≤40 kg:** PO 20-90 mg/kg/day in divided doses q8-12hr

### Community-acquired pneumonia or acute bacterial sinusitis

**Adult:** PO 2000 mg/125 mg (Augumentin XR) q12hr x 7-10 days (pneumonia), 10 days (sinusitis)

### Renal dose

**Adult:** PO CCr 10-30 ml/min dose q12hr; CCr <10 ml/min dose q24hr; do not use 875 mg strength if CCr <30 ml/min; Augmentin XR is contraindicated in renal disease

**Available forms:** Tabs 250, 500, 875 mg amoxicillin/125 mg clavulanate; chewable tabs 200/28.5, 400/57 mg; powder for oral susp 125, 250/28.5, 200/28.5, 400/57, 600/42.9 mg/5 ml; (XR) ext rel tabs 1000 mg amoxicillin/62.5 mg clavulanate; (ES) powder for oral susp 600 mg amoxicillin; 42.9 mg clavulanate 5 ml

## Implementation

### PO route

- Give in even doses around the clock; if GI upset occurs, give with food; product must be taken for 10-14 days to ensure organism death and prevent superinfection; store in tight container; cap can be opened and mixed with food or liquid; chewable tabs should be chewed
- Administer only as directed; two 250-mg tabs not equivalent to one 500-mg tab due to strength of clavulanate
- Shake susp well before each dose; may be used alone or mixed in drinks, use immediately; susp may be stored in refrigerator for 10 days

## ADVERSE EFFECTS

**CNS:** Headache, fever, seizures, agitation, insomnia
**GI:** *Nausea, diarrhea, vomiting,* increased AST, ALT, abdominal pain, glossitis, colitis, black tongue, pseudomembranous colitis, jaundice
**GU:** Oliguria, proteinuria, hematuria, *vaginitis, moniliasis,* glomerulonephritis
**HEMA:** Anemia, bone marrow depression, granulocytopenia, leukopenia, eosinophilia, thrombocytopenic purpura
**INTEG:** Rash, urticaria, dermatitis, toxic epidermal necrolysis
**META:** Hyperkalemia, hypokalemia, alkalosis, hypernatremia
**SYST:** Anaphylaxis, respiratory distress, serum sickness, superinfection, Stevens-Johnson syndrome , superinfection, candidiasis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (90%) |
| **Distribution** | Readily in body tissues, fluids, CSF; crosses placenta |
| **Metabolism** | Liver (30%) |
| **Excretion** | Breast milk; kidney, unchanged (70%), removed by hemodialysis |
| **Half-life** | 1-1.3 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½ hr |
| **Peak** | 1-2.5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Allopurinol: increased skin rash
Probenecid: increased amoxicillin levels, used for this reason
Warfarin: increased anticoagulant effect, monitor closely: dose adjustment may be needed

### Drug/food
High-fat meal: decreased absorption

### Drug/lab test
Increased: AST/ALT, alk phos, LDH
Interference: urine glucose tests (Clinitest, Benedict's reagent, cupric $SO_4$)

## NURSING CONSIDERATIONS
### Assessment
- Assess patient for previous sensitivity reaction to penicillins or other cephalosporins; cross-sensitivity between penicillins and cephalosporins is common
- Assess patient for signs and symptoms of **infection**, including characteristics of wounds, sputum, urine, stool, WBC >10,000/$mm^3$, earache, fever; obtain baseline information and during treatment
- Complete C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for anaphylaxis:** rash, urticaria, pruritus, chills, dyspnea, laryngeal edema, fever, joint pain; angioedema may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity)
- Monitor renal studies: urinalysis, protein, blood, BUN, creatinine
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test baseline and monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- Assess bowel pattern daily; diarrhea, cramping, blood in stools, report to prescriber; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- Assess for **overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- Pregnancy/baseline: Use only if clearly needed, cautious use in breastfeeding, excreted in breast milk

### Patient/family education
- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools occur; may indicate superinfection
- Instruct patient to take all medication prescribed for the length of time prescribed
- Advise patient to notify prescriber of diarrhea with blood or pus, which may indicate pseudomembranous colitis

### Evaluation
**Positive therapeutic outcome**
- Absence of signs/symptoms of infection (WBC <10,000/$mm^3$, temp WNL)
- Reported improvement in symptoms of infection

## TREATMENT OF ANAPHYLAXIS:
Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, $O_2$, **IV** corticosteroids

**⚠ HIGH ALERT**

## amphotericin B lipid complex (ABLC)
(am-foe-ter'i-sin)
**Abelcet**
*Func. class.:* Antifungal
*Chem. class.:* Amphoteric polyene

**Do not confuse:** Abelcet/amphotericin B

**ACTION:** Increases cell membrane permeability in susceptible fungi by binding sterols; alters cell membrane, thereby causing leakage of cell components, cell death

**Therapeutic outcome:** Decreased fever, malaise, rash; negative C&S for infecting organism

**USES:** Indicated for the treatment of invasive fungal infections in patients who cannot tolerate or have failed conventional amphotericin B therapy; broad-spectrum activity against many fungal, yeast and mold pathogen infections, including *Aspergillus, Zygomycetes, Fusarium, Cryptococcus,* and many hard-to-treat *Candida* species; *Aspergillus fumigatus, Aspergillus, Blastomyces dermatitidis, Candida albicans, Candida guilliermondii, Candida stellatoidea, Candida tropicalis, Coccidioides immitis, Cryptococcus, Histoplasma, sporotrichosis*

**Precautions:** Hypersensitivity, anemia, breastfeeding, cardiac disease, children, electrolyte imbalance, geriatric, hematological/hepatic/renal disease, hypotension, pregnancy

## DOSAGE AND ROUTES
**Adult: IV** 3-5 mg/kg/day as a single inf given at 2.5 mg/kg/hr

### Renal dose
**Adult:** IV CCr <10 ml/min; give 5 mg/kg q24-36hr

**Available forms:** Susp for inj 100 mg/20-ml vial

## Implementation

- Do not confuse four different types; these are not interchangeable: conventional amphotericin B, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome
- May premedicate with acetaminophen, diphenhydrAMINE
- Use only after C&S confirms organism

### IV route

- Give product only after C&S confirms organism, product needed to treat condition; make sure product is used for life-threatening infections
- Handle with aseptic technique because amphotericin B lipid complex (ABLC) has no preservatives; visually inspect parenteral products for particulate matter and discoloration before use

**Filtration and dilution**

- Prior to dilution, store at 36°-46° F (2°-8° C), protected from moisture and light; do not freeze; the diluted, ready-for-use admixture is stable for up to 48 hours at 36°-46° F (2°-8° C) and an additional 6 hr at room temperature; do not freeze
- Prepare the admixture for infusion by first shaking the vial until there is no evidence of yellow sediment on the bottom of the vial
- Transfer the appropriate amount of drug from the required number of vials into one or more sterile syringes using an 18-gauge needle
- Attach the provided 5-micron filter needle to the syringe; inject the syringe contents through the filter needle, into an IV bag containing the appropriate amount of $D_5W$ injection; each filter needle may be used on the contents of no more than four 100-mg vials
- The suspension must be diluted with $D_5W$ injection to a final concentration of 1 mg/ml; for pediatric patients and patients with cardiovascular disease, the final concentration may be 2 mg/ml; DO NOT USE SALINE SOLUTIONS OR MIX WITH OTHER DRUGS OR ELECTROLYTES
- The diluted ready-for-use admixture is stable for up to 48 hr at 36°-46° F (2°-8° C) and an additional 6 hr at room temperature; do not freeze

**IV INF**

- Flush IV line with $D_5W$ injection before use or use a separate IV line; DO NOT USE AN IN-LINE FILTER
- Before infusion, shake the bag until the contents are thoroughly mixed; max rate 2.5 mg/kg/hr; if the infusion time exceeds 2 hr, mix the contents by shaking the infusion bag every 2 hr

**Y-site compatibilities:** Acyclovir, allopurinol, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bumetanide, buprenorphine, busulfan, butorphanol, CARBOplatin, carmustine, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin dexamethasone, digoxin, diphenhydrAMINE, DOCEtaxel, doxacurium, DOXOrubicin liposomal, enalaprilat, EPINEPHrine, eptifibatide, ertapenem, etoposide, famotidine, fentaNYL, fludarabine, fluorouracil, fosphenytoin, furosemide, ganciclovir, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, insulin, regular ketorolac, lepirudin, lidocaine, linezolid, LORazepam, mannitol, melphalan, meperidine, methotrexate, methylPREDNISolone, metoclopramide, mitoMYcin, mivacurium, nafcillin, nesiritide, nitroglycerin, nitroprusside, octreotide, oxaliplatin, PACLitaxel, pamidronate, pantoprazole, PEMEtrexed, pentazocine, PENTobarbital, PHENobarbital, phentolamine, piperacillin-tazobactam, procainamide, ranitidine, succinylcholine, SUFentanil, tacrolimus, telavancin, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticaracillin-clavulanate, trimethobenzamide, verapamil, vinBLAStine, vinCRIStine, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** *Headache, fever, chills,* peripheral nerve pain, paresthesias, peripheral neuropathy, seizures, dizziness

**CV:** Bradycardia, hypotension, cardiac arrest, chest pain, hypertension

**EENT:** Tinnitus, deafness, diplopia, blurred vision

**GI:** *Nausea, vomiting, anorexia,* diarrhea, cramps, hemorrhagic gastroenteritis, acute liver failure, jaundice, bilirubinemia

**GU:** *Hypokalemia,* azotemia, hyposthenuria, renal tubular acidosis, nephrocalcinosis, permanent renal impairment, anuria, oliguria

**HEMA:** Normochromic, normocytic anemia, thrombocytopenia, agranulocytosis, leukopenia, eosinophilia

**INTEG:** *Burning, irritation,* pain, necrosis at inj site with extravasation, flushing, dermatitis

**META:** Hyponatremia, hypomagnesemia, hypokalemia

**MS:** Arthralgia, myalgia, generalized pain, weakness, weight loss

**RESP:** Bronchospasm, dyspnea

**SYST:** Toxic epidermal neurolysis, exfoliative dermatitis, anaphylaxis, sepsis, infection, infusion reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability (IV) |
| **Distribution** | Body tissues |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, detectable for several weeks |
| **Half-life** | Terminal lipid complex mean 7 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Immediate |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Cidofovir: do not use concurrently
Digoxin: increased hypokalemia
Pentamidine, tacrolimus, tenofovir: increased nephrotoxicity

### Drug classifications

Other nephrotoxic antibiotics (aminoglycosides, CISplatin, vancomycin, cycloSPORINE, polymyxin B), antineoplastics, salicylates): increased nephrotoxicity
Azole antifungals: decreased amphotericin B lipid complex effect; antifungals may still be used concurrently in serious resistant infections
Corticosteroids, skeletal muscle relaxants, thiazides, loop diuretics: increased hypokalemia, monitor electrolytes

### Drug/lab test

Increased: AST/ALT, alk phos, BUN, creatinine, LDH, bilirubin
Decreased: magnesium, potassium, Hgb, WBC, platelets

## NURSING CONSIDERATIONS

### Assessment

- VS every 15-30 min during first inf; note changes in pulse, B/P
- I&O ratio; watch for decreasing urinary output, change in specific gravity; discontinue product to prevent permanent damage to renal tubules
- Blood studies: CBC, potassium, sodium, calcium, magnesium every 2 wk; BUN, creatinine 2-3 ×/wk
- Weight weekly; if weight increases by more than 2 lb/wk, edema is present; renal damage should be considered
- **For renal toxicity:** increasing BUN, serum creatinine; if BUN is >40 mg/dl or if serum creatinine is >3 mg/dl, product may be discontinued, dosage reduced
- **For hepatotoxicity:** increasing AST, ALT, alk phos, bilirubin
- **For allergic reaction:** dermatitis, rash; product should be discontinued, antihistamines (mild reaction) or EPINEPHrine (severe reaction) should be administered
- For hypokalemia: anorexia, drowsiness, weakness, decreased reflexes, dizziness, increased urinary output, increased thirst, paresthesias
- Infusion reactions: fever, chills, pain, swelling at site
- For ototoxicity: tinnitus (ringing, roaring in ears), vertigo, loss of hearing (rare)
- Pregnancy/breastfeeding: Use only when clearly needed

### Patient/family education

- Teach patient that long-term therapy may be needed to clear infection (2 wk-3 mo, depending on type of infection)
- Instruct patient to notify prescriber of bleeding, bruising, or soft-tissue swelling, neurologic, renal symptoms
- Pregnancy/breastfeeding: Advise patient to notify provider if pregnancy is planned or suspected, not to breastfeed

### Evaluation

**Positive therapeutic outcome**

- Decreased fever, malaise, rash; negative C&S for infecting organism

**⚠ HIGH ALERT**

## amphotericin B liposomal (LAmB)

(am-foe-ter'i-sin)
**AmBisome**
*Func. class.:* Antifungal
*Chem. class.:* Amphoteric polyene

**Do not confuse:** AmBisome/amphotericin B

**ACTION:** Increases cell membrane permeability in susceptible fungi by binding to membrane sterols; alters cell membrane, thereby causing leakage of cell components, cell death

**Therapeutic outcome:** Resolution of infection

**USES:** Empirical therapy for presumed fungal infection in febrile neutropenic patients; treatment of *Cryptococcal* Meningitis in HIV-infected patients; treatment of *Aspergillus, Candida,* and/or *Cryptococcus* infections refractory to amphotericin B deoxycholate, or in patients where renal impairment or unacceptable toxicity precludes the use of amphotericin B deoxycholate *(Aspergillus flavus, Aspergillus fumigatus, Blastomyces dermatitidis, Candida albicans, Candida krusei,*

*Candida lusitaniae, Candida parapsilosis, Candida tropicalis, Cryptococcus neoformans)*; treatment of visceral leishmaniasis

**Unlabeled uses:** Coccidioidomycosis, histoplasmosis

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Anemia, breastfeeding, cardiac disease, children, electrolyte imbalance, geriatric, hematological/hepatic/renal disease, hypotension, pregnancy, severe bone marrow depression

## DOSAGE AND ROUTES

### Systemic fungal infections caused by *Aspergillus* sp., *Candida* sp., *Cryptococcus sp.* refractory to or intolerant of amphotericin B deoxycholate treatment

**Adults and children:** IV 3 to 5 mg/kg/dose q24hr, treatment time depends on condition

### For the treatment of esophageal candidiasis (unlabeled) in HIV-infected patients

**Adults/adolescents:** IV 3 to 4 mg/kg/dose q24hr for 14 to 21 days

### For the treatment of cryptococcal meningitis in HIV-infected patients

**Adults/adolescents/children/infants:** IV 6 mg/kg/dose q24hr

### For the treatment of severe disseminated (nonmeningeal) or diffuse pulmonary coccidioidomycosis (unlabeled) in HIV-infected patients

**Adults:** IV 3 to 5 mg/kg/dose q24hr

### Renal dose

**Adult:** IV CCr <10 ml/min; use 3 mg/kg q24hr

**Available forms:** Powder for inj 50-mg vial

### Implementation

- Do not confuse four different types; these are not interchangeable: conventional amphotericin B, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome
- May premedicate with acetaminophen, diphenhydrAMINE

**IV route**

- Make sure product is used for life-threatening infections
- Administer by IV infusion only; handle with aseptic technique as LAmB does not contain any preservatives
- Visually inspect products for particulate matter and discoloration

**Reconstitution**

- LAmB *must* be reconstituted using sterile water for injection (without a bacteriostatic agent); do not reconstitute with saline or add saline to the reconstituted suspension, do not mix with other drugs; doing so can cause a precipitate to form
- Reconstitute vials containing 50 mg of LAmB/12 ml of sterile water (4 mg/ml)
- Immediately after the addition of water, SHAKE THE VIAL VIGOROUSLY for 30 sec; the suspension should be yellow and translucent; visually inspect vial for particulate matter and continue shaking until product is completely dispersed
- Store suspension for up to 24 hours refrigerated if using sterile water for injection; do not freeze

**Filtration and dilution**

- Calculate the amount of reconstituted (4 mg/ml) suspension to be further diluted and withdraw this amount into a sterile syringe
- Attach the provided 5-micron filter to the syringe; inject the syringe contents through the filter, into the appropriate amount of $D_5W$ injection; use only one filter per vial
- The suspension must be diluted with $D_5W$ injection to a final concentration of 1-2 mg/ml before administration; for infants and small children, lower concentrations (0.2-0.5 mg/ml) may be appropriate to provide sufficient volume for infusion
- Use injection of LAmB within 6 hr of dilution with $D_5W$

**IV INF**

- Flush intravenous line with $D_5W$ injection before infusion; if this cannot be done, then a separate IV line must be used
- An inline membrane filter may be used provided the mean pore diameter of the filter is not less than 1 micron
- Administer by IV infusion using a controlled infusion device over a period of approximately 120 min; infusion time may be reduced to approximately 60 min in patients who tolerate the infusion; if discomfort occurs during infusion, the duration of infusion may be increased

**Acetaminophen and diphenhydrAMINE**

- 30 min before inf to reduce fever, chills, headache
- Store protected from moisture and light; diluted solution is stable for 24 hr at room temp

**Y-site compatibilities:** Acyclovir, amifostine, aminophylline, anidulafungin, atropine, azithromycin, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, CARBOplatin, carmustine, ceFAZolin, ceFOXitin, ceftizoxime, ceftRIAXone,

cefuroxime, cimetidine, clindamycin, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, diphenhydrAMINE, doxacurium, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fludarabine, fluorouracil, fosphenytoin, furosemide, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, ifosfamide, isoproterenol, ketorolac, levorphanol, lidocaine, linezolid, mesna, methotrexate, methylPREDNISolone, metoprolol, milrinone, mitoMYcin, nesiritide, nitroglycerin, nitroprusside, octreotide, oxaliplatin, oxytocin, palonosetron, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENobarbital, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, ranitidine, SUFentanil, tacrolimus, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, trimethoprim-sulfamethoxazole, vasopressin, vinCRIStine, voriconazole, zidovudine

## ADVERSE EFFECTS

**CNS:** *Headache, fever, chills,* peripheral nerve pain, paresthesias, peripheral neuropathy, seizures, dizziness, insomnia

**CV:** Bradycardia, hypotension, cardiac arrest

**EENT:** Tinnitus, deafness, diplopia, blurred vision

**ENDO:** Hyperglycemia

**GI:** *Nausea, vomiting, anorexia,* diarrhea, cramps, hemorrhagic gastroenteritis, acute liver failure

**GU:** *Hypokalemia,* azotemia, hyposthenuria, renal tubular acidosis, nephrocalcinosis, permanent renal impairment, anuria, oliguria

**HEMA:** Normochromic normocytic anemia, thrombocytopenia, agranulocytosis, leukopenia, eosinophilia, hyponatremia, hypomagnesemia

**INTEG:** *Burning, irritation,* pain, necrosis at inj site with extravasation, flushing, dermatitis, skin rash (topical route)

**MS:** Arthralgia, myalgia, generalized pain, weakness, weight loss

**RESP:** Dyspnea

**SYST:** Stevens–Johnson syndrome, toxic epidermal neurolysis, exfoliative dermatitis, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability (IV) |
| **Distribution** | Body tissues |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, detectable for several weeks |
| **Half-life** | Liposomal mean 4-6 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Immediate |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Digoxin: increased hypokalemia

### Drug classifications

Other nephrotoxic antibiotics (aminoglycosides, CISplatin, vancomycin, cycloSPORINE, polymyxin B): increased nephrotoxicity

Corticosteroids, skeletal muscle relaxants, thiazides: increased hypokalemia

## NURSING CONSIDERATIONS

### Assessment

- VS every 15-30 min during first inf; note changes in pulse, B/P
- I&O ratio; watch for decreasing urinary output, change in specific gravity; discontinue product to prevent permanent damage to renal tubules
- Blood studies: CBC, potassium, sodium, calcium, magnesium every 2 wk, BUN, creatinine 2-3 ×/wk
- Weight weekly; if weight increases by more than 2 lb/wk, edema is present; renal damage should be considered
- **For renal toxicity:** increasing BUN, serum creatinine; if BUN is >40 mg/dl or if serum creatinine is >3 mg/dl, product may be discontinued, dosage reduced
- **For hepatotoxicity:** increasing AST, ALT, alk phos, bilirubin, monitor LFTs
- **For allergic reaction:** dermatitis, rash; product should be discontinued, antihistamines (mild reaction) or EPINEPHrine (severe reaction) administered
- **For hypokalemia:** anorexia, drowsiness, weakness, decreased reflexes, dizziness, increased urinary output, increased thirst, paresthesias
- **For ototoxicity:** tinnitus (ringing, roaring in ears), vertigo, loss of hearing (rare)
- **Infusion reaction:** chills, fever, pain, swelling at site
- **Pregnancy/breastfeeding:** Use only if clearly needed, do not breastfeed, excretion unknown

### Patient/family education

- Teach patient that long-term therapy may be needed to clear infection (2 wk-3 mo, depending on type of infection)
- Instruct patient to notify prescriber of bleeding, bruising, or soft-tissue swelling, renal, neurological side effects

## Evaluation

**Positive therapeutic outcome**

• Decreased fever, malaise, rash; negative C&S for infecting organism

## ampicillin (Rx)

(am-pi-sill′in)

**Ampicin, Apo-Ampi, Nu-Ampi, Penbritin**

*Func. class.:* Broad-spectrum antiinfective

*Chem. class.:* Aminopenicillin

**ACTION:** Interferes with cell wall replication of susceptible organisms; the cell wall, rendered osmotically unstable, swells and bursts from osmotic pressure, lysis mediated by cell wall autolysis

**Therapeutic outcome:** Bactericidal effects for the following organisms: effective for gram-positive cocci *(Streptococcus aureus, Streptococcus pyogenes, Streptococcus faecalis, Streptococcus pneumoniae)*, gram-negative cocci *(Neisseria meningitidis)*, gram-negative bacilli *(Haemophilus influenzae, Proteus mirabilis, Salmonella, Shigella, Listeria monocytogenes)*, gram-positive bacilli

**USES:** Infections of respiratory tract, skin, skin structures, GI/GU tract; otitis media, meningitis, septicemia, sinusitis, and endocarditis prophylaxis, bacterial endocarditis

## CONTRAINDICATIONS

Hypersensitivity to penicillins, antimicrobial resistance, skin infection

**Precautions:** Pregnancy, breastfeeding, neonates, hypersensitivity to cephalosporins, renal disease, mononucleosis

## DOSAGE AND ROUTES

### Renal dose

**Adult and child:** CCr 10-50 ml/min extend to q6-12hr; CCr <10 ml/min dose q12-16hr

### Systemic infections

**Adult and child ≥40 kg (88 lb):** PO 250-500 mg q6hr; **IV**/IM 2-8 g daily in divided doses q4-6hr

**Child <40 kg:** PO 50-100 mg/kg/day in divided doses q6-8hr; **IV**/IM 50-500 mg/kg/day in divided doses q6-8hr

### Bacterial meningitis

**Adult/adolescent:** IM/**IV** 150-200 mg/kg/day in divided doses, q3-4hr; IDSA IV 12 g divided q4hr

**Infant/child:** IM/**IV** 150-200 mg/kg/day in divided doses q3-4hr; IDSA dose IV 300 mg/kg/day divided q6hr

**Neonate >7 days and >2000 g:** IM/**IV** 200 mg/kg/day divided q6hr; IDSA dose IV 200 mg/kg/day divided q6-8hr

### Prevention of bacterial endocarditis

**Adult:** IM/**IV** 2 g 30 min before procedure

**Child:** IM/**IV** 50 mg/kg 30 min before procedure, max 2 g

### GI/GU infections other than caused by *N. gonorrhoeae*

**Adult and child >40 kg:** PO 250-500 mg q6hr, may use larger dose for more serious infections

**Child <40 kg:** PO 50 mg/kg/day in divided doses q6-8hr

**Available forms:** Powder for inj 125, 250, 500 mg, 1, 2, 10 g; **IV** inf 500 mg, 1, 2 g; caps 250, 500 mg; powder for oral susp, 125, 250, 500 mg/5 mg

## Implementation

**PO route**

• Give in even doses around the clock; product must be taken for 10-14 days to ensure organism death and prevent superinfection; store caps in tight container; store after reconstituting in refrigerator up to 2 wk, 1 wk room temperature

• Tabs may be crushed or caps opened and mixed with water

• Shake susp well before each dose; store for 2 wk in refrigerator or 1 wk at room temperature

**IM route (painful)**

• **Reconstitute** with 125 mg/0.9-1.2 ml; 250 mg/0.9-1.9 ml; 500 mg/1.2-1.8 ml; 1 g/2.4-7.4 ml; 2 g/6.8 ml

• **Give** deep in large muscle mass

**IV route**

• **Reconstitute** with 125 mg/0.9-1.2 ml; 250 mg/0.9-1.9 ml; 500 mg/1.2-1.8 ml; 1 g/2.4-7.4 ml; 2 g/6.8 ml

**Direct IV route**

• **Give** over 3-5 min in lower dosages (125-500 mg) or over 15 min in higher dosages (1-2 g)

**Intermittent IV infusion route**

• **Give** after diluting with 0.9% NaCl, LR, $D_5W$, $D_5$/0.45% NaCl; use 50 ml of sol and dilute to concentration of <30 mg/ml

**Y-site compatibilities:** Acyclovir, alemtuzumab, amifostine, allopurinol, argatroban, azithromycin, aztreonam, carmustine, cyclophosphamide, cytarabine, DAUNOrubicin, dexrazoxane, doxapram, DOXOrubicin liposome, enalaprilat, esmolol, etoposide phosphate, famotidine, filgrastim, fludarabine, foscarnet, gallium, gemtuzumab, granisetron, heparin, regular insulin, labetalol, lepirudin, leucovorin, liposome, magnesium sulfate, mannitol, melphalan, meperidine, milrinone, morphine, multivitamins, ofloxacin,

penicillin G potassium, perphenazine, phytonadione, potassium acetate, potassium chloride, propofol, remifentanil, thiotepa, tolazoline, vecuronium, vinBLAStine, vit B with C, zoledronic acid

**Y-site incompatibilities:** Calcium gluconate, EPINEPHrine, fluconazole, hetastarch, HYDROmorphone, hydrALAZINE, ondansetron, sargramostim, verapamil, vinorelbine

## ADVERSE EFFECTS

**GI:** *Nausea, vomiting, diarrhea,* pseudomembranous colitis, stomatitis, black hairy tongue
**GU:** Oliguria, proteinuria, hematuria, *vaginitis, moniliasis,* glomerulonephritis
**HEMA:** Anemia, increased bleeding time, bone marrow depression, granulocytopenia, leukopenia, eosinophilia, hemolysis
**INTEG:** *Rash,* urticaria, toxic epidermal necrolysis, erythema, multiforme
**SYST:** Anaphylaxis, serum sickness, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Moderate, in duodenum (35%-50%) |
| **Distribution** | Readily in body tissues, fluids, CSF; crosses placenta |
| **Excretion** | Breast milk; kidney unchanged (70%), removed by dialysis |
| **Half-life** | 50-110 min |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | Rapid | Rapid | Rapid |
| **Peak** | 2 hr | 1 hr | Rapid |
| **Duration** | Unknown | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Allopurinol: increased ampicillin-induced skin rash, monitor for rash
Probenecid: increased ampicillin levels, decreased renal excretion

### Drug classifications

Contraceptives (oral): may decrease contraceptive effectiveness; use reliable contraception, use alternative contraception
H2 antagonists, proton pump inhibitors: decreased ampicillin level
Oral anticoagulants: increased bleeding, monitor INR/PTT

### Drug/lab test

Increased: eosinophil
Decreased: conjugated estrogens in pregnancy, conjugated estriol, Hgb, WBC, platelets
False positive: urine glucose
Interfere: urine glucose (Clinitest, Benedict's reagent, cupric $SO_4$)

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction to penicillins or other cephalosporins; cross-sensitivity between penicillins and cephalosporins is common
- Assess patient for signs and symptoms of **infection**, including characteristics of wounds, sputum, urine, stool, WBC $>10{,}000/mm^3$, earache, fever; obtain baseline information and during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for allergic reactions:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be on unit for anaphylactic reaction; also, check for ampicillin rash: pruritic, red, raised; identify allergies before using
- Identify urine output, hematuria; if decreasing, notify prescriber (may indicate nephrotoxicity)
- Monitor renal studies: urinalysis, protein, blood, BUN, creatinine
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis
- Assess for **overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- Pregnancy/breastfeeding: Use only if clearly needed, cautious use in breastfeeding, excreted in breast milk

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection
- Instruct patient to take all medication prescribed for the length of time ordered
- Advise patient to notify prescriber of diarrhea with blood or pus, which may indicate pseudomembranous colitis

• Tab may be crushed; cap may be opened and mixed with water; to use alternative contraception

### Evaluation

**Positive therapeutic outcome**

• Absence of signs/symptoms of infection (WBC <10,000, temp WNL)
• Reported improvement in symptoms of infection

## TREATMENT OF ANAPHYLAXIS:

Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, $O_2$, **IV** corticosteroids

## ampicillin/sulbactam (Rx)

(am-pi-sill'in/sul-bak'tam)

**Unasyn**

*Func. class.:* Broad-spectrum antiinfective
*Chem. class.:* Aminopenicillin

**ACTION:** Interferes with cell wall replication of susceptible organisms; the cell wall, rendered osmotically unstable, swells and bursts from osmotic pressure; lysis due to cell wall autolytic enzymes; this combination extends the spectrum of activity and inhibits β-lactamase that may inactivate ampicillin

**Therapeutic outcome:** Bactericidal against *Staphylococcus aureus, Klebsiella, Bacteroides fragilis, Enterobacter, Acinetobacter calcoaceticus, Pneumococcus, Enterococcus, Streptococcus, Escherichia coli, Proteus mirabilis, Neisseria meningitidis, Neisseria gonorrhoeae, Shigella, Salmonella,* and *Haemophilus influenzae* organisms; use only with β-lactamase–producing strain of infection

**USES:** Skin infections, intraabdominal infections, gynecological infections, asthma, cellulitis, diabetes mellitus, diabetic foot ulcer, dialysis, diarrhea, eczema, IBS, leukemia, meningitis, nosocomial pneumonia, ulcerative colitis; *Actinobacter, Actinomyces, Bacillus anthracis, Bacteroides, Bifidobacterium, Bordetella pertussis, Borrelia burgdorferi, Brucella, Clostridium, Corynebacterium diptheriae/xerosis, Eikenella corrodens, Enterococcus faecalis, Erysipelothrix rhusiopathiae, Escherichia coli, Eubacterium, Fusobacterium, Gardnerella vaginalis, Haemophilus influenzae* (beta-lactamase negative/positive), *Helicobacter pylori, Klebsiella, Lactobacillus, Leptospira, Listeria monocytogenes, Moraxella catarrhalis, Morganella morganii, Neisseria gonorrhoeae, Pasteurella multocida, Peptococcus, Peptostreptococcus, Porphyromonas, Prevotella, Propionibacterium, Proteus mirabilis, Proteus vulgaris, Providencia rettgeri, Providencia stuartii, Salmonella, Shigella, Staphylococcus aureus* (MSSA)/*epidermidis/saprophyticus, Streptococcus agalactiae/dysgalactiae/pneumoniae/pyrogenes, Treponema pallidum,* viridans streptococci

**Unlabeled uses:** Hospital/community-acquired pneumonia, infective endocarditis, pelvic inflammatory disease

## CONTRAINDICATIONS

Hypersensitivity to ampicillin, or sulbactam

**Precautions:** Pregnancy, breastfeeding, neonates, hypersensitivity to cephalosporins, renal disease, mononucleosis, viral infections, syphilis

## DOSAGE AND ROUTES

**Adult and child >40 kg:** IM/**IV** 1 g ampicillin and 0.5 g sulbactam to 2 g ampicillin, and 1 g sulbactam q6hr, not to exceed 4 g/day sulbactam
**Child <40 kg:** **IV** 100-200 mg/kg/day (ampicillin component) divided q6hr, max 4 g/day

### Renal dose

**Adult ≥40 kg:** IM/IV CCr 15-29 ml/min dose q12hr; CCr 5-14 ml/min dose q24hr

### Community-acquired pneumonia (unlabeled)

**Adult:** IV 3 g q12hr in combination X ≥ 5 days

### Endocarditis (unlabeled)

**Adult:** IV 12 g divided q8hr
**Child:** IV 300 mg/kg per day divided q8hr

### Pelvic inflammatory disease (unlabeled)

**Adult/adolescent:** IV 3 g q6hr in combination

**Available forms:** Powder for inj 1.5 g (1 g ampicillin, 0.5 g sulbactam), 3 g (2 g ampicillin, 1 g sulbactam), 15 g (10 g ampicillin, 5 g sulbactam)

### Implementation

• Scratch test to assess allergy after securing order from prescriber; usually done when penicillin is only product choice

**IM route**

• Reconstitute by adding 3.2 ml/1.5 g or 6.4 ml/3 g; use sterile water, 0.5% or 2% lidocaine; give within 1 hr of preparation; give deep in large muscle mass, aspirate
• Do not use IM in child
• Give after C&S completed; on empty stomach

**IV direct route**

• Give **IV** after diluting 1.5 g/3.2 ml sterile water for inj; or 3 g/6.4 ml (250 mg ampicillin/125 mg sulbactam); allow to stand until foaming stops; give directly over 10-15 min, inject slowly

**Intermittent IV infusion route**
- Dilute further in 50 ml or more of $D_5W$, $D_5$/10.45% NaCl, 10% invert sugar in water, LR, 6% sodium lactate, isotonic NaCl; administer within 1 hr after reconstitution; give as an intermittent inf over 15-30 min

**Y-site compatibilities:** Alemtuzumab, amifostine, aminocaproic acid, anidulafungin, argatroban, atenolol, bivalirudin, bleomycin, CARBOplatin, carmustine, cefepime, CISplatin, codeine, cyclophosphamide, cytarabine, DAPTOmycin, DAUNOrubicin liposome, dexmedetomidine, DOCEtaxel, doxacurium, DOXOrubicin liposomal, eptifibatide, etoposide, fenoldopam, filgrastim, fludarabine, fluorouracil, foscarnet, gallium, gatifloxacin, gemcitabine, granisetron, irinotecan, levofloxacin, linezolid, methotrexate, metroNIDAZOLE, octreotide, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, remifentanil, riTUXimab, rocuronium, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, TNA, TPN, trastuzumab, vecuronium, vinCRIStine, voriconazole, zoledronic acid

**Y-site incompatibilities:** IDArubicin, ondansetron, sargramostim

## ADVERSE EFFECTS

**CNS:** Lethargy, hallucinations, anxiety, depression, twitching, coma, seizures

**GI:** *Nausea, vomiting, diarrhea,* increased AST, ALT, abdominal pain, glossitis, colitis, pseudomembranous colitis, hepatic necrosis/failure, black hairy tongue

**GU:** Oliguria, proteinuria, hematuria, *vaginitis, moniliasis,* glomerulonephritis, dysuria

**HEMA:** Anemia, increased bleeding time, bone marrow depression, granulocytopenia, leukopenia, eosinophilia, hemolysis

**INTEG:** Injection site reactions, rash, edema, urticaria

**SYST:** Anaphylaxis, serum sickness, toxic epidermal necrolysis, Stevens-Johnson syndrome, hypoalbuminemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM) |
| **Distribution** | Readily in body tissues, fluids, CSF; crosses placenta |
| **Metabolism** | Liver (10%-50%) |
| **Excretion** | Breast milk; kidney unchanged (75%) |
| **Half-life** | 50-110 min (ampicillin) |

### Pharmacodynamics

| | IM | IV |
|---|---|---|
| **Onset** | Rapid | Immediate |
| **Peak** | 1 hr | Infusion's end |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Allopurinol: ampicillin-induced skin rash, check for rash
Methotrexate: increased methotrexate level
Probenecid: increased ampicillin levels, decreased renal excretion

### Drug classifications

Oral anticoagulants: increased bleeding risk, check INR, PT

### Drug/lab test

False positive: urine glucose, urine protein

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction to penicillins or cephalosporins; cross-sensitivity between penicillins and cephalosporins is common
- Assess patient for signs and symptoms of **infection,** including characteristics of wounds, sputum, urine, stool, WBC >10,000/$mm^3$, earache, fever; obtain baseline information and during treatment; complete C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for allergic reactions:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be on unit for anaphylactic reaction
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity)
- Assess renal studies: urinalysis, protein, BUN, creatinine
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- Assess for superinfection: perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

• Pregnancy/breastfeeding: Use only if clearly needed, cautious use in breastfeeding, excreted in breast milk

### Patient/family education

• Teach patient to report sore throat, bruising, bleeding, joint pain, persistent diarrhea; may indicate blood dyscrasias (rare) or superinfection
• Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate pseudomembranous colitis
• Instruct patient to use another form of contraception other than oral contraceptives
• **Instruct patient to report immediately pseudomembranous colitis:** fever, diarrhea with pus, blood, or mucus; may occur up to 4 wk after treatment
• Instruct patient to wear or carry emergency ID if allergic to penicillin products

### Evaluation

**Positive therapeutic outcome**

• Absence of signs/symptoms of infection (WBC $<10{,}000/mm^3$, temp WNL, absence of red draining wounds, earache)
• Reported improvement in symptoms of infection

## TREATMENT OF OVERDOSE:

Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, $O_2$, **IV** corticosteroids for anaphylaxis

## anakinra (Rx)

(an-ah-kin'rah)
**Kineret**
*Func. class.:* Antirheumatic agent (disease modifying), immunomodulator
*Chem. class.:* Recombinant form of human interleukin-1 receptor antagonist (IL-1Ra)

**Do not confuse:** anakinra/amikacin
Kineret/Amikin

## ACTION:

A form of human interleukin-1 receptor antagonist (IL-1Ra) produced by DNA technology; blocks activity of IL-1, resulting in decreased inflammation, cartilage degradation, bone resorption

**Therapeutic outcome:** Decreased pain, inflammation

## USES:

Reduction in signs and symptoms of moderate to severe active rheumatoid arthritis in patients 18 years of age or older who have not responded to other disease-modifying agents, neonatal-onset multisystem inflammatory disease

## CONTRAINDICATIONS

Hypersensitivity to *Escherichia coli*–derived proteins or this product, sepsis, latex

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal impairment, active infections, immunosuppression, neoplastic disease, asthma

## DOSAGE AND ROUTES

### Rheumatoid arthritis

**Adult:** SUBCUT 100 mg daily at same time of the day

### Renal dose

**Adult:** CCr <30 ml/min; SUBCUT 100 mg every other day

### Neonatal-onset multisystem inflammatory disease

**Adult/child:** SUBCUT 1-2 mg/kg/day; may increase by 0.5-1 mg to max 8 mg/kg/day (adult) or 7.6 mg/kg/day (child)

**Available forms:** Inj, 100 mg/0.67 ml prefilled glass syringe

### Implementation

• Do not use if cloudy or discolored or if particulate is present; protect from light
• Do not admix with other sol or medications, do not use filter
• Store in the refrigerator, do not freeze, do not shake, protect from light

## ADVERSE EFFECTS

**CNS:** Headache, fever
**CV:** Cardiac arrest
**EENT:** Sinusitis
**GI:** Abdominal pain, nausea, diarrhea
**HEMA:** Neutropenia
**INTEG:** Rash, *inj site reaction,* allergic reaction
**MISC:** Flulike symptoms, infection
**MS:** *Worsening of RA, arthralgia*
**RESP:** *URI*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (SUBCUT) |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Urine |
| **Half-life** | 4-6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3-7 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Rilonacept: do not use

TNF blocking agents: Increased severe infection risk, do not use together

### Drug/lab
Increase: eosinophils
Decrease: platelets, WBCs

### Drug classifications
Antibody reactions: decreased
Vaccines: Avoid concurrent use; immunizations should be brought up to date before treatment

## NURSING CONSIDERATIONS
### Assessment
- **Rheumatoid arthritis:** assess pain, stiffness, ROM, swelling of joints during treatment
- Assess for inj site pain, swelling; usually occur after 2 inj (4-5 days)
- Assess for **infections**, stop treatment if present, do not start if patient has active infection
- Pregnancy/breastfeeding: Identify if pregnancy is planned or suspected, or if breastfeeding, use only if clearly needed

### Patient/family education
- Teach patient about self-administration if appropriate: inj should be made in thigh, abdomen, upper arm; rotate sites at least 1 in from old site, store in refrigerator, do not freeze, do not shake
- Advise patient to notify prescriber if pregnancy is planned or suspected, avoid breastfeeding
- Advise patient not to receive vaccines while taking this product, update vaccines before treatment

### Evaluation
**Positive therapeutic outcome**
- Decreased inflammation, pain in joints

**⚠ HIGH ALERT**

# anastrozole (Rx)
(an-ass-stroh′zole)
**Arimidex**
*Func. class.:* Antineoplastic
*Chem. class.:* Aromatase inhibitor

**ACTION:** Highly selective nonsteroidal aromatase inhibitor that lowers serum estradiol concentrations; many breast cancers have strong estrogen receptors

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Advanced breast carcinoma in estrogen-receptor-positive patients (usually postmenopausal); patients with advanced disease on tamoxifen, adjunct therapy, endometriosis

## CONTRAINDICATIONS
Pregnancy, hypersensitivity, breastfeeding

**Precautions:** Children, geriatric, cardiac/hepatic disease, premenopausal females, osteoporosis

## DOSAGE AND ROUTES
**Adult:** PO 1 mg daily; continue for 5 yr in ERT early breast cancer who have already received 2-3 yr of tamoxifen and are switched to anastrozole, max 5 yr; may also combine with tamoxifen for up to 10 yr

**Available forms:** Tabs 1 mg

### Implementation
- Do not break, crush, or chew enteric products
- Give with food or fluids for GI upset; repeat dose may be needed if vomiting occurs
- Store in light-resistant container at room temperature

## ADVERSE EFFECTS
**CNS:** Hot flashes, headache, light-headedness, depression, dizziness, confusion, insomnia, anxiety, fatigue, mood changes
**CV:** Chest pain, hypertension, thrombophlebitis, edema, MI, CVA, cerebral infarction, angina, *vasodilation*, PE, DVT
**GI:** Nausea, vomiting, altered taste leading to anorexia, diarrhea, constipation, abdominal pain, dry mouth, weight gain
**GU:** Vaginal bleeding, pruritus vulvae, vaginal dryness, pelvic pain, UTI
**HEMA:** Leukopenia, anemia
**INTEG:** *Rash,* Stevens-Johnson syndrome
**MISC:** Hypercholesterolemia
**MS:** Bone pain, myalgia, asthenia, bone loss, osteoporosis, arthralgia, fractures
**RESP:** Cough, sinusitis, dyspnea, pulmonary embolism

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Adequately absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Feces, urine |
| **Half-life** | 50 hr |

### Pharmacodynamics
| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4-7 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Drug/drug
- Do not use with oral contraceptives, estrogen, tamoxifen, androstenedione, DHEA

### Drug/lab test

Increased: GGT, AST, ALT, alkaline phosphatase, cholesterol, LDL

## NURSING CONSIDERATIONS

### Assessment

- Monitor bone mineral density, cholesterol, lipid panel periodically
- **Assess serious skin reactions:** Stevens-Johnson syndrome
- Not effective in hormone receptor-negative disease, use only in postmenopausal women
- That tumor flare—increase in size of tumor, increased bone pain—may occur and will subside rapidly; may take analgesics for pain
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding, do not use in pregnancy or breastfeeding

### Patient/family education

- Instruct patient to report any complaints, side effects to health care prescriber; if dose is missed, do not double next dose
- Advise patient that vaginal bleeding, pruritus, hot flashes, can occur and are reversible after discontinuing treatment
- Teach patient to take adequate calcium, vitamin D; risk of bone loss/fractures
- Inform patient that rash or lesions are temporary and may become large during beginning therapy
- **Tumor flare:** The increase in size of tumor, increased bone pain may occur and will subside rapidly, may take analgesics for the pain

### Evaluation

**Positive therapeutic outcome**

- Decreased spread of malignant cells in breast cancer

## anidulafungin (Rx)

(a-nid-yoo-luh-fun′jin)

**Eraxis**

*Func. class.:* Antifungal, systemic

*Chem. class.:* Echinocandin

**ACTION:** Inhibits fungal enzyme synthesis; causes direct damage to fungal cell wall

**Therapeutic outcome:** Decreased symptoms of candida infection, negative culture

**USES:** Esophageal candidiasis, *Aspergillosis, Candida albicans, Candida glabrata, Candida parapsilosis, Candida tropicalis*

## CONTRAINDICATIONS

Hypersensitivity to this product or other echinocandins

**Precautions:** Pregnancy, breastfeeding, children, severe hepatic disease

## DOSAGE AND ROUTES

### Candidemia and other candidal infections; serious systemic infections

**Adult: IV** loading dose 200 mg on day 1, then 100 mg/day until 14 days or more since last positive culture

### Esophageal candidiasis

**Adult: IV** loading dose 100 mg on day 1, then 50 mg/day for at least 14 days and for at least 7 days after symptoms are resolved

**Available forms:** Powder for injection, lyophilized 50, 100 mg

### Implementation

**IV route**

- Visually inspect prepared infusions for particulate matter and discoloration—do not use if present; give by IV infusion only, after dilution
- **Reconstitution:** Reconstitute each 50 mg or 100 mg vial/15 ml or 30 ml of sterile water for injection, respectively (3.33 mg/ml)
- **Storage:** Reconstituted solutions are stable for ≤24 hr at room temperature
- **Dilution:** Do not use any other diluents besides dextrose 5% in water ($D_5W$) or sodium chloride 0.9% (NS)
- ***Preparation of the 200-mg loading dose infusion:*** Withdraw the contents of either four 50-mg reconstituted vials OR two 100-mg reconstituted vials and add to an IV infusion bag or bottle containing 200 ml of $D_5W$ or NS to give a total infusion volume of 260 ml
- ***Preparation of the 100-mg daily infusion:*** Withdraw the contents of one 100-mg reconstituted vial OR two 50-mg reconstituted vials and add to an IV infusion bag or bottle containing 100 ml of $D_5W$ or NS to give a total infusion volume of 130 ml
- ***Preparation of a 50-mg daily infusion:*** Withdraw the contents of one 50-mg reconstituted vial and add to an IV infusion bag or bottle containing 50 ml of $D_5W$ or NS to give a total infusion volume of 65 ml

**Intermittent IV INF route**

- Do not mix or co-infuse with other medications
- Administer as a slow IV infusion at a rate of 1.4 ml/min or 84 ml/hr; minimum duration of infusion is 180 min for the 200-mg dose, 90 min for the 100-mg dose, and 45 min for the 50-mg dose

• Store reconstituted vials at 59°-86° F (15°-30° C) for up to 24 hr; do not freeze (dehydrated alcohol); store reconstituted vials at 36°-46° F (2°-7° C) (sterile water) for up to 24 hr; do not freeze

**IV compatibilities:** Acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone hydrochloride, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin sulbactam, argatroban, arsenic trioxide, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, ceftAZidime, ceftizoxime, ceftRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin, DAUNOrubicin liposome, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid injection, LORazepam, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, mitoXANtrone, mivacurium, morphine, moxifloxacin, mycophenolate mofetil, nafcillin, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate, streptozocin, succinylcholine, SUFentanil citrate, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tirofiban, tobramycin, topotecan, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

### Candidemia/other candida infections

**CNS:** Seizures, dizziness, *headache*
**CV:** Deep vein thrombosis, atrial fibrillation, right bundle branch block, hypotension, QT prolongation, sinus arrhythmia, thrombophlebitis superficial, ventricular extrasystoles (rare)
**GI:** *Nausea; anorexia; vomiting; diarrhea; increased AST, ALT*
**META:** Hypokalemia

### Esophageal candidiasis

**CNS:** *Headache*
**GI:** *Nausea, anorexia, vomiting, diarrhea,* hepatic necrosis
**HEMA:** Neutropenia, thrombocytopenia, leukopenia, coagulopathy
**INTEG:** *Rash,* urticaria, itching, flushing
**META:** Hypocalcemia, hyperglycemia, hyperkalemia, hypernatremia, hypomagnesemia (rare)
**MS:** *Back pain, rigors*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Steady state after loading dose, protein binding 84% |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Distribution 0.5-1 hr, terminal 40-50 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug/lab test

Increased: amylase, bilirubin, CPK, creatinine, ECG, lipase, PT, alk phos
Decreased: platelets, magnesium, potassium, transferase, urea

## NURSING CONSIDERATIONS

### Assessment

• Assess for **infection**, clearing of cultures during treatment; obtain culture at baseline and throughout; product may be started as soon as culture is taken, those with HIV pharyngeal candidiasis may need antifungals

• **Blood dyscrasias (rare):** monitor CBC (RBC, Hct, Hgb), differential, platelet count periodically; notify prescriber of results
• Monitor hepatic studies before and during treatment: bilirubin, AST, ALT, alk phosphatase; uric acid, as needed
• Assess for **bleeding:** hematuria, heme-positive stools, bruising or petechiae, mucosa or orifices; blood dyscrasias can occur
• Assess for GI symptoms: frequency of stools, cramping, if severe diarrhea occurs, electrolytes may need to be given

### Patient/family education

• Advise patient to notify prescriber if pregnancy is suspected or planned; use nonhormonal form of contraception while taking this product
• Instruct patient to avoid breastfeeding while taking this product
• Advise patient to inform prescriber of kidney or liver disease
• Advise patient to report bleeding
• Teach patient to report signs of infection: increased temp, sore throat, flulike symptoms
• Teach patient to notify prescriber of nausea, vomiting, diarrhea, jaundice, anorexia, clay-colored stools, dark urine; hepatotoxicity may occur

### Evaluation

**Positive therapeutic outcome**

• Decreased symptoms of candidal infection, negative culture

**RARELY USED**

## antihemophilic factor recombinant, single chain

(an-tee-hee-moe-fil'ik-fak'tor ree-kom'buh-nant)

**Afstyla**

*Func. class.:* Hemostatic-coagulation factor

**USES:** In adults and children with hemophilia A (congenital factor VIII deficiency) for on-demand treatment and control of bleeding episodes, prophylaxis to reduce the frequency of bleeding episodes, perioperative management of bleeding

## CONTRAINDICATIONS

Hypersensitivity to this product or hamster protein

## DOSAGE AND ROUTES

One unit per kilogram body weight will raise the factor VIII level by 2 IU/dl (2.1)

**Calculating required dose:** (2.1) Dose (IU) = Body weight (kg) × Desired factor VIII rise (IU/dl or % of normal) × 0.5 (IU/kg per IU/dl)

**Routine prophylaxis (2.1):**
**Adult/adolescent (12 yr):** IV 20-50 IU/kg 2-3 times qwk initially Child **(<12 yr): IV** 30-50 IU/kg 2-3 times qwk initially

## apraclonidine ophthalmic

*See Appendix B*

## apremilast

(a-pre'mi-last)

**Otezla**

*Func. class.:* Musculoskeletal agent: disease-modifying antirheumatic drug (DMARD)

**ACTION:** A phosphodiesterase-4 (PDE4) inhibitor specific for cyclic adenosine monophosphate (cAMP). Inhibition of PDE4 results in an increase in intracellular concentration of cAMP, with a partial inhibition of proinflammatory mediators and an increase in the production of some antiinflammatory mediators

**Therapeutic outcome:** Resolution of symptoms of psoriatic arthritis or plaque psoriasis

**USES:** Treatment of active psoriatic arthritis; severe plaque psoriasis (in those not a candidate for phototherapy)

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, depression/suicidal, renal disease (CCr <30 ml/min)

## DOSAGE AND ROUTES

### Treatment of active psoriatic arthritis/severe plaque psoriasis

**Adult: PO** To reduce the risk for gastrointestinal symptoms, titrate to a final dose of 30 mg bid; day 1: 10 mg PO AM; day 2: 10 mg AM and PM; day 3: 10 mg AM and 20 mg PM; day 4: 20 mg AM and PM; day 5: 20 mg AM and 30 mg PM; day 6 and thereafter: 30 mg bid

### Renal dose

**Adult:** PO CCr ≥30 ml/min: no change; CCr <30 ml/min: 30 mg every day. Initially, 10 mg **AM** days 1-3; 20 mg **AM** days 4 and 5; 30 mg every day for day 6 and thereafter

**Available forms:** Tab 30 mg; starter pack

### Implementation

Give whole; do not crush, break, or chew; give without regard to meals

## ADVERSE EFFECTS

**CNS:** *Headache,* depression, suicidal ideation, fatigue, insomnia
**GI:** Diarrhea, nausea, vomiting, abdominal pain, frequent bowel movements, dyspepsia, weight loss
**MS:** Back pain
**RESP:** URI, pharyngitis, bronchitis
**SYST:** Hypersensitivity reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 68% bound to plasma proteins |
| **Metabolism** | Liver, metabolized by CYP3A4 |
| **Excretion** | Urine (58%), feces (39%) |
| **Half-life** | 6-9 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2.5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

CYP3A4 inducers (rifampin, isoniazid, pyrazinamide, barbiturates, phenytoin, carbamazepine, enzalutamide), avoid concurrent use; decreased effect of apremilast

### Drug/herb

CYP3A4 inducers (St. Johns' wort), avoid concurrent use: decreased effect of apremilast

## NURSING CONSIDERATIONS

### Assessment

- **Psoriatic arthritis/severe plaque psoriasis:** assess for hypersensitivity reactions
- **Pregnancy and breastfeeding:** use only if benefits outweigh fetal risk if used during pregnancy, call 877-311-8972; cautious use in breastfeeding
- Assess for depression and suicidal ideation, mood changes; for renal failure or severe renal impairment (CCr <30 ml/min), dosage reduction is required

### Patient/family education

- Teach patient to report rash, hypersensitivity reactions
- Teach patient to avoid use in pregnancy and use cautiously in breastfeeding; if used during pregnancy, call 877-311-8972 to enroll in registry
- Advise patient to be alert for depression and suicidal ideation, mood changes; if these occur, notify prescriber immediately

### Evaluation

**Positive therapeutic outcome**

- Resolution of symptoms of psoriatic arthritis or plaque psoriasis

## aprepitant (Rx)

(ap-re'pi-tant)
**Emend**
## fosaprepitant
**Emend**
*Func. class.:* Antiemetic
*Chem. class.:* Miscellaneous

**Do not confuse:** aprepitant/fosaprepitant

**ACTION:** Selective antagonist of human substance P/neurokinin 1 ($NK_1$) receptors, decreasing emetic reflex

**Therapeutic outcome:** Decreased nausea, vomiting during chemotherapy

**USES:** Prevention of nausea, vomiting associated with cancer chemotherapy (highly emetogenic/moderately emetogenic) including high-dose cisplatin; used in combination with other antiemetics; postop nausea, vomiting

## CONTRAINDICATIONS

Hypersensitivity to this product, polysorbate 80

**Precautions:** Pregnancy, breastfeeding, children, geriatric, hepatic disease

## DOSAGE AND ROUTES

### Prevention of nausea/vomiting after chemotherapy antineoplastics

**Adult:** PO day 1 (1 hr prior to chemotherapy) aprepitant 125 mg with 12 mg 1st dose of aprepitant on day 1 of regimen (fosaprepitant)

### Prevention of postop nausea/vomiting

**Adult:** PO 40 mg within 3 hr of induction of anesthesia

**Available forms:** Caps 40, 80, 125 mg; powder for inj, 150 mg; combo pack cap 80-125 mg

### Implementation

**PO route**

- Give PO on 3-day schedule, given with other antiemetics
- Take first dose 1 hr prior to chemotherapy
- Store at room temperature; keep in original bottles, blisters

**IV route**

- Only approved as a substitute for the 1st dose of aprepitant in 3-day regimen

- Reconstitution: use aseptic technique; inject 5 ml 0.9% NaCl into the vial, directing stream to wall of vial to prevent foam; swirl; do not shake
- Prepare inf bag with 145 ml/150 mg do not dilute or reconstitute with any divalent cations such as calcium, magnesium, including LR, Hartmann's sol
- Withdraw the entire volume from vial and transfer to inf bag; total volume 115 ml (1 mg/1 ml)
- Gently invert bag 2-3 times; reconstituted sol is stable for 24 hr at lower room temperature or <25° C
- Visually inspect for particulates and discoloration
- Infuse over 20-30 min, stable for 24 hr at room temperature

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* insomnia, anxiety, depression, confusion, peripheral neuropathy
**CV:** Bradycardia, tachycardia, DVT, hypertension, hypotension
**GI:** *Diarrhea; constipation;* abdominal pain; anorexia; gastritis; increased AST, ALT; *nausea;* vomiting; heartburn
**GU:** Increased BUN, serum creatine, proteinuria, dysuria
**HEMA:** Anemia, thrombocytopenia, neutropenia
**INTEG:** Pruritus, rash, urticaria, infection reaction
**MISC:** Asthenia, fatigue, dehydration, fever, hiccups, tinnitus, alopecia
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 95% protein bound |
| **Metabolism** | Liver (CYP3A4 enzymes to an active metabolite) |
| **Excretion** | Not in kidneys |
| **Half-life** | 10-12 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

ALPRAZolam, midazolam, triazolam: increased level of each product, decrease dose of each product
Paroxetine: decreased action of both products

### Drug classifications

CYP2C9 substrates (phenytoin, TOLBUTamide, warfarin), hormonal contraceptives: decreased action
CYP3A4 inhibitors (clarithromycin, diltiazem, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, troleandomycin): increased aprepitant action
CYP3A4 inducers (carBAMazepine, phenytoin, rifampin): decreased aprepitant action
CYP3A4 substrates (ALPRAZolam, dexamethasone, DOCEtaxel, etoposide, ifosfamide, imatinib, irinotecan, methylPREDNISolone, midazolam, PACLitaxel, pimozide, triazolam, vinBLAStine, vinCRIStine, vinorelbine): increased action

### Drug/food

Grapefruit juice: decreased effect

## NURSING CONSIDERATIONS

### Assessment

- Assess for hypersensitivity reactions: pruritus, rash, urticaria, anaphylaxis
- Assess for absence of nausea, vomiting during chemotherapy
- CBC, LFTs, creatinine baseline and periodically
- Pregnancy/breastfeeding: Use only if clearly needed, do not breastfeed. excretion unknown

### Patient/family education

- Teach to report diarrhea, constipation
- Advise to take only as prescribed
- Advise to report all medication to prescriber prior to taking this medication
- Instruct to use nonhormonal form of contraception while taking this agent
- Advise those on warfarin to have clotting monitored closely during 2-wk period following administration of aprepitant
- Teach to avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Absence of nausea, vomiting during cancer chemotherapy

## arformoterol (Rx)

(ar-for-moe'ter-ole)
**Brovana**
*Func. class.:* Long-acting adrenergic $\beta_2$-agonist, sympathomimetic, bronchodilator

**Do not confuse:** Brovana/Boniva

**ACTION:** Causes bronchodilation by action on $\beta_2$ (pulmonary) receptors by increasing levels of cyclic AMP, which relaxes smooth muscle; produces bronchodilation, CNS, and cardiac stimulation, and increased diuresis and gastric acid secretion; longer acting than isoproterenol

**Therapeutic outcome:** Absence of dyspnea, wheezing after 1 hr, improved airway exchange, improved ABGs

## USES:

Maintenance bronchospasm prevention in COPD, including chronic bronchitis, emphysema

## CONTRAINDICATIONS

Hypersensitivity to sympathomimetics, this product, or racemic formoterol; tachydysrhythmias, severe cardiac disease, heart block, children, monotherapy in asthma

**Precautions:** Pregnancy, breastfeeding, cardiac disorders, hyperthyroidism, diabetes mellitus, hypertension, prostatic hypertrophy, closed-angle glaucoma, seizures, hypoglycemia

**BLACK BOX WARNING:** Asthma-related death

## DOSAGE AND ROUTES

### COPD

**Adult:** NEB 15 mcg, bid, AM, PM

**Available forms:** Inh sol 15 mcg/2 ml

### Implementation

- Must be used by nebulization; give over 5-10 min
- Store in refrigerator; if stored at room temp, discard after 6 wk or if past expiration date, whichever is sooner

## ADVERSE EFFECTS

**CNS:** *Tremors, anxiety,* insomnia, headache, dizziness, stimulation, *restlessness,* hallucinations, flushing, irritability
**CV:** Palpitations, tachycardia, hypo/hypertension, angina, dysrhythmias, AV block, heart failure, prolonged QT, supraventricular tachycardia
**EENT:** Dry nose, irritation of nose and throat
**GI:** Heartburn, nausea, vomiting
**MISC:** Flushing, sweating, anorexia, bad taste/smell changes, hypokalemia, anaphylaxis, *hypoglycemia*
**MS:** Muscle cramps, back pain
**RESP:** Cough, wheezing, dyspnea, bronchospasm, dry throat

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Crosses placenta, protein binding 52%-65% |
| **Metabolism** | Direct conjugation by CYP2D6, CYP2C19, extensively |
| **Excretion** | Urine 63%, feces 11% |
| **Half-life** | Terminal (COPD) 26 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | 1-1½ hr |
| **Duration** | 4-6 hr |

## INTERACTIONS

### Individual drugs

Oxytoxics: increased severe hypotension
Theophylline: increased toxicity

### Drug classifications

Adrenergics, MAOIs, tricyclics: increased action of arformoterol; do not use together
Class IA/III antidysrhythmics, MAOIs, tricyclics: increased QT prolongation
Nebulized bronchodilators: increased action of nebulized bronchodilators
**Other β-blockers:** decreased arformoterol action, asthma-related death, avoid concurrent use
Potassium-losing diuretics: increased ECG changes/hypokalemia

### Drug/herb

Caffeine (kola nut, green/black tea, guarana, yerba maté, coffee, chocolate): increased stimulation

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess respiratory function: vital capacity, forced expiratory volume, ABGs; lung sounds, heart rate and rhythm, B/P, sputum (baseline and peak); actively deteriorating COPD and asthma-related death may occur; a rescue inhaler should be readily available

- Determine that patient has not received theophylline therapy or other bronchodilators before giving dose
- Assess patient's ability to self-medicate
- Assess for allergic reactions
- Assess **paradoxical bronchospasm;** hold medication, notify prescriber if bronchospasm occurs
- Pregnancy/breastfeeding: Use only if benefits outweigh fetal risk, cautious use in breastfeeding

### Patient/family education

**BLACK BOX WARNING:** Teach patient to use exactly as prescribed, that death has resulted from asthma with products similar to this one, to have a rescue inhaler always

- Advise patient not to use OTC medications; excess stimulation may occur
- An opened unit-dose vial should be used immediately, store vials in refrigerator

• To notify prescriber if there is more frequent use needed

### Evaluation

**Positive therapeutic outcome**

• Absence of dyspnea, wheezing after 1 hr, improved airway exchange, improved ABGs

**⚠ HIGH ALERT**

## argatroban (Rx)

(are-ga-troe'ban)

**Argatroban**

*Func. class.:* Anticoagulant

*Chem. class.:* Direct Thrombin inhibitor

**Do not confuse:** argatroban/Aggrastat/Lorgaran

**ACTION:** Direct inhibitor of thrombin that is derived from L-arginine; it reversibly binds to the thrombin active site

**Therapeutic outcome:** Absence or decrease of thrombosis

**USES:** Thrombosis prophylaxis or treatment; anticoagulation prevention/treatment of thrombosis in heparin-induced thrombocytopenia (HIT); percutaneous coronary intervention (PCI) in those with a history of HIT, deep vein thrombosis, pulmonary embolism

## CONTRAINDICATIONS

Hypersensitivity, overt major bleeding

**Precautions:** Pregnancy, breastfeeding, children, intracranial bleeding, impaired renal function, hepatic disease, severe hypertension, after lumbar puncture, spinal anesthesia, major surgery/trauma, congenital or acquired bleeding, GI ulcers, abrupt discontinuation

## DOSAGE AND ROUTES

### Prevention/treatment of thrombosis (heparin-induced thrombocytopenia)

**Adult:** CONT **IV** inf 2 mcg/kg/min; adjust dose until steady-state aPPT is 1.5-3 × initial baseline, not to exceed 100 sec, max dose 10 mcg/kg/min

### Percutaneous coronary intervention (PCI) in HIT

**Adult:** **IV** inf 25 mcg/kg/min and a bol of 350 mcg/kg given over 3-5 min, check ACT 5-10 min after bol is completed, proceed if ACT >300 sec; if ACT <300 sec, give another 150 mcg/kg bol and increase infusion rate to 30 mcg/kg/min; recheck ACT in 5-10 min; if ACT >450 sec, decrease infusion rate to 15 mcg/kg/min; recheck ACT in 5-10 min; once ACT is therapeutic, continue for duration of procedure

### Hepatic dose

**Adult:** Cont inf 0.5 mcg/kg/min, adjust rate based on APTT

**Available forms:** Inj 100 mg/ml (2.5 ml) (must dilute 100-fold), 50 mg/50 ml, 125 mg/125 ml

### Implementation

• Avoid all IM inj that may cause bleeding

**IV, direct route**

• **For PCI:** 350 mg/kg bol, and continuous inf of 25 mcg/kg/min, check ACT 5-10 min after bolus

**Intermittent IV INF route**

• **Dilute** in 0.9% NaCl, $D_5W$, LR to a final conc 1 mg/ml; **dilute** each 2.5-ml vial 100-fold by mixing with 250 ml of diluent, mix by repeated inversion of the diluent bag for 1 min; may be slightly hazy briefly

• Dosage adjustment may be made after review of aPTT, not to exceed 10 mcg/kg/min

## ADVERSE EFFECTS

**CNS:** Fever, intracranial bleeding, headache

**CV:** Atrial fibrillation, ventricular tachycardia, coronary thrombosis, MI, myocardial ischemia, coronary occlusion, bradycardia, chest pain, hypotension

**GI:** Nausea, vomiting, abdominal pain, diarrhea, GI bleeding

**GU:** Hematuria, abnormal kidney function, UTI

**HEMA:** Hemorrhage

**MISC:** *Back pain,* infection

**RESP:** Dyspnea, coughing, hemoptysis, pulmonary edema

**SYST:** Sepsis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | To extracellular fluid, 54% plasma protein binding |
| **Metabolism** | Liver |
| **Excretion** | Feces |
| **Half-life** | 39-51 min |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Clopidogrel, dipyridamole, heparin, ticlopidine, warfarin: increased bleeding risk, avoid using concurrently

### Drug classifications
Antiplatelets, glycoprotein IIb/IIIa antagonists (abciximab, eptifibatide, tirofiban), NSAIDs, other anticoagulants, salicylates, thrombolytics (alteplase, reteplase, tenecteplase, urokinase): increased risk of bleeding, avoid using concurrently

### Drug/herb
Garlic, ginger, ginkgo, horse chestnut: increased bleeding risk

### Drug/lab
Decrease: Hgb/HcT

## NURSING CONSIDERATIONS
### Assessment
- Obtain baseline aPTT before treatment; do not start treatment if aPTT ratio ≥2.5, then aPTT 4 hr after initiation of treatment and at least daily thereafter; if aPTT above target, stop inf for 2 hr, then restart at 50%, take aPTT in 4 hr; if below target, increase inf rate by 20%, take aPTT in 4 hr, do not exceed inf rate of 0.21 mg/kg/hr without checking for coagulation abnormalities
- Monitor aPTT, which should be 1.5-3 × control, draw blood for ACT q20-30min during long PCI
- Assess for bleeding gums, petechiae, ecchymosis, black tarry stools, hematuria/epistaxis, decreased B/P, HCT, vaginal bleeding, and possible hemorrhage
- Fever, skin rash, urticaria
- **Anaphylaxis:** assess for dyspnea, rash during treatment
- Pregnancy/breastfeeding: Use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown

### Patient/family education
- Advise patient to use soft-bristle toothbrush to avoid bleeding gums, avoid contact sports, use electric razor, avoid IM inj
- Instruct patient to report any signs of bleeding: gums, under skin, urine, stools; trouble breathing, wheezing, skin rash
- Pregnancy/breastfeeding: Teach patient to notify provider if planning to become pregnant, breastfeeding
- Advise patient to notify provider of hepatic/GI disease, recent surgery, injury
- Advise patient not to use OTC products, herbals unless approved by prescriber

### Evaluation
#### Positive therapeutic outcome
- Absence or decrease of thrombosis

## ARIPiprazole (Rx)
(a-rip-ip-pra′zol)
**Abilify, Abilify Discmelt, Abilify Maintena**
*Func. class.:* Antipsychotic/neuroleptic

**Do not confuse:** ARIPiprazole/RABEprazole

**ACTION:** Exact mechanism unknown; may be mediated through both dopamine type 2 ($D_2$) and serotonin type 2 ($5\text{-}HT_2$) antagonism, dopamine system stabilizer

**Therapeutic outcome:** Decreased excitement, hallucinations, delusions, paranoia, reorganization of patterns of thought, speech

**USES:** Schizophrenia and bipolar disorder (adults and adolescents), agitation, mania, major depressive disorder, short-term mania or mixed episodes of bipolar disorder, irritability in autism

## CONTRAINDICATIONS
Hypersensitivity, breastfeeding, seizure disorders

**Precautions:** Pregnancy, geriatric, renal/cardiac/hepatic disease, neutropenia

**BLACK BOX WARNING:** Children with depression, dementia, suicidal ideation

## DOSAGE AND ROUTES
### Schizophrenia
**Adult:** PO 10-15 mg/day; if needed, dosage may be increased to 30 mg daily after 2 wk; maintenance 15 mg/day, periodically reassess; IM/EXT REL (monthly inj susp) 400 mg qmo
**Adolescent 13-17 yr:** 2 mg/day, may increase to 5 mg after 2 days, then 10 mg after 2 more days, max 30 mg/day

### Major depressive disorder
**Adult:** PO 2-5 mg/day as an adjunct to other antidepressant treatment; adjust by 5 mg at ≥1 wk (range, 2-15 mg/day)

### Agitation in bipolar disorder/schizophrenia
**Adult:** IM 9.75 mg as a single dose; may start with a lower dose, max 30 mg/day

### Bipolar disorder
**Adult:** 15 mg/day, may increase to 30 mg/day if needed (monotherapy): adjunctive to lithium or valproate PO 10-15 mg qd, may increase to 30 mg as needed
**Child ≥10 yr/adolescent:** PO 2 mg, titrate to 5 mg/day after 2 days to a target of 10 mg/day after another 2 days

### Irritability associated with autism

**Child ≥6 yr/adolescent:** PO 2 mg/day, increase to 5 mg/day after 1 wk, may increase to 10-15 mg/day if needed, dose changes should not occur more frequently than q1wk

### Tourette's disorder

**Child 6-18 yr and ≥ 50 kg:** PO 2 mg/day × 2 days, then increase to 5 mg/day, target 10 mg/day on day 8

**Child 6-18 yr and <50 kg:** PO 2 mg/day × 2 days, then increase to 5 mg/day then gradually increase in weekly intervals, max 10 mg/day

### Potential CYP2D6 inhibitor, strong CYP3A4 inhibitors

**Adult:** PO reduce to 50% of usual dose, increase dose when CYP2D6, CYP3A4 inhibitor is withdrawn

### Combination of strong CYP3A4/CYP2D6 inhibitors

**Adult:** PO reduce to 25% of usual dose

**Available forms:** Tabs 2, 5, 10, 15, 20, 30 mg; inj 9.75 mg/1.3 ml; orally disintegrating tab 10, 15 mg; oral sol 1 mg/ml; susp for injection 441 mg/1.6 ml, 662 mg/2.4 ml, 882 mg/3.2 ml; susp EXT REL 300, 400 mg

### Implementation

- Administer reduced dose in geriatric
- Decreased stimulus by dimming lights, avoiding loud noises
- Supervise ambulation until patient is stabilized on medication; do not involve in strenuous exercise program because fainting is possible; patient should not stand still for a long time
- Store in tight, light-resistant container
- Available as ready to use
- Oral sol can be substituted for tablet mg per mg up to 25-mg dose; patients receiving 30-mg tablets should receive 25 mg of sol
- IM route: EXT REL monthly (Abilify Maintena)
- Do not give IV or subcut

## ADVERSE EFFECTS

**CNS:** *Drowsiness, insomnia, agitation, anxiety, headache,* seizures, neuroleptic malignant syndrome, *lightheadedness, akathisia, asthenia, tremor,* stroke, suicidal ideation, dystonia, cogwheel rigidity

**CV:** Orthostatic hypotension, tachycardia, chest pain, hypertension, peripheral edema

**EENT:** Blurred vision, rhinitis

**GI:** Constipation, *nausea,* vomiting, jaundice, weight gain

**INTEG:** *Rash*

**META:** Hyperglycemia, dyslipidemia

**MS:** Musculoskeletal pain/stiffness, myalgia

**RESP:** *Cough*

**SYST:** Death in geriatric patients with dementia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding, 90% |
| **Metabolism** | Liver, extensively to major active metabolism |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol: increased sedation

CarBAMazepine: decreased effects of ARIPiprazole

Erythromycin, FLUoxetine, ketoconazole, quiNIDine, PARoxetine: increased effects of ARIPiprazole, reduce dose

Famotidine, valproate: decreased ARIPiprazole level

Lithium: increased EPS

### Drug classifications

Antihypertensives: Increased antihypertensive effect, monitor BP

Antipsychotics: increased EPS

CNS depressants: increased sedation

CYP3A4/CYP2D6 inhibitors: increased effects of ARIPiprazole, reduce dose

CYPA34 inducers: decreased effects of ARIPiprazole; increase dose as needed

### Drug/herb

St. John's wort: decreased ARIPiprazole effect

### Drug/Lab

False positive: amphetamine drug screen

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess mental status before initial administration, children/young adults may exhibit suicidal thoughts/behaviors, the smallest amount of product should be given; elderly patients with dementia-related psychosis are at increased risk of death

- Check for swallowing of PO medication; check for hoarding or giving of medication to other patients
- Monitor I&O ratio; palpate bladder if urinary output is low
- Monitor liver function tests qmo, AIMS assessment, neurologic function

• Assess affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
• Monitor B/P standing and lying; also pulse, respirations; take q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes
• Assess for dizziness, faintness, palpitations, tachycardia on rising
• Assess for EPS, including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)
• **Assess for neuroleptic malignant syndrome:** hyperthermia, increased CPK, altered mental status, muscle rigidity
• Monitor weight, lipid profile, fasting blood glucose
• Assess skin turgor daily
• Assess for constipation, urinary retention daily; if these occur, increase bulk and water in diet
• **Beers:** Avoid in older adults, high risk of CVA, delirium, may use in schizophrenia, bipolar, or short-term use as an antiemetic in chemotherapy
• **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, pregnant patient should be enrolled in the National Pregnancy Registry for Atypical Antipsychotics 866-961-2388, avoid breastfeeding, use only if benefits outweigh fetal risk

### Patient/family education

• Advise patient that orthostatic hypotension may occur and to rise from sitting or lying position gradually
• Advise patient to avoid hot tubs, hot showers, tub baths; hypotension may occur
• Instruct patient to avoid abrupt withdrawal of this product; EPS may result; product should be withdrawn slowly
• Teach patient to avoid OTC preparations (cough, hayfever, cold) unless approved by prescriber, because serious product interactions may occur; avoid use with alcohol, CNS depressants; increased drowsiness may occur
• Advise patient to avoid hazardous activities if drowsy or dizzy
• Explain importance of compliance with product regimen
• Advise patient, family to report impaired vision, tremors, muscle twitching, urinary retention
• Instruct patient to take extra precautions to stay cool in hot weather, that heat stroke may occur

**BLACK BOX WARNING:** Teach patient to report suicidal thoughts/behaviors, dementia immediately

### Evaluation

**Positive therapeutic outcome**
• Decreased emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

## TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting*

## asenapine (Rx)

(a-sen′a-peen)
**Saphris**
*Func. class.:* Antipsychotic, atypical; DOPamine/serotonin antagonist
*Chem. class.:* Dibenzazepine

## ACTION:

Unknown; may be mediated through both dopamine type 2 ($D_2$) and serotonin type 2 ($5\text{-}HT_{2A}$) antagonism

**Therapeutic outcome:** Decrease in delusions, hallucinations

## USES:

Bipolar 1 disorder, schizophrenia

## CONTRAINDICATIONS

Breastfeeding, hypersensitivity

**Precautions:** Pregnancy, children, geriatric patients, cardiac/renal/hepatic disease, breast cancer, Parkinson's disease, dementia, seizure disorder, CNS depression, agranulocytosis, QT prolongation, torsades de pointes, suicidal ideation, substance abuse, diabetes mellitus

**BLACK BOX WARNING:** Increased mortality in elderly patients with dementia-related psychosis

## DOSAGE AND ROUTES

### Schizophrenia

**Adult:** SL 5 mg bid, max 20 mg/day

### Bipolar 1 disorder

**Adult:** SL 10 mg bid, may decrease to 5 mg bid as needed, max 20 mg/day

### Acute mania, mixed episodes (bipolar 1 disorder monotherapy)

**Child:** 10-17 SL 2.5 mg bid, may increase after 3 days to 5 mg bid, then after 3 more days, increase to 10 mg bid as tolerated

**Available forms:** SL tab 2.5, 10 mg

### Implementation

**PO route**
• Give anticholinergic agent for EPS
• Avoid use with CNS depressants

• **SL tab:** remove tab, place tab under tongue; after it dissolves, swallow; advise not to chew, crush or swallow tabs, not to eat or drink for 10 min
• Supervise ambulation until patient is stabilized on medication; do not involve in strenuous exercise program because fainting is possible; patient should not stand still for a long time
• Increase fluids to prevent constipation
• Store in tight, light-resistant container

## ADVERSE EFFECTS

**CNS:** *EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia, drowsiness, insomnia, agitation, anxiety, headache,* seizures, neuroleptic malignant syndrome, dizziness, suicidal ideation, drowsiness, depression
**CV:** Orthostatic hypotension, sinus tachycardia, heart failure, QT prolongation, stroke, bundle branch block
**ENDO:** Hyperglycemia, hyperlipidemia
**GI:** *Nausea,* vomiting, *constipation,* weight gain, increased appetite; oral hypoesthesia/paresthesia (SL)
**HEMA:** Thrombocytopenia, agranulocytosis, anemia, leukopenia
**INTEG:** Serious allergic reaction (anaphylaxis, angioedema)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 95% |
| **Metabolism** | Liver |
| **Excretion** | Unknown |
| **Half-life** | Terminal 24 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | ½-1½ hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased sedation
Chloroquine, clarithromycin, droperidol, erythromycin, haloperidol, methadone, pentamidine: increased QT prolongation
CarBAMazepine: increased asenapine excretion

### Drug classifications

Other CNS depressants: increased sedation
CYP2D6 inhibitors/substrates (SSRIs), other antipsychotics: increased EPS
Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics: increased QT prolongation
CYP2D6 inducers (carBAMazepine, barbiturates, phenytoin, rifampin): decreased asenapine action
SSRIs: increased serotonin syndrome

### Drug/herb

Kava: increased CNS depression, increased EPS
Betel palm: increased EPS

### Drug/lab test

Increased: cholesterol, glucose, LFTs, lipids, prolactin levels, triglycerides
Decreased: sodium

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess mental status before initial administration; watch for suicidal thoughts and behaviors; dementia and death may occur in the elderly

• Assess for affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
• Monitor B/P standing and lying, pulse, respirations; take these q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes; QT prolongation may occur
• Monitor for dizziness, faintness, palpitations, tachycardia on rising
• Assess for **EPS,** including akathisia, tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)
• **Assess for neuroleptic malignant syndrome:** hyperthermia, increased CPK, altered mental status, muscle rigidity
• Assess for constipation daily; increase bulk and water in diet if needed
• Assess for weight gain, hyperglycemia, metabolic changes in diabetes
• Pregnancy/breastfeeding: Identify if pregnancy is planned or suspected, if pregnant register at the National Pregnancy Registry for Atypical Antipsychotics 866-961-2388, do not breastfeed, use only if benefits, outweigh fetal risk

### Patient/family education

• Caution patient that orthostatic hypotension may occur and to rise from sitting or lying position gradually
• Teach patient to avoid hot tubs, hot showers, tub baths; hypotension may occur
• Advise patient to avoid abrupt withdrawal of this product; EPS may result; product should be withdrawn slowly
• Advise patient to avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber, serious product interactions may occur; avoid use of alcohol, increased drowsiness may occur
• Advise patient to avoid hazardous activities if drowsy or dizzy
• Weight, thyroid function studies, serum prolactin, lipid profile, serum electrolytes,

creatinine, pregnancy test, neurologic function, LFTs, glycosylated hemoglobulin A1C, CBC, blood glucose, AIMS assessment baseline and periodically
• Advise patient about compliance with product regimen
• Advise patient that heat stroke may occur in hot weather; take extra precautions to stay cool
• Advise patient to use contraception, inform prescriber if pregnancy is planned or suspected
• Advise patient to report suicidal thoughts/behaviors immediately
• Pregnancy/breastfeeding: Teach patient to enroll in the registry, not to breastfeed

### Evaluation

**Positive therapeutic outcome**
• Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

## TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting*

**⚠ HIGH ALERT**

## aspirin (acetylsalicylic acid, ASA) (OTC)

(as′pir-in)
**APC-ASA Coated Aspirin 🍁, Apo-Asa 🍁, A.S.A., Asaphen 🍁, Asatab 🍁, Ascriptin Enteric, Aspergum, Aspirin 🍁, Aspir-Low, Aspirtrin, Bayer Aspirin, Bayer Children's Aspirin, Bufferin, Ecotrin, Entrophen 🍁, Equaline, Good Sense Aspirin, Halfprin, Lowprin 🍁, Novasen 🍁, PMS-ASA 🍁, Rivasa 🍁, St. Joseph Children's, St. Joseph's Adult, Walgreens Aspirin Adult**
*Func. class.:* Nonopioid analgesic
*Chem. class.:* Salicylate

**Do not confuse:** **Aspirin**/Anacin, **Adult Low**/Anacin-3

**ACTION:** Blocks pain impulses by blocking COX-1 in CNS, reduces inflammation by inhibition of prostaglandin synthesis; antipyretic action results from vasodilatation of peripheral vessels; decreases platelet aggregation

**Therapeutic outcome:** Decreased pain, inflammation, fever; absence of MI, transient ischemic attacks, thrombosis

**USES:** Mild to moderate pain or fever including rheumatoid arthritis, osteoarthritis, thromboembolic disorders, transient ischemic attacks, rheumatic fever, post-MI, prophylaxis of MI, ischemic stroke, angina; acute MI

**Unlabeled uses:** Prevention of cataracts (long-term use), prevention of pregnancy loss in women with clotting disorders, polycythemia vera

## CONTRAINDICATIONS

Pregnancy, breastfeeding, children <12 yr, children with flulike symptoms, hypersensitivity to salicylates, tartrazine (FDC yellow dye #5), GI bleeding, bleeding disorders, vit K deficiency, peptic ulcer, acute bronchospasm, agranulocytosis, increased intracranial pressure, intracranial bleeding, nasal polyps, urticaria

**Precautions:** Abrupt discontinuation, acetaminophen/NSAIDs hypersensitivity, acid/base imbalance, alcoholism, ascites, asthma, bone marrow suppression, geriatric patients, dehydration, G6PD deficiency, gout, heart failure, anemia, renal/hepatic disease, pre/postoperatively, gastritis, pregnancy **C** 1st trimester

## DOSAGE AND ROUTES

### Rheumatoid arthritis, osteoarthritis, other inflammatory conditions

**Adult:** PO 3 g/day in divided doses q4-6hr, target salicylate level 150-300 mcg/ml

### Juvenile rheumatoid arthritis

**Child:** PO or RECT 90-130 mg/kg/day in divided doses, target salicylate level 150-300 mcg/ml

### MI, stroke prophylaxis

**Adult:** PO 50-325 mg/day

### Pain/fever

**Adult:** PO/RECT 325-1000 mg q4hr prn, max 4 g/day
**Child 2-11 yr:** PO 10-15 mg/kg/dose q4hr, max 4 g/day

### Thromboembolic disorders

**Adult:** PO 325-650 mg/day or bid

### Transient ischemic attacks (risk)

**Adult:** PO 50-325 mg/day (grade 1A)

### Prevention of recurrent MI

**Adult:** PO 75-162 mg/day

### CABG

**Adult:** PO 325 mg/day starting 6 hr post-procedure, continue for 1 yr

### PTCA

**Adult:** PO 325 mg 2 hr presurgery, then 160-325 mg daily

### Evolving MI with ST segment elevation (STEMI)

**Adult:** PO 160-325 mg nonenteric, chewed and swallowed immediately, maintenance 75-162 mg qd

**Available forms:** Tabs 81, 325, 500, 650, 800 mg; chewable tabs 81 mg; supp 300, 600, mg; gum 227 mg; enteric coated tabs 81, 325, 500, 975 mg; ext rel 800 mg; del rel tabs 325, 500 mg; supp 300, 600 mg

### Implementation

**PO route**

- Do not break, crush, or chew enteric product
- Administer to patient crushed or whole; chewable tab should be chewed
- Give with food or milk to decrease gastric symptoms; separate by 2 hr of enteric product; absorption may be slowed
- Give antacids 1-2 hr after enteric products
- Give with 8 oz of water and have patient sit upright for 30 min after dose; discard tabs if vinegar-like smell is present; avoid if allergic to tartrazine
- Give ½ hr before planned exercise

**Rectal route**

- Place suppository in refrigerator for at least 30 min before removing wrapper

## ADVERSE EFFECTS

**CNS:** Stimulation, drowsiness, dizziness, confusion, seizures, headache, flushing, hallucinations, coma, intracranial hemorrhage
**CV:** Rapid pulse, pulmonary edema, dysrhythmias
**EENT:** Tinnitus, hearing loss
**ENDO:** Hypoglycemia, hyponatremia, hypokalemia
**GI:** *Nausea, vomiting,* GI bleeding, diarrhea, heartburn, anorexia, hepatitis, GI ulcer
**HEMA:** Thrombocytopenia, agranulocytosis, leukopenia, neutropenia, hemolytic anemia, increased PT, PTT, bleeding time
**INTEG:** *Rash,* urticaria, bruising
**RESP:** Wheezing, hyperpnea, bronchospasm
**SYST:** Reye's syndrome (children), anaphylaxis, laryngeal edema, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed, small intestine (PO); erratic (enteric); slow (RECT) |
| **Distribution** | Rapidly, widely distributed; crosses placenta, protein binding 90% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Inactive metabolites, kidney; breast milk |
| **Half-life** | 15-20 min (low doses); 9 hr (high doses) |

### Pharmacodynamics

| | PO | RECT |
|---|---|---|
| **Onset** | 15-30 min | Slow |
| **Peak** | 1-2 hr | 4-5 hr |
| **Duration** | 4-6 hr | 6-7 hr |

PO: Enteric-coated: Onset 10-30 min, duration 2-4 hr,
Solution: Onset 10-30 min, peak 15-30 min, duration 2-4 hr

## INTERACTIONS

### Individual drugs

Alcohol, cefamandole, clopidogrel, eptifibatide, heparin, plicamycin, ticlopidine, tirofiban: increased risk of bleeding, monitor for bleeding
Ammonium chloride, nizatidine: increased salicylate level
Insulin, methotrexate, phenytoin, valproic acid, increased effects of each specific product, monitor for increased effects of each product
Nitroglycerin: increased hypotension
Probenecid: decreased effects of probenecid
Spironolactone, sulfinpyrazone: decreased effects

### Drug classifications

ACE inhibitors: decreased antihypertensive effect, monitor BP
Antacids (high doses), corticosteroids, urinary alkalizers: decreased effects of aspirin, monitor for decreased aspirin effects
Anticoagulants, thrombolytics: increased risk of bleeding
Diuretics (loop), sulfonylamides, NSAIDs, β-blockers: decreased effect of each specific product
NSAIDs, antiinflammatories, steroids: increased gastric ulcers
Penicillins, oral hypoglycemics, sulfonamides, thrombolytic agents: increased effects of each specific product
Salicylates: decreased blood glucose levels
Urinary acidifiers: increased salicylate levels

### Drug/herb

Feverfew, garlic, ginger, ginkgo, ginseng *(Panax),* horse chestnut: increased risk of bleeding

### Drug/food

Foods acidifying urine may increase aspirin levels
Fish oil (omega-3-fatty acids): increased risk of bleeding

### Drug/lab test

Increased: coagulation studies, liver function studies, serum uric acid, amylase, $CO_2$, urinary protein

Decreased: serum potassium, cholesterol
Interference: VMA, 5-HIAA, xylose tolerance test, TSH, pregnancy test

## NURSING CONSIDERATIONS

### Assessment

- Assess for **pain:** character, location, intensity, ROM before and 1 hr after administration
- Monitor liver function studies: AST, ALT, bilirubin, creatinine if patient is on long-term therapy
- Monitor renal function studies: BUN, urine creatinine if patient is on long-term therapy
- Monitor blood studies: CBC, Hct, Hgb, PT if patient is on long-term therapy
- Check I&O ratio; decreasing output may indicate renal failure (long-term therapy)
- **Assess hepatotoxicity:** dark urine, clay-colored stools, yellowing of the skin and sclera, itching, abdominal pain, fever, diarrhea if patient is on long-term therapy
- **Assess for allergic reactions:** rash, urticaria; if these occur, product may have to be discontinued; in patients with asthma, nasal polyps, allergies, severe allergic reactions may occur
- Assess for **ototoxicity:** tinnitus, ringing, roaring in ears; audiometric testing needed before, after long-term therapy
- Monitor **salicylate level:** therapeutic level 150-300 mcg/ml for chronic inflammation
- Check edema in feet, ankles, legs
- Identify prior product history; there are many product interactions
- Beers: Avoid chronic use in older adults, GI bleeding may occur

### Patient/family education

- Teach patient to report any symptoms of renal/hepatic toxicity, visual changes, ototoxicity, allergic reactions, bleeding (long-term therapy)
- Instruct patient to take with 8 oz of water and sit upright for 30 min after dose to facilitate product passing into the stomach; to discard tabs if vinegar-like smell is present; to avoid if allergic to tartrazine
- Instruct patient not to exceed recommended dosage; acute poisoning may result
- Advise patient to read label on other OTC products; many contain aspirin
- Inform patient that the therapeutic response takes 2 wk (arthritis)
- Teach patient to report tinnitus, confusion, diarrhea, sweating, hyperventilation
- Advise patient to avoid alcohol ingestion; GI bleeding may occur
- Advise patient with allergies, nasal polyps, asthma, that allergic reactions may develop
- Instruct patient to read labels on other OTC products: may contain salicylates
- Teach patient not to give to children or teens with flulike symptoms or chicken pox; Reye's syndrome may develop
- Instruct patient not to use during 3rd trimester of pregnancy
- Teach patient to take with a full glass of water

### Evaluation

**Positive therapeutic outcome**

- Decreased pain
- Decreased inflammation
- Decreased fever
- Absence of MI
- Absence of transient ischemic attacks, thrombosis

## TREATMENT OF OVERDOSE:

Lavage, monitor electrolytes, VS

**⚠ HIGH ALERT**

**RARELY USED**

## aspirin/omeprazole

(as'pir-in/oh-mep'ra-zole)
**Yosprala**
*Func. class.:* Platelet inhibitor, salicylate combination

**USES:** For the reduction of cardiovascular mortality and prevention of secondary cardiovascular and cerebrovascular events (MI prophylaxis, stroke prophylaxis) in patients at risk for aspirin-associated gastric ulcers and who also have a history of stroke, TIA, MI, angina (including unstable angina) or are post cardiac surgery (CABG, PTCA)

## CONTRAINDICATIONS

NSAID/salicylate hypersensitivity, viral infection

## DOSAGE AND ROUTES

**Adult:** PO 81 mg aspirin/40 mg omeprazole or 325 mg aspirin/40 mg omeprazole qday

## atazanavir (Rx)

(at-a-za-na'veer)
**Reyataz**
*Func. class.:* Antiretroviral
*Chem. class.:* Protease inhibitor

**ACTION:** Inhibits human immunodeficiency virus (HIV-1) protease, which prevents maturation of the infectious virus

**Therapeutic outcome:** Decreasing symptoms of HIV

**USES:** HIV-1 infection in combination with other antiretroviral agents

## CONTRAINDICATIONS

Hypersensitivity, Child-Pugh Class C

**Precautions:** Pregnancy, breastfeeding, children, geriatric, liver disease, alcoholism, antimicrobial resistance, AV block, diabetes, dialysis, elderly, women, hemophilia, hypercholesterolemia, immune reconstitution syndrome, lactic acidosis, pancreatitis, cholelithiasis, serious rash

## DOSAGE AND ROUTES

### Antiretroviral-naive patients

**Adult:** PO 400 mg daily

**Child ≥6 yr/adolescent ≤40 kg:** PO 300 mg with ritonavir 100 mg qd

**Child ≥6 yr/adolescent 20 to <40 kg:** PO 200 mg with ritonavir 100 mg qd

**Child ≥6 yr/adolescent 15 to <20 kg:** PO 150 mg with ritonavir 80 mg qd

### Antiretroviral-experienced patients

**Adult:** PO 300 mg daily and ritonavir 100 mg daily

**Pregnant adult/adolescent (2nd/3rd trimester) with $H_2$ blocker or tenofovir:** PO 400 mg with ritonavir 100 mg qd

**Child ≥6 yr/adolescent ≥40 kg:** PO 300 mg with ritonavir 100 mg qd

**Child ≥6 yr/adolescent 20 to <40 kg:** PO 200 mg with ritonavir 100 mg qd

**Infants ≥ 3 months and children 10 to <25 kg:** Oral powder 15 to <25 kg 250 mg/dose q24hr with ritonavir 80 mg/dose q24hr; 10 to <15 kg 200 mg/dose q24hr with ritonavir 80 mg/dose q24hr

### Hepatic dose

**Adult:** PO (Child-Pugh B) 300 mg daily; (Child-Pugh C) do not use

**Available forms:** Caps 100, 150, 200, 300 mg, oral powder 50 mg

### Implementation

- Administer with food; take 2 hr before or 1 hr after antacid or didanosine; swallow cap whole, do not open
- Oral powder: Use with food or beverage, mix 1 tablespoon of food with powder, then add another tablespoon of food to container, mix and feed; mix with 30 ml of liquid, give and mix another 15 ml to cup to remove residual and give, use within 1 hr of mixing

## ADVERSE EFFECTS

**CNS:** Headache, depression, dizziness, insomnia, peripheral neuropathy

**CV:** Increased PR interval

**EENT:** Yellowing of sclera

**GI:** *Diarrhea, abdominal pain, nausea,* vomiting, hepatotoxicity, cholelithiasis

**INTEG:** *Rash,* Stevens-Johnson syndrome, *photosensitivity,* DRESS

**MISC:** Fatigue, fever, arthralgia, back pain, cough, lipodystrophy, pain, gynecomastia, nephrolithiasis, lactic acidosis, hyperbilirubinemia (pregnancy, females, obesity)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid, increased with food |
| **Distribution** | 86% protein bound |
| **Metabolism** | Liver extensively by CYP3A4 |
| **Excretion** | 27% excreted unchanged in urine/feces (minimal) |
| **Half-life** | 7 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alfuzisun, ariprazole, brentuximab, cabazitaxel, carBAMazepine, cilostazol, colchine, eletriptan, eplerenone, crizotinib, DOCEtaxel, ixabepilone, iloperidine, lurasidone, maraviroc, nilotinib, vilazodone, vemurafenib, dasatinib, lapatinib, SORAfenib, trazodone, risperiDONE, raltegravir, QUEtiapine

Clarithromycin, romiDEPsin, ranolazine, salmeterol: increased QT prolongation

Chlorazepate, clarithromycin, cycloSPORINE, diazepam, irinotecan, midazolam, pimozide, sildenafil, sirolimus, tacrolimus, triazolam, warfarin: increased levels resulting in toxicity, monitor for toxicity

Didanosine, efavirenz, rifampin: decreased atazanavir levels

Indinavir: increased hyperbilirubinemia

Ritonavir, telaprevir: decreased telaprevir levels when used with atazanavir and ritonavir

### Drug classifications

Antacids, $H_2$-receptor antagonists, proton pump inhibitors, CYP3A4 inducers: decreased atazanavir levels

Antidepressants (tricyclics), antidysrhythmics, antifungals (itraconazole, ketoconazole, voriconazole) ergots, calcium channel blockers, HMG-CoA reductase inhibitors, immunosuppressants, other protease inhibitors (amprenavir, darunavir, fosamprenavir, indinavir, nelfivanavir, ritonavir, saquinavir): increased levels resulting in increased toxicity, monitor for toxicity

Contraceptives (oral), estrogens: increased effects (unboosted), decreased (boosted with ritonavir)

CYP3A4 substrates, CYP3A4 inhibitors: increased atazanavir levels

### Drug/herb

Red yeast rice: myopathy, rhabdomyolysis
St. John's wort: decreased atazanavir levels, avoid concurrent use

### Drug/lab test

Increased: AST, ALT, total bilirubin, amylase, lipase, CK
Decreased: Hgb, neutrophils, platelets

### Drug/food

Increased: drug bioavailability (to be taken with food)

## NURSING CONSIDERATIONS

### Assessment

- **Immune reconstitution syndrome:** when given with combination antiretroviral therapy
- Assess for hepatic failure; ALT, AST, bilirubin, do not use in Child-Pugh C
- Assess for signs of infection, anemia
- Monitor liver function studies: ALT, AST, bilirubin
- Monitor bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- If pregnant, call Antiretroviral Pregnancy Registry 800-258-4263, do not breastfeed, use additional contraception when boosted with ritonivir
- PR interval in those taking calcium channel blockers, digoxin
- Monitor viral load, CD4 count throughout treatment
- **Serious rash (Stevens-Johnson syndrome, DRESS):** most rashes last 1-4 wk; if serious, discontinue product
- **Immune Reconstitution syndrome:** time of onset is variable when given with combination antiretroviral therapy

### Patient/family education

- Advise to take as prescribed with other antiretrovirals as prescribed; if dose is missed, take as soon as remembered up to 1 hr before next dose; do not double dose; do not share with others
- Teach that product must be taken daily to maintain blood levels for duration of therapy
- To report yellowing of skin, sclera
- Instruct to notify prescriber if diarrhea, nausea, vomiting, rash occur; dizziness, lightheadedness; ECG may be altered
- Inform that product interacts with many products and St. John's wort; advise prescriber of all products, herbal products used
- Advise that redistribution of body fat may occur; the effect is not known
- Teach that product does not cure HIV-1 infection or prevent transmission to others, only controls symptoms
- Advise that if taking sildenafil with atazanavir, there may be an increased risk of phosphodiesterase type 5 inhibitor–associated adverse events, including hypotension and prolonged penile erection; notify physician promptly of these symptoms
- **Pregnancy/breastfeeding:** Encourage patient to register with the Antiretroviral Pregnancy Registry if pregnant, to notify provider if pregnancy is planned or suspected, not to breastfeed

### Evaluation

**Positive therapeutic outcome**

- Increasing CD4 counts; decreased viral load, resolution of symptoms of HIV-1 infection

**⚠ HIGH ALERT**

## atazanavir/cobicistat (Rx)

(at-a-za-na'veer/koe-bik'-i-stat)
**Evotaz**
*Func. class.:* Antiretroviral
*Chem. class.:* Protease inhibitor

**ACTION:** Inhibits human immunodeficiency virus (HIV-1) protease, which prevents maturation of the infectious virus; it combines a protease inhibitor with an enhancer

**Therapeutic outcome:** Decreasing symptoms of HIV

**USES:** HIV-1 infection in combination with other antiretroviral agents

## CONTRAINDICATIONS

Hypersensitivity, Child-Pugh Class C

**Precautions:** Pregnancy, breastfeeding, children, geriatric, liver disease, alcoholism, antimicrobial resistance, AV block, diabetes, dialysis, elderly, women, hemophilia, hypercholesterolemia, immune reconstitution syndrome, lactic acidosis, pancreatitis, cholelithiasis, serious rash

## DOSAGE AND ROUTES

**Adults: PO** 300 mg/150 mg qday in both treatment-naive and treatment-experienced patients
**Adolescents (unlabeled): PO** 300 mg/150 mg qday in combination with other antiretroviral agents as part of an alternative initial regimen (treatment-naïve)

**Available forms:** Tabs 300 mg/150 mg

### Implementation

- Antiretroviral drug resistance testing (preferably genotypic testing) is recommended before initiation of therapy in antiretroviral treatment-naïve patients and before changing therapy for treatment failure
- Give with food

## ADVERSE EFFECTS

**CNS:** Headache, depression, dizziness, insomnia, peripheral neuropathy
**CV:** Increased PR interval
**EENT:** Yellowing of sclera
**GI:** *Diarrhea, abdominal pain, nausea, vomiting,* hepatotoxicity, cholelithiasis
**INTEG:** *Rash,* Stevens-Johnson syndrome, *photosensitivity,* DRESS
**MISC:** Fatigue, fever, arthralgia, back pain, cough, lipodystrophy, pain, gynecomastia, nephrolithiasis, lactic acidosis, hyperbilirubinemia (pregnancy, females, obesity)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid, increased with food |
| **Distribution** | 86% protein bound |
| **Metabolism** | Liver extensively by CYP3A4 |
| **Excretion** | 27% excreted unchanged in urine/feces (minimal) |
| **Half-life** | 7 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Clorazepate, clarithromycin, cycloSPORINE, diazepam, irinotecan, midazolam, pimozide, sildenafil, sirolimus, tacrolimus, triazolam, warfarin: increased levels resulting in toxicity
Didanosine, efavirenz, rifampin: decreased atazanavir levels
Indinavir: increased hyperbilirubinemia
Ritonavir, telaprevir: decreased telaprevir levels when used with atazanavir and ritonavir

### Drug classifications

Antacids, $H_2$-receptor antagonists, proton pump inhibitors, CYP3A4 inducers: decreased atazanavir levels

Antidepressants (tricyclics), antidysrhythmics, ergots, calcium channel blockers, HMG-CoA reductase inhibitors, immunosuppressants, other protease inhibitors: increased levels resulting in increased toxicity

Contraceptives (oral), estrogens: increased effects (unboosted), decreased (boosted with ritonavir) CYP3A4 substrates, CYP3A4 inhibitors: increased atazanavir levels

### Drug/herb

Red yeast rice: myopathy, rhabdomyolysis
St. John's wort: decreased atazanavir levels, avoid concurrent use

### Drug/lab test

Increased: AST, ALT, total bilirubin, amylase, lipase, CK
Decreased: Hgb, neutrophils, platelets

### Drug/food

Increased: drug bioavailability (to be taken with food)

## NURSING CONSIDERATIONS

### Assessment

- **Assess for hepatic failure; hepatic studies:** ALT, AST, bilirubin
- Assess for lactic acidosis, hyperbilirubinemia (females, pregnancy, obesity)
- Monitor PR interval in those taking calcium channel blockers, digoxin
- Assess for signs of infection, anemia, nephrolithiasis
- Monitor bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- Monitor viral load, CD4 count throughout treatment
- **Serious rash (Stevens-Johnson syndrome, DRESS):** most rashes last 1-4 wk; if serious, discontinue product
- **Immune reconstitution syndrome:** when given with combination antiretroviral therapy, time of onset is variable

### Patient/family education

- Advise to take as prescribed with other antiretrovirals as prescribed; if dose is missed, take as soon as remembered up to 1 hr before next dose; do not double dose; do not share with others
- Teach that product must be taken daily to maintain blood levels for duration of therapy
- Advise patient to report yellowing of skin, sclera
- Instruct to notify prescriber if diarrhea, nausea, vomiting, rash occur; dizziness, lightheadedness; ECG may be altered
- Inform that product interacts with many products and St. John's wort; advise prescriber of all products, herbal products used
- Advise that redistribution of body fat may occur; the effect is not known
- Teach that product does not cure HIV-1 infection or prevent transmission to others, only controls symptoms

• Advise that if taking sildenafil or other phosphodiesterase type 5 inhibitors with atazanavir, there may be an increased risk of phosphodiesterase type 5 inhibitor-associated adverse events, including hypotension and prolonged penile erection; notify physician promptly of these symptoms

### Evaluation

**Positive therapeutic outcome**

• Increasing CD4 counts; decreased viral load, resolution of symptoms of HIV-1 infection

**⚠ HIGH ALERT**

## atenolol (Rx)

(a-ten'oh-lole)

**Tenormin, Tenolin** 🍁

*Func. class.:* Antihypertensive

*Chem. class.:* β-Blocker; $\beta_1$-, $\beta_2$-blocker (high doses)

**Do not confuse:** atenolol/albuterol/Altenol, Tenormin/thiamine/Imuran

**ACTION:** Competitively blocks stimulation of β-adrenergic receptor within vascular smooth muscle; produces negative chronotropic activity (decreases rate of SA node discharge, increases recovery time), slows conduction of AV node, decreases heart rate, negative inotropic activity, decreases $O_2$ consumption in myocardium; also decreases renin-aldosterone-angiotensin system at high doses, inhibits $\beta_2$-receptors in bronchial system at higher doses

**Therapeutic outcome:** Decreased B/P, heart rate, prevention of angina pectoris, MI

**USES:** Mild to moderate hypertension; prophylaxis of angina pectoris; suspected or known MI (**IV** use), MI prophylaxis, atrial fibrillation/flutter

## CONTRAINDICATIONS

Pregnancy, hypersensitivity to β-blockers, cardiogenic shock, 2nd- or 3rd-degree heart block, sinus bradycardia, cardiac failure

**Precautions:** Major surgery, breastfeeding, diabetes mellitus, renal disease, thyroid disease, HF, COPD, asthma, well-compensated heart failure, dialysis, myasthenia gravis, Raynaud's disease, pulmonary edema

**BLACK BOX WARNING:** Abrupt discontinuation, may precipitate angina, MI

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO 25-50 mg daily, increasing q1-2wk to 100 mg daily; may increase to 200 mg daily for angina or up to 100 mg for hypertension

**Child:** PO 0.8-1 mg/kg/dose initially, range 0.8-1.5 mg/kg/day, max 2 mg/kg/day

**Geriatric:** PO 25 mg/day initially

### Chronic stable angina

**Adult:** PO 50 mg q day, then 100 mg/day prn after 7 days, max 200 mg/day

### Post MI, MI prophylaxis

**Adult:** PO 1000 mg/day, in 1-2 divided doses, may need for 1-3 yr post MI

### Renal dose

**Adult:** PO CCr 15-35 ml/min, max 50 mg/day; CCr <15 ml/min max 25 mg/day; hemodialysis 25-50 mg after dialysis

**Available forms:** Tabs 25, 50, 100 mg

### Implementation

**PO route**

• Given before meals, at bedtime; tablet may be crushed or swallowed whole; give with food, same time of day to prevent GI upset; reduced dosage in renal dysfunction; take at same time each day

• Store protected from light, moisture; place in cool environment

## ADVERSE EFFECTS

**CNS:** *Insomnia, fatigue, dizziness, mental changes,* memory loss, hallucinations, depression, lethargy, drowsiness, strange dreams, catatonia

**CV:** Profound hypotension, bradycardia, HF, *cold extremities, postural hypotension, 2nd- or 3rd-degree heart block*

**ENDO:** Increased hypoglycemic response to insulin

**GI:** *Nausea, diarrhea,* vomiting, mesenteric arterial thrombosis, ischemic colitis

**GU:** Impotence, decreased libido

**HEMA:** Agranulocytosis, thrombocytopenia, purpura

**INTEG:** Rash, fever, alopecia

**RESP:** Bronchospasm, dyspnea, wheezing, pulmonary edema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 50%-60% (PO) |
| **Distribution** | Crosses placenta; protein binding (5%-15%) |
| **Metabolism** | Not metabolized |
| **Excretion** | Breast milk, kidneys (50%), feces (50%—unabsorbed product) |
| **Half-life** | 7 hr |

### Pharmacodynamics

| | PO |
|---|---|
| **Onset** | 1 hr |
| **Peak** | 2-4 hr |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Digoxin, diltiazem, hydrALAZINE, methyldopa, prazosin, reserpine, verapamil: increased hypotension, bradycardia

EPHEDrine, pseudoephedrine: increased hypertension

DOPamine, insulin, theophylline: decreased effect of each of these drugs

### Drug classifications

Aluminum antacids, NSAIDs, penicillins, salicylates: decreased atenolol effect

Amphetamines: increased hypertension

Anticholinergics, antihypertensives: cardiac glycosides, calcium channel blockers: increased hypotension, bradycardia, monitor and adjust dose if needed

Antidiabetic agents (oral) MAOIs: decreased effect of each of these drugs

Sympathomimetics (cough, cold preparations): mutual inhibition

### Drug/herb

Hawthorn: increased atenolol effect

Ephedra (ma huang): decreased atenolol effect

### Drug/lab test

Increased: uric acid, potassium, triglyceride, blood, BUN, ANA titer, platelets, alkaline phosphatase, creatinine, LDH, AST/ALT

Decreased: glucose

## NURSING CONSIDERATIONS

### Assessment

- Monitor **hypertension,** B/P during beginning treatment, periodically thereafter; pulse q4hr; note rate, rhythm, quality: apical/radial pulse before administration; notify prescriber of any significant changes (pulse <50 bpm); ECG
- Hypotension: may be caused in hemodialysis
- Hypoglycemia: may be masked in diabetes mellitus
- Check for baselines in renal, liver function tests before therapy begins
- Assess for edema in feet, legs daily; monitor I&O, daily weight; check for jugular vein distention, crackles bilaterally, dyspnea (HF)
- **Pregnancy/breastfeeding:** Do not use in pregnancy/breastfeeding

### Patient/family education

**BLACK BOX WARNING:** Teach patient not to discontinue product abruptly; taper over 2 wk (angina) as directed, **may precipitate angina, MI,** if stopped abruptly; take at same time each day

- Teach patient not to use OTC products containing α-adrenergic stimulants (such as nasal decongestants, OTC cold preparations); to limit alcohol, smoking; to limit sodium intake as prescribed
- Teach patient how to take pulse and B/P at home; advise when to notify prescriber (<60 bpm)
- Instruct patient to comply with weight control, dietary adjustments, modified exercise program
- Advise patient to carry/wear emergency ID for products, allergies, conditions being treated; tell patient product controls symptoms but does not cure
- Caution patient to avoid hazardous activities if dizziness, drowsiness is present
- Teach patient to report symptoms of HF: difficult breathing, especially on exertion or when lying down, night cough, swelling of extremities or bradycardia, dizziness, confusion, depression, fever
- Teach patient to take product as prescribed, not to double doses, skip doses; take any missed doses as remembered if at least 6 hr until next dose
- Advise to change position slowly
- Advise patient that product may mask symptoms of hypoglycemia in diabetic patients
- Advise patient to use contraception while taking this product, do not use in pregnancy, breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P in hypertension (after 1-2 wk)
- Absence of dysrhythmias
- Absence of MI
- Decreased angina/pain
- Increased activity tolerance

## TREATMENT OF OVERDOSE:

Lavage, **IV** atropine for bradycardia, **IV** theophylline for bronchospasm, digoxin, $O_2$, diuretic for cardiac failure, hemodialysis, **IV** glucose for hyperglycemia, **IV** diazepam (or phenytoin) for seizures

A

⚠ HIGH ALERT

RARELY USED

## atezolizumab

(a-te-zoe-liz′ue-mab)

**Tecentriq**

*Func. class.:* Antineoplastic

**USES:** Treatment of locally advanced or metastatic urothelial carcinoma, including bladder cancer and other urinary system cancers, in patients who progress during or after platinum-containing chemotherapy for advanced disease, or within 12 months of neoadjuvant or adjuvant platinum-containing chemotherapy

### CONTRAINDICATIONS

Hypersensitivity

### DOSAGE AND ROUTES

**Adult: IV** INF 1200 mg over 60 min q3wk until disease progression or unacceptable toxicity. If the first infusion is tolerated, infusions may be given over 30 min

## atomoxetine (Rx)

(at-o-mox′eh-teen)

**Strattera**

*Func. class.:* Psychotherapeutic—miscellaneous

**ACTION:** A selective norepinephrine reuptake inhibitor; may inhibit the presynaptic norepinephrine transporter; exact mechanism of action is unknown

**Therapeutic outcome:** Decreased hyperactivity, impulsivity, increased attention, organization, ability to complete tasks

**USES:** Attention deficit hyperactivity disorder

### CONTRAINDICATIONS

Hypersensitivity, closed-angle glaucoma, MAOI therapy, history of pheochromocytoma

**Precautions:** Pregnancy, breastfeeding, hypertension, hepatic disease, angioedema, bipolar disorder, dysrhythmias, CAD, hypo/hypertension, arteriosclerosis, cardiac disease, cardiomyopathy, heart failure, jaundice

**BLACK BOX WARNING:** Children <6 yr, suicidal ideation

### DOSAGE AND ROUTES

**ADHD**

**Child ≤70 kg, and <6 yr:** PO 0.5 mg/kg/day, increase after 3 days to a target daily dose of 1.2 mg/kg in AM or evenly divided doses AM, late afternoon; max 1.4 mg/kg/day or 100 mg daily, whichever is less

**Adult and child >6 yr and >70 kg:** PO 40 mg daily, increase after 3 days to a target daily dose of 80 mg in AM or evenly divided doses AM, late afternoon; max 100 mg daily

**Initial dosage titration with strong CYP2D6 inhibitors**

**Adult and child >6 yr weighing >70 kg:** PO 40 mg/day each AM or 2 evenly divided doses, titrate to target of 80 mg/day if symptoms do not improve after 4 wk and dose is well tolerated

**Hepatic dose**

Child-Pugh B: reduce dose by 50%
Child-Pugh C: reduce dose by 75%

**Available forms:** Caps 10, 18, 25, 40, 60, 80, 100 mg

**Implementation**

- Swallow whole; do not break, crush, or chew
- Give without regard to food
- Provide gum, hard candy, frequent sips of water for dry mouth

### ADVERSE EFFECTS

**CNS:** *Insomnia,* dizziness, headache, irritability, crying, mood swings, fatigue, hypoesthesia, lethargy, paresthesia
**CV:** *Palpitations,* hot flushes, tachycardia, increased B/P
**ENDO:** Growth retardation
**GI:** Dyspepsia, nausea, anorexia, dry mouth, weight loss, vomiting, diarrhea, constipation, hepatic injury
**GU:** Urinary hesitancy, retention, dysmenorrhea, erectile disturbance, ejaculation failure, impotence, prostatitis, abnormal orgasm, male pelvic pain
**INTEG:** Exfoliative dermatitis, sweating, rash
**MISC:** Cough, rhinorrhea, dermatitis, ear infection, rhabdomyolysis

**Pharmacokinetics**

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding, 98% |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Unknown, half-life 5 hr |

**Pharmacodynamics**

Unknown

### INTERACTIONS

**Individual drug**

Albuterol: increased cardiovascular effects

### Drug classifications

CYP2D6 inhibitors (amiodarone, cimetidine [weak], citalopram, clomiPRAMINE, delavirdine, escitalopram, FLUoxetine, gefitinib, imatinib, PARoxetine, propafenone, quiNIDine [potent], ritonavir, sertraline, thioridazine, venlafaxine): increased effects of atomoxetine
Increase: B/P pressor agents
MAOIs or within 14 days of MAOIs, vasopressors: hypertensive crisis
Increase: QT prolongation, torsade de pointes dofetilide, grepafloxacin, mesoridazine, pimozide, probucol, sparfloxacin, ziprasidone
Pressor agents: increased cardiovascular effects

## NURSING CONSIDERATIONS

### Assessment

- Monitor VS, B/P; check patients with cardiac disease more often for increased B/P
- **Hepatic injury:** may cause liver failure: monitor LFT; assess for jaundice, pruritus, flu-like symptoms, upper right quadrant pain

**BLACK BOX WARNING:** Assess mental status: mood, sensorium, affect, stimulation, insomnia, aggressiveness, suicidal ideation in children/young adults

- Assess appetite, sleep, speech patterns
- Assess for attention span, decreased hyperactivity in ADHD persons, growth rate, weight; therapy may need to be discontinued
- Priapism: Monitor for urinary function (hesitancy, retention, sexual changes)
- Pregnancy/breastfeeding: Identify if pregnancy is planned or suspected, or if breastfeeding, use only if benefits outweigh fetal risk

### Patient/family education

- Advise patient to avoid OTC preparations, other medications, herbs, supplements unless approved by prescriber, no tapering needed when discontinuing product
- Advise patient to avoid alcohol ingestion
- Advise patient to avoid hazardous activities until stabilized on medication
- Advise patient to get needed rest; patients will feel more tired at end of day; do not take dose late in day, insomnia may occur

**BLACK BOX WARNING:** Advise to report suicidal ideation

- Teach patient to notify prescriber immediately if erection >4 hr
- To report immediately, fatigue, chest pain, difficulty breathing
- **Pregnancy/breastfeeding:** Teach patient to notify provider if pregnancy is planned or suspected, avoid use in pregnancy, breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Decreased hyperactivity (ADHD)

## atorvastatin (Rx)

(a-tore'va-stat-in)
**Lipitor**
*Func. class.:* Antilipidemic
*Chem. class.:* HMG-CoA reductase inhibitor

**Do not confuse:** atorvastatin/atomoxetine, Lipitor/Loniten/ZyrTEC

**ACTION:** Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis, high doses lead to plaque regression

**Therapeutic outcome:** Decreased cholesterol levels and LDLs, increased HDLs

**USES:** As an adjunct in primary hypercholesterolemia (types Ia, Ib), dysbetalipoproteinemia, elevated triglyceride levels; prevention of cardiovascular disease by reduction of heart risk in those with mildly elevated cholesterol

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, active liver disease

**Precautions:** Past liver disease, alcoholism, severe acute infections, trauma, severe metabolic disorders, electrolyte imbalance

## DOSAGE AND ROUTES

**Adult:** PO 10-20 mg daily, usual range 10-80 mg, dosage adjustments may be made in 2-4 wk intervals, max 80 mg/day; patients requiring >45% reduction in LDL may be started at 40 mg daily

### Heterozygous familial hypercholesterolemia

**Child 10-17 yr:** PO 10 mg q day, adjust q4 wk, max 20 mg/day

**Available forms:** Tabs 10, 20, 40, 80 mg

### Implementation

- Administer total daily dose at any time of day
- Store in cool environment in airtight, light-resistant container

## ADVERSE EFFECTS

**CNS:** Headache, asthenia, insomnia
**EENT:** Lens opacities
**GI:** *Abdominal cramps, constipation, diarrhea, heartburn,* nausea, dyspepsia, *flatus,* liver dysfunction, pancreatitis, increased serum transaminase
**GU:** Impotence, urinary tract infection

**INTEG:** Rash, pruritus, alopecia, photosensitivity (rare)
**MISC:** Hypersensitivity; gynecomastia (child)
**MS:** Myalgia, rhabdomyolysis, arthralgia, myositis
**RESP:** Pharyngitis, sinusitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Bile, feces, kidneys |
| **Half-life** | 14 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Amiodarone, boceprevir, nelfinavir, lopinavir/ritonavir
Clofibrate, cycloSPORINE, gemfibrozil, niacin: increased risk of rhabdomyolysis, use lower dose
Colestipol: decreased action of atorvastatin, myopathy
Digoxin: increased action of digoxin CYP3A4 inhibitors, monitor digoxin levels often
Erythromycin: increased levels of atorvastatin
Warfarin: increased action of warfarin

### Drug classifications

Antifungals (azole): possible rhabdomyolysis
Contraceptives (oral): increased levels

### Drug/herb

St. John's wort: decreased effect

### Drug/food

Grapefruit juice: possible toxicity
Oat bran may reduce effectiveness

### Drug/lab test

Increased: ALT, AST, CK
Interference: thyroid function tests

## NURSING CONSIDERATIONS

### Assessment

- **Hypercholesterolemia:** assess nutrition: fat, protein, carbohydrates; nutritional analysis should be completed by dietitian before treatment; assess for muscle pain, tenderness; obtain CPK if these occur, product may need to be discontinued; monitor triglycerides, cholesterol at baseline and throughout treatment; LDL and VLDL should be watched closely; if increased, product should be discontinued
- Monitor bowel pattern daily; diarrhea may be a problem
- Monitor liver function studies q1-2mo during the first 1½ yr of treatment; AST, ALT, liver function tests may be increased
- Monitor renal studies in patients with compromised renal system: BUN, I&O ratio, creatinine
- Assess eyes via ophthalmic exam 1 mo after treatment begins, annually
- **Rhabdomyolysis:** Assess for muscle pain, tenderness, obtain CPK baseline, if markedly increased, product may need to be discontinued, many drug interactions make the possibility of rhabdomyolysis greater
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, do not breastfeed or use in pregnancy

### Patient/family education

- Inform patient that compliance is needed for positive results to occur, not to double doses
- Teach patient that risk factors should be decreased: high-fat diet, smoking, avoid alcohol consumption, absence of exercise
- Advise patient to notify prescriber if the GI symptoms of diarrhea, abdominal or epigastric pain, nausea, vomiting; chills, fever, sore throat; muscle pain, weakness occur
- Advise patient that treatment will take several years
- Advise patient that blood work and eye exam will be necessary during treatment
- Advise not to take if pregnant or breastfeeding
- Advise patient to stay out of the sun, use protective clothing, or use sunscreen to prevent photosensitivity (rare)

### Evaluation

**Positive therapeutic outcome**

- Decreased cholesterol levels, serum triglyceride
- Improved HDL:LDL ratio

## atovaquone (Rx)

(a-toe'va-kwon)
**Mepron**
*Func. class.:* Antiprotozoal
*Chem. class.:* Analog of ubiquinone

**ACTION:** Interferes with DNA/RNA synthesis in protozoa

**Therapeutic outcome:** Antiprotozoal for *Pneumocystis jiroveci* only

**USES:** *P. jiroveci* infections in patients intolerant of trimethoprim/sulfamethoxazole (cotrimoxazole), prophylaxis, *Toxoplasma gondii,* toxoplasmosis

## CONTRAINDICATIONS

Hypersensitivity or history of developing life-threatening allergic reactions to any component of the formulation, benzyl alcohol sensitivity

**Precautions:** Pregnancy, breastfeeding, GI/hepatic disease, neonates, respiratory insufficiency

## DOSAGE AND ROUTES

### Acute, mild, moderate *Pneumocystis jiroveci* pneumonia (PCP)

**Adult and adolescent 13-16 yr:** PO 750 mg tid with food for 21 days

### *Pneumocystis jiroveci* pneumonia prophylaxis

**Adult and adolescent:** PO 1500 mg daily with meal

**Available forms:** Susp 750 mg/5 ml

### Implementation

- Give with food (preferably fatty); to increase absorption of the product and higher plasma concentrations; give tid × 3 wk
- Give oral suspension after shaken
- Take all contents of foil pouch

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache, anxiety,* insomnia, asthenia, fever
**CV:** Hypotension
**GI:** *Nausea, vomiting, diarrhea,* anorexia, increased AST and ALT, acute pancreatitis, constipation, abdominal pain
**HEMA:** Anemia, neutropenia
**INTEG:** Pruritus, urticaria, *rash*
**META:** Hypoglycemia, hyponatremia
**OTHER:** Cough, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poor; increased when taken with fatty foods |
| **Distribution** | Unknown |
| **Metabolism** | Hepatic recycling |
| **Excretion** | Feces, unchanged (94%) |
| **Half-life** | 2-3 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-8 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Metoclopramide, Rifampin, rifabutin, tetracycline: decreased effectiveness of atovaquone, avoid concurrent use
Zidovudine: increased level of zidovudine, monitor for toxicity

### Drug/lab test

Increase: AST, ALT, alk phos
Decrease: glucose, neutrophils, Hgb, sodium

## NURSING CONSIDERATIONS

### Assessment

- Assess for ***Pneumocystis jiroveci:*** monitor WBC, bilateral lung sounds, sputum for C&S; these should be checked before, periodically during, after treatment; after collection of 1st sputum, therapy may begin
- Monitor for signs of **infection;** anemia; monitor bowel pattern before, during treatment
- Monitor respiratory status: rate, character, wheezing, dyspnea; ABGs, chest films
- Assess for dizziness, confusion, hallucination
- Assess for allergies before treatment, reaction of each medication; place allergies on chart; notify all people giving products
- Pregnancy/breastfeeding: Identify if pregnancy is planned or suspected, use only if benefits outweigh fetal risk, cautious use in breastfeeding

### Patient/family education

- Instruct patient to take with food, preferably fatty foods, to increase plasma concentrations
- Advise patient to take product exactly as prescribed

### Evaluation

**Positive therapeutic outcome**

- Decreased temperature
- Ability to breathe
- Three negative sputum cultures

## atropine (Rx)

(a'troe-peen)
*Func. class.:* Antidysrhythmic, anticholinergic parasympatholytic, antimuscarinic
*Chem. class.:* Belladonna alkaloid

**Do not confuse:** atropine/Akarpine

**ACTION:** Blocks acetylcholine at parasympathetic neuroeffector sites; increases cardiac output, heart rate by blocking vagal stimulation in heart; dries secretions by blocking vagus

**Therapeutic outcome:** Drying of secretions, increased heart rate, cycloplegia, mydriasis

**USES:** Bradycardia <40-50 bpm, bradydysrhythmia, reversal of anticholinesterase agents, insecticide poisoning, blocking cardiac vagal reflexes, decreasing secretions before surgery, antispasmodic with GU and biliary surgery, bronchodilator, AV heart block, irinotecan-induced diarrhea, rapid-sequence intubation

## CONTRAINDICATIONS

Hypersensitivity to belladonna alkaloids, closed-angle glaucoma, GI obstructions, myasthenia gravis, thyrotoxicosis, ulcerative colitis, prostatic hypertrophy, tachycardia/tachydysrhythmias, asthma, acute hemorrhage, severe hepatic disease, myocardial ischemia, paralytic ileus

**Precautions:** Pregnancy, breastfeeding, child <6 yr, geriatric, renal disease, HF, hyperthyroidism, COPD, hypertension, intraabdominal infections, Down syndrome, spastic paralysis, gastric ulcer

## DOSAGE AND ROUTES

### Bradycardia/bradydysrhythmias

**Adult:** **IV** bol 0.5-1 mg given q3-5min, not to exceed 2 mg

**Child:** **IV** 0.02 mg/kg, may repeat X1, min dose 0.1 mg to avoid paradoxical reaction, max single dose 0.5 mg, max total dose 1 mg

### Organophosphate poisoning

**Adult and child:** IM (AtroPen)/**IV** 1-2 mg q 20-30 min until muscarinic symptoms disappear; may need 6 mg qhr

**Adult and child ≥90 lb, usually >10 yr:** 2 mg IM (AtroPen)

**Child 40-90 lb, usually 4-10 yr:** 1 mg IM (AtroPen)

**Child 15-40 lb, 6 mo-4 yr:** 0.5 mg IM (AtroPen)

**Infant <15 lb:** IM/**IV** 0.05 mg/kg q5-20min

### Presurgery

**Adult and child >20 kg:** SUBCUT/IM/ **IV** 0.4-0.6 mg 30-60 min before anesthesia

**Child <20 kg:** IM/SUBCUT 0.01 mg/kg up to 0.4 mg ½-1 hr preop, max 0.6 mg/dose

**Available forms:** Inj 0.05, 0.1, 0.4, 0.8, 1 mg/ml; inj prefilled autoinjectors (AtroPen) 0.25, 0.5, 1, 2 mg

### Implementation

**IM route**

• Expect atropine flush 15-20 min after inj; it may occur in children and is not harmful

**AtroPen**

• Use no more than 3 AtroPen injections unless under the supervision of trained provider

• Use as soon as symptoms appear (tearing, wheezing, muscle fasciculations, excessive oral secretions), may use through clothing

**IV route**

• Give **IV** undiluted or diluted with 10 ml sterile water; give at a rate of 0.6 mg/min; give through Y-tube or 3-way stopcock; do not add to **IV** sol; may cause paradoxical bradycardia lasting 2 min

**Y-site compatibilities:** Amrinone, etomidate, famotidine, heparin, hydrocortisone sodium succinate, meropenem, nafcillin, potassium chloride, SUFentanil, vit B/C

## ADVERSE EFFECTS

**CNS:** Headache, dizziness, involuntary movement, confusion, psychosis, anxiety, coma, flushing, drowsiness, insomnia, weakness, delirium (geriatric)

**CV:** Hypo/hypertension, paradoxical bradycardia, angina, PVCs, tachycardia, ectopic ventricular beats, bradycardia, palpitations

**EENT:** Blurred vision, photophobia, glaucoma, eye pain, pupil dilatation, nasal congestion, increased intraoccular pressure

**GI:** Dry mouth, nausea, vomiting, abdominal pain, anorexia, constipation, paralytic ileus, abdominal distention, altered taste

**GU:** Retention, hesitancy, impotence, dysuria

**INTEG:** Rash, urticaria, contact dermatitis, dry skin, flushing

**MISC:** Suppression of breastfeeding, decreased sweating, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, SUBCUT, IM) |
| **Distribution** | Crosses blood-brain barrier, placenta |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, unchanged (70%-90%); breast milk |
| **Half-life** | 13-40 hr |

### Pharmacodynamics

| | IM/ SUBCUT | IV | Ophth |
|---|---|---|---|
| **Onset** | 15 min | 2-4 min | ½ hr |
| **Peak** | 30 min | 2-4 min | 30-60 min |
| **Duration** | 4-6 hr | 4-6 hr | 1-2 wk |

## INTERACTIONS

### Individual drugs

Amantadine: increased anticholinergic effects

Ketoconazole, levodopa: decreased absorption

Potassium chloride (oral): increased mucosal lesions, avoid concurrent use

### Drug classifications

Antacids: decreased absorption of atropine

Antidepressants (tricyclic), antiparkinson agents, phenothiazines, antidysrhythmics: increased anticholinergic effect

## NURSING CONSIDERATIONS

### Assessment

- Monitor I&O ratio; check for urinary retention and daily output in geriatric or postoperative patients
- Monitor ECG for ectopic ventricular beats, PVC, tachycardia in cardiac patients
- Monitor for bowel sounds; check for constipation; abdominal distention and constipation may occur
- Monitor respiratory status: rate, rhythm, cyanosis, wheezing, dyspnea, engorged neck veins
- Monitor cardiac rate: rhythm, character, B/P continuously
- Monitor allergic reaction: rash, urticaria
- Beers: Avoid in older adults, highly anticholinergic, high risk of delirium, in men decreases urinary flow
- Pregnancy/breastfeeding: Identify if pregnancy is planned or suspected, use only if benefits outweigh fetal risk

### Patient/family education

- Advise patient not to perform strenuous activity in high temperatures; heat stroke may result
- Instruct patient to take as prescribed; not to skip doses
- Instruct patient to report change in vision; blurring or loss of sight; trouble breathing; sweating; flushing, chest pain, allergic reactions, constipation, urinary retention, to use sunglasses to protect the eyes
- Caution patient not to operate machinery if drowsiness occurs
- Advise patient not to take OTC products without approval of physician
- Teach patient not to freeze or expose to light (Astropen)

### Evaluation

**Positive therapeutic outcome**

- Decreased dysrhythmias
- Increased heart rate
- Decreased secretions, GI, GU spasms
- Bronchodilatation

## TREATMENT OF OVERDOSE:

$O_2$, artificial ventilation, ECG; administer DOPamine for circulatory depression; administer diazepam or thiopental for seizure; assess need for antidysrhythmics

**atropine ophthalmic**
*See Appendix B*

**⚠ HIGH ALERT**

# axitinib

**Inlyta**

*Func. class.:* Antineoplastic, biologic response modifier, signal transduction inhibitor (STI)

*Chem. class.:* Tyrosine kinase inhibitor

**ACTION:** Inhibits receptor tyrosine kinases including vascular endothelial growth factor receptors (VEGFR)-1, VEGFR-2, and VEGFR-3; inhibits tumor growth and phosphorylation of VEGFR-2 and VEGF-mediated endothelial cell proliferation

**Therapeutic outcome:** Decreased spread of malignancy

**USES:** Treatment of advanced renal cell cancer after failure of one prior systemic therapy

## CONTRAINDICATIONS

Pregnancy, breastfeeding

**Precautions:** Risk for or history of thromboembolic disease, recent bleeding, untreated brain metastasis, recent GI bleeding, GI perforation, fistula, surgery, moderate hepatic disease, uncontrolled hypertension, hyper/hypothyroidism, proteinuria, infertility, end-stage renal disease (CrCl $<$15 ml/min); not intended for use in adolescents, children, infants, neonates

## DOSAGE AND ROUTES

**Adult: PO** 5 mg bid (at 12 hr intervals), may increase to 7 mg bid and then to 10 mg bid in those not receiving antihypertensives who tolerate the lower dosage for at least 2 consecutive wk with no more than grade 2 adverse reactions. Reduce to 3 mg bid if a dose reduction is needed; if further reduction is necessary, reduce to 2 mg bid

**Adult receiving a strong CYP 3A4/5 inhibitor:** Reduce dose by 1/2, adjust as needed

**Available forms:** Tab 1, 5 mg

### Implementation

- Give with or without food; swallow tablet whole with a glass of water
- If patient vomits or misses a dose, an additional dose should not be taken; the next dose should be taken at the usual time
- Store at room temperature

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, reversible posterior leukoencephalopathy syndrome (RPLS), fatigue

**CV:** Hypertension, arterial thromboembolic events (ATE), venous thromboembolic events (VTE)

**ENDO:** Hypothyroidism, hyperthyroidism
**GI:** Lower GI bleeding/perforation/fistula. abdominal pain, constipation, diarrhea, dysgeusia, dyspepsia, dysphonia, hemorrhoids, nausea, mucosal inflammation, stomatitis, vomiting, increased ALT/AST
**GU:** Proteinuria
**HEMA:** Bleeding, intracranial bleeding, anemia, polycythemia, decreased/increased hemoglobin, lymphopenia, thrombocytopenia, neutropenia
**INTEG:** Palmar-plantar erythrodysesthesia (hand and foot syndrome), rash, dry skin, pruritus, alopecia, erythema
**MISC:** Weight loss dehydration metabolic and electrolyte laboratory abnormalities included
**MS:** Asthenia, arthralgia, musculoskeletal pain, myalgia
**RESP:** Cough, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding >99% |
| **Metabolism** | Liver |
| **Excretion** | Unknown |
| **Half-life** | 2.5-6.1 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CYP3A4/5 inhibitor, strong, moderate (ketoconazole, boceprevir, chloramphenicol, conivaptan, delavirdine, fosamprenavir, imatinib, indinavir, isoniazid, itraconazole, dalfopristin; quinupristin, posaconazole, ritonavir, telithromycin, tipranavir [boosted with ritonavir], darunavir [boosted with ritonavir], aldesleukin, IL-2, amiodarone, aprepitant, fosaprepitant atazanavir, bromocriptine, clarithromycin, crizotinib, danazol, diltiazem, dronedarone, erythromycin, fluvoxaMINE, lanreotide, lapatinib, miconazole, mifepristone, nefazodone, nelfinavir, niCARdipine, octreotide, pantoprazole, saquinavir, tamoxifen, verapamil, voriconazole, grapefruit juice): increased axitinib effect, avoid using together or reduce axitinib dose
CYP3A4/5 inducers, strong/moderate (rifampin, carBAMazepine, dexamethasone, phenytoin, PHENobarbital, rifabutin, rifapentine, St. John's wort, ethanol, bexarotene, bosentan, efavirenz, etravirine, griseofulvin, metyrapone, modafinil, nafcillin, nevirapine, OXcarbazepine, vemurafenib, pioglitazone, topiramate): decreased effect of axitinib, avoid using together
CYP3A4/5 inhibitor and inducers (quiNINE): increased or decreased axitinib effect

### Drug/lab test

Increase: creatinine, lipase, amylase, potassium
Decrease: bicarbonate, calcium, albumin, glucose, phosphate, sodium
Increase or decrease: sodium, glucose

### Drug/food

Increase drug effect: grapefruit or grapefruit juice

### Drug/herb

St. John's wort: decreased effect of axitinib

## NURSING CONSIDERATIONS

### Assessment

- Bleeding: monitor for GI bleeding or perforation; temporarily discontinue therapy if a patient develops any bleeding that requires treatment
- Surgery: discontinue ≥24 hr before surgery, may be resumed after adequate wound healing
- Hepatic/renal disease: dosage should be reduced in patients with moderate (Child-Pugh Class B) hepatic disease, monitor liver function tests (ALT, AST, bilirubin) before and periodically during therapy; monitor CCr before and during treatment
- Hypertension: B/P should be well controlled before starting treatment; monitor patients for hypertension and administer antihypertensive therapy as needed before and during therapy; dose should be reduced for persistent hypertension; therapy should be discontinued if B/P remains elevated after a dosage reduction or if there is evidence of hypertensive crisis; after discontinuation monitor B/P for hypotension in those receiving antihypertensives
- Hyper/hypothyroidism: monitor thyroid function tests before and periodically during therapy; thyroid disease should be treated with thyroid medications
- Monitor for proteinuria before and periodically during therapy; product may need to be decreased or discontinued if moderate to severe proteinuria occurs
- **Pregnancy/breastfeeding:** determine if the patient is pregnant or breastfeeding before using this product; may also cause infertility, do not use in pregnancy or breastfeeding

### Patient/family education

- Instruct patient to use contraception during treatment or to avoid use of this product;

to notify prescriber if pregnancy is planned or suspected, not to breastfeed
• Instruct patient to notify prescriber of bleeding that is severe or that requires treatment
• Teach patient that product will be discontinued ≥24 hr before surgery; may be resumed after adequate wound healing
• Teach patient that laboratory testing will be required before and periodically during product use
• Teach patient how to monitor B/P and that B/P products should be continued as directed by prescriber

### Evaluation

**Positive therapeutic outcome**
• Decreased spread of malignancy

**⚠ HIGH ALERT**

## azaCITIDine (Rx)

(a-za-sie-ti′deen)
**Vidaza**
*Func. class.:* Antineoplastic hormone
*Chem. class.:* Pyrimidine nucleoside analogue

**Do not confuse:** azaCITIDine/ azaTHIOprine

**ACTION:** Cytotoxic by producing damage to double-strand DNA during DNA synthesis

**Therapeutic outcome:** Improved blood counts in refractor anemia

**USES:** Myelodysplastic syndrome (MDS)

## CONTRAINDICATIONS

Pregnancy, hypersensitivity to this product or mannitol, advanced malignant hepatic tumors

**Precautions:** Breastfeeding, children, geriatric, renal/hepatic disease; baseline albumin <30 g/L; a man should not father a child while taking this product

## DOSAGE AND ROUTES

**Adult:** SUBCUT 75 mg/m² daily × 7 days, q4wk, premedicate with antiemetic; dose may be increased to 100 mg/m² if no response is seen after 2 treatment cycles; minimum treatment 4 cycles

**Available forms:** Powder for inj, 100 mg

### Implementation

• Increase patient's fluid intake to 2-3 L/day to prevent dehydration, unless contraindicated
• Assist patient with rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss
• Provide a nutritious diet with iron, vitamin supplement, low fiber, few dairy products
• Use cytotoxic handling procedures

**SUBCUT route**
• **Reconstitute** with 4 ml sterile water for inj (25 mg/ml), **inject** diluents slowly into vial, **invert** vial 2-3 times and gently rotate; sol will be cloudy, use immediately; divide doses >4 ml into two syringes; invert the contents 2-3 times and gently roll syringe between the palms for 30 sec immediately before administration; rotate inj site

**IV intermittent INF route**
• **Reconstitute** each vial with 4 ml sterile water for inj, **shake** well until all solids are dissolved, (10 mg/ml) withdraw sol and **inject** in 50-100 NS or LR, **infuse** over 10-40 min

## ADVERSE EFFECTS

**CNS:** Anxiety, depression, dizziness, fatigue, headache, fever, insomnia
**CV:** Cardiac murmur, hypotension, tachycardia, peripheral edema, chest pain
**GI:** Diarrhea, nausea, vomiting, anorexia, constipation, abdominal pain, distention, tenderness, hemorrhoids, mouth hemorrhage, tongue ulceration, stomatitis, dyspepsia, hepatotoxicity, hepatic coma
**GU:** Real failure, renal tubular acidosis, dysuria, UTI
**HEMA:** Leukopenia, anemia, thrombocytopenia, neutropenia, ecchymosis, febrile neutropenia, petechiae
**INTEG:** Irritation at site, rash, sweating, pyrexia, pruritus
**META:** Hypokalemia
**MS:** Weakness, arthralgia, muscle cramps, myalgia, back pain
**RESP:** Cough, dyspnea, pharyngitis, pleural effusion

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Urine |
| **Half-life** | 35-49 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | ½ hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Antineoplastics, other: increased bone marrow suppression
Increase: bleeding, anticoagulants

### Drug/lab
Increase: BUN/creatinine
Decrease: WBC, platelets, neutrophils, potassium

## NURSING CONSIDERATIONS
### Assessment
- Assess for CNS symptoms: fever, headache, chills, dizziness
- Monitor bone marrow suppression with patients with baseline WBC $3 \times 10^9$/L, absolute neutrophil count (ANC) $= 1.5 \times 10^9$/L, and platelets $= 75 \times 10^9$/L, adjust dose; ANC $< 0.5 \times 10^9$/L, platelets $< 25 \times 10^9$/L, give 50% dose next course; ANC 0.5-1.5 $\times$ $10^9$/L, platelets 25-50 $\times$ $10^9$/L, give 67% next course
- Assess buccal cavity q8hr for dryness, sores, or ulceration, white patches, oral pain, bleeding, dysphagia
- Assess for bruising, bleeding, blood in stools, urine, sputum, emesis; myelodysplastic syndrome (MDS), splenomegaly

### Patient/family education
- Instruct patient to avoid foods with citric acid or hot or rough texture if stomatitis is present; to drink adequate fluids
- Instruct patient to report stomatitis; any bleeding, white spots, ulcerations in mouth; tell patient to examine mouth daily, report symptoms
- Instruct patient to avoid crowds, persons with known infections; not to receive immunizations
- Advise patient to use contraception during and for several months after therapy, pregnancy D not to breastfeed, not to father a child while receiving this product

### Evaluation
**Positive therapeutic outcome**
- Improvement in blood counts in refractory anemia, or refractory anemia with excess blasts

## azaTHIOprine (Rx)
(ay-za-thye'oh-preen)
**Azasan, Imuran**
*Func. class.:* Immunosuppressant
*Chem. class.:* Purine antagonist

**Do not confuse:** azaTHIOprine/azaCITIDine

**ACTION:** Produces immunosuppression by inhibiting purine synthesis in cells

**Therapeutic outcome:** Absence of graft rejection, slowing of rheumatoid arthritis

**USES:** Renal transplants to prevent graft rejection, refractory rheumatoid arthritis

**Unlabeled uses:** Myasthenia gravis, chronic ulcerative colitis, Crohn's disease, Behçet's syndrome

## CONTRAINDICATIONS
Pregnancy, breastfeeding, hypersensitivity

**Precautions:** Severe renal/hepatic disease, geriatric, thiopurine methyltransferase deficiency, infection, bone marrow suppression, must be used by an experienced clinician

**BLACK BOX WARNING:** neoplastic disease

## DOSAGE AND ROUTES
### Prevention of rejection
**Adult and child:** **IV** 3-5 mg/kg/day, then maintenance (PO) of at least 1-3 mg/kg/day,

### Renal dose
**Adult:** PO; give lower dose in tubular necrosis in immediate postcadaveric transplant period, CCr 10-50 ml/min 75% of dose; CCr <10 ml/min 50% of dose

### Refractory rheumatoid arthritis
**Adult:** PO 1 mg/kg/day; may increase dosage after 2 mo by 0.5 mg/kg/day and then q4wk; not to exceed 2.5 mg/kg/day

### Idiopathic thrombocytopenia purpura (unlabeled)
**Adult:** PO 1-2 mg/kg/day X 3-6 mo max 150 mg/day

**Available forms:** Tabs 50, 75, 100 mg; inj **IV** 100 mg

### Implementation
**PO route**
- Give with meals to reduce GI upset; nausea is common

**IV route**
- Prepare in biological cabinet using gown, gloves, mask

**Direct, IV route**
- **Dilute** to 10 mg/ml with 0.9% NaCl, 0.45% NaCl, $D_5W$, **give** over 5 min

**Intermittent IV INF route**
- **Reconstitute** 100 mg/10 ml of sterile water for inj; rotate to dissolve; **further dilute** with 50 ml or more saline or glucose in saline, **give** over ½-1 hr

**Y-site compatibilities:** Alfentanil, atracurium, atropine, benztropine, calcium gluconate, cycloSPORINE, enalaprilat, epoetin alfa, erythromycin, fentaNYL, fluconazole, folic acid, furosemide, glycopyrrolate, heparin, insulin, mannitol, mechlorethamine, metoprolol, naloxone, nitroglycerin, oxytocin, penicillin G, potassium chloride, propranolol, protamine, SUFentanil, trimetaphan, vasopressin

**Solution compatibilities:** $D_5W$, NaCl 0.9%, NaCl 0.45%

## ADVERSE EFFECTS

**GI:** Nausea, vomiting, stomatitis, esophagitis, pancreatitis, hepatotoxicity, jaundice, hepatic veno-occlusive disease
**HEMA:** Leukopenia, thrombocytopenia, anemia, pancytopenia, bleeding
**INTEG:** Rash, alopecia
**MISC:** Raynaud's symptoms, serum sickness, secondary malignancy, infection
**MS:** Arthralgia, muscle wasting

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Readily (PO) |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver to mercaptopurine |
| **Excretion** | Kidney, minimal |
| **Half-life** | 3 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Unknown | Unknown |
| **Peak** | 4 hr | Unknown |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Do not admix with other products
Allopurinol: increased action of azaTHIOprine, use decreased dose of azaTHIOprine or avoid using
CycloSPORINE: increased myelosuppression
Sulfamethoxazole-trimethoprim: increased leukopenia
Warfarin: decreased action of warfarin

### Drug classifications

ACE inhibitors: increased leukopenia, monitor for increased leukopenia
Antineoplastics: increased myelosuppression, monitor for increased myelosupression
Toxoids, vaccines: decreased immune response

### Drug/lab test

Increased: liver function tests
Decreased: uric acid
Interference: CBC, diff count

## NURSING CONSIDERATIONS

### Assessment

- Assess symptoms of **rheumatoid arthritis:** pain in joints, stiffness, poor range of motion, mobility, inflammation before and during treatment
- Monitor **blood studies:** CBC, Hgb, WBC, platelets during treatment monthly; if leukocytes are $<3000/mm^3$ or platelets $<100{,}000/mm^3$, product should be discontinued or reduced; decreased Hgb level may indicate bone marrow suppression
- **Bone marrow suppression:** severe leukopenia, pancytopenia, thrombocytopenia
- **Monitor liver function studies:** alkaline phosphatase, AST, ALT, amylase, bilirubin; and for hepatotoxicity: dark urine, jaundice, itching, light-colored stools; product should be discontinued
- Monitor I&O, weight daily, report decreasing urine output, toxicity may occur
- Assess for **infection:** increased temp, WBC; sputum, urine

### Patient/family education

- Teach patient to take as prescribed, do not miss doses; if dose is missed on daily regimen, skip dose; if on multiple dosing/day, take as soon as remembered
- Teach patient that therapeutic response may take 3-4 mo in rheumatoid arthritis, to continue with prescribed exercise, rest, other medications; that product is needed for life in renal transplant
- Instruct patient to report fever, rash, severe diarrhea, chills, sore throat, fatigue, since serious infections may occur; or clay-colored stools and cramping (hepatotoxicity)
- Advise patient to use contraceptive measures during treatment for 16 wk after ending therapy; product is teratogenic
- Advise patient to avoid vaccinations
- Tell patient to avoid crowds and persons with known infections to reduce risk of infection
- Teach patient to take with food to decrease GI intolerance
- Teach patient regarding multiple significant drug/drug interactions
- Instruct patient not to use OTC medications without approval of prescriber
- Advise patient to use soft-bristled toothbrush to prevent bleeding

### Evaluation

**Positive therapeutic outcome**

- Absence of graft rejection
- Immunosuppression in autoimmune disorders
- Increased joint mobility without pain in rheumatoid arthritis

## azelaic acid topical

*See Appendix B*

## azelastine (Rx)

(ay′ze-lass-teen)

**Optivar**

*Func. class.:* Leukotriene synthesis inhibitor

*Chem. class.:* Phthalazinone derivative

**ACTION:** Inhibits the synthesis and release of leukotrienes; antagonizes action of acetylcholine, histamine, serotonin

**Therapeutic outcome:** Decreased nasal stuffiness, itching, swollen eyes

**USES:** Seasonal allergic rhinitis

### CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy

### DOSAGE AND ROUTES

**Adult and child ≥12 yr:** NASAL 2 sprays/nostril bid

**Available forms:** Spray 137 mcg/actuation

#### Implementation

- Remove cap/safety clip from spray pump
- Prime pump if using for first time, push 4 times quickly, away from face, blow your nose, then place tip of pump into one nostril, while holding other nostril closed, tilt head forward, and spray into nostril
- Put cover/safety clip back on

### ADVERSE EFFECTS

**CNS:** Sedation (more common with increased dosages), drowsiness

**MISC:** Weight increase, myalgia

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively |
| **Excretion** | Feces |
| **Half-life** | 25-42 hr |

#### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4-5 hr |
| **Duration** | Unknown |

### INTERACTIONS

#### Individual drugs

Alcohol: increased CNS depression

#### Drug classifications

CNS depressants, opioids, sedative/hypnotics: increased CNS depression

### NURSING CONSIDERATIONS

#### Assessment

- Assess respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness; provide fluids to 2 L/day to decrease secretion thickness

#### Patient/family education

- Teach patient all aspects of product uses; to notify prescriber if confusion, sedation occur; to avoid driving and other hazardous activity if drowsiness occurs; to avoid alcohol and other CNS depressants that may potentiate effect
- Caution patient not to exceed recommended dosage; dysrhythmias may occur

#### Evaluation

**Positive therapeutic outcome**

- Absence of runny or congested nose

## azelastine nasal agent

*See Appendix B*

## azelastine ophthalmic

*See Appendix B*

## azilsartan

(ay-zil-sar′tan)

**Edarbi**

(Pronunciation)

*Func. class.:* Antihypertensive

*Chem class.:* Angiotensin II receptor antagonist

**ACTION:** Antagonizes angiotensin II at the $AT_1$ receptor in tissues like vascular smooth muscle and the adrenal gland. Two angiotensin II receptors, $AT_1$ and $AT_2$, have been identified; azilsartan exhibits more than a 10,000-fold greater affinity for the $AT_1$ receptor than the $AT_2$ receptor.

**Therapeutic outcome:** Decreased B/P

**USES:** Hypertension, alone or in combination with other antihypertensives

### CONTRAINDICATIONS

**BLACK BOX WARNING:** Pregnancy (2nd/3rd trimesters)

**Precautions:** Angioedema, African descent, renal disease, renal artery stenosis, children, geriatrics, heart failure, hypovolemia, breastfeeding, pregnancy 1st trimester

## DOSAGE AND ROUTES

**Adult:** PO 80 mg/day, may give an initial dose of 40 mg/day in patients receiving high-dose diuretic therapy

**Available forms:** Tabs 40, 80 mg

### Implementation

- May administer without regard to food
- Use original package to protect from light, moisture, and heat

## ADVERSE EFFECTS

**CNS:** Dizziness, fatigue, asthenia, syncope
**CV:** Hypotension, orthostatic hypotension
**GI:** Nausea, diarrhea
**HEMA:** Anemia
**INTEG:** Angioedema, rash, pruritus
**MS:** Muscle cramps
**RESP:** Cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Absolute bioavailability (60%) not affected by food; steady state within 5 days and no accumulation in plasma occurs with once-daily dosing; hydrolyzed to the active metabolite, azilsartan, in GI tract during absorption, rapidly absorbed |
| **Distribution** | Protein binding, >99%, to serum albumin |
| **Metabolism** | Metabolized by CYP2C9 |
| **Excretion** | 55% eliminated (feces), 42% (urine) |
| **Half-life** | Elimination half-life 11 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1.5-3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CycloSPORINE: in those with poor renal function, increased renal failure risk: monitor closely
Lithium: increased lithium toxicity
Sodium phosphate monobasic monohydrate, sodium phosphate dibasic anhydrous: increased phosphate nephropathy

### Drug classifications

Antidiabetics: increased hypoglycemia
NSAIDs in those with poor renal function: monitor closely: Increased renal failure risk
Other antihypertensives, other angiotensin receptor antagonists, MAOIs: increased hypotensive effect

### Drug/herb

Ephedra: decreased antihypertensive effect
Hawthorn: increased antihypertensive effect

## NURSING CONSIDERATIONS

### Assessment

- **Angioedema:** Assess for facial swelling, difficulty breathing

**BLACK BOX WARNING:** Pregnancy (2nd/3rd trimester), can cause fetal death, avoid breastfeeding

- Response and adverse reactions especially in renal disease
- B/P, pulse during beginning therapy and periodically thereafter; note rhythm, rate, quality; obtain electrolytes before beginning therapy

### Patient/family education

- Instruct patient to comply with dosage schedule even if feeling better

**BLACK BOX WARNING:** Instruct patient to notify prescriber of facial swelling; if pregnancy is planned or suspected (2nd/3rd trimester, do not use)

- Advise patient that diarrhea, dehydration, excessive perspiration, vomiting, may lead to fall in B/P, to consult prescriber if these occur
- Instruct patient to rise slowly from lying or sitting to minimize orthostatic hypotension; that product may cause dizziness
- Instruct patient to avoid OTC medications unless approved by prescriber; to inform all health care providers of product use
- Instruct patient to use proper technique for obtaining B/P

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P

## azithromycin (Rx)

(ay-zi-thro-my'sin)
**AzaSite, Zithromax, Zmax**
*Func. class.:* Antiinfective
*Chem. class.:* Macrolide (azalide)

**Do not confuse:** azithromycin/erythromycin, Zithromax/Zinacef

**ACTION:** Binds to 50S ribosomal subunits of susceptible bacteria and suppresses protein synthesis; much greater spectrum of activity than erythromycin; more effective against gram-negative organisms

**Therapeutic outcome:** Bacteriostatic against the following susceptible organisms:

PO, acute pharyngitis/tonsillitis (group A streptococcal); acute skin/soft tissue infections; community-acquired pneumonia

**USES:** Mild to moderate infections of the upper respiratory tract, in children: acute otitis media, lower respiratory tract; uncomplicated skin and skin structure infections, nongonococcal urethritis, or cervicitis; prophylaxis of disseminated *Mycobacterium avium* complex (MAC); *Bacillus anthracis, Bacteroides bivius, Bordetella pertussis, Borrelia burgdorferi, Campylobacter jejuni,* CDC coryneform group G, *Chlamydia trachomatis, Chlamydophila pneumoniae, Clostridium perfringens, Gardnerella vaginalis, Haemophilus ducreyi/influenzae* (beta-lactamase negative/positive), *Helicobacter pylori, Klebsiella granulomatis, Legionella pneumoniae/moraxella/catarrhalis, Mycobacterium avium/intracellulare, Mycoplasma genitalium/hominis/pneumoniae, Neisseria gonorrhoeae, Peptostreptococcus, Prevotella bivia, Rickettsia tsutsugamushi, Salmonella typhi, Staphylococcus aureus* (MSSA)*/epidermidis, Streptococcus, Toxoplasma gondii, Treponema pallidum, Ureaplasma urealyticum, Vibrio cholerae,* viridans streptococci; **opthalmic: bacterial conjunctivitis**

## CONTRAINDICATIONS

Hypersensitivity to azithromycin, erythromycin, or any macrolide, hepatitis, jaundice

**Precautions:** Pregnancy, breastfeeding, child <6 mo for otitis media, child <2 yr for pharyngitis, geriatric, renal/hepatic/cardiac disease, tonsillitis, QT prolongation, ulcerative colitis, torsades de pointes, sunlight exposure, sodium restriction, myasthenia gravis, pseudomembranous colitis, contact lenses, hypokalemia, hypomagnesemia

## DOSAGE AND ROUTES

### Most infections

**Adult:** PO 500 mg on day 1, then 250 mg daily on days 2-5 for a total dose of 1.5 g or 500 mg a day × 3 days
**Child 2-15 yr:** PO 10 mg/kg on day 1, then 5 mg/kg × 4 days

### Pelvic inflammatory disease

**Adult:** PO/**IV** 500 mg **IV** q24hr × 2 doses, then 250 mg PO q24hr × 7-10 days

### Cervicitis, chlamydia, chancroid, nongonococcal urethritis, syphilis

**Adult:** PO 1 g single dose

### Gonorrhea

**Adult:** PO 2 g single dose

### Endocarditis prophylaxis

**Adult:** PO 500 mg 1 hr prior to procedure
**Child:** PO 15 mg/kg 1 hr prior to procedure

### Community-acquired pneumonia

**Adult:** PO 500 mg on day 1, then 250 mg PO once daily on days 2-5
**Adolescent/child, infant ≥6 mo:** Susp PO 10 mg/kg on day 1, then 5 mg/kg/day on days 2-5
**Adult/adolescent, child ≥34 kg:** Ext Rel Susp PO 2 g as a single dose (≥1 hr before or 2 hr after a meal)
**Infant ≥6 mo and child weighing 5 to <34 kg and adolescent weighing <34 kg:** Ext Rel Susp PO 60 mg/kg as a single dose (≥1 hr before or 2 hr after a meal)
**Adult and adolescent ≥16 yr:** Initially, 500 mg **IV** infusion as a single daily dose × 2 days or more then 500 mg PO/day to complete a 7-10 day course
**Adolescent <16 yr, child, infant ≥3 mo: IV** 10 mg/kg, max 500 mg qd × 2 days, then conversion to oral therapy as soon as possible to complete a 5-day course. After **IV** loading doses have been given, oral dosage is 5 mg/kg/day, max 250 mg/dose

### Disseminated MAC infections

**Adult:** PO 600 mg/day in combination with ethambutol 15 mg/kg/day

### MAC in HIV

**Adult/adolescent:** PO 1.2 g qwk, alone or with rifabutin

### Lower respiratory tract infections

**Adult:** PO 500 mg day 1, then 250 mg × 4 days
**Child:** PO 5-12 mg/kg/day × 5 days

### Acute otitis media

**Child >6 mo:** PO 30 mg/kg as a single dose or 10 mg/kg daily × 3 days or 10 mg/kg as a single dose on day 1, max 500 mg/day, then 5 mg/kg on days 2-5, max 250 mg/day

### Prevention of acute otitis media

**Child:** PO 10 mg/kg qwk × 6 mo

### Bacterial conjunctivitis

**Adult/child ≥ 1 yr:** opthalmic instill 1 drop in affected eye bid × 2 days then 1 drop in eye q day × 5 days

**Available forms:** Tabs 250, 500, 600 mg; powder for inj 500 mg; powder for oral susp 1 g/packet; susp 100, 200 mg/5 ml; ophthalmic drops 1% sol

### Implementation

#### Opthalmic route

- Store in refrigerator
- Do not touch dropper to eye

**PO route**

- Provide adequate intake of fluids (2 L) during diarrhea episodes
- Give with a full glass of water; give susp 1 hr before or 2 hr after meals; tabs may be taken without regard to food; do not give with fruit juices
- Store at room temperature
- Reconstitute 1 g packet for susp with 60 ml water, mix, rinse glass with more water and have patient drink to consume all medication; packets not for pediatric use
- Do not take aluminum/magnesium-containing antacids or food simultaneously with this product

**Intermittent IV infusion route**

- **Reconstitute** 500 mg product/4.8 ml sterile water for inj (100 mg/ml), shake, **dilute** with ≥ 250 ml 0.9% NaCl, 0.45% NaCl, or LR to 1-2 mg/ml; diluted solution is stable for 24 hr or 7 days if refrigerated
- **Give** 1 mg/ml sol over 3 hr or 2 mg/ml sol over 1 hr, never give IM or as a bolus

**Y-site compatibilities:** Acyclovir, alatrofloxacin, alemtuzumab, alfentanil, aminocaproic acid, aminophylline, amphotericin B liposome/complex, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, ceFAZolin, cefepime, cefoTEtan, cefOXitin, ceftaroline, cefTAZidime, ceftizoxime, cimetidine, cisatracurium, CISplatin, cyclophosphamide, cycloSPORINE, cytarabine, DAPTOmycin, DAUNOrubicin liposome, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, doripenem, doxacurium, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, EPINEPHrine, epiRUBicin, eptifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, fenoldopam, fluconazole, fluorouracil, foscarnet, fosphenytoin, gallium, ganciclovir, gatifloxacin, gemcitabine, granisetron, haloperidol, heparin, hydrocortisone phosphate/succinate, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, inamrinone, irinotecan, isoproterenol, labetalol, lepirudin, magnesium sulfate, mannitol, meperidine, meropenem, mesna, mechlorethamine, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, milrinone, minocycline, mivacurium, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, ofloxacin, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pantoprazole, PEMEtrexed, PENTobarbital, phenylephrine, piperacillin, potassium acetate/phosphates, procainamide, prochlorperazine, promethazine, propranolol, raNITIdine, remifentanil, rocuronium, sodium acetate, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, telavancin, teniposide, thiotepa, ticarcillin, tigecycline, tirofiban, TPN, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, vertigo, somnolence, fatigue

**CV:** Palpitations, chest pain, QT prolongation, torsades de pointes (rare)

**EENT:** Hearing loss, tinnitus, loss of smell (anosmia)

**GI:** *Nausea, diarrhea,* hepatotoxicity, abdominal pain, stomatitis, heartburn, dyspepsia, flatulence, melena, cholestatic jaundice, pseudomembranous colitis, tongue discoloration

**GU:** Vaginitis, moniliasis, nephritis

**HEMA:** Anemia

**INTEG:** Rash, urticaria, pruritus, photosensitivity, pain at injection site

**SYST:** Angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid (PO) up to 50% |
| **Distribution** | Widely distributed |
| **Metabolism** | Unknown, minimal metabolism |
| **Excretion** | Unchanged (bile); kidneys, minimal |
| **Half-life** | 11-70 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Unknown | Unknown |
| **Peak** | 2-4 hr | End of infusion |
| **Duration** | 24 hr | 24 hr |

## INTERACTIONS

### Individual drugs

Bromocriptine, carBAMazepine, cycloSPORINE, digoxin, disopyramide, methylPREDNISolone, nelfinavir, phenytoin, tacrolimus, theophylline, triazolam: increased effects of specific products

Ergotamine: ergot toxicity

Amiodarone, droperidol, methadone, nilotinib, propafenone, quiNIDine: increased QT prolongation

Pimozide: increased dysrhythmias; fatal reaction; do not use concurrently

Triazolam: decreased clearance of triazolam

### Drug classifications

Aluminum, magnesium antacids: decreased levels of azithromycin, separate by ≥2 hr

Anticoagulants (orals): increased effect of oral anticoagulants

### Drug/food

Decreased: absorption—food (suspension)

### Drug/lab test

Increased: bilirubin, alkaline phosphatase, CPK, BUN, creatinine, AST, ALT, potassium, blood glucose

Decreased: blood glucose, potassium, sodium

## NURSING CONSIDERATIONS

### Assessment

- **QT prolongation, torsades de pointes:** assess for patients with serious bradycardia, ongoing pro-arrhythmic conditions, or elderly; more common in these patients
- Assess for signs and symptoms of **infection:** drainage, fever, increased WBC >10,000/mm$^3$, urine culture positive, sore throat, sputum culture positive
- Monitor respiratory status: rate, character, wheezing, tightness in chest; discontinue product if these occur
- Monitor allergies before treatment, reaction of each medication; place allergies on chart, notify all people giving products; skin eruptions, itching
- Monitor I&O ratio, renal studies; report hematuria, oliguria in renal disease; check urinalysis, protein, blood
- Monitor liver studies: AST, ALT, bilirubin, LDH, alkaline phosphatase; CBC with diff
- Monitor C&S before product therapy; product may be taken as soon as culture is taken; C&S may be repeated after treatment
- **Assess for serious skin reactions:** Stevens-Johnson syndrome, toxic epidermal necrolysis, angioedema, discontinue if rash occurs
- **Assess for pseudomembranous colitis:** blood or pus in diarrhea stool, abdominal pain, fever, fatigue, anorexia; obtain CBC, serum albumin
- Assess for **superinfection:** sore throat, mouth, tongue; fever, fatigue, diarrhea, anogenital pruritus
- Pregnancy/breastfeeding: Use only if clearly needed, cautious use in breastfeeding, excreted in breast milk

### Patient/family education

- Instruct patient to report sore throat, black furry tongue, fever, loose foul-smelling stool, vaginal itching, discharge, fatigue; may indicate **superinfection**
- Caution patient not to take aluminum/magnesium-containing antacids or food simultaneously with this product; blood levels of azithromycin will be decreased
- Instruct patient to notify prescriber of diarrhea stools, dark urine, pale stools, yellow discoloration of eyes or skin, severe abdominal pain; cholestatic jaundice is a severe adverse reaction
- Teach patient to take Zmax 1 hr prior to or 2 hr after a meal; shake well before use
- Teach patient to complete dosage regimen; to notify prescriber if symptoms continue
- Teach patient to use protective clothing or stay out of the sun: photosensitivity may occur
- Teach patient to notify prescriber if pregnancy is suspected
- Cardiovascular death has occurred in those with serious bradycardia or ongoing hypokalemia, hypomagnesemia; avoid use

### Evaluation

**Positive therapeutic outcome**

- C&S negative for infection
- WBC within 5000-10,000/mm$^3$

**azithromycin ophthalmic**

## baclofen (Rx)

(bak′loe-fen)

**Gablofen, Lioresal Intrathecal**

*Func. class.:* Skeletal muscle relaxant, central acting

*Chem. class.:* GABA, chlorophenyl derivative

**Do not confuse:** Lioresal/Lotensin, baclofen/Bactroban/bacitracin

**ACTION:** Inhibits synaptic responses in CNS by stimulating $GABA_B$ receptor subtype, which decreases neurotransmitter function, decreasing frequency, severity of muscle spasms

**Therapeutic outcome:** Decreased spasticity of muscles

**USES:** Spasticity in spinal cord injury, multiple sclerosis

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, geriatric, peptic ulcer, renal/hepatic disease, stroke, seizure disorder, diabetes mellitus, psychosis. Abrupt discontinuation (Intrathecal)

## DOSAGE AND ROUTES

### Spasticity in multiple sclerosis/spinal cord injury

**Adult, child ≥12 yr:** PO 5 mg tid × 3 days, then 10 mg tid × 3 days, then 15 mg tid × 3 days, then 20 mg tid × 3 days, then titrated to response, max 80 mg/day (20 mg qid); IT use implantable IT inf pump; use screening trial of 3 separate bol doses if needed 24 hr apart (50 mcg/ml, 75 mcg/1.5 ml, 100 mcg/2 ml); patients who do not respond to 100 mcg should not be considered for chronic IT therapy; spinal origin spasticity 12-2003 mcg/day; cerebral origin spasticity 22-1400 mcg/day

**Child 2-7 yr:** PO 10-15 mg/day divided q8hr; titrate every 3 days by 5-15 mg/day to max 40 mg/day

**Child ≥8 yr:** As above, max 60 mg/day

**Child:** IT initial test dose same as adult; for small children, initial dose of 25 mcg/dose may be used; 25-1200 mcg/day inf, titrated to response in screening phase

**Available forms:** Tabs 10, 20 mg; IT inj 10,000 mcg/20 ml, 20,000 mcg/20 ml, 40,000 mcg/20 ml; 50 mcg/ml, 0.05 mcg/ml, 10 mg/20 ml, 10 mg/5 ml, 50 mg/20 ml; pharmacy can prepare extemporaneous liquid preparations

### Implementation

**PO route**

- Give with meals for GI symptoms; gum, frequent sips of water for dry mouth
- Store in airtight container at room temperature

**IT route**

- **For screening,** dilute to a concentration of 50 mcg/ml with NaCl for inj (preservative free); give test over 1 min; watch for decreasing muscle tone, frequency of spasm; if inadequate, use two more test doses q24hr; **maintenance inf** via implantable pump of 500-2000 mcg/ml dosage because individual titration is required
- Do not give IT dose by inj, **IV,** IM, SUBCUT, epidural

**BLACK BOX WARNING:** Don't discontinue abruptly, may be fatal

## ADVERSE EFFECTS

**CNS:** *Dizziness, weakness, fatigue, drowsiness,* headache, disorientation, insomnia, paresthesias, tremors, seizures, coma; life-threatening CNS depression, impaired cognition, memory loss, insomnia, somnolence, CNS infection (IT)

**CV:** Hypotension, bradycardia, flushing, orthostatic hypotension, chest pain, palpitations, edema; cardiovascular collapse (IT)

**EENT:** Nasal congestion, blurred vision, mydriasis, tinnitus

**GI:** *Nausea,* constipation, vomiting, abdominal pain, dry mouth, anorexia, weight gain

**GU:** Urinary frequency, hematuria

**INTEG:** Rash, pruritus

**RESP:** Dyspnea, respiratory failure (IT)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Good (PO) |
| **Distribution** | Widely, crosses placenta, protein binding 30% |
| **Metabolism** | Liver, partially |
| **Excretion** | Kidney, unchanged 70%-80% |
| **Half-life** | 2½-4 hr |

### Pharmacodynamics

| | PO/IT |
|---|---|
| **Onset** | 0.5-1 hr |
| **Peak** | 2-3 hr |
| **Duration** | >8 hr |

## INTERACTIONS

### Individual drugs

Alcohol: CNS depression

### Drug classifications
Antidepressants (tricyclics), antihistamines, barbiturates, MAOIs, opioids, sedative/hypnotics: increased CNS depression, avoid concurrent use
Antihypertensives: increased hypotension

### Drug/herb
Kava, valerian, chamomile: increased CNS depression

### Drug/lab test
Increased: AST, ALT, alkaline phosphatase, blood glucose, CK

## NURSING CONSIDERATIONS
### Assessment
- Abrupt discontinuation Serious adverse reactions may occur with intrathecal route
- **Multiple sclerosis:** spasms, spasticity, ataxia, mobility, improvement should occur
- Monitor B/P, weight, blood glucose, and hepatic function periodically
- **Withdrawal symptoms:** Agitation, tachycardia, insomnia, hyperpyrexia
- Check for increased seizure activity in patients with epilepsy; this product decreases seizure threshold, monitor ECG
- Check I&O ratio; check for urinary retention, frequency, hesitancy
- Allergic reactions: rash, fever, respiratory distress; severe weakness, numbness in extremities
- Assess CNS depression: dizziness, drowsiness, psychiatric symptoms
- Check dosage, as individual titration is required
- Assess for CNS depression, dizziness, drowsiness, psychiatric symptoms
- **Intrathecal:** Have emergency equipment nearby; assess test dose and titration, if there is no response, check pump and catheter for proper functioning
- **Pregnancy/breastfeeding:** Use in pregnancy only if benefits outweigh fetal risk, avoid breastfeeding, excretion unknown

### Patient/family education
- Advise patient not to discontinue medication quickly; hallucinations, spasticity, tachycardia will occur; product should be tapered off over 1-2 wk, especially intrathecal form
- Advise patient not to take with alcohol, other CNS depressants
- Teach patient to avoid hazardous activities if drowsiness, dizziness occurs; to rise slowly to prevent orthostatic hypotension
- Teach patient to avoid using OTC medications: cough preparations, antihistamines, unless directed by prescriber; to take with food or milk
- Teach patient to notify prescriber if nausea, headache, tinnitus, insomnia, confusion, constipation, or inadequate, painful urination continues

**Pregnancy/breastfeeding:** To notify if pregnancy is planned or suspected, avoid breastfeeding
- May require 1-2 mo for full response

### Evaluation
**Positive therapeutic outcome**
- Decreased pain, spasticity, ability to perform ADLs

## TREATMENT OF OVERDOSE:
Induce emesis of conscious patient, dialysis, physostigmine to reduce life-threatening CNS side effects

**⚠ HIGH ALERT**

## basiliximab (Rx)
(bas-ih-liks'ih-mab)
**Simulect**
*Func. class.:* Immunosuppressant
*Chem. class.:* Murine/human monoclonal antibody (interleukin-2) receptor antagonist

**ACTION:** Binds to and blocks the IL-2 receptor, which is selectively expressed on the surface of activated T lymphocytes; impairs the immune system to antigenic challenges

**Therapeutic outcome:** Prevention of graft rejection

**USES:** Acute allograft rejection in renal transplant patients when used with cycloSPORINE and corticosteroids

## CONTRAINDICATIONS
Mannitol, murine protein hypersensitivity

**Precautions:** Pregnancy, children, geriatric, infections, breastfeeding, neoplastic disease, vaccination

**BLACK BOX WARNING:** Requires a specialized care setting and experienced clinician

## DOSAGE AND ROUTES
**Adult/child ≥35 kg: IV** 20 mg × 2 doses; first dose within 2 hr before transplant surgery; second dose given 4 days after transplantation
**Child <35 kg: IV** 10 mg × 2 doses; first dose within 2 hr before transplant surgery; second dose given 4 days after transplantation

**Available forms:** Powder for inj 10, 20 mg

### Implementation

**Intermittent IV INF route**
- **Reconstitute** 10 mg vial/2.5 ml or 20 mg vial in 5 ml sterile water for inj; shake gently to dissolve, **dilute** reconstituted sol in 25 ml (10 mg vial) or 50 ml (20 mg vial) with 0.9% NaCl or $D_5W$, gently invert bag, do not shake, **give** over ½ hr, do not admix
- Storage of reconstituted sol refrigerated for up to 24 hr or at room temp for 4 hr

## ADVERSE EFFECTS

**CNS:** *Pyrexia, chills, tremors, headache, insomnia, weakness,* dizziness; psychiatric/behavioral changes (child)
**CV:** *Chest pain,* angina, cardiac failure, hypo/hypertension, edema
**GI:** *Vomiting, nausea, diarrhea,* constipation, abdominal pain, GI bleeding, gingival hyperplasia, stomatitis
**GU:** Urinary retention/ frequency
**INTEG:** *Acne,* pruritus, impaired wound healing
**META:** Acidosis, hypercholesterolemia, hyperuricemia, hypo/hyperkalemia, hypocalcemia, hypophosphatemia
**MISC:** Infection, moniliasis, anaphylaxis, anemia, allergic reaction, dysuria, CMV infection, candidiasis, abnormal vision
**MS:** Arthralgia, myalgia
**RESP:** *Dyspnea, wheezing, cough,* pulmonary edema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 7 days (adult)<br>9½ days (child) |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | ½ hr (adult) |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Immunosuppressants: increased immunosuppression

### Drug/herb

Echinacea, melatonin: Decreased immunosuppression

### Drug/lab test

Increased: BUN, cholesterol, uric acid, creatinine, potassium, calcium, blood glucose, Hgb, Hct
Decreased: Hgb, Hct, platelets, magnesium, phosphate

## NURSING CONSIDERATIONS

### Assessment

- Assess for infection, increased temp, WBC, sputum, urine, may be fatal (bacterial, protozoal, fungal)
- Monitor blood studies: Hgb, WBC, platelets during treatment qmo; if leukocytes are $<3000/mm^3$, product should be discontinued
- Monitor liver function studies: alkaline phosphatase, AST, ALT, bilirubin
- **Assess hepatotoxicity:** dark urine, jaundice, itching, light-colored stools; product should be discontinued
- **Assess for anaphylaxis, hypersensitivity:** dyspnea, wheezing, rash, pruritus, hypotension, tachycardia; if severe hypersensitivity reactions occur, product should not be used again
- **Pregnancy/breastfeeding:** Use in pregnancy only if benefits outweigh fetal risk, caution use in breastfeeding, excretion unknown

### Patient/family education

- Instruct patient to report fever, chills, sore throat, fatigue, since serious infection may occur; avoid crowds, persons with known upper respiratory infections; use contraception during treatment

### Evaluation

**Positive therapeutic outcome**
- Absence of graft rejection

## beclomethasone (Rx, inhalation)

(be-kloe-meth'a-sone)
**QVAR**
*Func. class.:* antiasthmatic
*Chem. class.:* corticosteroid

**Do not confuse:** beclomethasone/ betamethasone

**ACTION:** Prevents inflammation by suppression of migration of polymorphonuclear leukocytes, fibroblasts, reversal of increased capillary permeability and lysosomal stabilization; does not suppress hypothalamus and pituitary function

**Therapeutic outcome:** Decreased inflammation and normal immunity

**USES:** Seasonal, perennial allergic/vasomotor rhinitis, nasal polyps, chronic steroid-dependent asthma

## CONTRAINDICATIONS

Hypersensitivity, status asthmaticus (primary treatment)

**Precautions:** Pregnancy, breastfeeding, child <12, nasal disease/surgery, nonasthmatic bronchial disease, bacterial, fungal, viral infections of mouth, throat, lungs, HPA suppression, osteoporosis, Cushing's syndrome, diabetes mellitus, measles, cataracts, corticosteroid hypersensitivity, glaucoma, herpes infection

## DOSAGE AND ROUTES

**Adult and child >12 yr:** inh 48-80 mcg bid (alone) or 40-160 mcg bid (with inhaled corticosteroids), max 320 bid

**Child 5-12 yr:** inh 40 mcg bid, max 80 mcg bid

**Available forms:** Oral inh 40, 80, 250 mcg /metered spray

### Implementation

**Oral route**

- Give PO, using a spacer device for proper dose
- Shake oral inhaler well, use spacer
- Use after cleaning aerosol top daily with warm water; dry thoroughly
- Store in cool environment; do not puncture or incinerate container

**Nasal route**

- Shake inhaler, invert, tilt head backward, insert nozzle into nostril, away from septum; hold other nostril closed and depress activator, inhale through nose, exhale through mouth

## ADVERSE EFFECTS

**CNS:** *Headache;* psychiatric/behavioral changes (child)

**EENT:** *Candidal infection of oral cavity, hoarseness,* sore throat, dysgeusia, loss of taste/smell, pharyngitis, rhinitis, sinusitis, cataracts, fungal infections, epistaxis

**ENDO:** Hypothalamic-pituitary (HPA) suppression

**GI:** Dry mouth, dyspepsia

**MISC:** Angioedema, adrenal insufficiency, facial edema, Churg-Strauss syndrome (rare)

**RESP:** Bronchospasm, wheezing, cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Locally only |
| **Distribution** | Not distributed |
| **Metabolism** | Lungs, liver (by CYP3A) |
| **Excretion** | Feces, urine |
| **Half-life** | 2.8 hr |

### Pharmacodynamics

| | Inh | Nasal |
|---|---|---|
| **Onset** | 1-4 wk | 10 min |
| **Peak** | Unknown | Unknown |
| **Duration** | Unknown | Unknown |

## NURSING CONSIDERATIONS

### Assessment

- Assess adrenal suppression: 17-KS, plasma cortisol for decreased levels, adrenal function periodically for HPA axis suppression during prolonged therapy; monitor growth and development
- Assess blood studies, neutrophils, decreased platelets; WBC with diff at baseline and q3mo; if neutrophils are <1000/mm$^3$, discontinue treatment
- Check nasal passages during long-term treatment for changes in mucus; check for burning, stinging; assess for glucocorticoid withdrawal: dizziness, hypotension, fatigue, muscle/joint pain; notify prescriber immediately
- Assess respiratory status: rest, rhythm, characteristics; auscultate lung bilaterally before and throughout treatment
- Assess for fungal infections in mucous membranes
- **Pregnancy/breastfeeding:** Inhaled product: fetal harm appears remote, acceptable to use in breastfeeding
- **Bronchospasm:** Use short-acting bronchodilator
- **Upper respiratory infection, especially fungal**
- **Beers:** Avoid use in older adults, high risk of delirium

### Patient/family education

- Teach patient to gargle/rinse mouth after each use to prevent oral fungal infections
- Teach patient that in times of stress, systemic corticosteroids may be needed to prevent adrenal insufficiency; do not discontinue oral product abruptly, taper slowly
- Teach patient to continue using product even if mild nasal bleeding occurs; is usually transient
- Teach patient method of administration after providing written instructions from manufacturer

### Pregnancy/breastfeeding:

- Teach patient to notify prescriber if pregnancy is planned or suspected, do not breastfeed
- Teach patient to check growth in child on long-term therapy
- Teach patient to taper PO products before starting inhalation products
- Teach patient to carry medical alert ID with corticosteroid user listed
- Clean inhaler by wiping with dry cloth, need for spacer or face mask

• Teach patient the symptoms of **adrenal insufficiency:** nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain, depression

### Evaluate

**Positive therapeutic outcome**

• Decrease in runny nose, improved symptoms of bronchial asthma

## beclomethasone nasal (Rx) agent

*See Appendix B*

## belatacept (Rx) REMS

(bel-a-ta′sept)

**Nulojix**

*Func. class.:* Biologic response modifier

*Chem. class.:* Fusion protein (Immunosuppressant

**Do not confuse:** belatacept/ Betasept Surgical Scrub

**ACTION:** Activated T lymphocytes are the mediators of immunologic rejection, and this product is a selective T-cell costimulation blocker; blocks the CD28 mediated co-stimulation of T lymphocytes by binding to CD80 and CD86 on antigen-presenting cells; inhibits T-lymphocyte proliferation and the production of the cytokines interleukin-2, interferon-gamma, interleukin-4, and TNF-alpha.

**Therapeutic outcome:** Absence of kidney transplant rejection

**USES:** Kidney transplant rejection prophylaxis given with basiliximab induction, mycophenolate mofetil, corticosteroids

### CONTRAINDICATIONS

Hypersensitivity, EBV seronegative, and specialized setting, EBV status unknown

**BLACK BOX WARNING:** Infection, organ transplant, requires an experienced clinician, secondary malignancy, posttransplant lymphoproliferation disorder (PTLD)

**Precautions:** Breastfeeding, immunosuppression, child/infant/neonate, pregnancy, diabetes mellitus, progressive multifocal leukoencephalopathy, immunosuppression, sunlight exposure, TB

### DOSAGE AND ROUTES

**Adult: IV** 10 mg/kg rounded to nearest 12.5 mg increment give over 30 min the day of transplantation (day 1) but before transplantation, on day 5 approximately 96 hours after the day 1 dose 1, at the end of wk 2, at the end of wk 4, at the end of wk 8, and at the end of wk 12; maintenance dosage is 5 mg/kg rounded to nearest 12.5 mg increment given over 30 min at the end of wk 16 and q4wk ± 3 days thereafter; doses should be calculated on actual body weight on the transplantation day unless the patient's weight varies by >10%

### Available forms:

Powder for inj 250 mg

### Implementation

**BLACK BOX WARNING:** Only providers skilled in the use of immunosuppressant and management of transplant should use these products

• Increased risk for serious infection, malignancy, ENLIST Registry for drug safety monitoring 1-800-321-1335

• **Restricted access:** New prescriptions not available as of March 2017; current patients must be enrolled in the Nulojix distribution program 1-877-625-2566

**IV route**

• Visually inspect for particulate matter, discoloration, discard if present

• Calculate the number of vials required

• Reconstitute each vial/10.5 ml of sterile water for injection, 0.9% sodium chloride, $D_5W$ using the silicone-free disposable syringe provided with each vial and an 18G to 21G needle. If silicone-free disposable syringe, use a new silicone-free disposable syringe. If you need additional silicone-free disposable syringes, call 888-685-6549. If the powder is accidentally reconstituted using a different syringe than the one provided, the solution may develop a few translucent particles. Discard any solutions prepared using siliconized syringes.

• Using aseptic technique, inject the diluent into the vial and direct the stream of diluent to the glass wall of the vial. To minimize foaming, rotate and invert with gentle swirling until the contents are dissolved. Do not shake when reconstituted (25 mg/ml), should be clear to slightly opalescent and colorless to pale yellow. Do not use if opaque particles, discoloration, or other foreign particles are present.

• Calculate the total volume of the reconstituted 25 mg/ml sol required to provide the prescribed dose. Further dilute this volume with a volume of inf fluid equal to the volume of the reconstituted drug sol required. Use either NS or $D_5W$ if drug was reconstituted with SWFI; use NS if drug was reconstituted with NS; use $D_5W$ if drug was reconstituted with $D_5W$. With the same silicone-free disposable syringe used for reconstitution, withdraw the required amount, inject it into the inf container, gently rotate; final concentration in inf container should range (2-10 mg/ml). Volume of 100 ml will be appropriate for

most doses, but total inf volumes ranging from 50-250 ml may be used. Discard any unused drug solution; after reconstitution, immediately transfer the reconstituted sol from the vial to the inf bag or bottle; complete within 24 hr.

**IV INF route**

- Give over 30 min, use an infusion set and a sterile, nonpyrogenic low-protein-binding filter (0.2-1.2 mm), use a separate line
- Storage: refrigerate, protect from light ≤24 hr; max 4 hr of the total 24 hr can be at room temp and room light

## ADVERSE EFFECTS

**CV:** Hypo/hypertension
**CNS:** progressive multifocal leukoencephalopathy (PMI), anxiety, dizziness, fever, insomnia, tremor
**EENT:** Pharyngitis, stomatitis
**GI:** Abdominal pain, constipation, diarrhea, nausea, vomiting
**GU:** Renal tubular necrosis, renal failure, proteinuria, urinary incontinence, dysuria, UTI
**HEMA:** Anemia, neutropenia, leukopenia, leukoencephalopathy
**INTEG:** Acne, alopecia, infusion reaction
**META:** Hypercholesterolemia, hyperglycemia, hyper/hypokalemia, hypocalcemia, hypophosphatemia, hypomagnesemia
**MS:** Arthralgia
**SYST:** Secondary malignancy, posttransplant lymphoproliferation disorder (PTLD), wound dehiscence, BK-virus associated neuropathy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Steady state by week 8 after transplantation and by month 6 during the maintenance phase |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Half-life range 6.1-15.1 days during receipt of 10 mg/kg IV doses; 3.1-11.9 days during receipt of 5 mg/kg IV doses |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

- Increased effect, toxicity: mycophenolic acid
- Do not use 30 days before or with this product: Live virus vaccines

### Drug classifications

Corticosteroids: increased belatacept effect
Vaccines: avoid concurrent use
Immunosuppressives: avoid increased dose

## NURSING CONSIDERATIONS

### Assessment

- Progressive multifocal leukoencephalopathy (PMI): apathy, confusion, ataxia may occur during treatment

**BLACK BOX WARNING: Transplant rejection:** flulike symptoms, decreasing urinary output, malaise; some may experience pain in area (rare; monitor BUN/Creatinine)

**BLACK BOX WARNING: Infection:** Monitor for fever, immunosuppression occurs, chills, increased WBC, wound dehiscences

**BLACK BOX WARNING: Posttransplant lymphoproliferation disorder (PTLD):** May lead to secondary malignancy (lymphoma) or infectious mononucleosislike lesions (mood change, confusion, memory loss, change in gait, talking); may be treated with antivirals or immunosuppressant may need to be discontinued

- Hyperlipidemia: Monitor cholesterol, triglycerides; an antilipidemic may be needed
- Store refrigerated, protected from light ≤24 hr; max 4 hr of the total 24 hr can be at room temperature and room light
- **Pregnancy/breastfeeding:** Use in pregnancy if benefits outweigh fetal risk, pregnant patients should enroll in the pregnancy registry 1-877-681-6296, use adequate contraception during and for 4 months after last dose, discontinue breastfeeding or product, excretion in breast milk unknown

### Evaluation

**Positive therapeutic outcome**

- Absence of renal transplant rejection

### Patient/family education

- Teach reason for product and expected result, use REMS guidelines
- Teach to avoid exposure to sunlight, tanning beds, risk of secondary malignancy
- Teach to avoid crowds, persons with known infections
- Advise that repeated lab test will be needed, to inform providers of all OTC, Rx medications, herbs, supplements
- Advise to avoid with vaccines
- Advise that immunosuppressants will be needed for life to prevent rejection/infection;

teach symptoms of rejection and to call provider immediately

## belimumab (Rx)

(be-lim′ue-mab)

**Benlysta**

*Func. class.:* Immunosuppressant, Monoclonal antibody

*Chem. class.:* Disease-modifying antirheumatic drugs (DMARDs)

**ACTION:** Inhibits B-lymphocyte stimulator (BLyS), which is needed for B-cell survival; normally, soluble BLyS binds to its receptors on B cells and allows B-cell survival; binds BLyS and prevents binding to its receptors on B cells

**Therapeutic outcome:** Decreasing symptoms of SLE: decreased fever, malaise, joint pains, myalgias, fatigue

**USES:** Active, autoantibody-positive, systemic lupus erythematosus (SLE) in combination with standard therapy

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** African descent patients, depression, children/infants, Box immunosuppression, infection, pregnancy, breastfeeding, suicidal ideation, vaccination, geriatrics, secondary malignancy, cardiac disease, requires experienced clinician

## DOSAGE AND ROUTES

**Adult:** 10 mg/kg IV over 1 hr q2wk for the first 3 doses, then q4wk

**Available forms:** Powder for injection 120, 400 mg

### Implementation

- Only health care providers prepared to manage anaphylaxis should administer this product, may give premedication for prophylaxis against infusion and hypersensitivity reactions (antihistamine/antipyretic)

**Intermittent IV infusion route**

- Visually inspect particulate matter and discoloration whenever solution and container permit
- **Give** as IV infusion only, do not give IV bolus or push, give over 1 hr and slow or stop if infusion reactions occur
- Do not give with any other agents in the same IV line
- Allow to stand at room temperature for 10-15 min before using
- **Reconstitute** with the appropriate amount of sterile water for injection (80 mg/ml); add 1.5 ml of sterile water (120 mg/vial) or 4.8 ml of sterile water (400 mg/vial)
- Direct the stream of sterile water toward the side of the vial to minimize foaming; gently swirl for 60 sec and allow to sit during reconstitution, gently swirling for 60 secs q5min until the powder is dissolved; do not shake; reconstitution is complete in 10 to 30 min
- If a mechanical reconstitution device (swirler) is used, max 500 rpm swirled for ≤30 min
- The solution should be opalescent, and colorless to pale yellow, and without particles; small air bubbles are expected; protect from sunlight
- **Dilution:** Only dilute in NS for injection; dilute reconstituted solution with enough normal saline to 250 ml. From a 250-ml infusion bag or bottle of normal saline, withdraw and discard a volume equal to the volume of the reconstituted solution required for dose; add the required volume of the reconstituted solution the infusion bag/bottle; gently invert to mix
- Discard any unused solution
- Storage in refrigerator or at room temp; total time from reconstitution to completion of inf max 8 hr

## ADVERSE EFFECTS

**CNS:** Anxiety, *depression,* dizziness, fever, headache, *insomnia, migraine*, suicidal ideation, progressive multifocal leukoencephalopathy
**CV:** Bradycardia, hypotension
**GU:** UTI
**GI:** Diarrhea, nausea
**MISC:** Bronchitis, cystitis, dyspnea, **leukopenia,** myalgia, nasopharyngitis, pharyngitis, rash
**SYST:** Anaphylaxis, angioedema, antibody formation, infection, influenza, infusion reactions, secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Terminal half-life 19.4 days; distribution half-life 1.75 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Drug/Herb

Echinacea: Decreases product effect, avoid using together

### Individual drugs
IV cyclophosphamide, biologic therapies (riTUXimab, ofatumumab): avoid concurrent use

### Drug classifications
Vaccines: within 30 days of belimumab, response to vaccine will be decreased

### Drug/lab test
Decrease: leukocytes

## NURSING CONSIDERATIONS

### Assessment
- **SLE:** Monitor for decreasing fever, malaise, fatigue, joint pain, myalgias
- **Progressive multifocal leukoencephalopathy:** Apathy, confusion, ataxia, cognitive problems
- **Suicidal ideation:** More common in those with preexisting depression
- **Infection:** Determine if a chronic or acute infection is present, may be fatal when used with this product; do not begin therapy if any products are being used for a chronic infection; leukopenia may occur with this product and susceptibility to infections increased
- **Anaphylaxis, infusion site reactions:** If these occur, stop infusion (angioedema, rash, pruritus, wheezing)
- **African descent patients:** Use cautiously in these patients, may not respond to this product
- Cardiac disease: Monitor closely for cardiovascular side effects, bradycardia, hypotension
- **Pregnancy/breastfeeding:** Determine if pregnant or if pregnancy is planned or suspected, if pregnant call 877-681-6269 to enroll in registry, do not breastfeed; contraception is required during and for 4 mo after conclusion of therapy

### Patient/family education
- Teach patient to notify prescriber if pregnancy is planned or suspected, use reliable contraception during and for 4 mo after final treatment, to avoid breastfeeding
- Advise patient to seek treatment immediately for serious hypersensitive reactions
- Advise patient not to receive live vaccinations during treatment
- Teach patient that compliance is required
- Teach patient to avoid others with known infections, to report fever, cough, sore throat immediately
- Teach patient to report history of cancer in patient or family

### Evaluation
- Decreasing symptoms of SLE: decreasing fatigue, fever, malaise

**⚠ HIGH ALERT**

# belinostat (Rx)

(beh-lih'noh-stat')

**Beleodaq**

*Func. class.:* Antineoplastic-biologic response modifier

*Chem. class.:* Histone deacetylase inhibitors

**Do not confuse:** belinostat/beractant

**ACTION:** A class I and II inhibitor of the histone deacetylase (HDAC) enzymes. Overexpression of HDACs is present in some cancer cells. HDAC inhibitors have been shown to activate differentiation, inhibit the cell cycle, and induce apoptosis

**Therapeutic outcome:** Prevention of spread of disease

**USES:** For the treatment of relapsed or refractory peripheral T-cell lymphoma (PTCL)

## CONTRAINDICATIONS
Hypersensitivity, pregnancy

**Precautions:** Hematologic toxicity (thrombocytopenia, leukopenia, neutropenia, lymphopenia, anemia), serious infections (pneumonia, sepsis), fatal hepatic toxicity, tumor lysis syndrome (TLS), breastfeeding

## DOSAGE AND ROUTES

**Adult: IV** 1000 mg/m$^2$ over 30 min on days 1-5 q21d. Reduce the dose to 750 mg/m$^2$ in those who are homozygous for the UGT1A1*28 allele. Cycles should be repeated until disease progression or unacceptable toxicity.

**Available forms:** Powder for injection 500 mg (single-use vial)

### Implementation

**Intermittent IV route**
- Reconstitution: Add 9 ml of sterile water for injection/500 mg, swirl until there are no visible particles in the solution (50 mg/ml); stable at room temperature for up to 12 hr
- Withdraw the appropriate amount from the reconstituted vial and further dilute in 250 ml 0.9% sodium chloride for injection; the final solution is stable at room temperature for up to 36 hr, including infusion time; use a 0.22-micron in-line filter; give over 30 min; if pain occurs at infusion site, run over 45 min

**Dose adjustments due to treatment-related toxicity**

**Hematologic toxicities:**
- Do not begin the next cycle of treatment until the absolute neutrophil count (ANC) is ≥1000/mm$^3$ and platelet count ≥50,000/mm$^3$

- ANC nadir ≥500/mm³ and platelet count nadir ≥25,000/mm³: no dose adjustment
- ANC nadir <500/mm³ (any platelet count): begin next cycle of treatment at a reduced dose of 750 mg/m². For the second occurrence of an ANC nadir <500/mm³, reduce the dose of the next cycle to 500 mg/m², if the ANC nadir is <500/mm³ after 2 dose reductions, discontinue therapy
- Platelet nadir <25,000/mm³ (any ANC): begin next cycle of treatment at a reduced dose of 750 mg/m². For the second occurrence of a platelet nadir <25,000/mm³, reduce the dose of the next cycle to 500 mg/m². If the platelet nadir is <25,000/mm³ after 2 dose reductions, discontinue therapy.

**Nonhematologic toxicities:**

- Grade 3 or 4 nausea, vomiting, or diarrhea for >7 days with supportive management, or other grade 3 or 4 toxicity of any duration: hold treatment. When toxicity resolves to grade ≤2, restart the next cycle at a reduced dose of 750 mg/m². For the second occurrence of grade 3 or 4 toxicity (for a duration >7 days with supportive management for GI toxicities), resume therapy at 500 mg/m² upon resolution to grade ≤2. If the grade 3 or 4 toxicity recurs after 2 dose reductions, discontinue therapy.

## ADVERSE EFFECTS

**CNS:** Fatigue headache dizziness, fever, chills
**CV:** Hypotension, QT prolongation
**GI:** *Constipation, anorexia, abdominal pain, nausea, vomiting, diarrhea,* hepatotoxicity
**HEMA:** Anemia, thrombocytopenia, neutropenia
**INTEG:** Injection-site reactions, rash, phlebitis
**MISC:** Hypokalemia
**RESP:** Dyspnea, cough
**SYST:** Multiorgan failure, TLS, serious infections, tumor lysis syndrome TLS

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 92.9%-95.8% protein bound |
| **Metabolism** | 80%-90% metabolized by hepatic UGT1A1; liver |
| **Excretion** | 40% excreted renally, primarily as metabolites |
| **Half-life** | 1.1 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Strong UGT1A1 inhibitors (atazanavir, indinavir); avoid concurrent use if possible: increased belinostat

### Drug/lab tests

Increase: Creatinine, LDH
Decrease: Platelets, neutrophils, RBC

## NURSING CONSIDERATIONS

### Assessment

- **Hematologic toxicity (thrombocytopenia, leukopenia, neutropenia, lymphopenia, anemia):** Monitor CBC before starting therapy and then every week. Dose modifications may be necessary in patients with bone marrow suppression and should be determined by the ANC and platelet count nadirs of the previous cycle of therapy. Platelet counts should be ≥50,000/mm³ and ANC >1000/mm³ before starting each cycle.
- **Serious infections (pneumonia, sepsis):** May be fatal. Do not use in those with an active infection. Use caution in patients with a history of extensive or intensive chemotherapy, as they may be at higher risk for life-threatening infections, monitor for dyspnea, cough, characteristics of sputum.
- **Fatal hepatic toxicity:** Monitor LFTs before the start of each cycle. Those with signs of hepatic disease may require dose modification or discontinuation.
- **Tumor lysis syndrome (TLS):** Those with high tumor burden or advanced-stage disease are at greater risk for development of TLS; consider tumor lysis prophylaxis with antihyperuricemic agents and hydration beginning 12-24 hr before treatment; for TLS treatment, administer aggressive IV hydration, antihyperuricemic agents, correct electrolyte abnormalities, and monitor renal function
- **Pregnancy and breastfeeding:** Consider discontinuing breastfeeding, identify whether the patient is pregnant before using, do not use if pregnant
- **Anaphylaxis, infusion site reactions:** Angioedema, rash, pruritus, wheezing; if these occur, stop infusion immediately and notify prescriber
- **Renal studies:** Monitor BUN/creatinine periodically, if renal disease is present use cautiously

### Patient/family education

- Teach patient to avoid use in breastfeeding, and not to use in pregnancy, fertility may be impaired
- Advise patient to report infusion-site reactions, rash, severe constipation or diarrhea, abdominal pain, nausea, vomiting

- **Bleeding:** Teach patient to report bruising, bleeding
- **Tumor lysis syndrome:** Teach patient to report fatigue, dark urine, nausea, weakness, confusion, change in heart rate
- **Infection:** Teach patient to report sore throat, cough, trouble breathing
- **Hepatic toxicity:** Teach patient to report dark urine, anorexia, yellow skin/eyes, itching, abdominal pain
- That compliance is needed with product and lab testing

### Evaluation

**Positive therapeutic outcome**

- Prevention of spread of disease

## benazepril (Rx)

(ben-a'za-pril)

**Lotensin**

*Func. class.:* Antihypertensive

*Chem. class.:* ACE inhibitor

**Do not confuse:** benazepril/Benadryl

**ACTION:** Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE, preventing conversion of angiotensin I to angiotensin II

**Therapeutic outcome:** Decreased B/P in hypertension

**USES:** Hypertension, alone or in combination with thiazide diuretics

**Unlabeled uses:** HF

## CONTRAINDICATIONS

Breastfeeding, children, hypersensitivity to ACE inhibitors, hereditary angioedema

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Impaired renal/liver function, dialysis patients, hypovolemia, blood dyscrasias, HF, COPD, asthma, geriatric, bilateral renal artery stenosis

## DOSAGE AND ROUTES

**Adult:** PO 10 mg daily initially, then 20-40 mg/day divided bid or daily (without a diuretic); 5 mg PO daily (with a diuretic); max 80 mg daily

**Geriatric:** PO based on clinical response

### Renal dose

**Adult:** PO 5 mg daily with CCr <30 ml/min or CCr >3 mg/d/use; increase as needed to max of 40 mg/day

**Available forms:** Tabs 5, 10, 20, 40 mg

### Implementation

- Store in airtight container at 86° F (30° C) or less
- Severe hypotension may occur after 1st dose of this medication; decreased hypotension may be prevented by reducing or discontinuing diuretic therapy 3 days before beginning benazepril therapy
- Storage in tight container at 86° F (30° C) or less

## ADVERSE EFFECTS

**CNS:** Anxiety, hypertonia, insomnia, paresthesia, headache, dizziness, fatigue

**CV:** Hypotension, postural hypotension, syncope, palpitations, angina

**GI:** Nausea, constipation, vomiting, gastritis, diarrhea, melena, hepatotoxicity, pancreatitis

**GU:** Increased BUN, creatinine, decreased libido, impotence, urinary tract infection, renal insufficiency

**HEMA:** Agranulocytosis, neutropenia

**INTEG:** Rash, flushing, sweating, alopecia

**META:** Hyperkalemia, hyponatremia

**MISC:** Angioedema, Stevens-Johnson syndrome, hypersensitivity

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | <40% |
| **Distribution** | Unknown; crosses placenta |
| **Metabolism** | Liver metabolites; protein binding 97% |
| **Excretion** | Kidney, breast milk (minimal) |
| **Half-life** | 10-11 hr (metabolite); increased in renal disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | ½-1 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased hypotension (large amounts)

AzaTHIOprine: increased myelosuppression

Digoxin, lithium: increased serum levels, may cause toxicity, monitor lithium or digoxin levels

Increase: Hypotension, hyperkalemia in diabetes, renal disease; aliskiren, do not use in diabetes, avoid use in GFR<60 ml/min

### Drug classifications

Antihypertensives, diuretics, nitrates, phenothiazines: increased hypotension

Diuretics (potassium-sparing), potassium supplements: increased hyperkalemia, monitor potassium, BUN, creatinine

NSAIDs: decreased hypotensive effects, may need to reduce dose, monitor B/P

### Drug/herb

Ephedra (Ma huang), avoid concurrent use: decreased antihypertensive effect

Hawthorn: increased antihypertensive effect

### Drug/lab test

Increased: AST, ALT, alkaline phosphatase, bilirubin, uric acid, blood glucose, potassium, BUN, creatinine

## NURSING CONSIDERATIONS

### Assessment

- **Hypertension:** B/P, pulse baseline and periodically; monitor, check for orthostatic hypotension, syncope; if changes occur, dosage change may be required; notify prescriber of changes; monitor compliance
- **Monitor blood dyscrasias:** neutrophils, decreased platelets; WBC with differential at baseline, q3mo; if neutrophils $<1000/mm^3$, discontinue treatment
- Monitor renal studies: protein, BUN, creatinine; watch for increased levels that may indicate nephrotic syndrome and renal failure; monitor urine for protein; monitor renal symptoms: polyuria, oliguria, frequency, dysuria
- Establish baselines in renal, liver function tests before therapy begins
- Check potassium levels throughout treatment, although hyperkalemia rarely occurs; diuretic should be discontinued 3 days prior to initiation with benazepril; if hypertension is not controlled, a diuretic can be added; measure B/P at peak 2-4 hr and trough (before next dose); this product is less effective in African-American descendants

**BLACK BOX WARNING:** Pregnancy/breastfeeding: Identify if pregnancy is planned or suspected, do not use in pregnancy, breastfeeding

- **Assess for allergic reactions:** rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help; angioedema, Stevens-Johnson syndrome is more common in African-American descendants

### Patient/family education

- Instruct patient not to discontinue product abruptly; advise patient to tell all persons associated with care
- Teach patient not to use OTC products (cough, cold, allergy) unless directed by prescriber; serious side effects can occur; xanthines such as coffee, tea, chocolate, cola can prevent action of product
- Emphasize the importance of complying with dosage schedule, even if feeling better; to continue with medical regimen to decrease B/P: exercise, cessation of smoking, decreasing stress, diet modifications
- Emphasize the need to rise slowly to sitting or standing position to minimize orthostatic hypotension, not to exercise in hot weather because increased hypotension can occur
- Teach patient to notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, coughing, shortness of breath, bruising, bleeding, swelling of face, tongue, lips, difficulty breathing, signs of infection, cough
- Caution patient to report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P, strenuous exercise; to consume adequate fluids
- Instruct patient to use caution in hot weather
- Caution patient that product may cause dizziness, fainting, light-headedness; may occur during first few days of therapy; to avoid activities that may be hazardous
- Teach patient how to take B/P; teach normal readings for age group; ensure patient takes own B/P

**BLACK BOX WARNING:** Advise patient to notify prescriber of pregnancy, product will need to be discontinued

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P in hypertension

## TREATMENT OF OVERDOSE:

0.9% NaCl **IV** inf, hemodialysis

**RARELY USED**

## bendamustine (Rx)

(ben-da-muss'teen)

**Bendeka, Treanda**

*Func. class.:* Antineoplastic alkylating agent

*Chem. class.:* Nitrogen mustard

**Therapeutic outcome:** Improvement in blood counts and morphology

## USES:

Chronic lymphocytic leukemia, non-Hodgkin's lymphoma

## CONTRAINDICATIONS

Pregnancy, fetal harm may occur; hypersensitivity to this product or mannitol, children, hepatic disease, renal impairment, breastfeeding

## DOSAGE AND ROUTES

### Chronic lymphocytic leukemia

**Adult: IV** inf 100 $mg/m^2$ over 30 min on days 1, 2, q28days up to 6 cycles

### Non-Hodgkin's lymphoma
**Adult:** **IV** inf 120 mg/m$^2$ over 60 min on days 1, 2, q21days up to 8 cycles

### Renal/hepatic dose
**Adult:** IV inf CCr <40 ml/min, do not use; AST or ALT 2.5-10 × upper limit normal (ULN) or bilirubin 1.5-3 × ULN, do not use

**Available forms:** Powder for inj 25, 100 mg; solution for injection 100 mg/4 ml

### Implementation
- Give allopurinol for 1-2 wk to those at high risk for tumor lysis syndrome; usually develops in first treatment cycle
- Give blood transfusions; or RBC colony-stimulating factors to counter anemia unless cure is the intent
- Give antiemetic 30-60 min before giving product to prevent vomiting
- Give all medications PO, if possible avoid IM inj if platelets are <100,000/mm$^3$

## benzocaine topical
*See Appendix B*

## benztropine (Rx)
(benz'troe-peen)
**Cogentin**
*Func. class.:* Cholinergic blocker, antiparkinson agent
*Chem. class.:* Tertiary amine

**Do not confuse:** benztropine/bromocriptine

**ACTION:** Blockade of central acetylcholine receptors in the CNS; neurotransmitters are balanced, balances cholinergic activity

**Therapeutic outcome:** Decreased involuntary movements

**USES:** Parkinsonian symptoms, EPS associated with neuroleptic products, acute dystonia

**Unlabeled Uses:** Hypersalivation

## CONTRAINDICATIONS
Hypersensitivity, closed-angle glaucoma, dementia, tardive dyskinesia

**Precautions:** Pregnancy, breastfeeding, children, geriatric, tachycardia, renal/hepatic disease, product abuse history, dysrhythmias, hypo/hypertension, psychosis; myasthenia gravis, GI/GU obstruction, child ≤3 yr, peptic ulcer, megacolon, prostate hypertrophy

## DOSAGE AND ROUTES
### Drug-induced extrapyramidal symptoms
**Adult:** IM/IV 1-4 mg daily/bid; give PO dose as soon as possible; PO 1-2 mg bid/tid; increase by 0.5 mg q5-6days
**Child >3 yr:** IM/IV 0.02-0.05 mg/kg/dose 1-2 ×/day
**Geriatric:** PO 0.5 mg daily-bid, increase by 0.5 mg q5-6days; max 4 mg/day

### Parkinsonian symptoms
**Adult:** PO 1-2 mg daily, in 1-2 divided doses; increased 0.5 mg q5-6days titrated to patient response; max 6 mg daily

### Postencephalitic parkinsonism
**Adult:** PO/IM/IV 2 mg qday in one dose or divided, max 6 mg qday

### Acute dystonic reactions
**Adult:** IM/IV 1-2 mg, may increase to 1-2 mg bid (PO)

**Available forms:** Tabs 0.5, 1, 2 mg; inj 1 mg/ml (2-mg ampules)

### Implementation
**PO route**
- Give with or after meals to prevent GI upset; may give with fluids other than water; hard candy, frequent drinks, gum to relieve dry mouth
- Give at bedtime to avoid daytime drowsiness in patient with parkinsonism
- May be crushed and mixed with food
- Store at room temperature

**IM route**
- Inject deeply in muscle; use filtered needle to remove solution from ampule
- Give in large muscle mass for dystonic symptoms

**IV direct route**
- Use in emergencies, not used often

**Y-site compatibilities:** Alfentanil, amikacin, aminophylline, ascorbic acid injection, atracurium, atropine, azaTHIOprine, aztreonam, bumetanide, buprenorphine, butorphanol, calcium chloride, gluconate, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, clindamycin, cyanocobalamin, cycloSPORINE, dexamethasone, digoxin, diphenhydrAMINE, DOBUTamine, DOPamine, Doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin lactobionate, esmolol, famotidine, fentaNYL, fluconazole, folic acid (as sodium salt), gentamicin, glycopyrrolate, heparin, hydrocortisone sodium succinate, hydrOXYzine,

imipenem-cilastatin, inamrinone, insulin, regular, isoproterenol, ketorolac, labetalol, lactated Ringer's, lidocaine, magnesium sulfate, mannitol, meperidine, metaraminol, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, midazolam, minocycline, morphine, multiple vitamins injection, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G potassium, sodium, pentamidine, pentazocine, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, raNITIdine, Ringer's injection, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus

## ADVERSE EFFECTS

**CNS:** Confusion; anxiety, restlessness, irritability, delusions, hallucinations, headache, sedation, depression, incoherence, dizziness, memory loss; delirium (geriatric)
**CV:** Palpitations, tachycardia, hypotension, bradycardia
**EENT:** Blurred vision, photophobia, dilated pupils, difficulty swallowing
**GI:** *Dryness of mouth, constipation,* nausea, vomiting, abdominal distress, paralytic ileus
**GU:** Hesitancy, retention, dysuria
**INTEG:** Rash, urticaria, dermatoses
**MISC:** Increased temperature, flushing, decreased sweating, hyperthermia, heat stroke, numbness of fingers

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Good (PO, IM), complete (**IV**) |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | IM/IV | PO |
|---|---|---|
| **Onset** | 15 min | 1 hr |
| **Peak** | 7 hr | Unknown |
| **Duration** | 6-10 hr | 6-24 hr |

## INTERACTIONS

### Individual drugs

Bethanechol: decreased cholinergic effects
Disopyramide, quiNIDine: increased anticholinergic 5 effects, reduce dose, monitor response

### Drug classifications

Antidepressants (tricyclic), antihistamines, phenothiazines: increased anticholinergic amantadine effects
Antidiarrheals, antacids: decreased absorption

## NURSING CONSIDERATIONS

### Assessment

- Assess for **parkinsonism**, EPS: shuffling gait, muscle rigidity, involuntary movements, loss of balance, pill rolling, muscle spasms, drooling before and during treatment, tardive dyskinesia (TD), do not use in TD, exacerbation of symptoms may occur
- **Paralytic ileus:** assess for abdominal pain, intermittent constipation/diarrhea
- Monitor I&O ratio; retention commonly causes decreased urinary output, distention, frequency, incontinence
- Monitor for urinary hesitancy, retention; palpate bladder if retention occurs
- Monitor for constipation, cramping, pain in abdomen, abdominal distention; increase fluids, bulk, exercise if this occurs
- Assess for tolerance over long-term therapy; dosage may have to be increased or changed
- Assess for mental status: affect, mood, CNS depression, worsening of mental symptoms during early therapy
- Assess for benztropine "buzz" or "high," patients may imitate EPS
- Do not discontinue abruptly, taper
- **Pregnancy/breastfeeding:** Safe use is not established, antimuscarinic products inhibit lactation, excretion in breast milk is unknown
- **Beers:** Avoid in older adults, high risk of delirium, CNS effects, decreased urinary flow

### Patient/family education

- Teach patient to report urinary hesitancy/retention, dysuria
- Teach patient to use caution in hot weather; product may increase susceptibility to stroke since perspiration is decreased; patient should remain indoors
- Advise patient not to discontinue this product abruptly; to taper off over 1 wk to prevent withdrawal symptoms (insomnia, involuntary movements, anxiety, tachycardias), to take as directed, not to double doses
- Advise patient that tabs may be crushed, mixed with food; may take whole dose at bedtime if approved by prescriber
- Caution patient to avoid driving or other hazardous activities; drowsiness, dizziness may occur
- Teach patient to avoid OTC medication: cough, cold preparations with alcohol, antihistamines, antacids, or antidiarrheals within 2 hr

unless directed by prescriber; increased CNS depression may occur
• Teach patient to avoid strenuous exercise or activities in hot weather, overheating may occur
• Advise patient to rise from sitting or recumbent position slowly to minimize orthostatic hypotension
• Teach patient to use good oral hygiene; to use sugarless gum, hard candy, frequent sips of water to decrease dry mouth; if dry mouth continues, saliva substitutes may be prescribed
• Instruct patient that doses should not be doubled, but missed dose may be taken up to 2 hr before next dose

### Evaluation

**Positive therapeutic outcome**

• Absence of involuntary movements (pill rolling, tremors, muscle spasms) after 2 days of treatment

## betamethasone topical

*See Appendix B*

## betamethasone (augmented) topical

*See Appendix B*

## betaxolol ophthalmic

*See Appendix B*

**⚠ HIGH ALERT**

## bevacizumab (Rx)

(beh-va-kiz′you-mab)

**Avastin**

*Func. class.:* Antineoplastic—miscellaneous

*Chem. class.:* Monoclonal antibody

**Do not confuse:** Avastin/Astelin

**ACTION:** Monoclonal antibody selectively binds to and inhibits activity of human vascular endothelial growth factor to reduce microvascular growth and inhibition of metastatic disease progression

**Therapeutic outcome:** Decreased tumor size

**USES:** Metastatic carcinoma of the colon or rectum in combination, renal cell carcinoma, glioblastoma, non–small cell lung cancer

**Unlabeled uses:** Adjunctive in breast, renal/ovarian cancer, (wet) macular degeneration

### CONTRAINDICATIONS

Hypersensitivity, serious bleeding, hypertensive crisis, recent surgery

**Precautions:** Pregnancy, breastfeeding, children, geriatric, HF, blood dyscrasias, CV disease, hypertension, surgery, thromboembolic disease, hamster protein/murine hypersensitivity

**BLACK BOX WARNING:** GI perforation, wound dehiscence, bleeding

### DOSAGE AND ROUTES

**Recurrent platinum-sensitive, epithelial, ovarian, fallopian tube, or primary peritoneal cancer with CARBOplatin and PACLitaxel**

**Adult: IV** 15 mg/kg with PACLitaxel (175 mg/m2 IV over 3 hr) and CARBOplatin (AUC 5 IV on day 1 and q3wk × 6-8 cycles), then bevacizumab 15 mg/kg IV q3wk as a single agent until disease progression or unacceptable toxicity

**Metastatic colorectal cancer**

**Adult: IV** INF in combination with 5-fluorouracil 5 mg/kg q14 days given over 90 min; if well tolerated, the next infusion may be given over 60 min; if 60 min infusions are well tolerated, subsequent infusions may be given over 30 min; (second-line) 5 mg/kg q2wk or 7.5 mg/kg q3wk with fluoropyrimidine and irinotecan or fluoropyrimidine and oxaliplatin-based agent

**Non–small cell lung cancer**

**Adult: IV** 15 mg/kg over 60-90 min with CARBOplatin and PAClitaxel

**Metastatic cervical cancer**

**Adult: IV** 15 mg/kg q3wk with paclitaxel and CISplatin or PACLitaxel and topotecan

**Metastatic renal cell carcinoma**

**Adult: IV** 15 mg/kg q2wk with interferon alfa 9 million units SUBCUT 3 × per wk, up to 52 wk

**Available forms:** Inj 25 mg/ml

### Implementation

**IV intermittent infusion route**

• Do not give by **IV** bolus or **IV** push, do not admix
• Give as **IV** inf over 90 min for first dose and 60 min thereafter, if well tolerated

**BLACK BOX WARNING: Wound dehiscence:** do not give for ≥28 days after surgery, make sure wounds are healed prior to use

### ADVERSE EFFECTS

**CNS:** *Asthenia, dizziness,* intracranial hemorrhage (malignant glioma), headache, fatigue, confusion, weakness

**CV:** Deep vein thrombosis, arterial thrombosis, hypo/hypertension, hypertensive crisis, heart failure
**GI:** Nausea, vomiting, anorexia, diarrhea, constipation, abdominal pain, colitis, taste change, dyspepsia, stomatitis, GI hemorrhage/perforation
**GU:** Proteinuria, urinary frequency/urgency, nephrotic syndrome, ovarian failure
**HEMA:** Leukopenia, neutropenia, thrombocytopenia, microangiopathic hemolytic anemia, thromboembolism, bleeding
**META:** Bilirubinemia, hypokalemia, hyponatremia
**MISC:** Exfoliative dermatitis, hemorrhage, non-GI fistula formation, *alopecia, impaired wound healing,* osteonecrosis of the jaw, antibody formation, back pain myalgia
**RESP:** Dyspnea, upper respiratory infection
**INTEG:** Skin discoloration, infusion reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Steady state 100 days |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 20 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Steady state 100 days |

## INTERACTIONS

### Individual drugs

SUNItinib: avoid concurrent use; microangiopathic hemolytic anemia may occur

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P q3-4wk
- Assess for symptoms of infection; may be masked by product
- Monitor **CNS reaction:** dizziness, confusion
- Assess for **HF:** crackles, jugular vein distention, dyspnea during treatment
- Assess **GU status** (proteinuria); nephrotic syndrome may occur; monitor urinalysis for increasing protein level; products should be held if protein ≥2 g/24 hr

**BLACK BOX WARNING: Wound dehiscence:** discontinue 28 days before elective surgery, hold for ≥28 days until incision is healed

- Assess for GI perforation, serious bleeding, nephrotic syndrome, hypertensive crisis; GI perforation (constipation, fever, abdominal pain, nausea, vomiting)
- **Serious bleeding:** Assess for bleeding from any orifice, stroke, deep vein thrombosis, product should be discontinued permanently; for surgery, product should be discontinued temporarily
- **Reversible posterior leukoencephalopathy syndrome (RPLS):** discontinue if this disorder develops (headache, vision changes, seizures, altered mental status); MRI may be ordered, occurs 16 hr-1 yr after beginning treatment
- **Pregnancy/Breastfeeding:** Drug may lead to fetal harm, Do not use in pregnancy, do not breastfeed
- Thromboembolic events: Assess for stroke, TIA, MI, usually occurs in geriatric patients who used this product previously
- **Fistulas:** May occur within 6 mo of beginning treatment, may be fatal

### Patient/family education

- Instruct patient to avoid hazardous tasks, since confusion, dizziness may occur
- Instruct patient to report signs of infection: sore throat, fever, diarrhea, vomiting
- Advise patient not to become pregnant while taking this product, or for several months after discontinuing treatment
- Advise patient to notify prescriber if pregnant or planning a pregnancy, discuss possible infertility with patient
- Need to discontinue a month before surgery and not restart until wound is healed

**BLACK BOX WARNING:** Teach patient to report bleeding, changes in urinary patterns, edema, abdominal pain

### Evaluation

**Positive therapeutic outcome**

- Decrease in size of tumors

## bezlotoxumab

(bez'loe-tox'ue-mab)
**Zinplava**
*Func. class.:* Biologic response modifier, monoclonal antibody

**ACTION:** Binds to *Clostridium difficile* toxin B, inhibiting the binding of toxin B and neutralizing its effects

**Therapeutic outcome:** No recurrence when used with antibiotic therapy

**USES:** For pseudomembranous colitis to reduce recurrence of *C. difficile* infection (CDI) in patients who are receiving antibacterial

treatment of CDI and are at a high risk for CDI recurrence

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Breastfeeding, pregnancy, heart failure

## DOSAGE AND ROUTES:

**Adult: IV** 10 mg/kg IV as a single dose during antibacterial treatment for CDI

**Available forms:** Solution for injection 1000 mg/40 ml

## IMPLEMENTATION

- Give by IV infusion, visually inspect parenteral products for particulate matter and discoloration prior to use
- Dilution of the vials: Do not shake, withdraw the required volume from the vial based on the patient's weight and transfer into an IV bag of either 0.9% NaCl or D5 injection to 1-10 mg/ml. Mix the diluted solution by gentle inversion, do not shake
- Storage: The diluted solution may be stored at room temperature for 16 hr or refrigerated 2-8° C (36-46° F) up to 24 hr; if refrigerated, allow the solution to come to room temperature before use, do not freeze

**Intravenous (IV) infusion:** Infuse the diluted solution IV over 60 min using a sterile, nonpyrogenic, low-protein–binding 0.2-0.5 micron inline or add-on filter, give via a central line or a peripheral catheter, do not give IV push or bolus, do not coadminister other drugs simultaneously through the same infusion line

## ADVERSE EFFECTS

**CNS:** Fever, headache, dizziness, fatigue
**CV:** Ventricular tachycardia, heart failure, hypertension
**Misc:** *Infusion-related reactions,* nausea, dyspnea, antibody formation

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Catabolism |
| **Half-life** | 19 days |

### Pharmacodynamics

Unknown

## INTERACTIONS

None known

## NURSING CONSIDERATIONS

### Assessment

- **Pseudomembranous colitis:** Assess for diarrhea that is watery or bloody, fever, abdominal cramping/pain, pus or mucus in the stools, dehydration
- **Heart failure:** Monitor for heart failure during administration, death has occurred from heart failure; causes of death included infections, cardiac failure, and respiratory failure
- Pregnancy/breastfeeding: Identify if the patient is pregnant or breastfeeding, there are no adequate and well-controlled studies in pregnancy or breastfeeding
- Infusion-related reactions: Monitor for infusion-related reactions, redness, swelling; if these occur, infusion should be discontinued

### Evaluation

**Positive therapeutic outcome**
No recurrence when used with antibiotic therapy

### Patient/family education

- Advise on the reason for product and expected result
- **Pseudomembranous colitis:** Teach patient to report immediately diarrhea that is watery or bloody, fever, abdominal cramping/pain, pus or mucus in the stools, dehydration
- **Infusion-related reactions:** Teach patient to report immediately infusion-related reactions, redness, swelling; if these occur, infusion should be discontinued

## bimatoprost ophthalmic

*See Appendix B*

## bisacodyl (Rx, OTC)

(bis-a-koe'dill)
**Alophen, Bicholate, Carter's Little Pills, Codulax, Dacodyl, Doxidan, Dulcolax, Ex-Lax Ultra Tab, Femilax, Fleet (bisacodyl), Feen-A-Mint, Soflax-Ex**
*Func. class.:* Laxative, stimulant
*Chem. class.:* Diphenylmethane

**Do not confuse:** Dulcolax (bisacodyl), Dulcolax (docusate)

**ACTION:** Acts directly on intestine by increasing motor activity; thought to irritate colonic intramural plexus; increases water in the colon

**Therapeutic outcome:** Decreased constipation

**USES:** Short-term treatment of constipation, bowel or rectal preparation for surgery, examination

## CONTRAINDICATIONS

Hypersensitivity, abdominal pain, nausea, vomiting, appendicitis, acute surgical abdomen, ulcerated hemorrhoids, acute hepatitis, fecal impaction, intestinal/biliary tract obstruction

**Precautions:** Pregnancy, breastfeeding, rectal fissures, severe CV disease

## DOSAGE AND ROUTES

**Adult ≥12 yr:** PO 5-15 mg in PM or AM; may use up to 30 mg for bowel or rectal preparation; RECT 10 mg (single dose), 30 ml enema
**Child 6-11 yr:** PO 5 mg as a single dose; RECT 5 mg as a single dose

**Available forms:** Tabs del rel 5, 10 mg; enteric-coated tabs 5 mg; supp 5, 10 mg; enema 10 mg/30 ml

### Implementation

**Oral route**

- Swallow tabs whole; do not break, crush, or chew
- Give alone with water only for better absorption; do not take within 1 hr of antacids, milk
- Administer in AM or PM (oral dose)

**Rectal route**

- Lubricate before insertion, patient should retain for ½ hr
- Insert high in rectum

## ADVERSE EFFECTS

**CNS:** Muscle weakness
**GI:** *Nausea, vomiting, anorexia, cramps,* diarrhea, rectal burning (supp)
**META:** Protein-losing enteropathy, alkalosis, hypokalemia, tetany, electrolyte and fluid imbalances

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poor |
| **Distribution** | Unknown |
| **Metabolism** | Liver, minimally |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics

| | PO | Rect |
|---|---|---|
| **Onset** | 6-10 hr | 15-60 min |
| **Peak** | Unknown | Unknown |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Drug classifications

Antacids, gastric acid pump inhibitors, $H_2$-blockers: increased gastric irritation

### Drug/food

Increased irritation—dairy products: separate by 2 hr

### Drug/lab test

Increased: sodium phosphate
Decreased: calcium, magnesium

### Drug/herb

Flax, lily of the valley, pheasant's eye, senna, squill: increased laxative action

## NURSING CONSIDERATIONS

### Assessment

- Monitor blood, urine electrolytes if used often by patient; check I&O ratio to identify fluid loss
- Assess **GI symptoms:** cramping, rectal bleeding, nausea, vomiting; if these symptoms occur, product should be discontinued; identify cause of constipation; identify whether fluids, bulk, or exercise are missing from lifestyle
- Multiple products/routes may be used for bowel prep
- **Pregnancy/breastfeeding:** Safety not determined, may be used in breastfeeding

### Patient/family education

- Discuss with the patient that adequate fluid and bulk consumption is necessary
- Advise patient that normal bowel movements do not always occur daily
- Teach patient not to use in presence of abdominal pain, nausea, vomiting; tell patient to notify prescriber if constipation is unrelieved or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness, excessive thirst
- Teach patient to take with a full glass of water; take with dairy products, separate by 2 hr; separate from other foods by 1 hr
- Teach patient to identify bulk, water, constipating products, exercise in patient's life
- Instruct patient not to use laxatives for long-term therapy because bowel tone will be lost; 1 wk use is usually sufficient

### Evaluation

**Positive therapeutic outcome**

- Decreased constipation within 3 days

## bismuth subsalicylate (OTC)

(bis'meth sub-sa-li'si-late)
**Bismatrol, Bismed, Bismylate, Kaopectate, Kaopectolin, Kao-Tin, K-Pek, Maalox Total Stomach Relief, Peptic Relief, Pepto-Bismol, Pink Bismuth, StomaK-care**
*Func. class.:* Antidiarrheal/weak antacid
*Chem. class.:* Salicylate

**ACTION:** Inhibits prostaglandin synthesis responsible for GI hypermotility, intestinal inflammation; stimulates absorption of fluid and electrolytes; binds toxins produced by *Escherichia coli*

**Therapeutic outcome:** Absence of loose, watery stools

**USES:** Diarrhea (cause undetermined); prevention of diarrhea when traveling; may be included to treat *Helicobacter pylori,* heartburn, indigestion, nausea

**Unlabeled uses:** Chronic infantile diarrhea, traveler's diarrhea, gastric/duodenal ulcer, *H. pylori* eradication

## CONTRAINDICATIONS

Child <3 yr; flulike symptoms; history of GI bleeding; varicella, hypersensitivity to this product or salicylates, PUD

**Precautions:** Pregnancy, breastfeeding, geriatric, gout, diabetes mellitus, bleeding disorders, previous hypersensitivity to NSAIDs, *Clostridium difficile*–associated diarrhea when used with antiinfectives for *H. pylori*

## DOSAGE AND ROUTES

### Antidiarrheal

**Adult:** PO 2 tab or 30 ml/15 ml extra/max strength q30min or 2 tabs q6min, max 4.2 g/24 hr

### Antiulcer

**Adult:** PO 524 mg q30-60min or 1048 mg q1hr, max 4.2 g/24 hr; given with metroNIDAZOLE or tetracycline

### Traveler's diarrhea (Unlabeled)

**Adult: PO** 30 ml q30min (8 times/day regular strength) (4 times/day max strength)

**Available forms:** Tabs 262 mg; chewable tabs 262 mg/15 ml, liquid 262 mg/15 ml, 525 mg/ml

### Implementation

- **Suspension:** Shake susp before use; chewable tabs should not be swallowed whole, use measuring cup/syringe

## ADVERSE EFFECTS

**CNS:** Confusion, twitching, neurotoxicity (high dose)
**EENT:** Hearing loss, tinnitus, metallic taste, blue gums, black tongue (chew tabs)
**GI:** Increased fecal impaction (high doses), dark stools, constipation, diarrhea, nausea
**HEMA:** Increased bleeding time

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Salicylate >90% |
| **Distribution** | None |
| **Metabolism** | None |
| **Excretion** | Feces (unchanged) |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1 hr |
| **Peak** | 2 hr |
| **Duration** | 4 hr |

## INTERACTIONS

### Individual drugs

Methotrexate: increased toxicity
Tetracycline: decreased absorption, phenytoin, separate by ≥2 hr
Increase: effect of anticoagulants (PO), antidiabetics (PO)

### Drug classifications

Anticoagulants (oral): increased effect of anticoagulants
Quinolones: decreased absorption of quinolones
Salicylates: increased risk of salicylate toxicity

### Drug/lab test

Interference: radiographic studies of GI system

## NURSING CONSIDERATIONS

### Assessment

- **Diarrhea:** Assess bowel pattern (frequency, consistency, shape, volume, color) before product therapy, after treatment; check weight, bowel sounds; identify factors contributing to diarrhea (bacteria, diet, medications, tube feedings)
- Monitor skin turgor; dehydration may occur in severe diarrhea; monitor electrolytes (potassium, sodium, chloride) if diarrhea is severe or continues long term
- **Pregnancy/breastfeeding:** Avoid in pregnancy, do not use in breastfeeding

### Patient/family education

- Teach patient to stop use if symptoms do not improve within 2 days or become worse, or if diarrhea is accompanied by high fever
- Teach patient to increase fluids for rehydration
- Tell patient to chew or dissolve chewable tabs in mouth; do not swallow whole; shake susp before using, maintain hydration
- Tell patient to avoid other salicylates unless directed by prescriber; not to give to children because of possibility of Reye's syndrome
- Tell patient that stools may turn gray; tongue may darken; impaction may occur in debilitated patients
- Separate quinolones, phenytoin, tetracycline by ≥ 2 hrs

### Evaluation
**Positive therapeutic outcome**
• Decreased diarrhea or absence of diarrhea when traveling; resolution of ulcers

**⚠ HIGH ALERT**

## bisoprolol (Rx)
(bis-oh′pro-lole)
**Monocor**
*Func. class.:* Antihypertensive
*Chem. class.:* $\beta_1$-Blocker (selective)

**Do not confuse:** Zebeta/Diabeta/Zetia

**ACTION:** Preferentially and competitively blocks stimulation of $\beta_1$-adrenergic receptor within cardiac muscle (decreases rate of SA node discharge, increases recovery time), slows conduction of AV node, decreases heart rate, which decreases $O_2$ consumption in myocardium; decreases renin-aldosterone-angiotensin system; inhibits $\beta_2$-receptors in bronchial and vascular smooth muscle at high doses

**Therapeutic outcome:** Decreased B/P, heart rate

**USES:** Mild to moderate hypertension

**Unlabeled uses:** Stable angina, stable HF for heart control in atrial fibrillation/flutter

## CONTRAINDICATIONS
Hypersensitivity to β-blockers, cardiogenic shock, heart block (2nd or 3rd degree), sinus bradycardia, acute cardiac failure

**Precautions:** Pregnancy, breastfeeding, children, major surgery, diabetes mellitus, HF, renal/hepatic/thyroid/peripheral vascular/aortic/mitral valve disease, COPD, asthma, well-compensated heart failure, myasthenia gravis, abrupt discontinuation

## DOSAGE AND ROUTES
### Renal/hepatic dose
**Adult:** PO CCr <40 ml/min 2.5 mg, titrate upward

### Hypertension
**Adult:** PO 2.5-5 mg/day, may increase if necessary to 20 mg once daily, max 20 mg/day; reduce to 2.5 mg in bronchospastic disease

### Angina (unlabeled)
**Adult:** PO 5-20 mg/day

### Heart failure (unlabeled)
**Adult:** PO 1.25 mg/day × 48 hr, then 2.5 mg/day for 1st mo, then 5 mg/day, max 10 mg/day

**Available forms:** Tabs 5, 10 mg

### Implementation
• Give daily; give with food to prevent GI upset; may be crushed
• Store protected from light, moisture; place in cool environment

## ADVERSE EFFECTS
**CNS:** Headache, insomnia, fatigue, dizziness, mental changes, memory loss, hallucinations, depression, lethargy, drowsiness, strange dreams, catatonia, peripheral neuropathy
**CV:** Ventricular dysrhythmias, profound hypotension, bradycardia, HF, cold extremities, postural hypotension
**EENT:** Sore throat, dry burning eyes, dry mouth
**GI:** Nausea, diarrhea, vomiting
**INTEG:** Sweating
**RESP:** Dyspnea, cough, upper respiratory infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown; protein binding (30%) |
| **Metabolism** | Liver, inactive metabolites |
| **Excretion** | Urine, unchanged (50%) |
| **Half-life** | 9-12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | 24 hr |

## INTERACTIONS
### Individual drugs
Amiodarone, digoxin: increased bradycardia
Guanethidine, reserpine: increased hypotension

### Drug classifications
ACE inhibitors, α-blockers, calcium channel blockers, diuretics: increased antihypertensive effect
Antidiabetics: increased antidiabetic effect
Calcium channel blockers: increased myocardial depression
Ergots: increased peripheral ischemia
NSAIDs, salicylates: decreased antihypertensive effects, may mask hypoglycemic symptoms

### Drug/herb
Hawthorn: increased β-blocking effect
Ephedra: decreased β-blocking effect

### Drug/lab test
Increased: AST, ALT, blood glucose, BUN, uric acid, potassium, lipoprotein, ANA titer
Interference: glucose/insulin tolerance tests

## NURSING CONSIDERATIONS

### Assessment

- **Hypertension:** Monitor B/P during beginning treatment, periodically thereafter; pulse: note rate, rhythm, quality; apical/radial pulse before administration; notify prescriber of any significant changes (pulse <50 bpm)
- Check for baselines in renal, liver function tests before therapy begins
- **HF:** assess for edema in feet, legs daily, monitor I&O, daily weight; check for jugular vein distention, crackles, bilaterally, dyspnea
- Monitor skin turgor, dryness of mucous membranes for hydration status, especially geriatric
- **Pregnancy/breastfeeding:** Use in pregnancy only if benefits outweigh fetal risk, cautious use in breastfeeding

### Patient/family education

**BLACK BOX WARNING:** Teach patient not to discontinue product abruptly, taper over 1 wk; may cause precipitate angina if stopped abruptly; evaluate noncompliance

- Teach patient not to use OTC products containing α-adrenergic stimulants (such as nasal decongestants, cold preparations); to avoid alcohol, smoking; to limit sodium intake as prescribed
- Teach patient how to take pulse and B/P at home; advise when to notify prescriber
- Instruct patient to comply with weight control, dietary adjustments, modified exercise program
- Tell patient to carry/wear emergency ID to identify product being taken, allergies; tell patient product controls symptoms but does not cure
- Caution patient to avoid hazardous activities if dizziness, drowsiness present
- Teach patient to take product as prescribed, not to double doses, skip doses; take any missed doses as soon as remembered if at least 8 hr until next dose
- Advise patient to report slow heart rate dizziness, confusion, depression, fever, cold extremities
- Teach diabetic patient drug may mask signs of hypoglycemia or alter blood glucose levels

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P in hypertension (after 1-2 wk)

## TREATMENT OF OVERDOSE:

Lavage, **IV** atropine for bradycardia, **IV** theophylline for bronchospasm, digoxin, $O_2$, diuretic for cardiac failure, hemodialysis, **IV** glucose for hypoglycemia, **IV** diazePAM (or phenytoin) for seizures

**⚠ HIGH ALERT**

# bivalirudin (Rx)

(bye-val-i-rue'din)

**Angiomax**

*Func. class.:* Anticoagulant

*Chem. class.:* Thrombin inhibitor

**ACTION:** Direct inhibitor of thrombin that is highly specific; able to inhibit free and clot-bound thrombin

**Therapeutic outcome:** Anticoagulation in percutaneous transluminal coronary angioplasty (PTCA), used with aspirin; heparin-induced thrombocytopenia with thrombosis syndrome

**USES:** Unstable angina in patients undergoing PTCA, used with aspirin; heparin-induced thrombocytopenia; heparin-induced thrombocytopenia with thrombosis syndrome, PCI with IIb/IIIa

## CONTRAINDICATIONS

Hypersensitivity, active bleeding, cerebral aneurysm, intracranial hemorrhage, recent surgery, CVA

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal function impairment, hepatic disease, asthma, blood dyscrasias, thrombocytopenia, GI ulcers, hypertension, inflammatory bowel disease, vitamin K deficiency

## DOSAGE AND ROUTES

### PCI/PTCA

**Adult: IV** bol 0.75 mg/kg, then **IV** inf 1.75 mg/kg/hr for 4 hr; another **IV** inf may be used at 0.2 mg/kg/hr for ≤20 hr; this product is intended to be used with aspirin (325 mg daily) adjusted to body weight

### HIT/HITTS

**Adult: IV** bol 0.75 mg/kg, then cont INF 1.75 mg/kg/hr for duration of procedure

### Renal dose

**Adult:** IV CCr ≥ 30 ml/min no change; CCr 10-29 ml/min consider reduction to 1 ml/kg/hr

**Available forms:** Inj, lyophilized 250 mg vial

### Implementation

- Prior to PTCA, give with aspirin, 325 mg **IV** direct 1 mg/kg as a bolus; then intermittent infusion

**Intermittent IV infusion route**

- To each 250-mg vial add 5 ml of sterile water for inj, swirl until dissolved, further dilute reconstituted vial with 50 ml of $D_5W$ or 0.9% NaCl (5 mg/ml); the dose is adjusted to body weight, run at 2.5 mg/kg/hr, do not admix before or during administration
- Give reduced dose in renal impairment

**Y-site compatibilities:** Abciximab, acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, arsenic trioxide, atenolol, atracurium, atropine, azithromycin, aztreonam, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, capreomycin, CARBOplatin, carmustine, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, cimetidine hydrochloride, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, DAUNOrubicin liposome, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, dilTIAZem, diphenhydrAMINE, DOCEtaxel, dolasetron, DOPamine, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoprostenol, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, mitoXANtrone, mivacurium, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride/phosphates, procainamide, promethazine, propranolol, raNITIdine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, warfarin, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** *Headache, insomnia, anxiety, nervousness*
**CV:** *Hypo/hypertension, bradycardia,* ventricular fibrillation
**GI:** *Nausea, vomiting, abdominal pain, dyspepsia*
**HEMA:** Hemorrhage, thrombocytopenia
**MISC:** Pain at inj site, pelvic pain, urinary retention, fever, anaphylaxis, infection
**MS:** *Back pain*
**GU:** Urinary retention, renal failure, oliguria

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | No protein binding |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys |
| **Half-life** | 25 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | 1 hr |

## INTERACTIONS

### Individual drugs

Aspirin, treprostinil: increased risk of bleeding, GPIIb/IIIa inhibitors, use together cautiously

### Drug classifications

Anticoagulants, thrombolytics: increased risk of bleeding, NSAIDs, salicylates, cephalosporins, antineoplastics, sulfinpyrazone

### Drug/herb

Angelica, chamomile, devil's claw, dong quai, garlic, ginger, ginkgo, ginseng, horse chestnut, saw palmetto, avoid concurrent use

## NURSING CONSIDERATIONS

### Assessment

- Assess for fall in B/P or Hct that may indicate hemorrhage, hematoma, hemorrhage at puncture site are more common in the elderly, monitor coagulation studies, Hct before use
- Assess for fever, skin rash, urticaria
- Assess **bleeding:** check arterial and venous sites, IM inj sites, catheters; all punctures should be minimized
- **PCI use:** assess for possible thrombosis, stenosis, unplanned stent, prolonged ischemia, decreased reflow
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education
- Explain reason for product and expected results
- Teach patient not to use other OTC products unless approved by prescriber
- Teach patient not to use hard-bristle toothbrush, regular razor to avoid any injury: hemorrhage may result

### Evaluation
**Positive therapeutic outcome**
- Anticoagulation in PTCA

**⚠ HIGH ALERT**

## bleomycin (Rx)
(blee-oh-mye'sin)
**Blenoxane** 🍁
*Func. class.:* Antineoplastic, antibiotic
*Chem. class.:* Glycopeptide

**ACTION:** Inhibits synthesis of DNA, RNA, protein; derived from *Streptomyces verticillus;* phase specific in the $G_2$ and M phases; a nonvesicant, sclerosing agent

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Cancer of head, neck, penis, cervix, vulva of squamous cell origin, Hodgkin's/non-Hodgkin's disease, testicular carcinoma, as a sclerosing agent for malignant pleural effusion

## CONTRAINDICATIONS
Pregnancy, breastfeeding, hypersensitivity

**Precautions:** Renal/hepatic/respiratory disease, patients >70 yr old

**BLACK BOX WARNING:** Idiosyncratic reaction, pulmonary fibrosis, requires specialized care setting, experienced clinician

### Hodgkin's lymphoma
**Adult/adolescent/child:** IV, IM, SUBCUT 5-20 units/m2 may give in combination

## DOSAGE AND ROUTES
**Adult and child:** IM/SUBCUT/**IV** 0.25-0.5 units/kg q1-2wk or 10-20 units/$m^2$; then 1 unit/day or 5 units/wk; may also be given by cont INF; max total dose, 400 units in lifetime

### Hodgkin's disease (test dose)
**Adult and child (unlabeled):** IM/**IV**/SUBCUT <2 units for first 2 doses followed by 24 hr observation

### Malignant pleural effusion
**Adult:** 60 units diluted in 100 ml of 0.9% NaCl intrapleural inj given through a thoracotomy tube following drainage of excess pleural fluid and complete lung expansion, remove after 4 hr

### Testicular cancer
**Adult:** IV 10-20 units/m2 q1-2 × 1wk, may be given in combination

### Renal Dose
**Adult/child:** CCr 40-50 ml/min reduce dose by 30%; CCr 30-39 ml/min reduce dose by 40%; CCr 20-29 ml/min reduce dose by 45%; CCr 10-19 ml/min reduce dose by 55%; CCr 5-10 ml/min reduce dose by 60%

**Available forms:** Powder for inj 15, 30 units/vial

### Implementation
- Avoid contact with skin; very irritating; wash completely to remove
- Give fluids **IV** or PO before chemotherapy to hydrate patient
- Give antacid before oral agent; give antiemetic 30-60 min before giving product and prn to prevent vomiting; give antibiotics for prophylaxis of infection
- Provide liquid diet: carbonated beverages, gelatin may be added if patient is not nauseated or vomiting
- Rinse mouth tid-qid with water, club soda; brush teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

**IM/SUBCUT route**
- IM test dose in lymphoma
- Reconstitute with 1-5 ml sterile water for inj; max conc 5 units/ml, $D_5W$, 0.9% NaCl, rotate inj sites

**IV route**
- Product should be prepared by experienced personnel using proper precautions
- Two test doses 2-5 units before initial dose in lymphoma; monitor for anaphylaxis
- Give by direct **IV** after reconstituting 15- or 30-unit vial with 5 or 10 ml of 0.9% NaCl; give 15 units or less/10 min through Y-tube or 3-way stopcock initial dose; monitor for anaphylaxis

**Intermittent IV infusion route**
- Administer after diluting 50-100 ml 0.9% NaCl, $D_5W$ and giving at prescribed rate

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime,

chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone sodium succinate, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, raNITIdine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tirofiban, tobramycin, tolazoline, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine

## ADVERSE EFFECTS

**CNS:** Pain at tumor site, headache, confusion, fever, chills, malaise
**CV:** MI, stroke
**GI:** *Nausea, vomiting, anorexia, stomatitis, weight loss,* ulceration of mouth, lips
**GU:** Hemolytic-uremic syndrome
**IDIOSYNCRATIC REACTION:** Hypotension, confusion, fever, chills, wheezing
**INTEG:** *Rash, hyperkeratosis, nail changes, alopecia,* pruritus, acne, striae, peeling, hyperpigmentation, phlebitis
**RESP:** Fibrosis, pneumonitis, wheezing, pulmonary toxicity
**SYST:** Anaphylaxis, radiation recall, Raynaud's phenomenon

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM, SUBCUT, intrapleural, intraperitoneal) |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver, 30% |
| **Excretion** | Kidneys, unchanged (50%) |
| **Half-life** | 2-4 hr; increased in renal disease |

### Pharmacodynamics

| | |
|---|---|
| IV, IM SUBCUT | Peak 30-60 min |

## INTERACTIONS

### Individual drugs

Filgrastim, sargramostim: increased toxicity
Fosphenytoin, phenytoin: decreased phenytoin levels, check drug level periodically
Radiation: increased toxicity, bone marrow suppression

### Drug classifications

Anesthetics (general), antineoplastics: increased toxicity, use together cautiously
Live virus vaccines: avoid concurrent use, adverse reactions may occur

### Drug/lab test

Increased: uric acid
Decrease: Pulmonary function tests

## NURSING CONSIDERATIONS

### Assessment

- Assess buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine)
- Assess symptoms indicating anaphylaxis: rash, pruritus, urticaria, purpuric skin lesions, itching, flushing, wheezing, hypotension; have emergency equipment available

**BLACK BOX WARNING: Pulmonary toxicity/fibrosis:** Risk increases >70 yr, assess pulmonary function tests; chest x-ray before, during therapy; monitor q2wk during treatment; pulmonary diffusion capacity for carbon monoxide ($DL_{CO}$) monthly; if <40% of pretreatment value, stop treatment; assess for dyspnea, crackles, unproductive cough, chest pain, tachypnea, fatigue, increased pulse, pallor, lethargy, more common in the elderly, radiation therapy, pulmonary disease; usually occurs with cumulative doses >400 units

• Monitor CBC, differential, platelet count weekly; withhold product for WBC <4000/mm$^3$ or platelet count <100,000/mm$^3$; notify prescriber of results for WBC <20,000/mm$^3$, platelets <150,000/mm$^3$

**BLACK BOX WARNING: Idiosyncratic reaction:** Severe reaction in those with lymphoma, assess hypotension, mental confusion, fever, chills, wheezing in lymphoma

**BLACK BOX WARNING:** Requires a specialized care setting and experienced clinician due to severe reactions

• Monitor temp (may indicate beginning of infection)
• Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly
• Assess for bleeding: hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr; inflammation of mucosa, breaks in skin
• Treat pulmonary infection prior to treatment; identify dyspnea, crackles, unproductive cough, chest pain, tachypnea
• Identify effects of alopecia on body image; discuss feelings about body changes; if edema in feet, joint pain, stomach pain, shaking present, prescriber should be notified; identify inflammation of mucosa, breaks in skin
• **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

• Teach patient to avoid use of products containing aspirin or ibuprofen, razors, commercial mouthwash; bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools); decreased urination
• Instruct patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath)
• Instruct patient to report any changes in breathing or coughing even several months after treatment; to avoid crowds and persons with respiratory tract or other infections
• Inform patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
• Caution patient not to have any vaccinations without the advice of the prescriber; serious reactions can occur
• Advise patient contraception is needed during treatment and for several months after completion of therapy

### Evaluation

**Positive therapeutic outcome**

• Prevention of rapid division of malignant cells

**⚠ HIGH ALERT**

## bortezomib (Rx)

(bor-tez′oh-mib)
**Velcade**
*Func. class.:* Antineoplastic—miscellaneous
*Chem. class.:* Proteasome inhibitor

**ACTION:** Reversible inhibitor of chymotrypsin-like activity in mammalian cells; causes a delay in tumor growth by disrupting normal homeostatic mechanisms 26S proteasome

**Therapeutic outcome:** Decreased growth and spread of malignant cells

**USES:** Multiple myeloma previously untreated or when at least two other treatments have failed; mantle cell lymphoma

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to this product, boron, or mannitol

**Precautions:** Peripheral neuropathy, children, geriatric, cardiac/hepatic disease, hypotension, tumor lysis syndrome, thrombocytopenia, infection, diabetes mellitus, bone marrow suppression, intracranial bleeding, injection-site irritation

## DOSAGE AND ROUTES

### Multiple myeloma (previously untreated)

**Adult: IV** bol/subcut Give for 9 6-wk cycles; cycle 1-4, 1.3 mg/m$^2$/dose given on days 1, 4, 8, 11, then a 10-day rest period (days 12-21) and again on days 22, 25, 29, 32, then a 10-day rest period (days 33-42) given with melphalan (9 mg/m$^2$/day on days 1-4) and predniSONE (60 mg/m$^2$/day on days 1-4); this 6-wk cycle is considered one course; in cycles 5-9, give bortezomib 1.3 mg/m$^2$/dose on days 1, 8, 22, 29 with melphalan (9 mg/m$^2$/day on days 1-4) and predniSONE (60 mg/m$^2$/day on days 1-4); this 6-wk cycle is considered one course; at least 72 hr should elapse between consecutive doses

### Mantle cell lymphoma in combination

**Adult: IV** bol/subcut 1.3 mg/m$^2$/dose (days 1, 4, 8, 11) followed by 10-day rest period (days 12 to 21); × 6 (3wk) cycles with riTUXimab 375 mg/m2, cyclophosphamide 750 mg/m2, DOXOrubicin 50mg/m2 all on day 1, and predniSONE 100mg/m2 q day on day 1-5, give bortezomib before riTUXimab

### Neuropathic pain
Grade 1 with pain or grade 2, reduce to 1 mg/m$^2$; grade 2 with pain or grade 3, hold product until toxicity resolves, then start at 0.7 mg/m$^2$ qwk; grade 4 hematologic toxicities, withhold use

### Relapsed multiple myeloma or mantle cell lymphoma
who have received ≥ 1 prior therapy
**Adult:** IV BOL/SUBCUT 1.3 mg/m2/dose on days 1, 4, 8, 11 followed by a 10-day rest period

### Hepatic dose
**Adult:** IV bilirubin >1.5 × ULN reduce to 0.7 mg/m$^2$ in cycle 1, consider dose escalation to 1 mg/m$^2$ or further reduction to 0.5 mg/m$^2$ in next cycles based on tolerability

**Available forms:** Lyophilized powder for inj 3.5 mg

### Implementation
**SUBCUT route**
- Reconstitute with 1.4 ml NS (2.5 mg/ml) or 3.5 ml NS (1 mg/ml); the 1 mg/ml may be used for local inj site reaction with the 2.5 mg/ml solution; if injection-site reaction occurs, use 1 mg/ml; the final product should be a clear, colorless solution; if any discoloration or particulate matter is observed, do not use
- Store reconstituted at room temperature, give within 8 hr of reconstitution, store ≤8 hr in a syringe; total storage time must be ≤8 hr when exposed to normal light
- Determine the volume of reconstituted bortezomib to be administered by multiplying the desired dose in mg/m$^2$ by the patient's BSA and dividing the result by the concentration (1 mg/ml or 2.5 mg/ml); discard unused drug, as no preservative is present
- Place a sticker that indicates subcut use on the syringe

**SUBCUT inj**
- Inject subcutaneously in the thigh or abdomen; do not inject into a site that is tender, bruised, erythematous, or indurated; rotate injection sites; new sites should be at least 1 inch from an old site
- Use of gloves and protective clothing are recommended to prevent skin contact

**IV direct**
- **Reconstitute** each vial with 3.5 ml 0.9% NaCl (1 mg/ml), sol should be clear/colorless; **inject** bol over 3-5 sec
- Store unopened product at room temperature, protect from light
- Use protective clothing during handling, preparation; avoid contact with skin
- Monitor for extravasation at inj site

## ADVERSE EFFECTS
**CNS:** Anxiety, insomnia, dizziness, headache, *peripheral neuropathy,* rigors, paresthesia, fever, headache
**CV:** Hypotension, edema, HF
**GI:** Abdominal pain, *constipation,* diarrhea, dyspepsia, *nausea, vomiting,* anorexia
**HEMA:** Anemia, neutropenia, thrombocytopenia
**MISC:** Dehydration, weight loss, herpes zoster, *rash,* pruritus, blurred vision
**MS:** *Fatigue, malaise, weakness,* arthralgia, bone pain, muscle cramps, myalgia, back pain, tumor lysis syndrome
**RESP:** Cough, pneumonia, dyspnea, URI, ARDs, pneumonitis, interstitial pneumonia, lung infiltration

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 83% |
| **Metabolism** | P450 enzymes (3A4, 2D6, 2C19, 2C9, 1A2) |
| **Excretion** | Unknown |
| **Half-life** | 9-15 hr |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual drugs
Amiodarone, amprenavir, chloramphenicol, CISplatin, colchicine, cycloSPORINE, dapsone, didanosine, disulfiram, DOCEtaxel, gold salts, INH, iodoquinol, isoniazid, lamiVUDine, metroNIDAZOLE, nitrofurantoin, oxaliplatin, PACLitaxel, penicillAMINE, phenytoin, ritonavir, stavudine, sulfaSALAzine, thalidomide, vinBLAStine, vinCRIStine, zacatabine, zidovudine, and others: increased peripheral neuropathy

### Drug classifications
Anticoagulants, NSAIDs, platelet inhibitors, salicylates, thrombolytics: increased bleeding risk
Antihypertensives: increased hypotension, monitor B/P often
Antivirals, statins, HMG-CoA reductase inhibitors: increased peripheral neuropathy
Hematopoietic pregenitor cells (sargramostim, filgrastim): do not use within 24 hr of chemotherapy
Oral hypoglycemics: increased hypo/hyperglycemia
Products that induce or inhibit CYP3A4: increased toxicity or decreased efficacy
Decreased: effect of norethindrone, estradiol, combination oral contraceptives,

another nonhormonal contraceptive should be used
Fatal pulmonary toxicity: assess for risk factors, or new worsening pulmonary symptoms
Tumor lysis syndrome: usually with those with a high tumor burden

### Drug/herb
St. John's wort: toxicity or decreased efficacy

### Drug/lab tests
Increase: LFTs, glucose, platelets, Hb

## NURSING CONSIDERATIONS
### Assessment
- Assess hematologic status: platelets, CBC throughout treatment
- **Reversible posterior leukoencephalopathy syndrome (RPLS): Headache, confusion, lethargy, possible hypertension, usually occurs 16 hr to 1 yr after initial treatment, discontinue product**

### Patient/family education
- **Pregnancy/breastfeeding:** Teach to use contraception while on this product, do not breastfeed
- Advise diabetic to monitor blood glucose levels
- Instruct to contact prescriber if new or worsening peripheral neuropathy, severe vomiting, diarrhea, easy bruising, bleeding, infection
- Advise to avoid driving, operating machinery until effect is known
- Advise to avoid using other medications unless approved by prescriber
- Bleeding risk (report bruising, bleeding)
- Provide fluids and electrolytes as needed
- Teach patient to report immediately, headache, confusion, lethargy (RPLS)
- **Pregnancy/breastfeeding:** do not use in pregnancy, breastfeeding

### Evaluation
**Positive therapeutic outcome**
- Improvement of multiple myeloma symptoms

## bosentan (Rx) REMS
(boh-sen-tan)
**Tracleer**
*Func. class.:* Vasodilator
*Chem. class.:* Endothelin receptor antagonist

**Do not confuse:** Tracleer/Tricor

**ACTION:** Peripheral vasodilation occurs via antagonism of the effect of endothelin on endothelium and vascular smooth muscle

**Therapeutic outcome:** Decreased pulmonary arterial hypertension

**USES:** Pulmonary arterial hypertension with WHO class III, IV symptoms

**Unlabeled uses:** Septic shock to improve microcirculatory blood flow

## CONTRAINDICATIONS
Hypersensitivity, CVA, CAD

**Precautions:** Breastfeeding, children, geriatric, mitral stenosis, impaired hepatic function, anemia, edema, jaundice, hypovolemia, hypotension

**BLACK BOX WARNING:** Pregnancy, hepatic disease, requires an experienced clinician, contraceptive requirements, pregnancy testing

## DOSAGE AND ROUTES
**Adult ≥10-20 and child >12 yr:** PO 31.25 mg qday, titrate up to 31.25 mg BID after 4 wk
**Adult <20-40 and child >12 yr:** PO 31.25 mg bid, titrate to 62.5 mg bid after 4 wk (unlabeled)

### Adults taking a protease inhibitor for ≥10 days
**Adult:** PO 62.5 mg qday or every other day based on tolerance, max 125 mg/day

### Hepatic dose
**Adult:** PO
- **Baseline AST/ALT <3× ULN:** no dosage change, monitor LFTs qmo, reduce or interrupt if elevated
- **AST/ALT >3 and ≤5× ULN:** repeat test; if confirmed, reduce to 62.5 mg bid or interrupt; monitor LFTs q2wk, if interrupted, restart when LFTs <3× ULN, check LFTs within 3 days
- **Increase in AST/ALT >5 and ≤5× ULN:** during treatment, repeat test to confirm, discontinue, monitor LFTs q2wk until LFTs <3× ULN, restart at starting dose
- **AST/ALT >8× ULN:** discontinue permanently

**Available forms:** Tabs 62.5, 125 mg

### Implementation
- Store at room temperature
- Only available through the TAP program 866-228-3546

## ADVERSE EFFECTS
**CNS:** Headache, flushing, fatigue, fever
**CV:** *Hypotension, chest pain,* palpitations, edema of lower limbs, fluid retention
**GI:** Abnormal liver function, dyspepsia, hepatotoxicity, diarrhea

**HEMA:** Anemia, leukopenia, neutropenia, lymphopenia, thrombocytopenia
**INTEG:** Pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, rash
**MISC:** Anaphylaxis, oligospermia, tumor lysis syndrome, respiratory infection, arthralgia
**SYST:** Secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 50% absorbed |
| **Distribution** | Protein binding >98% |
| **Metabolism** | Liver (metabolites); metabolized CYP2C9, CYP3A4, and possibly CYP2C19; steady state 3-5 days |
| **Excretion** | Biliary |
| **Half-life** | 5 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

CycloSPORINE, glyBURIDE: do not coadminister
CycloSPORINE, ketoconazole: increased bosentan level
CycloSPORINE: decreased cycloSPORINE level
GlyBURIDE: glyBURIDE level decreased significantly, bosentan also decreased, increased liver function tests
Ketoconazole: increased bosentan level
Simvastatin: decreased effects
Warfarin: decreased anticoagulation

### Drug classifications

Contraceptives (hormonal), statins: decreased effects
CYP2C9, CYP3A4 inhibitors: increased bosentan effects

### Drug/lab test

**BLACK BOX WARNING:** Increased: ALT, AST

Decreased: Hgb, Hct

## NURSING CONSIDERATIONS

### Assessment

- **Serious skin toxicities:** angioedema occurring 8-21 days after initiating therapy
- Assess B/P, pulse during treatment until stable
- **Assess hepatic toxicity:** AST, ALT, bilirubin; liver enzymes may increase; if ALT/AST >3 and ≤5 × ULN, decrease dose or interrupt treatment and monitor AST/ALT q2wk; if >2 × ULN, and bilirubin >2 × ULN or signs of hepatitis, hepatic disease, stop treatment; vomiting, jaundice; product should be discontinued
- Assess blood studies: Hct, Hgb after 1 mo, 3 mo, then q3mo may be decreased
- **Pulmonary hypertension/HF:** fluid retention, weight gain, increased leg edema; may occur within wks
- **Beers:** Use with caution in older adults, syncope may be exacerbated

**BLACK BOX WARNING:** Experienced clinician: Must be enrolled in the Tracleer REMS program and comply with requirements

**BLACK BOX WARNING:** Pregnancy: perform pregnancy testing before and during treatment in all female patients of childbearing potential, do not use unless a negative serum or urine pregnancy test is confirmed during the first 5 days after a normal menstrual period and at least 11 days after the last unprotected sex, then monthly, do not use hormonal contraceptive as sole method

### Patient/family education

- Instruct patient to report jaundice, dark urine, joint pain, fatigue, malaise, bruising, easy bleeding, fluid retention

**BLACK BOX WARNING:** Pregnancy, monitor pregnancy test monthly; patient must use nonhormonal contraception during and ≥ 1 month after conclusion of treatment

- Instruct patient to take without regard to food, do not take new meds/herbs without prescriber approval, to take in AM or PM

### Evaluation

**Positive therapeutic outcome**

- Decrease in pulmonary hypertension

**⚠ HIGH ALERT**
**RARELY USED**

## bosutinib (Rx)

(boe-sue'ti-nib)
**Bosulif**
*Func. class.:* Antineoplastic biologic response modifiers
*Chem. class.:* Signal transduction inhibitors (STIs), tyrosine kinase inhibitor

**USES:** Treatment of CML; (chronic accelerator phase) Philadelphia-chromosome–positive patients in blast-cell crisis

## CONTRAINDICATIONS
Pregnancy, hypersensitivity

**Precautions:** Breastfeeding, children, diarrhea, geriatric patients, hepatic disease, bone marrow suppression, infection, thrombocytopenia, neutropenia, immunosuppression, fluid retention

## DOSAGE AND ROUTES
**Adult: PO** 500 mg daily with food, may increase to 600 mg/day in those who have not developed grade 3 toxicity or in patients who do not reach complete hematological response by wk 8 or complete cytogenic response (CCyR) by wk 12

### Hepatic dosage
**Adult:** PO Any baseline hepatic impairment: Start at 200 mg/day; liver transaminase $>5 \times$ ULN hold dose until levels $\leq 2.5 \times$ ULN, then resume at 400 mg/day; liver transaminase level $\geq 3 \times$ ULN and bilirubin $>2 \times$ ULN and alk phos $<2 \times$ ULN, discontinue

### Dosage adjustments for treatment related toxicity
**Hematologic toxicity:** ANC $<1000 \times 10^6$/L or platelet count $<50{,}000 \times 10^6$/L: hold dose until ANC $\geq 1000 \times 10^6$/L and platelets $\geq 50{,}000 \times 10^6$/L; if recovery within 2 wks, resume therapy at the same dose; if blood counts remain low after 2 wks, upon recovery, resume at 100 mg/day less than the previous dose

**Diarrhea:** Grade 3 or 4 diarrhea (≥7 stools/day compared with baseline): hold therapy until recovery to grade 1 toxicity or lower; resume therapy at 400 mg/day

**Other nonhematologic toxicity:** Significant or moderate or severe toxicity: hold therapy until toxicity resolves; resume therapy at 400 mg/day

**⚠ HIGH ALERT**

## brentuximab (Rx)
(bren-tak′see-mab)
**Adcetris**
*Func. class.:* antineoplastic
*Chem. class.:* monoclonal antibody

**ACTION:** The anticancer activity is due to the binding of the ADC to CD30-expressing cells, followed by the internalization and transportation of the ADC-CD30 complex to lysosomes, and the release of MMAE via selective proteolytic cleavage. MMAE binds to tubulin and disrupts the microtubule network within the cell, inducing cell cycle arrest and apoptotic death of the cells

**Therapeutic outcome:** Decreasing symptoms of Hodgkin's disease (increased lymph nodes, night sweats, weight loss, splenomegaly, hepatomegaly)

**USES:** For the treatment of Hodgkin's disease after failure of autologous stem cell transplant (ASCT) or after failure of at least 2 prior multiagent chemotherapy regimens in patients who are not ASCT candidates; For the treatment of non-Hodgkin's lymphoma (NHL): For the treatment of systemic anaplastic large cell lymphoma (sALCL) after failure of at least one prior multiagent chemotherapy regimen

## CONTRAINDICATIONS
Hypersensitivity, pregnancy

**BLACK BOX WARNING:** Progressive multifocal leukoencephalopathy (PML)

**Precautions:** Breastfeeding, children, infants, neonates, neutropenia, peripheral neuropathy, tumor lysis syndrome (TLS)

## DOSAGE AND ROUTES
**Adult:** IV 1.8 mg/kg IV over 30 minutes every 3 weeks until disease progression or unacceptable toxicity. For patients >100 kg, max weight used for dosage calculation should be 100 kg, which translates to no more than 180 mg/dose

### Dose adjustments for toxicity due to peripheral neuropathy:
**For Grade <3:** No dosage adjustments are recommended; For new or worsening grade 2/3: Interrupt treatment until toxicity resolves to grade ≤1; when resuming treatment, reduce dosage to 1.2 mg/kg IV q3wk; For Grade 4: Discontinue treatment

### Dose adjustments for toxicity due to neutropenia:
**For neutropenia Grade <3:** No dosage adjustments; For Grade 3/4 neutropenia: Interrupt treatment until toxicity resolves to baseline or grade ≤2; consider the use of growth factors (CSFs) for subsequent cycles of therapy; For Grade 4 neutropenia despite the use of growth factors: Discontinue treatment or reduce the dose to 1.2 mg/kg IV q3wk

**Available forms:** Powder for injection 50 mg

**Implementation:**

**Intermittent IV infusion route**
- Visually inspect for particulate matter and discoloration whenever solution and container permit
- Give only as an IV infusion, do not give as an IV push or bolus

- Use cytoxic handling procedures
- Do not mix with, or administer as an infusion with, other IV products
- Calculate the dose (mg) and the number of vials required. For patients weighing >100 kg, use 100 kg to calculate the dose; reconstitute each 50 mg vial/10.5 ml of sterile water for injection (5 mg/ml)
- Direct the stream of sterile water toward the wall of the vial and not directly at the cake or powder; gently swirl the vial to aid in dissolution, do not shake
- Discard any unused portion left in the vial
- After reconstitution, dilute immediately with ≥100 ml of 0.9% sodium chloride, 5% dextrose, or lactated ringers solution to a final concentration (0.4 mg/ml-1.8 mg/ml)
- Use the diluted solution immediately or store in refrigerator for ≤24 hrs after reconstitution; do not freeze
- Infuse over 30 min

## ADVERSE EFFECTS

**CNS:** Headache, dizziness, *fever,* peripheral neuropathy, anxiety, chills, confusion, *fatigue,* paresthesias, insomnia, night sweats, progressive multifocal leukoencephalopathy (PML)
**CV:** Peripheral edema, supraventricular arrhythmia
**GI:** *Abdominal pain, nausea, vomiting,* constipation, *diarrhea,* weight loss
**HEMA:** Anemia, neutropenia, thrombocytopenia, lymphadenopathy
**INTEG:** *Rash,* pruritus, alopecia, xerosis
**RESP:** Pneumothorax, pneumonitis, pulmonary embolism, dyspnea, *cough*
**SYST:** Anaphylaxis, tumor lysis syndrome, antibody formation, Stevens-Johnson syndrome, infusion reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding, 68%-82% |
| **Metabolism** | Small amount, potent inhibitors or inducers of CYP3A4, may alter action |
| **Excretion** | Unknown |
| **Half-life** | Terminal 4-6 days; three components are released |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Boceprevir, dalfopristin; delavirdine, isoniazid, indinavir, itraconazole, ketoconazole, quinupristin, rifAMPin, ritonavir; telithromycin, tipranavir: increased brentuximab component action:
**Bleomycin:** increased noninfectious pulmonary toxicity; do not use together

### Drug/herb

St. John's wort: increased brentuximab CYP3A4 inducers P-gb inhibitors action
Decrease: brentuximab action-CYP3A4 inducers

## NURSING CONSIDERATIONS

### Assessment

- **Tumor lysis syndrome (TLS):** Assess for hyperkalemia, hyperphosphatemia, hypocalcemia; may develop renal failure may use allopurinol or rasburicase to prevent TLS; monitor serum BUN/Creatinine
- **Pregnancy:** determine if pregnancy is planned or suspected, do not use in pregnancy/breastfeeding
- **Progressive multifocal leukoencephalopathy (PML):** Assess for weakness, or paralysis, vision loss, impaired speech, and cognitive deterioration; often fatal
- Monitor CBC and differential, LFTs, serum bilirubin (direct and indirect), electrolytes, uric acid, neurologic function

### Patient/family education

- Teach patient to report immediately weakness, change in vision, impaired speech; peripheral neuropathy, neutropenia if severe
- Advise patient to use reliable contraception, do not use in breastfeeding
- Use the diluted sol immediately or store in refrigerator for ≤24 hr after reconstitution; do not freeze

### Evaluation

**Positive therapeutic outcome**

- Decreasing symptoms of Hodgkin's disease (increased lymph nodes, night sweats, weight loss, splenomegaly, hepatomegaly)

**brimonidine ophthalmic**
*See Appendix B*

**brinzolamide ophthalmic**
*See Appendix B*

**bromfenac ophthalmic**
*See Appendix B*

**⚠ HIGH ALERT**

# bromocriptine (Rx)

(broe-moe-krip'teen)

**Cycloset, Parlodel**

*Func. class.:* Antiparkinsonian agent; DOPamine receptor agonist

**Do not confuse:** bromocriptine/benztropine/brimonidine, Parlodel/pindolol/Provera

**ACTION:** Inhibits prolactin release by activating postsynaptic DOPamine receptors; activation of striatal DOPamine receptors may be reason for improvement in Parkinson's disease

**Therapeutic outcome:** Decreased involuntary movements in Parkinson's disease; decreased breastfeeding; decreased hormone levels in acromegaly; absence of amenorrhea in hyperprolactinemia

**USES:** Parkinson's disease, amenorrhea/galactorrhea caused by hyperprolactinemia, infertility, acromegaly, pituitary adenomas, adjunct in type 2 diabetes

**Unlabeled uses:** Neuroleptic malignant syndrome, alcoholism, premenstrual syndrome, mastalgia, cocaine withdrawal

## CONTRAINDICATIONS

Hypersensitivity to ergot, bromocriptine/eclampsia; uncontrolled hypertension, preeclampsia, basilar/hemiplegic migraine, breastfeeding, migraine

**Precautions:** Pregnancy, breastfeeding, children, hepatic/renal disease, pituitary tumors, peptic ulcer disease, sulfite hypersensitivity, pulmonary fibrosis, dementia, GI bleeding, bipolar disorder, abrupt discontinuation, acute MI, angina, type 1 diabetes mellitus

## DOSAGE AND ROUTES

### Parkinson's disease (not Cycloset)

**Adult:** PO 1.25 mg bid with meals; may increase q2-4wk by 2.5 mg/day; not to exceed 100 mg/day, levodopa should be continued while bromocriptine is being instituted

### Hyperprolactinemia (not Cycloset)

**Adult:** PO 1.25-2.5 mg with meals; may increase by 2.5 mg q3-7days; usual dosage 2.5-15 mg/day

### Acromegaly (not Cycloset)

**Adult:** PO 1.25-2.5 mg/day × 3 days at bedtime; may increase by 1.25-2.5 mg q3-7days; usual range 20-30 mg/day; max 100 mg/day

### Type 2 diabetes (Cycloset only)

**Adult:** PO (initially) 0.8 mg qd in AM within 2hr of waking, titrate by 0.8 mg/day no more than qwk to max 1.6-4.8 mg/day

### Pituitary adenoma (not Cycloset)

**Adult/adolescent ≥ 16 yr:** PO 1.25 mg bid-tid, may increase over several weeks to 10-20 mg/day

### Traumatic brain injury (unlabeled)

**Adult:** PO 2.5 mg daily, continue if response occurs

**Available forms:** Caps 5 mg; tabs 2.5 mg; (Perodel), 0.8mg (cycloset)

### Implementation

- Give with meals or milk to prevent GI symptoms; cyclosert: give with food in AM within 2 hr of waking crush tab if patient has swallowing difficulty
- Give at bedtime so dizziness, orthostatic hypotension do not occur
- Store at room temperature in airtight container

## ADVERSE EFFECTS

**CNS:** *Headache,* depression, restlessness, anxiety, nervousness, confusion, seizures, hallucinations, *dizziness,* fatigue, drowsiness, abnormal involuntary movements, psychosis, weakness

**CV:** *Orthostatic hypotension,* decreased B/P, palpitations, extrasystole, shock, dysrhythmias, bradycardia, MI

**EENT:** Blurred vision, diplopia, burning eyes, nasal congestion

**GI:** *Nausea, vomiting, anorexia,* cramps, constipation, diarrhea, dry mouth, GI hemorrhage

**GU:** Frequency, retention, incontinence, diuresis

**INTEG:** *Rash on face, arms,* alopecia, coolness, pallor of fingers, toes, peripheral edema

**META:** Hypoglycemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poorly absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver, completely |
| **Excretion** | 85%-98% feces |
| **Half-life** | 4 hr (initial); 50 hr (terminal) |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½-1½ hr |
| **Peak** | 1-3 hr |
| **Duration** | 8-12 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased disulfiramlike reaction
Chloramphenicol, levodopa, probenecid: increased neurologic effects
Haloperidol, loxapine, methyldopa, metoclopramide, reserpine: decreased levels of bromocriptine
Levodopa: increased neurologic effects
Metoclopramide: decreased effect of bromocriptine, avoid concurrent use

### Drug classifications

Antihypertensives: increased hypotension, doses of both products may need to be adjusted
Butyrophenones, CYP3A4 inhibitors, phenothiazines, thioxanthenes: decreased bromocriptine effect
Contraceptives (oral), estrogens, MAOIs, phenothiazines, progestins: decreased levels of bromocriptine, dose may need to be decreased
CYP3A4 inducers: increased bromocriptine effect, use cautiously
Salicylates, sulfonamides: increased neurologic effects, doses of both products may need to be adjusted

### Drug/lab test

Increased: growth hormone, AST, ALT, BUN, CK, uric acid, alkaline phosphatase

## NURSING CONSIDERATIONS

### Assessment

- Assess symptoms of **Parkinson's disease** (EPS): shuffling gait, muscle rigidity, involuntary movements, pill rolling, muscle spasms, drooling before, during treatment
- Assess for resolution of symptoms of neuroleptic malignant syndrome: decreased temp, seizures, sweating, pulse
- Monitor for change in size of soft-tissue volume in acromegaly
- CNS symptoms: assess for CNS depression, hallucinations, vertigo, report symptoms immediately
- **Pregnancy:** may cause postpartum conception, use pregnancy testing q4wk or if menstruation does not occur
- Monitor B/P; establish baseline, compare with other readings; this product decreases B/P and causes orthostatic hypotension; patient should remain recumbent for 2-4 hr after first dose; supervise ambulation, obtain chest x-ray baseline

### Patient/family education

- Advise patient to change position slowly to prevent orthostatic hypotension
- Tabs may be crushed and mixed with food; bromocriptine to be taken within 2 hr of rising, that 8 wk are needed for full effect
- Caution patient to use contraceptives during treatment with this product; pregnancy may occur; to use methods other than oral contraceptives/subdermal implants
- Teach patient that therapeutic effect for Parkinson's disease may take 2 mo, titrate slowly: galactorrhea, amenorrhea
- Caution patient to avoid hazardous activity if dizziness, drowsiness occurs during treatment start-up
- Advise patient to avoid alcohol and OTC medication unless approved by prescriber
- Teach patients with acromegaly to notify prescriber immediately if severe headache, nausea, vomiting, blurred vision occur; indicates change in or enlargement of tumor
- Advise patient to report symptoms of MI immediately
- Teach patient to take with food, avoid alcohol

### Evaluation

**Positive therapeutic outcome**

- Parkinson's disease: decreased slow movements, decreased drooling
- Decreased breast engorgement with accompanied pain, tenderness
- Acromegaly: decreased growth hormone levels

## budesonide (Rx)

(byoo-des'oh-nide)
**Eceris, Entocort EC, Pulmicort, Pulmicort Flexhaler, Pulmicort Respules, Pulmicort Turbohaler, Rhinocort Aqua, Uceris**
*Func. class.:* Glucocorticoid

**ACTION:** Prevents inflammation by depression of migration of polymorphonuclear leukocytes, fibroblasts, reversal of increased capillary permeability and lysosomal stabilization; does not suppress hypothalamus and pituitary function

**USES:** Rhinitis; prophylaxis for asthma; Crohn's disease, ulcerative colitis

## CONTRAINDICATIONS

Hypersensitivity, status asthmaticus, acute bronchospasm

**Precautions:** Pregnancy; breastfeeding, children, TB, fungal, bacterial, systemic viral infections, ocular herpes simplex, nasal septal ulcers; hepatic disease, diabetes, GI disease, increased intraoccular pressure

## DOSAGE AND ROUTES

### Rhinitis

**Adult and child >6 yr:** Spray/inh 2 sprays in each nostril AM, PM, or 4 sprays in each nostril AM

### Asthma

**Adult and child >6 yr:** INH 400-1200 mcg/day
**Child 1-8 yrs previously taking bronchodilator alone:** (Respules) 0.5 mg q day or 0.25 mg bid susp via jet nebulizer, max 0.5 mg q day; previously using inhaled corticosteroid 0.5 mg q day or 0.25 mg bid susp via jet nebulizer, max 0.5 mg bid

### Crohn's disease, ulcerative colitis (Uceris)

**Adult:** PO 9 mg daily AM × 8 wk

### Laryngotracheobronchitis (croup) (unlabeled)

**Infant ≥3 months-child ≤5 yr:** (Pulmicort Respules INH susp) 2 mg inhaled as a single dose

**Available forms:** Dry powder for INH 90, 100 ✦ 180, 200 ✦, 400 ✦ 32 mcg/actuation (Rhinocort Aqua) nasal spray; susp for inh 0.5 mg/2 ml, 0.25 mg/2 ml; ext rel tab (Uceris) 9 mg; cap 3 mg, rectal foam 2 mg/actuation

### Implementation

**PO route (Crohn's disease)**

- Swallow caps whole; do not break, crush, or chew, take in AM
- May repeat 8-wk course if needed; may taper to 6 mg/day for 2 wk before cessation

**Oral inh route (dry powder for inh) (Pulmicort Turbuhaler)**

- A new Turbuhaler should be primed before use, per the priming instructions that come with the device; while priming the Turbuhaler and loading the dose, hold in upright position; to load the dose on a primed inhaler, twist the brown grip fully to the right as far as it will go, then twist it back fully to the left; there will be the sound of a "click"
- When inhaling, the Turbuhaler may be held upright or horizontally; turn head away from the inhaler and breathe out; place the mouthpiece between the lips and inhale deeply and forcefully; remove the inhaler from the mouth and exhale normally; do not blow or exhale into the mouthpiece; do not chew or bite on the mouthpiece; if more than one dose is required, repeat the steps
- After the last dose, rinse the mouth with water; do not swallow the water; keep inhaler clean and dry

**Inh susp route for nebulization (Pulmicort Respules)**

- Use via jet nebulizer connected to an air compressor with adequate airflow and equipped with a mouthpiece or suitable face mask; do not use ultrasonic nebulizers
- See manufacturer's direction on use of nebulizer and preparation of the solution
- Gently shake the ampule in a circular motion before opening it and placing the suspension in the nebulizer reservoir; using the "blow by" technique (i.e., holding the face mask or open tube near the patient's nose and mouth) is not recommended; use inh susp separately in the nebulizer
- Store inhal susp upright at controlled room temperature and protected from light; after opening the envelope, the shelf life of the unused respules is 2 wk; return unused respules to the aluminum foil envelope to protect from light; opened respule should be used promptly

**Intranasal inhalation route**

- Instruct patient on proper nasal inhalation priming and use; shake inhaler well; prior to initial use, the Rhinocort Aqua container must be shaken gently and the pump must be primed by actuating 8 times; if used daily, the pump does not need to be reprimed; if not used for 2 consecutive days, reprime with 1 spray or until a fine spray appears; if not used for more than 14 days, rinse the applicator and reprime with 2 sprays or until a fine spray appears; blow nose gently, without squeezing; with head upright, spray into each nostril; sniff while squeezing the bottle quickly and firmly; after use, rinse the tip of the bottle with hot water, taking care not to suck water into the bottle, and dry with a clean tissue; replace the cap
- To avoid the spread of infection, do not use the container for more than one person
- Store at 59°-86° F (15°-30° C); keep away from heat, open flame

**Rectal Foam Route**

- Product is flammable, may use prior to bedtime, applicators are single use only

## ADVERSE EFFECTS

**CNS:** *Headache,* insomnia, hypertonia, syncope, dizziness, drowsiness
**CV:** Chest pain, hypertension, sinus tachycardia, palpitation
**EENT:** *Sinusitis, pharyngitis,* rhinitis, oral candidiasis
**ENDO:** Adrenal insufficiency, growth suppression in children
**GI:** Dry mouth, dyspepsia, nausea, vomiting, abdominal pain
**MISC:** Ecchymosis, fever, *hypersensitivity,* flu-like symptoms, epistaxis, dysuria
**MS:** Back pain, myalgias, fractures
**RESP:** Nasal irritation, cough, nasal bleeding, *respiratory infections,* bronchospasm

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 39% |
| **Distribution** | In airways, protein binding 85%-90% |
| **Metabolism** | Liver |
| **Excretion** | In urine (60%), small amounts in feces, enters breast milk |
| **Half-life** | 2-3.6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Respules 2-8 days, Rhinocort Aqua 10 hr |
| **Peak** | Respules 4-6 wk, Rhinocort Aqua 2 wk |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Varicella live vaccine: avoid concurrent use in pediatric patients

### Drug classifications

CYP3A inhibitors: increased budesonide effect; dose adjustment may be required

## NURSING CONSIDERATIONS

### Assessment

- **Crohn's disease/ulcerative colitis: Assess for improvement: decreased stools, abdominal cramps, urgency**
- **Adrenal suppression: may occur if stopped abruptly, taper**
- Assess respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness; provide fluids to 2 L/day to decrease thickness of secretions; check for oral candidiasis
- For bronchospasm, stop treatment and give bronchodilator
- With viral infections, corticosteroid use can mask infections
- For increased intraocular pressure, discontinue use if increase occurs
- **Pregnancy/breastfeeding:** Fetal harm appears remote, excreted in breast milk, consider risk factors
- **Beers:** Avoid in older adults, high risk of delirium

### Patient/family education

- Teach patient to notify prescriber of pharyngitis, nasal bleeding, oral candidiasis
- Instruct patient not to exceed recommended dosage; adrenal suppression may occur
- Teach patient to carry/wear emergency ID identifying steroid use
- Instruct patient to read and follow package directions
- Instruct patient to prevent exposure to infections, especially viral
- Advise to use good oral hygiene if using by nebulizer or inhaler
- Teach patient to avoid breastfeeding
- Teach patient that product is not a bronchodilator and is not to be used for asthma; to use regularly
- Teach how to use as described in "administer"
- Advise to notify prescriber if symptoms persist after 3 wk, that results usually take 2 wk
- Advise to notify prescriber if exposure to measles, chickenpox occurs

### Evaluation

**Positive therapeutic outcome**

- Absence of asthma, rhinitis

## budesonide nasal agent

*See Appendix B*

## bumetanide (Rx)

(byoo-met'a-nide)

**Bumex, Burinex**

*Func. class.:* Loop diuretic, antihypertensive

*Chem. class.:* Sulfonamide derivative

**ACTION:** Acts on the ascending loop of Henle in the kidney to inhibit the reabsorption of the electrolytes sodium and chloride

**Therapeutic outcome:** Decreased edema in lung tissue and peripherally; decreased B/P

**USES:** Edema in congestive heart failure, ascites, heart failure

## CONTRAINDICATIONS

Hypersensitivity to sulfonamides, anuria, hepatic coma

**BLACK BOX WARNING:** Fluid and electrolyte depletion

**Precautions:** Pregnancy, breastfeeding, neonates, severe renal disease, ascites, hepatic cirrhosis, blood dyscrasias, ototoxicity, hyperuricemia, hypokalemia, hyperglycemia, oliguria, hypomagnesemia, hypovolemia

**BLACK BOX WARNING:** Dehydration

## DOSAGE AND ROUTES

**Adult/adolescent:** PO 0.5-2 mg daily may give 2nd or 3rd dose at 4-5 hr intervals; max 10 mg/day; may be given on alternate days or intermittently; **IM/IV** 0.5-1 mg; may give 2nd or 3rd dose at 2-3 hr intervals; max 10 mg/day

**Child (unlabeled):** PO/IM/**IV** 0.015-0.1 mg/kg/day or every other day, max 10 mg/day

**Available forms:** Tabs 0.5, 1, 2, 5 mg 🍁; inj 0.25 mg/ml

### Implementation

- Give in AM to avoid interference with sleep
- Potassium replacement if potassium level is <3.0 mg/dl whole, or use oral solutions; product may be crushed if patient is unable to swallow

**PO route**

- Use in AM to prevent nocturia
- The safest dosage schedule is on alternate days, without regard to food

**IV route**

- Do not use solution that is yellow or has a precipitate or crystals

**IV, direct route**

- Give undiluted through Y-tube or 3-way stopcock; give 20 mg or less/min

**Intermittent IV infusion route**

- May be added to 0.9% NaCl, $D_5W$, $D_{10}W$, $D_{20}W$, invert sugar 10% in electrolyte #1, LR, sodium lactate 1/6 mol/L; use within 24 hr to ensure compatibility; give through Y-tube or 3-way stopcock; give at 4 mg/min or less; use infusion pump

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amoxicillin, amphotericin B lipid complex (Abelcet), amphotericin B liposome (AmBisome), anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefepime, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAXone, cefuroxime, cephapirin, chloramphenicol, cimetidine, cisatracurium, CISplatin, cladribine, clarithromycin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, micafungin, miconazole, milrinone, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium/sodium, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, raNITIdine, remifentanil, rifAMPin, ritodrine, riTUXimab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, traMADol, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole

## ADVERSE EFFECTS

**CNS:** Headache, fatigue, weakness, vertigo
**CV:** *Hypotension,* chest pain, ECG changes, circulatory collapse, dehydration
**EENT:** Loss of hearing
**ELECT:** *Hypokalemia, hypochloremic alkalosis, hypomagnesemia, hyperuricemia, hypocalcemia, hyponatremia*
**ENDO:** *Hyperglycemia*
**GI:** Dry mouth, vomiting, anorexia, cramps, upset stomach, abdominal pain
**GU:** *Polyuria*
**HEMA:** Thrombocytopenia, leukopenia, granulocytopenia, hemoconcentration
**INTEG:** *Rash, pruritus*

### Pharmacokinetics

| | PO/IM |
|---|---|
| **Absorption** | Rapidly, completely absorbed |
| | **PO/IM/IV** |
| **Distribution** | Crosses placenta, protein binding >91% |
| **Metabolism** | Liver (30%-40%) |
| **Excretion** | Breast milk, urine (50% unchanged), feces (20%) |
| **Half-life** | 1-1½ hr |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | ½-1 hr | 40 min | 5 min |
| **Peak** | 1-2 hr | 1-2 hr | ½ hr |
| **Duration** | 3-6 hr | 4-6 hr | 3-6 hr |

## INTERACTIONS

### Individual drugs

Digoxin: increased toxicity
Indomethacin: decreased diuretic and antihypertensive effects of bumetanide
Lithium: decreased renal clearance causing increased toxicity
MetOLazone: increased diuresis, electrolyte loss
Probenecid: decreased diuretic effect, other diuretics

### Drug classifications

Aminoglycosides: increased ototoxicity, CISplatin, avoid concurrent use
Antidiabetics: decreased antidiabetic effects
NSAIDs: decreased diuretic effect
Potassium-wasting products: increased hypokalemia, monitor closely

### Drug/herb

Hawthorn, horse chestnut: increased diuretic effect

### Drug/Lab

Increase: Glucose
Decrease: Chloride, potassium, sodium, calcium, phosphorus

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for tinnitus, hearing loss, ear pain; periodic testing of hearing is needed when high doses of this product are given by **IV** route

**BLACK BOX WARNING:** Dehydration: watch for dehydration

- Assess fluid volume status: I&O ratio and record, distended red veins, crackles in lung, color, quality and specific gravity of urine, skin turgor, adequacy of pulses, moist mucous membranes, bilateral lung sounds, peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth and mucous membranes should be reported; if urinary output decreases or azotemia occurs, product should be discontinued

**BLACK BOX WARNING:** Monitor for fluid and electrolyte depletion: potassium, sodium, calcium, magnesium; also include BUN, blood pH, ABGs, uric acid, CBC, blood glucose; severe electrolyte imbalances should be corrected before starting treatment

- Assess B/P before and during therapy with patient lying, standing, and sitting as appropriate; orthostatic hypotension can occur rapidly
- Monitor for digoxin toxicity (anorexia, nausea, vomiting, confusion, paresthesia, muscle cramps) in patients taking digoxin; lithium toxicity in those taking lithium
- **Beers:** Use cautiously in older adults, may cause or exacerbate syndrome of inappropriate antidiuretic hormone secretion
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, avoid use in breastfeeding

### Patient/family education

- Teach patient to take the medication early in the day to prevent nocturia, if another dose is needed, take after noon
- Instruct the patient to take with food or milk if GI symptoms of nausea and anorexia occur
- Teach patient to maintain weekly record of weight and notify prescriber of weight loss of >5 lb
- Caution the patient that this product causes a loss of potassium, so food rich in potassium should be added to the diet; refer to a dietitian for assistance in planning
- Caution the patient not to exercise in hot weather or stand for prolonged periods since orthostatic hypotension will be enhanced
- Teach patient not to use alcohol or any OTC medications without prescriber's approval; serious product reactions may occur
- Emphasize the need to contact prescriber immediately if muscle cramps, weakness, nausea, dizziness, or numbness occur
- Teach patient to take own B/P and pulse and record
- Teach patient to avoid rising rapidly to minimize orthostatic hypotension
- Teach patient to weigh daily
- Caution the patient that orthostatic hypotension may occur; patient should rise slowly from sitting or reclining positions and lie down if dizziness occurs
- Teach patient to continue taking medication even if feeling better; this product controls symptoms but does not cure the condition
- Advise the patient with hypertension to continue other medical treatment (exercise, weight loss, relaxation techniques, cessation of smoking), edema, weight gain

### Evaluation

**Positive therapeutic outcome**

- Decreased edema
- Decreased B/P
- Increased diuresis

**⚠ HIGH ALERT**

## buprenorphine (Rx) (REMS)

(byoo-pre-nor'feen)

**Belbuca, Buprenex, Butrans, Subutex**

*Func. class.:* Opioid analgesic, partial agonist

*Chem. class.:* Thebaine derivative

**Controlled substance schedule V (parenteral); schedule III (tablet)**

**Do not confuse:** Buprenex/Bumex

**ACTION:** Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors, partial agonist at MU-opioid receptor

**Therapeutic outcome:** Relief of pain

**USES:** Moderate to severe pain, opiate agonist withdrawal/dependence

**Unlabeled uses:** Cocaine

## CONTRAINDICATIONS

Hypersensitivity, ileus, status asthmaticus

**BLACK BOX WARNING:** Respiratory depression

**Precautions:** Pregnancy, breastfeeding, substance abuse/alcoholism, increased intracranial pressure, MI (acute), severe heart disease, respiratory depression, renal/hepatic/pulmonary disease, hypothyroidism, Addison's disease

**BLACK BOX WARNING:** QT prolongation, use of heating pad, accidental exposure, potential for overdose/poisoning, substance abuse, IM, neonatal opioid withdrawal syndrome, coadministration with other CNS depressants, implant insertion and removal

## DOSAGE AND ROUTES

**Adult:** IM/**IV** 0.3 mg q6-8hr prn; may repeat; reduce dosage in geriatric, may repeat after 30-60 min; EPIDURAL (unlabeled) 4 mcg/kg or 2 mcg/kg (epidural injection), remove over 48 hr; TD: each patch is worn for 7 days (moderate-severe pain); **opioid-naive patients** (those taking <30 mg oral morphine or equivalent prior to beginning treatment with TD buprenorphine), 5 mcg/hr q7days, overestimating dose can be fatal; **conversion from other opiate agonist therapy,** titrate from other opioids for up to 7 days to no more than 30 mg oral morphine or equivalent prior to beginning TD therapy, begin with 5 mcg/hr q7days; for those with daily dose of 30-80 mg oral morphine or equivalent, start with 10 mcg/hr q7days; for those >80 mg oral morphine or equivalent start with 20 mcg/hr q7days; Transmucosal: 75 mcg qd or q12hrs

**Child 2-12 yr:** IM/**IV** 2-6 mcg/kg q4-8hr

### Opiate dependence

**Adult/adolescent ≥16 yr:** SL 8 mg day 1, 16 mg day 2, then maintenance 16 mg daily

**Available forms:** Inj 0.3 mg/ml (1-ml vials); SL tab 2, 8 mg as base, TD system 5, 7.5, 10, 15, 20 mcg/hr (weekly); oral dissolving film 75, 150, ✱ 300, 450, 600, 750, 900 mcg

### Implementation

- Give by inj (IM, **IV**), only with resuscitative equipment available; give slowly to prevent rigidity

**SL route**

- Do not chew, dissolve under tongue or take 2 or more at same time

**Transdermal route (REMS)**

- Apply to clean, dry, intact skin, each patch should be worn for 7 days, do not exceed dose, QTc prolongation may occur, may use first aid tape if edge of patch is not adhering

**BLACK BOX WARNING:** Do not apply direct heat source to patch

- Apply to upper outer arm, upper chest/back, or side of chest

**IM route**

- **Give** deep in large muscle mass; rotate sites of inj

**IV route**

- **Give IV** direct undiluted over ≥3-5 min (0.3 mg/2 min); give slowly
- With antiemetic if nausea, vomiting occur
- When pain is beginning to return; determine dosage interval by patient response; rapid injection will increase side effects

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, amphotericin B liposome (AmBisome), anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, butorphanol, calcium chloride/gluconate, CARBOplatin, cefamandole, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, $D_5W$-dextrose 5%, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin HCl, doxycycline, enalaprilat, ePHEDrine,

EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's injection, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, raNITIdine, remifentanil, Ringer's injection, riTUXimab, rocuronium, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole

**Additive incompatibilities:** DiazePAM, floxacillin, furosemide, LORazepam

## ADVERSE EFFECTS

**CNS:** *Drowsiness, dizziness, confusion, headache, sedation, euphoria,* increased intracranial pressure, amnesia, weakness, CNS depression

**CV:** Palpitations, bradycardia, change in B/P, tachycardia, QT prolongation, hypo/hypertension

**EENT:** Tinnitus, blurred vision, *miosis,* diplopia

**GI:** *Nausea,* vomiting, anorexia, constipation, cramps, dry mouth, abdominal pain, hepatotoxicity

**GU:** Dysuria, urinary retention

**INTEG:** *Rash,* urticaria, bruising, flushing, diaphoresis, pruritus

**RESP:** Respiratory depression, dyspnea, hypo/hyperventilation

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM) |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver, extensively by CYP3A4 |
| **Excretion** | Kidneys, feces, breast milk |
| **Half-life** | 2.2 hr (**IV**); 26 hr (transdermal); 37 hr (SL) |

### Pharmacodynamics

| | IM | IV |
|---|---|---|
| **Onset** | 15 min | Immediate |
| **Peak** | 1 hr | 5 min |
| **Duration** | 6-10 hr (Epidural route: duration is dose-dependent) | 6 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased respiratory depression, hypotension, sedation

### Drug classifications

Antidysrhythmics (class IA, III): increased QT prolongation

Antihistamines, antipsychotics, CNS depressants, MAOIs, sedatives/hypnotics, skeletal muscle relaxants: increased respiratory depression, hypotension

CYP3A4 inducers (carBAMazepine, PHENobarbital, phenytoin, rifAMPin): decreased buprenorphine effect

CYP3A4 inhibitors (erythromycin, indinavir, ketoconazole, ritonavir, saquinavir): increased buprenorphine effect

Opioids: increased CNS depression

### Drug/herb

St. John's wort: increased CNS depression

## NURSING CONSIDERATIONS

### Assessment

- Assess **pain characteristics:** location, intensity, type, severity before medication administration and after treatment 5, 15, 30 min (IV)

**BLACK BOX WARNING: Overdose:** Potential for overdose may occur from chewing, swallowing, snorting, or injecting extracted product from TD formulation

- **QT prolongation:** Assess often in those taking class Ia, III antidysrhythmics; patients with hypokalemia or cardiac instability (TD), max TD 20 mcg/hr q7 days
- Monitor VS after parenteral route; note muscle rigidity, product history, liver, kidney

function tests, respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min
• **Beers:** Avoid in older adults unless safer alternatives are available, may cause impaired psychomotor function, syncope
• Monitor CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction; withdrawal in opioid-dependent persons; if dependence occurs within 2 wk of discontinuing product, **withdrawal symptoms** will occur
• Monitor allergic reactions: rash, urticaria
• Monitor bowel pattern; severe constipation can occur

**BLACK BOX WARNING:** Accidental exposure: Keep away from children and pets, may be fatal

• Pregnancy/breastfeeding: Avoid use in pregnancy and breastfeeding, watch infant for decreased respiration, lethargy, decreased heart rate

### Patient/family education

• Instruct patient to report any symptoms of CNS changes, allergic reactions
• Caution patients to avoid CNS depressants: alcohol, sedative/hypnotics for at least 24 hr after taking this product

**BLACK BOX WARNING:** Advise that psychologic dependence leading to substance abuse may result when used for extended periods; long-term use is not recommended

**SL route:**
• Teach patient to place under tongue and allow to dissolve

**Transdermal route**
• Teach patient how to apply and dispose of patch
• Teach patient not to use a heating pad or other heat source, do not cut
• Advise to avoid driving, other hazardous activities until reaction is known
• Discuss with patient that dizziness, drowsiness, and confusion are common; to avoid getting up without assistance; to avoid hazardous activities
• Discuss in detail all aspects of the product
• Do not start new meds/herbs without prescriber approval
• Start stool softener/ laxatives to lessen constipation

### Evaluation

**Positive therapeutic outcome**
• Relief of pain

## TREATMENT OF OVERDOSE:

Naloxone 0.4 mg ampule diluted in 10 ml 0.9% NaCl, give by direct **IV** push 0.02 mg q2min (adult)

## buPROPion (Rx)

(byoo-proe'pee-on)
**Aplenzin, Budeprion SR Buproban, Forfivo XL, Wellbutrin, Wellbutrin SR, Wellbutrin XL, Zyban**
*Func. class.:* Antidepressant—miscellaneous, smoking deterrent
*Chem. class.:* Aminoketone

**Do not confuse:** buPROPion/busPIRone, Zyban/Diovan

**ACTION:** Inhibits reuptake of DOPamine, norepinephrine, serotonin

**Therapeutic outcome:** Decreased symptoms of depression after 2-3 wk

**USES:** Depression (Wellbutrin), smoking cessation (Zyban); seasonal affective disorder, substance abuse, glaucoma, smoking, cardiac disease, heart failure

**Unlabeled uses:** Neuropathic pain, enhancement of weight loss, attention-deficit/hyperactivity disorder (ADHD)

## CONTRAINDICATIONS

Hypersensitivity, eating disorders, seizure disorder

**Precautions:** Pregnancy, breastfeeding, geriatric, renal/hepatic disease, recent MI, cranial, head trauma, stroke, intracranial mass, trauma, seizure disorders, substance abuse, glaucoma, smoking, cardiac disease, heart failure, Tourette's syndrome, tics, tobacco smoking, abrupt discontinuation

**BLACK BOX WARNING:** Children <18 yr, suicidal thinking/behavior (young adults)

## DOSAGE AND ROUTES

### Depression

**Adult:** PO 100 mg bid initially, then increase after 3 days to 100 mg tid if needed, max 150 mg single dose; ER/SR, initially 150 mg AM, increase to 300 mg/day if initial dose is tolerated, after no less than 4 days; after several wk, titrate to 200 mg bid; Aplenzin 174 mg qAM; may increase to 348 mg qAM on day 4; may increase to 522 mg after several weeks if needed; Forfivo XL (not for initial treatment) 450 mg q day after titration with another product (300mg/day × ≥ 2 wks)
**Geriatric:** PO 50-100 mg/day, may increase by 50-100 mg q3-4days

### Smoking cessation (Zyban)

**Adult:** SR 150 mg q day × 3 days, then 150 mg bid for remainder of treatment, initiate 1-2 wk before targeted "quit day," continue for 7-12 wk; in combination with nicotine TD, 150 mg q day × 3 days, then 150 mg bid for remainder of treatment, give ≥8 hr apart, max 300 mg/day, initiate 1-2 wk before targeted "quit day," continue for 7-12 wk, may be continued for 8-20 wk

### Seasonal affective disorder

**Adult:** PO (Wellbutrin XL) 150 mg as a single dose in the AM, after 1 wk may be increased to 300 mg/day; (Aplenzin) 174 mg/day in AM, after 7 days may increase to 348 mg/day

**Available forms:** Tabs 75, 100 mg; sus rel tabs (**SR**), 100, 150, 200 mg; ext rel tab (XL) 100, 150, 300, 450 mg (SR-12 hr, XL-24 hr); ext rel tab (Aplenzin) 174, 348, 522 mg

### Implementation

- Give with food or milk for GI symptoms
- Give sugarless gum, hard candy, or frequent sips of water for dry mouth
- When switching to Aplenzin from Wellbutrin, Wellbutrin SR, or XL use these equivalents: 174 buPROPion HBr = 150 mg buPROPion HCl; 348 mg buPROPion HBr = 300 mg buPROPion HCl; 522 mg buPROPion HBr = 450 mg buPROPion HCl
- **Wellbutrin immediate rel,** separate by ≥6 hr, give in 3 divided doses; **Wellbutrin SR,** if multiple doses are used, separate by ≥8 hr; **Wellbutrin XL,** give q day in AM; Zyban SR, give in 2 divided doses ≥8 hr apart; **Aplenzin ER,** give q day in AM, a larger dose of Aplenzin is needed because these products are not equivalent
- Store at room temperature; do not freeze

## ADVERSE EFFECTS

**CNS:** *Headache, agitation, confusion,* seizures, delusions, *insomnia, sedation, tremors,* dizziness, akinesia, bradykinesia, suicidal ideation, mania, hot flashes, myoclonia, chest pain, flushing

**CV:** Dysrhythmias, *hypertension,* palpitations, *tachycardia,* hypotension, complete AV block, QRS prolongation (overdose)

**EENT:** *Blurred vision, auditory disturbance,* tinnitus

**GI:** *Nausea, vomiting, dry mouth,* anorexia, diarrhea, increased appetite, *constipation,* altered taste

**GU:** Impotence, frequency, retention, *menstrual irregularities,* nocturia, altered libido

**INTEG:** *Rash,* pruritus, *sweating,* Stevens-Johnson syndrome

**MISC:** *Weight loss or gain*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed; bioavailability poor |
| **Distribution** | Unknown |
| **Metabolism** | Liver extensively |
| **Excretion** | Kidneys |
| **Half-life** | 14 hr, steady state (immediate release) 1½-5 wk |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Up to 4 wk |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol, levodopa, theophylline: increased risk of seizures
CarBAMazepine, cimetidine, PHENobarbital, phenytoin: decreased buPROPion effect
Cimetidine: increased buPROPion levels
Ritonavir: increased buPROPion toxicity
Tamoxifen: decreased effect of tamoxifen
Do not use within 14 days of MAOIs

### Drug classifications

Antidepressants, benzodiazepines, MAOIs, phenothiazines, steroids (systemic): increased risk of seizures
CYP2D6/CYP2B6 inhibitors: increased buPROPion effect
CYP450, CYP2D6 products: decreased buPROPion effects
CYP2D6, CYP2B6 inducers: decreased buPROPion effect
MAOIs: acute toxicity

### Drug/herb

Kava, valerian: increased CNS depression

### Drug/lab test

Positive urine drug screen for amphetamine possible

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P (with patient lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg hold product, notify prescriber; take vital signs q4hr in patients with CV disease
- Assess smoking cessation progress after 7-12 wk, if progress has not been made, product should be discontinued
- Assess for increased risk of seizures; if patient has used CNS depressant or CNS stimulants, dosage of buPROPion should not be exceeded

• Monitor blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy
• Monitor hepatic studies: AST, ALT, bilirubin if on long-term treatment
• Check weight weekly; appetite may increase with product
• Assess ECG for flattening of T wave, bundle branch block, AV block, dysrhythmias in cardiac patients
• Assess for EPS primarily in geriatric: rigidity, dystonia, akathisia

**BLACK BOX WARNING:** Assess mental status: mood, sensorium, affect, suicidal tendencies; increase in psychiatric symptoms: depression, panic

• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk
• **Beers:** Avoid in older adults, lowers seizure threshold, may be acceptable in those with well-controlled seizures, where other treatment hasn't been effective
• Monitor urinary retention, constipation; constipation is more likely to occur in children or geriatric
• Identify alcohol consumption; if alcohol was consumed, hold dose

### Patient/family education

• Teach patient that therapeutic effects may take 2-3 wk; not to increase dose without prescriber's approval; that treatment for smoking cessation lasts 7-12 wk
• Teach patient to use caution in driving or other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing, especially geriatric
• Teach patient to avoid alcohol ingestion; alcohol may increase risk of seizures, obtain approval for other products
• Teach patient to increase fluids, bulk in diet if constipation, urinary retention occur, especially geriatric; notify prescriber immediately if urinary retention occurs
• Teach patient to take gum, hard sugarless candy, or frequent sips of water for dry mouth
• Advise patient not to use with nicotine patches unless directed by prescriber, may increase B/P

**BLACK BOX WARNING:** Teach patient that risk of seizures increases when dose is exceeded or if patient has seizure disorder; suicidal ideas, behavior, hostility, depression may occur in children or young adults

• Teach patient to notify prescriber if pregnancy is suspected or planned
• Report hearing, visual, CNS changes
• May need to use stool softener/laxative

### Evaluation

**Positive therapeutic outcome**
• Decrease in depression
• Absence of suicidal thoughts
• Smoking cessation

## TREATMENT OF OVERDOSE:

ECG monitoring, induce emesis, lavage, administer anticonvulsant

**⚠ HIGH ALERT**

## busPIRone (Rx)

(byoo-spye′rone)
**BuSpar, BuSpar Dividose, Buspirex, Bustab, PMS-Buspirone**
*Func. class.:* Antianxiety, sedative
*Chem. class.:* Azaspirodecanedione

**Do not confuse:** busPIRone/buPROPion

**ACTION:** Acts by inhibiting the action of serotonin (5-HT) by binding to serotonin and DOPamine receptors; also increases norepinephrine metabolism; has shown little potential for abuse, a good choice in substance abuse

**Therapeutic outcome:** Decreased anxiety

**USES:** Management and short-term relief of generalized anxiety disorders

## CONTRAINDICATIONS

Hypersensitivity, child <18 yr

**Precautions:** Pregnancy, breastfeeding, geriatric, impaired renal/hepatic function

## DOSAGE AND ROUTES

**Adult:** PO 7.5 mg bid; may increase by 5 mg/day q2-3days; max 60 mg/day

### Renal/hepatic dose

**Adult:** PO reduce by 25%-50% in mild to moderate hepatic disease, do not use in severe hepatic disease, CCr 11-70 ml/min reduce dose by 25%-50%, CCr <10 ml/min do not use

**Available forms:** Tabs 5, 7.5, 10, 15, 30 mg

### Implementation

• Give with food or milk for GI symptoms (avoid grapefruit juice); sugarless gum, hard candy, frequent sips of water for dry mouth
• May be crushed

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache, depression, stimulation, insomnia, nervousness, light-headedness, numbness, paresthesia, incoordination, tremors,* excitement, involuntary movements, confusion, akathisia, nightmares, hostility

**CV:** *Tachycardia, palpitations,* hypo/hypertension, CVA, HF, MI, chest pain

**EENT:** *Sore throat, tinnitus, blurred vision, nasal congestion,* red, itching eyes, change in taste, smell

**GI:** *Nausea, dry mouth, diarrhea, constipation,* flatulence, increased appetite, rectal bleeding

**GU:** Frequency, hesitancy, menstrual irregularity, change in libido

**INTEG:** *Rash,* edema, pruritus, alopecia, dry skin

**MISC:** *Sweating,* fatigue, weight gain, fever, serotonin syndrome

**MS:** *Pain, weakness,* muscle cramps, spasms, myalgia

**RESP:** Hyperventilation, chest congestion, shortness of breath

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid |
| **Distribution** | Protein binding 86% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Feces |
| **Terminal half-life** | 2-4 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 40-90 min |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression; avoid use

### Drug classifications

Products metabolized by CYP3A4 (erythromycin, itraconazole, nefazodone, ketoconazole, ritonavir, verapamil, dilTIAZem, several other protease inhibitors): increased busPIRone levels

MAOIs, procarbazine: increased B/P, do not use together

Products induced by CYP3A4 (rifAMPin, phenytoin, PHENobarbital, carBAMazepine, dexamethasone): decreased busPIRone action

Psychotropics: increased CNS depression, avoid use

Selective serotonin reuptake inhibitors (SNRIs, serotonin receptor agonists): increase serotonin syndrome

### Drug/food

Grapefruit juice: increased peak concentration of busPIRone

## NURSING CONSIDERATIONS

### Assessment

- Assess anxiety reaction: inability to sleep, apprehension, dread, foreboding, or uneasiness related to unidentified source of danger
- Assess for previous product dependence or tolerance; if patient is product dependent or tolerant, amount of medication should be restricted
- Monitor B/P (lying, standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; check I&O; may indicate renal dysfunction
- Monitor mental status: mood, sensorium, affect, sleeping patterns, drowsiness, dizziness, suicidal tendencies; withdrawal symptoms when dose is reduced or product discontinued
- Assess for CNS reaction, some reactions may be unpredictable
- **Pregnancy/breastfeeding:** Avoid in pregnancy/breastfeeding
- **Beers:** Avoid in older adults with delirium or a high risk of delirium

### Patient/family education

- Teach patient that product may be taken consistently with or without food; if dose is missed take as soon as remembered; do not double doses
- Caution patient to avoid OTC preparations unless approved by the prescriber; to avoid alcohol ingestion and other psychotropic medications unless prescribed; that 2 wk of therapy may be required before therapeutic effects occur; to avoid large amounts of grapefruit juice, max effect 3-6 wk
- Caution patient to avoid driving and activities requiring alertness since drowsiness may occur; until medication response is known, tell patient that drowsiness may worsen at beginning of treatment
- Instruct patient not to discontinue medication abruptly after long-term use; if dose is missed, do not double
- Advise patient to rise slowly or fainting may occur, especially in geriatric
- **Serotonin syndrome:** Teach patient to report immediately (fever, tremor, sweating, diarrhea, delirium)

### Evaluation

**Positive therapeutic outcome**

- Increased well-being
- Decreased anxiety, restlessness, sleeplessness, dread

## busulfan (Rx)

(byoo-sul′fan)
**Busulfex, Myleran**
*Func. class.:* Antineoplastic alkylating agent
*Chem. class.:* Bifunctional alkylating agent

**Do not confuse:** Alkeran/Myleran

**USES:** Chronic myelocytic leukemia, bone marrow ablation, stem cell transplant preparation in CML

### CONTRAINDICATIONS

Pregnancy (3rd trimester), breastfeeding, radiation, chemotherapy, blastic phase of chronic myelocytic leukemia, hypersensitivity

### DOSAGE AND ROUTES

**Chronic myelocytic leukemia**

**Adult:** PO 4-8 mg/day or 1.8-4 mg/m²/day initially; reduce dosage if WBC levels reach 30,000-40,000/mm³; stop if WBC ≤20,000/mm³; maintenance 1-3 mg/day
**Child:** PO 0.06-0.12 mg/kg/day or 1.8-4.6 mg/m²/day, reduce if WBC is 30,000-40,000/mm³; discontinue if WBC ≤20,000/mm³

**Allogenic hemopoietic stem cell transplantation in chronic myelogenous leukemia**

**Adult:** **IV** 0.8 mg/kg over 2 hr, q6hr × 4 days (total 16 doses); give cyclophosphamide **IV** 60 mg/kg over 1 hr/day for 2 days, starting after 16th dose of busulfan

**Available forms:** Tabs 2 mg; sol for inj 6 mg/ml

### ADVERSE EFFECTS

**CV:** *Hypotension,* thrombosis, *chest pain,* tachycardia, atrial fibrillation, heart block, pericardial effusion, cardiac tamponade (high dose with cyclophosphamide)
**GI:** Anorexia, constipation, dry mouth, nausea, vomiting, *diarrhea*
**RESP:** Alveolar hemorrhage, atelectasis, cough, hemoptysis, hypoxia, pleural effusion, pneumonia, sinusitis, pulmonary fibrosis
**CNS:** *Depression, dizziness, insomnia, headache*
**EENT:** *Blurred vision*
**GU:** Impotence, sterility, amenorrhea, gynecomastia, renal toxicity, hyperuremia, adrenal insufficiency–like syndrome
**HEMA:** Thrombocytopenia, leukopenia, pancytopenia, severe bone marrow depression
**INTEG:** Dermatitis, hyperpigmentation, alopecia
**MISC:** Chromosomal aberrations
**RESP:** Irreversible pulmonary fibrosis, pneumonitis

- Advise patient that contraception is needed during treatment and for ≥3 months after the completion of therapy (pregnancy); avoid breastfeeding; may cause infertility; discuss family planning before initiating therapy

**Evaluation**

**Positive therapeutic outcome**

- Decreased leukocytes to normal limits
- Absence of sweating at night
- Increased appetite, increased weight

## butoconazole vaginal antifungal

*See Appendix B*

**⚠ HIGH ALERT**

## butorphanol (Rx)

(byoo-tor′fa-nole)
**Stadol**
*Func. class.:* Mixed opiate analgesic
*Chem. class.:* Opioid antagonist, partial agonist
**Controlled substance schedule IV**

**ACTION:** Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors

**Therapeutic outcome:** Relief of pain

**USES:** Moderate to severe pain, general anesthesia induction/maintenance, headache, migraine, preanesthesia

### CONTRAINDICATIONS

Hypersensitivity to this product or preservative, addiction (opioid)

**Precautions:** Pregnancy, breastfeeding, child <18 yr, addictive personality, increased ICP, renal/hepatic disease, ileus, COPD

**BLACK BOX WARNING:** Coadministration with other CNS depressants, respiratory depression

### DOSAGE AND ROUTES

**Moderate to severe pain**

**Adult:** IM 1-4 mg q3-4hr prn; **IV** 0.5-2 mg q3-4hr prn; **nasal** spray in 1 nostril; may give another dose 1-1½ hr later; may repeat if needed in q3-4hr after last dose

**Geriatric: IV** ½ adult dose at 2× the interval; **intranasal** if no relief in 90-120 min, may repeat with 1 spray

### Severe pain

**Adult:** INTRANASAL 1 spray in each nostril q3-4hr

### Renal/hepatic dose

**Adult:** INTRANASAL max 1 mg, followed by 1 mg in 90-120 min; IM/IV give 50% of dose (0.5 mg IV, 1 mg IM); do not repeat within 6 hr

**Available forms:** Inj 1, 2 mg/ml; INTRANASAL 10 mg/ml

### Implementation

- Store in light-resistant container at room temperature

**Nasal route**

- Prime before first use, point sprayer away from face, pump activator 7 times until a fine, wide spray occurs; if not used for 48 hr, reprime by pumping 1-2 times
- If more than 1 spray is needed, use other nostril
- Do not share with others
- Nasal congestion/irritation may occur

**IM route**

- Give deeply in large muscle mass; rotate inj sites

**Intranasal route**

- Give 1 spray in nostril
- Remove clip and cover, prime before using until spray appears; pump must be reprimed q48hr; close nostril with finger and spray once quickly; have patient sniff

**IV direct route**

- Give **IV** undiluted at a rate of ≤2 mg/>3-5 min; titrate to patient response

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome (AmBisome), anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftRIAXone, cefuroxime, cephalothin, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone phosphate, dexmedetomidine, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's injection, levofloxacin, lidocaine, linezolid injection, LORazepam, magnesium, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentazocine, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, raNITIdine, remifentanil, Ringer's injection, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole

## ADVERSE EFFECTS

**CNS:** *Drowsiness, dizziness, confusion, headache, sedation, euphoria, weakness, hallucinations*, insomnia (nasal)
**CV:** Palpitations, bradycardia, hypotension
**EENT:** Tinnitus, blurred vision, miosis, diplopia, nasal congestion, unpleasant taste
**GI:** *Nausea, vomiting, anorexia, constipation, cramps*
**GU:** Urinary retention
**INTEG:** Rash, urticaria, bruising, flushing, diaphoresis, pruritus
**RESP:** Respiratory depression

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM, nasal); complete (**IV**) |
| **Distribution** | Crosses placenta, protein binding 80% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Feces (10%-15%); kidneys, unchanged (small amounts) |
| **Half-life** | 2-9 hr |

### Pharmacodynamics

| | IM | IV | Nasal |
|---|---|---|---|
| **Onset** | 5-15 min | 1 min | 15 min |
| **Peak** | 30-60 min | 4-5 min | 1-2 hr |
| **Duration** | 3-4 hr | 2-4 hr | 4-5 hr |

## INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** Alcohol: increased respiratory depression, hypotension, sedation

### Drug classifications

**BLACK BOX WARNING:** Antipsychotics, CNS depressants, opioids, MAOIs, sedative/hypnotics, skeletal muscle relaxants: increased respiratory depression, hypotension

MAOIs: do not use 2 wk before butorphanol, fatal reaction

## NURSING CONSIDERATIONS

### Assessment

- Monitor VS after parenteral administration; note muscle rigidity, product history, liver, kidney function tests, respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min

**BLACK BOX WARNING:** Monitor CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction

- Monitor allergic reactions: rash, urticaria
- Assess for withdrawal symptoms in opioid-dependent patient; pulmonary embolism, vascular occlusion, abscesses, ulcerations
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, usually compatible with breastfeeding

### Patient/family education

- Instruct patient to report any symptoms of CNS changes, allergic reactions; to avoid CNS depressants: alcohol, sedative/hypnotics for at least 24 hr after taking this product
- Discuss with patient that dizziness, drowsiness, and confusion are common; to avoid getting up without assistance, hazardous activities
- Discuss in detail all aspects of the product

**Nasal route**

- Teach patient to blow nose to clear both nostrils before using
- Patient should replace clip and cover after use; caution patient not to shake medication
- Teach patient how to use nasal product
- Teach patient to avoid hazardous activities

### Evaluation

**Positive therapeutic outcome**

- Pain relief

## TREATMENT OF OVERDOSE:

Narcan 0.4-2 mg **IV**, $O_2$, **IV** fluids, vasopressors

baclofen (Rx)
beclomethasone nasal agent
belinostat
benzocaine topical
betamethasone (augmented) topical
bezlotoxumab
bismuth subsalicylate (OTC)
bleomycin (Rx)
bosutinib
brinzolamide ophthalmic
budesonide (Rx)
buprenorphine (Rx)
busulfan (Rx)
basiliximab (Rx)
belatacept (Rx)
benazepril (Rx)
benztropine (Rx)
betaxolol ophthalmic
bimatoprost ophthalmic
bisoprolol (Rx)
bortezomib (Rx)
brentuximab (Rx)
bromfenac ophthalmic
budesonide nasal agent
buPROPion (Rx)
butoconazole vaginal antifungal
beclomethasone (Rx)
belimumab (Rx)
bendamustine (Rx)
betamethasone topical
bevacizumab (Rx)
bisacodyl (Rx, OTC)
bivalirudin (Rx)
bosentan (Rx)
brimonidine ophthalmic
bromocriptine (Rx)
bumetanide (Rx)
busPIRone (Rx)
butorphanol (Rx)

## calcitonin (salmon) (Rx)

**Calcimar, Caltine, Miacalcin**

*Func. class.:* Parathyroid agents (calcium regulator)

*Chem. class.:* Polypeptide hormone

**Do not confuse:** Fortical/Foradil

**ACTION:** Decreases bone resorption, blood calcium levels; increases deposits of calcium in bones; opposes parathyroid hormone

**Therapeutic outcome:** Lowered calcium level, decreasing symptoms of Paget's disease

**USES:** Paget's disease, postmenopausal osteoporosis, hypercalcemia

## CONTRAINDICATIONS

Hypersensitivity to this product or fish

**Precautions:** Pregnancy, breastfeeding, children, hypotension, hypocalcemia, secondary malignancy

## DOSAGE AND ROUTES

### Postmenopausal osteoporosis

**Adult:** SUBCUT/IM 100 units/day; nasal 200 units (1 spray) alternating nostrils daily, activate pump before 1st dose

### Paget's disease

**Adult:** SUBCUT/IM 100 units daily, maintenance 50-100 units daily or every other day, or 3 × per wk

### Hypercalcemia

**Adult:** SUBCUT/IM 4 units/kg q12hr, increase to 8 units/kg q12hr if response is unsatisfactory, no more than 4-7 days

**Available forms:** Inj 200 units/ml; nasal spray 200 units/actuation

### Implementation

- Store at <77° F (25° C); protect from light

**SUBCUT route**

- Rotate inj sites

**IM route (salmon)**

- **Give** after test dose of 10 international units/ml, 0.1 ml intradermally; watch 15 min; **give** only with EPINEPHrine and emergency meds available
- IM inj in deep muscle mass slowly; rotate sites; preferred route if volume is >2 ml, use within 2 hr of reconstitution

**Nasal route**

- Use alternating nostrils for nasal spray; allow to warm to room temperature, prime to get full spray

**Intranasal route**

- Prime pump before first use
- Use at bedtime, alternate nostrils qday
- Allow to come to room temperature before using
- Discard after 30 days

## ADVERSE EFFECTS

**CNS:** Headache, tetany, chills, weakness, dizziness, fever, tremors
**CV:** Chest pressure, hypertension
**EENT:** Nasal congestion, eye pain
**GI:** Nausea, diarrhea, vomiting, anorexia, abdominal pain, salty taste, epigastric pain
**GU:** Diuresis, nocturia, urine sediment, frequency, cystitis
**INTEG:** Rash, flushing, pruritus of earlobes, edema of feet, inj site reaction
**MS:** Swelling, tingling of hands, backache, myalgia
**RESP:** Dyspnea, flulike symptoms
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Rapid; kidneys, tissue, blood |
| **Excretion** | Kidneys, inactive metabolite |
| **Half-life** | 1 hr |

### Pharmacodynamics

| | SUBCUT |
|---|---|
| **Onset** | 15 min |
| **Peak** | 4 hr |
| **Duration** | 8-24 hr |

## INTERACTIONS

### Individual drugs

Lithium: decreased lithium effect, monitor lithium level

### Drug classifications

Bisphosphonates (Paget's disease): decreased effect of nasal spray, monitor for adequate effect

## NURSING CONSIDERATIONS

### Assessment

- **Anaphylaxis, hypersensitivity:** inability to breathe, rash, fever; have emergency equipment nearby
- Assess for GI symptoms, polyuria, flushing, head swelling, tingling, headache; may indicate hypercalcemia; nervousness, irritability, twitching, seizures, spasm, paresthesia indicate hypocalcemia during beginning of treatment
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, avoid breastfeeding

• Identify nutritional status; check diet for sources of vit D (milk, some seafood), calcium (dairy products, dark green vegetables), phosphates
• **Postmenopausal osteoporosis:** Monitor BUN, creatinine, uric acid, chloride, electrolytes, urine pH, urinary calcium, magnesium, phosphate, urinalysis; vit D 50-135 international units/dl), alkaline phosphatase baseline and q3-6mo; check urine sediment for casts throughout treatment; monitor urine hydroxyproline in Paget's disease, biochemical markers of bone formation/absorption, radiologic evidence of fracture; bone density (osteoporosis)
• **Toxicity (can occur rapidly):** Assess for increased product level, since toxic reactions occur rapidly; have parenteral calcium or gluconate on hand if calcium level drops too low; check for tetany (irritability, paresthesia, nervousness, muscle twitching, seizure, tetanic spasm)

### Patient/family education

• Teach patient to report difficulty swallowing immediately

**SUBCUT route/ IM route**

• Teach method of inj if patient will be responsible for self-medication
• Instruct patient to notify prescriber for hypercalcemic relapse: renal calculi, nausea, vomiting, thirst, lethargy, deep bone or flank pain
• Teach patient that warmth and flushing occur and last 1 hr
• Provide a low-calcium diet as prescribed (Paget's disease, hypercalcemia)
• **Pregnancy/breastfeeding:** Advise prescriber if pregnancy is planned or suspected, avoid breastfeeding

**Postmenopausal osteoporosis**

• Teach patient to take vitamin D and calcium as directed
• Teach patient that nausea, vomiting, and facial flushing occur often

**Nasal route**

• Teach patient to use alternating nostrils for nasal spray; use after warming to room temperature, prime to get full spray, discard after 30 days, report serious symptoms of rhinitis
• Advise patients with osteoporosis to increase calcium and vit D in diet and to continue with moderate exercise to prevent continued bone loss
• Advise patients to report difficulty swallowing or change in side effects to prescriber immediately

### Evaluation

**Positive therapeutic outcome**

• Calcium levels 9-10 mg/dl
• Decreasing symptoms of Paget's disease, including pain
• Decreased bone loss in osteoporosis

## calcitriol (Rx)

(kal-si-tree'ole)
**Calcijex ✱, Rocaltrol, Silkis ✱, Vectical**
*Func. class.:* Parathyroid agent (calcium regulator)
*Chem. class.:* Vitamin D hormone

**Do not confuse:** calcitriol/Calciferol

**ACTION:** Increases intestinal absorption, renal reabsorption of calcium, provides calcium for bones, increases renal tubular resorption of phosphate

**Therapeutic outcome:** Calcium at normal level

**USES:** Hypocalcemia in chronic renal disease, hyperparathyroidism, pseudohypoparathyroidism, psoriasis, renal osteodystrophy

## CONTRAINDICATIONS

Hypersensitivity, hyperphosphatemia, hypercalcemia, vit D toxicity

**Precautions:** Pregnancy, breastfeeding, renal calculi, CV disease

## DOSAGE AND ROUTES

### Hypocalcemia (stage 5 chronic kidney disease, on dialysis)

**Adult and child ≥6 yr: PO** 0.25 mcg/day
**IV** 1-2 mcg three times/wk, initially; may increase by 0.5-1 mcg q4-8wk
**Child 1-5 yr: PO** 0.25-2 mcg/day

### Renal osteodystrophy

**Adult and child ≥3 yr: PO** 0.25 mcg/day, may increase to 0.5 mcg/day
**Child <3 yr: PO** 0.01-0.015 mcg/kg/day

### Hypoparathyroidism

**Adult and child ≥6 yr: PO** 0.25 mcg/day, may increase q2-4wk, maintenance 0.5-2 mcg/day
**Child 1-5 yr: PO** 0.25-0.75 mcg daily
**Child <1 yr: PO** 0.04-0.08 mcg/kg/day

**Available forms:** Caps 0.25, 0.5 mcg; inj 1 mcg/ml, 2 mcg/ml; oral sol 1 mcg/ml; top 3 mcg/g

### Implementation

**PO route**

• Do not break, crush, or chew caps
• Give with meals for GI symptoms
• Store protected from light, heat, moisture

**Topical route**

• Rub into skin

**IV route**
• **Hypocalcemia** Give by direct **IV** over 1 min through catheter at hemodialysis conclusion

## ADVERSE EFFECTS

**CNS:** Drowsiness, headache, vertigo, fever, lethargy, hallucinations
**CV:** Palpitations, hypertension, dysrhythmias
**ENDO:** Hypercalcemia
**EENT:** Blurred vision, photophobia
**GI:** Nausea, diarrhea, vomiting, jaundice, anorexia, dry mouth, constipation, cramps, metallic taste
**GU:** Polyuria, hypercalciuria, hyperphosphatemia, hematuria, thirst
**MS:** Myalgia, arthralgia, decreased bone development, weakness
**SYST:** Anaphylaxis
**INTEG:** Pain at injection site, rash, pruritus

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | To liver, crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Bile |
| **Half-life** | 3-6 hr, undergoes hepatic recycling, excreted in bile |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 2-6 hr |
| **Peak** | 10-12 hr |
| **Duration** | Up to 5 days |

## INTERACTIONS

### Individual drugs

Cholestyramine, mineral oil: decreased absorption of calcitriol, avoid concurrent use
Phenytoin: increased vit D metabolism
Verapamil: increased dysrhythmias use cautiously

### Drug classifications

Antacids (magnesium): increased hypermagnesemia
Calcium supplements, diuretics (thiazide): increased hypercalcemia
Cardiac glycosides: increased dysrhythmias
Vitamin D products: increased toxicity
Vitamins (fat-soluble): decreased calcitriol absorption

### Drug/food

Large amounts of high-calcium foods may cause hypercalcemia

### Drug/lab test

Increase: AST/ALT, BUN, creatinine
False: increased cholesterol
Interference: alkaline phosphatase, electrolytes

## NURSING CONSIDERATIONS

### Assessment

• Assess GI symptoms, polyuria, flushing, head swelling, tingling, headache; may indicate hypercalcemia
• **Hypercalcemia:** dry mouth, metallic taste, polyuria, bone pain, muscle weakness, headache, fatigue, change in LOC, dysrhythmias, increased respirations, anorexia, nausea, vomiting, cramps, diarrhea, constipation, confusion, paresthesia, twitching, Chvostek's/Trousseau's sign, **hypocalcemia**
• Identify nutritional status; check diet for sources of vit D (milk, some seafood), calcium (dairy products, dark green vegetables), phosphates
• Monitor BUN, creatinine, uric acid, chloride, electrolytes, urine pH, urinary calcium, magnesium, phosphate, urinalysis (calcium should be kept at 9-10 mg/dl; vit D 50-135 international units/dl), alkaline phosphatase baseline and q3-6mo
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, no well-controlled studies, do not breastfeed
• **Vitamin D toxicity:** Assess for constipation, nausea, vomiting, headache, metal taste, anorexia, weakness, weight loss

### Patient/family education

• Teach patient the symptoms of hypercalcemia (renal stones, nausea, vomiting, anorexia, lethargy, thirst, bone or flank pain) and about foods rich in calcium
• Advise patient to avoid products with sodium: cured meats, dairy products, cold cuts, olives, beets, pickles, soups, meat tenderizers in chronic renal failure
• Advise patient to avoid products with potassium: oranges, bananas, dried fruit, peas, dark green leafy vegetables, milk, melons, beans in chronic renal failure
• Advise patient to avoid OTC products containing calcium, potassium, or sodium in chronic renal failure
• Instruct patient to avoid all preparations containing vit D
• Instruct patient to monitor weight weekly; maintain fluid intake

### Evaluation

**Positive therapeutic outcome**
• Calcium levels 9-10 mg/dl

## calcium acetate (OTC)

(kal'see-um ass'e-tate)

**Calphron, Eliphos, PhosLo, Phoslyra**

## calcium carbonate (Rx) (PO-OTC, Rx)

**Alka-Mints, Amitone, Apo-Cal, BioCal, Calcarb, Calci-Chew, Calciday, Calci-Mix, Calcite, Caltrate, Chooz, Maalox Antacid, Os-Cal, Rolaids Extra Strength Soft-chew, Tums, Tums E-X, Tums Kids, Tums Lasting Effects, Tums Dissolve, Tums Smoothies, Tums Ultra**

*Func. class.:* Antacid, calcium supplement

*Chem. class.:* Calcium product

**Do not confuse:** Os-Cal/Asacol

**ACTION:** Neutralizes gastric acidity

**Therapeutic outcome:** Neutralized gastric acidity; calcium at normal levels

**USES:** Antacid, calcium supplement; not suitable for chronic therapy, hyperphosphatemia, hypertension in pregnancy, osteoporosis, prevention/treatment of hypocalcemia, hypoparathyroidism

## CONTRAINDICATIONS

Hypersensitivity, hypercalcemia

**Precautions:** Pregnancy, breastfeeding, geriatric, fluid restriction, decreased GI motility, GI obstruction, dehydration, renal disease, hyperparathyroidism, bone tumors

## DOSAGE AND ROUTES

### Nutritional supplement including osteoporosis prophylaxis

**Adult ≥51 yr: PO** 1000-1500 mg/day elemental calcium (2500-3750 calcium carbonate)

**Adult 19-50 yr: PO** 1000 mg/day elemental calcium (2500 mg calcium carbonate)

### Chronic hypocalcemia

**Adult: PO** 2-4 g/day elemental calcium (5-10 g calcium carbonate) in 3-4 divided doses

**Child: PO** 45-65 mg/kg/day elemental calcium (112.5-162.5 mg/kg calcium carbonate) in 4 divided doses

**Neonate: PO** 50-150 mg/kg/day elemental calcium (125-375 mg/kg/day in 4-6 divided doses, max 1 g/day)

### Supplementation

**Adolescent and child 9-18 yr: PO** 1300 mg elemental calcium (3250 mg calcium carbonate)

**Child 4-8 yr: PO** 800 mg/day elemental calcium (2000 mg calcium carbonate)

**Child 1-3 yr: PO** 500 mg/day elemental calcium (1250 mg calcium carbonate)

**Infant 6-12 mo: PO** 270 mg/day elemental calcium based on total intake

**Neonate and infant <6 mo: PO** 210 mg/day elemental calcium based on total intake

### Hyperphosphatemia

**Adult: PO** Individualized on response

### Heartburn, dyspepsia, hyperacidity (OTC)

**Adult: PO** 1-2 tabs q2hr, max 9 tabs/24 hr (Alka-mints); chew 2-4 tab q1hr prn, max 16 tabs (Tums regular strength); chew 2-4 tab q1hr prn, max 10 tabs (Tums E-X); chew 2-3 tabs q1hr prn, max 10 tabs/24 hr (Tums Ultra)

**Available forms: Calcium carbonate: chewable tabs** 350, 420, 450, 500, 750, 1000, 1250 mg; **tabs** 500, 600, 650, 667, 1000, 1250, 1500 mg; **gum** 300, 450 500 mg; **susp** 1250 mg/5 ml; **caps** 1250 mg; **powder** 6.5 g/packet; **calcium acetate: tabs** 667 mg (169 mg Ca), **caps** 500 mg (125 mg Ca); **gelcaps:** 667 mg (169 mg elemental Ca)

### Implementation

**PO route**

- Administer as antacid 1 hr after meals and at bedtime
- Administer as supplement 1½ hr after meals and at bedtime
- Administer only with regular tablets or capsules; do not give with enteric-coated tablets
- Administer laxatives or stool softeners if constipation occurs

## ADVERSE EFFECTS

**GI:** *Constipation,* anorexia, nausea, vomiting, flatulence, diarrhea, rebound hyperacidity, eructation

**GU:** Calculi, hypercalciuria

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | ⅓ absorbed by small intestines, must have adequate vit D for absorption |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Feces, urine, crosses placenta |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Peak** | Unknown |

## INTERACTIONS

### Individual drugs

Atenolol, etidronate, phenytoin, risedronate, ketoconazole: decreased levels of each drug
Digoxin: increased toxicity from hypercalcemia
QuiNIDine: increased quiNIDine levels

### Drug classifications

Amphetamines: increased levels of amphetamines
Calcium channel blockers, calcium supplements, fluoroquinolones, iron products, salicylates, tetracyclines: PO decreased levels of each specific product
Thiazide diuretics: increased hypercalcemia

### Drug/lab test

Decrease: phosphates
False increase: chloride
False decrease: magnesium, oxalate, lipase
False positive: benzodiazepines

## NURSING CONSIDERATIONS

### Assessment

- Monitor $Ca^+$ (serum, urine); $Ca^+$ should be 8.5-10.5 mg/dl, urine $Ca^+$ should be 150 mg/day, monitor weekly
- **Assess for milk-alkali syndrome:** nausea, vomiting, disorientation, headache
- Assess for constipation; increase bulk in the diet if needed
- Assess for **hypercalcemia:** headache, nausea, vomiting, confusion; hypocalcemia: paresthesia, twitching, colic, dysrhythmias, Chvostek's/Trousseau's sign
- Assess those taking digoxin for toxicity
- Assess those taking for abdominal pain, heartburn, indigestion before, after administration
- **Pregnancy/breastfeeding:** Use only if clearly needed, no well-controlled studies, considered compatible with breastfeeding

### Patient/family education

- Advise patient to increase fluids to 2 L unless contraindicated, to add bulk to diet for constipation; notify prescriber of constipation
- Advise patient not to switch antacids unless directed by prescriber, not to use as antacid for >2 wk without approval by prescriber
- Teach patient that therapeutic dose recommendations are figured as elemental calcium
- Advise to avoid excessive use of alcohol, caffeine, tobacco
- Teach to avoid spinach, cereals, dairy products in large amounts

### Evaluation

**Positive therapeutic outcome**

- Absence of pain, decreased acidity
- Decreased hyperphosphatemia in renal failure (Acetate)

## CALCIUM SALTS

**calcium chloride (Rx)**
**calcium citrate (OTC)**
Cal-Citrate
Citracal
**calcium glubionate**
calcionate
**calcium gluceptate (Rx)**
**calcium gluconate (Rx)**
**calcium phosphate (OTC)**
*Func. class.:* Electrolyte replacement—calcium product

**ACTION:** Calcium needed for maintenance of nervous, muscular, skeletal systems, enzyme reactions, normal cardiac contractility, coagulation of blood; affects secretory activity of endocrine, exocrine glands

**Therapeutic outcome:** Calcium at normal level, absence of increased magnesium, potassium

**USES:** Prevention and treatment of hypocalcemia, hypermagnesemia, hypoparathyroidism, neonatal tetany, cardiac toxicity caused by hyperkalemia, lead colic, hyperphosphatemia, vit D deficiency, osteoporosis prophylaxis, calcium antagonist toxicity (calcium channel blocker toxicity)

## CONTRAINDICATIONS

Hypercalcemia, digoxin toxicity, ventricular fibrillation, renal calculi

**Precautions:** Pregnancy, breastfeeding, children, renal disease, respiratory disease, cor pulmonale, digitalized patient, respiratory failure, diarrhea, dehydration

## DOSAGE AND ROUTES

### >> Acute hypocalcemia (calcium chloride 10%):

**Adults: IV** 0.5-1 g; **for tetany**, give over 5-10 min. Repeat q4-6 hrs, as needed by calcium concentrations or **IV INF** 15 mg/kg of elemental calcium (37.5 mg/kg calcium chloride) over 4-6 hr.
**Child/infant:** IV range from 2.7-5 mg/kg/dose (0.027-0.05 ml/kg/dose of 10%). **For tetany**, slow IV 10 mg/kg/dose over 5-10 min, may repeat initial dosage in 4-6 hr. The initial dose can be followed by a **CONT INF** max 200 mg/kg/day.

### >> (Calcium gluconate):

**Adults: IV** 2-3 g slowly, max 5 ml/min (47.5 mg/min of calcium ion). **For tetany**, give over 5-10 min, repeat q6hr, as needed, as determined by serum calcium concentrations, max 15 g/day or **IV INF** 15 mg/kg of elemental calcium (167 mg/kg) over 4-6 hr may be administered if symptoms recur after initial IV calcium replacement

**Child/infant:** IV 200-500 mg/kg/day **CONT INF** or given in 4 divided doses, at max rate 5 ml/min (47.5 mg/min of calcium ion); **for tetany**, IV 100-200 mg/kg over 5-10 min, may repeat after 6 hr or followed by 500 mg/kg/day IV as a **CONT INF** or in 3-4 divided doses.
**Neonate:** IV 200-800 mg/kg/day as a **CONT INF** or given in 3-4 divided doses. **For tetany,** 100-200 mg/kg IV is recommended, followed by 500 mg/kg/day **CONT INF** or given in 3-4 divided doses.

### >> PO (calcium citrate):

**Adults:** PO 9.5-19 g/day in divided doses 2-4 times a day after meals

### >> PO (calcium gluconate):

**Adults:** PO 22.5-45 g/day in 3-4 divided doses
**Child/infant:** PO 500-725 mg/kg/day in 4 divided doses
**Neonate:** PO 500-1500 mg/kg/day in 4-6 divided doses

### >> IV (calcium chloride 10%):

**Adult:** **IV** 5-10 ml of a 10% solution (500-1000 mg) or 8-16 mg/kg given by slow IV inj; may repeat

### >> IV (calcium gluconate):

**Adult:** **IV** 500-800 mg of 10% solution (5-8 ml) max 3 g
**Infant/child:** IV 60-100 mg/kg or intraosseous (0.6-1 ml/kg) max 3 g

### >> For nutritional supplementation:

PO (any oral calcium salt; dosage expressed as elemental calcium):
**Adults ≥ 51 yrs:** PO 1200 mg per day (range 1000-1500 mg/day)
**Adults 19-50 yrs:** PO 1000 mg per day
**Children/adolescents 9-18 years of age:** PO 1300 mg per day
**Children 4-8 years of age:** PO 800 mg per day
**Children 1-3 years of age:** PO 500 mg per day
**Infants 6-12 months of age:** PO 270 mg per day based on total intake (consumption from breast milk/infant formula and solid food)
**Neonate/infant <6 months of age:** PO 210 mg per day based on total intake (content in human milk/infant formula). Source of calcium intake should come from food/breast milk only in order to prevent high levels of intake.

## Therapeutic Drug Monitoring:

Ionized calcium concentrations are the preferred measure to determine true hypocalcemia. If total serum calcium concentrations are obtained, calcium concentrations should be adjusted if hypoalbuminemia or hyperalbuminemia is present. The corrected calcium concentration may be estimated from the following formula:

$$\text{Corrected calcium (mg/dl)} = \text{serum calcium (mg/dl)} + 0.8\,[4 - \text{serum albumin (g/dl)}]$$

**Available forms:** Many; check product listings
Calcium chloride: Injection 10% solution (ampules, syringes, vials 10 ml)
Calcium citrate: Caps 150 mg; tabs 200, 250, 950, 1040 mg; granules 760 mg/3.5g
Calcium glubionate: Syrup 1.8 g/5 ml Calcium gluconate: Tabs 500-650, 975, 1 g; injection 10%

## Implementation

**PO route**
- Give PO with or following meals to enhance absorption
- Store at room temperature

**IM route**
- Can cause severe tissue necrosis, do not use IM
- Do not give chloride, gluconate IM

**IV route**
- Warm to room temperature, administer **IV** undiluted or diluted with equal amounts of 0.9% NaCl for inj to a 5% sol; give 0.5-1 ml/min, give slowly, rapid administration may cause cardiac arrest
- Give through small-bore needle into large vein; do not use scalp vein if extravasation occurs, necrosis will result (**IV**); IM inj may cause severe burning, necrosis, and tissue sloughing; warm sol to body temp before administering (only gluconate/gluceptate)
- Provide seizure precautions: padded side rails, decreased stimuli (noise, light); place airway suction equipment, padded mouth gag if calcium levels are low
- Patient should remain recumbent 30 min after IV dose, drop in B/P may result

### >> Calcium chloride

**Y-site compatibility:** Acyclovir, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid injection, asparaginase, atenolol, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, carmustine, caspofungin acetate, cefotaxime, cefoTEtan, cefOXitin, ceftaroline, ceftizoxime, chloramphenicol, chlorothiazide, chlorpheniramine, chlorproMAZINE, cimetidine,

CISplatin, clindamycin, cloxacillin, colistimethate, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexmedetomidine, dexrazoxane, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, doxapram, DOXOrubicin, doxycycline, edetate calcium disodium, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ergonovine, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, furosemide, gallamine, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin sodium, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, inamrinone, insulin, regular, irinotecan, isoproterenol, kanamycin, labetalol, lactated Ringer's, lepirudin, leucovorin, lidocaine, lincomycin, linezolid, LORazepam, mannitol, mechlorethamine, meperidine, mephentermine, mesna, metaraminol, methohexital, methotrexate, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, moxifloxacin, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, nalorphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxytocin, PACLitaxel (solvent/surfactant), pancuronium, papaverine, penicillin G potassium/sodium, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin-tazobactam, polymyxin B, potassium, potassium chloride, procainamide, prochlorperazine, promazine, promethazine, propranolol, protamine, pyridoxine, quinupristin-dalfopristin, raNITIdine, Ringer's injection, rocuronium, streptomycin, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin-clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, topotecan, trimetaphan, tubocurarine, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole

**Calcium gluconate Y-site compatibilities:** Acyclovir, aldesleukin, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid injection, asparaginase, atenolol, atracurium, atropine, azaTHIOprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, CARBOplatin, carmustine, caspofungin, cefamandole, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, ceftaroline, cefTAZidime, ceftizoxime, cefuroxime, chloramphenicol sodium succinate, chlorothiazide, chlorpheniramine, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, cloxacillin, codeine, colistimethate, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, DAUNOrubicin liposome, dexmedetomidine, dexrazoxane, digoxin, dilTIAZem, dimenhyDRINATE, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, DOXOrubicin liposomal, doxycycline, edetate calcium disodium, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ergonovine, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fludarabine, fluorouracil, folic acid (as sodium salt), furosemide, gallamine, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin sodium, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, insulin, regular, irinotecan, isoproterenol, kanamycin, ketamine, labetalol, lactated Ringer's injection, lepirudin, leucovorin, levofloxacin, lidocaine, lincomycin, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mephentermine, mesna, metaraminol, methohexital, methotrexate, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, mitoMYcin, mitoXANtrone, mivacurium, morphine, moxifloxacin, multiple vitamins injection, nafcillin, nalbuphine, nalorphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxaliplatin, oxytocin, PACLitaxel (solvent/surfactant), palonosetron, pancuronium, papaverine, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, polymyxin B, potassium acetate/chloride, procainamide, prochlorperazine, promazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, raNITIdine, remifentanil, Ringer's, riTUXimab, rocuronium, sargramostim, sodium acetate, streptomycin, succinylcholine, SUFentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, TPN (2-in-1), trastuzumab, trimethaphan, tubocurarine, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, vitamin B complex with C, voriconazole

## ADVERSE EFFECTS

**CV:** Shortened QT interval, heart block, hypotension, bradycardia, dysrhythmias; cardiac arrest (IV)
**GI:** Vomiting, nausea, constipation
**HYPERCALCEMIA:** Drowsiness, lethargy, muscle weakness, headache, constipation, coma, anorexia, nausea, vomiting, polyuria, thirst
**INTEG:** Pain, burning at **IV** site, severe venous thrombosis, necrosis, extravasation

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability (**IV**) |
| **Distribution** | Readily extracellular; crosses placenta, protein binding 40%-50% |
| **Metabolism** | Liver |
| **Excretion** | Feces (80%), kidney (20%), breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Unknown | Immediate |
| **Peak** | Unknown | Rapid |
| **Duration** | Unknown | ½-1½ hr |

## INTERACTIONS

### Individual drugs

Atenolol: decreased effect
Phenytoin, tetracyclines, thyroid: decreased absorption when calcium is taken PO
DilTIAZem, verapamil: decreased effects, increased toxicity

### Drug classifications

Antacids: milk-alkali syndrome (renal disease)
Digoxin glycosides: increased dysrhythmias
Diuretics (thiazide): increased hypercalcemia
Fluoroquinolones: decreased absorption of fluoroquinolones when calcium is taken PO
Iron salts: decreased absorption of iron when calcium is taken PO

### Drug/herb

Lily of the valley, pheasant's eye, shark cartilage, squill: increased side effects, action

### Drug/lab test

Increased: calcium

## NURSING CONSIDERATIONS

### Assessment

- **Monitor ECG for decreased QT interval and T-wave inversion during rapid administration:** in hypercalcemia, product should be reduced or discontinued
- Monitor calcium levels during treatment (9-10 mg/dl is normal level), urine calcium if hypercalciuria occurs
- Assess cardiac status: rate, rhythm, CVP (PWP, PAWP if being monitored directly)
- Assess digitalized patients closely, an increase in calcium increases digoxin toxicity risk
- **Hypocalcemia:** muscle twitching, paresthesia, dysrhythmias, laryngospasm
- **Pregnancy/breastfeeding:** Use only if clearly needed, no well-controlled studies, considered to be compatible with breastfeeding

### Patient/family education

- Caution patient to add food high in vit D content; to add calcium-rich foods to diet: dairy products, shellfish, dark green leafy vegetables; decrease oxalate-rich and zinc-rich foods: nuts, legumes, chocolate, spinach, soy
- Advise patient to prevent injuries, avoid immobilization

### Evaluation

**Positive therapeutic outcome**

- Decreased twitching, paresthesias, muscle spasms
- Absence of tremors, seizures, dysrhythmias, dyspnea, laryngospasm, negative Chvostek's sign, negative Trousseau's sign

## canagliflozin

(kan'a-gli-floe'zin)
**Invokana**
*Func. class.:* Oral antidiabetic
*Chem. class.:* Sodium otocose cotransporter 2, SGLT-2 inhibitor

**ACTION:** Blocks reabsorption by the kidney, increases glucose excretion, lowers blood glucose concentrations

**Therapeutic outcome:** Improved signs/symptoms of diabetes mellitus (decreased polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait

**USES:** Type 2 diabetes mellitus, with diet and exercise, may use in combination

## CONTRAINDICATIONS

Dialysis, renal failure, hypersensitivity, breastfeeding, diabetic ketoacidosis

**Precautions:** Pregnancy, children, renal/hepatic disease, hypothyroidism, hyperglycemia, hypotension, pituitary insufficiency, type 1 diabetes mellitus, malnutrition, fever, dehydration, adrenal insufficiency, geriatrics

## DOSAGE AND ROUTES

### Renal dose

**Adult:** PO eGFR 45-59 ml/min/1.73 $m^2$, max 100 mg/day; <45 ml/min/1.73 $m^2$, do not use

**Available forms:** Tabs 100, 300 mg

### Implementation

**PO route**

- Once daily with first meal of the day
- Adjust dose in times of stress, surgery, trauma
- Store at room temperature

## ADVERSE EFFECTS

**CNS:** Dizziness, fatigue
**GI:** Abdominal pain, pancreatitis, constipation, nausea
**GU:** Candidiasis, urinary frequency, polydipsia, polyuria, renal impairment
**INTEG:** Photosensitivity, rash, pruritus
**META:** Hypercholesterolemia, lipidemia, hypoglycemia, hyperkalemia, hypermagnesemia, hyperphosphatemia, hypersensitivity
**MISC:** Bone fractures
**CV:** Hypotension, orthostatic hypotension

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 99% protein binding |
| **Metabolism** | By UGT1A9, UGT2B4 |
| **Excretion** | 33% in urine |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Baclofen, cycloSPORINE, estrogen, isoniazid, tacrolimus: decreased effect, hyperglycemia
Gatifloxacin: do not use concurrently
Lithium: increased or decreased glycemic control
Increase: Hyperkalemia, potassium-sparing diuretics

### Drug classifications

ACE inhibitors, angiotensin II receptor antagonists, β-blockers, bile acid sequestrants, fibric acid derivatives, insulin, MAOIs, salicylates, sulfonylureas: increased hypoglycemia, monitor for hypoglycemia
Atypical antipsychotics, carbonic anhydrase inhibitors, corticosteroids, digestive enzymes, intestinal absorbents, loop diuretics, oral contraceptives, phenothiazines, progestins, protease inhibitors, sympathomimetics, thiazide diuretics: decreased effect, hyperglycemia

### Drug/lab tests

Increase: Magnesium, phosphate, uric acid, serum creatinine
Decrease: Serum glucose, eGFR
UGT inducers PHENobarbital, ritonavir; dose may need to be increased

## NURSING CONSIDERATIONS

### Assessment

- Assess for hypoglycemia (weakness, hunger, dizziness, tremors, anxiety, tachycardia, sweating), hyperglycemia; even though product does not cause hypoglycemia, if patient is on sulfonylureas or insulin, hypoglycemia may be additive; if hypoglycemia occurs, treat with dextrose, or, if severe, with IV glucagon
- Monitor for stress, surgery, or other trauma that may require a change in dose
- A1c q3mo, monitor serum glucose; 1 hr PP throughout treatment; serum cholesterol, serum creatinine/BUN, serum electrolytes
- **Bone fractures:** Monitor bone density, other conditions that may lead to bone fractures, fractures may occur within 3 mo of starting therapy
- **Renal impairment:** Monitor those with renal disease more frequently, increased creatinine, BUN may occur
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, or if breastfeeding

### Patient/family education

- Teach patient the symptoms of hypoglycemia/hyperglycemia, what to do about each
- Instruct patient that medication must be taken as prescribed; explain consequences of discontinuing medication abruptly; that insulin may need to be used for stress, including trauma, fever, surgery, to take as soon as remembered if dose is missed unless close to next dose, then skip and take at next dose, do not take double dose
- Instruct patient to avoid OTC medications and herbal supplements unless approved by health care provider
- Instruct patient that diabetes is a lifelong illness; that the diet and exercise regimen must be followed; that this product is not a cure
- Instruct patient to carry emergency ID and glucose source; to avoid sugar, because sugar is blocked by acarbose
- Teach patient that blood glucose monitoring is required to assess product effect
- Teach patient that GI side effects may occur

• **Yeast infections (women/men):** Advise women that yeast infections can occur with this product, women (vaginal), men (penile), to report discharge, itching, swelling
• **Pregnancy/breastfeeding:** Not to breastfeed, to advise prescriber if pregnancy is planned or suspected
• **Ketoacidosis:** Advise patient to notify prescriber immediately of nausea, vomiting
• Lack of appetite, sleepiness, difficulty breathing

### Evaluation
**Therapeutic response:** improved signs/symptoms of diabetes mellitus (decreased polyuria, polydipsia, polyphagia; clear sensorium, absence of dizziness, stable gait

## candesartan (Rx)
(can-deh-sar′tan)
**Atacand**
*Func. class.:* Antihypertensive
*Chem. class.:* Angiotensin II receptor (type $AT_1$)

**Do not confuse:** Atacand/antacid

**ACTION:** Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the $AT_1$ receptor found in tissues

**Therapeutic outcome:** Decreased B/P, decreased heart failure–related complications or death

**USES:** Hypertension, alone or in combination; HF NYHA Class II-IV and ejection fraction ≤40%

## CONTRAINDICATIONS
Hypersensitivity

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Pregnancy (1st trimester), breastfeeding, children, geriatric, hypersensitivity to ACE inhibitors, volume depletion, renal/hepatic impairment, renal artery stenosis, hypotension, electrolyte abnormalities

## DOSAGE AND ROUTES
**Adult:** PO (single agent) 16 mg daily initially in patients who are not volume depleted, range 8-32 mg/day; with diuretic or volume depletion, 8-32 mg/day as a single dose or divided bid
**Adult and child ≥6 yr and weight >50 kg:** PO 8-16 mg/day or divided bid, adjust to B/P, usual range 4-32 mg/day max 32 mg/day
**Child ≥6 yr and weight <50 kg:** PO 4-8 mg/day or divided bid, adjust to B/P
**Child ≥1 yr and <6 yr:** PO 0.2 mg/kg/day in 1 dose or divided in 2 doses/day, adjust B/P, max 0.4 mg/kg/day, max 16 mg/day

### Heart failure
**Adult:** PO 4 mg/day, may be doubled ≥2 wk, target dose 32 mg/day

### Renal/hepatic dose
**Adult:** PO ≤8 mg/day in severe renal disease/moderate hepatic disease, adjust dose as needed

**Available forms:** Tabs 4, 8, 16, 32 mg

### Implementation
• Administer without regard to meals
• Oral liquid (compounded) shake well, do not freeze

## ADVERSE EFFECTS
**CNS:** *Dizziness,* fatigue, headache, syncope
**CV:** Chest pain, peripheral edema, hypotension, palpitations
**EENT:** Sinusitis, rhinitis, pharyngitis
**GI:** *Diarrhea,* nausea, abdominal pain, vomiting
**GU:** Renal failure
**MS:** Arthralgia, pain
**RESP:** *Cough, upper respiratory infection*
**SYST:** Angioedema, hypersensitivity reactions

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Bound to plasma proteins |
| **Metabolism** | Extensive |
| **Excretion** | Feces, urine, breast milk |
| **Half-life** | 9 hr |

### Pharmacodynamics
| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr |
| **Duration** | 24 hr |

## INTERACTIONS
### Individual drugs
Lithium: increased lithium level
Potassium: increased hyperkalemia, ACE inhibitors

### Drug classifications
α-Blockers, ACE inhibitors, β-blockers, calcium channel blockers, MAOIs: increased hypotension
Diuretics (potassium sparing): increased hypokalemia
NSAIDs, salicylates: decreased effect

### Drug/herb
Astragalus, cola tree: increased or decreased antihypertensive effect
Ephedra: decreased antihypertensive effect
Hawthorn: increased antihypertensive effect

### Drug/Lab
Increase: albumin, ALT/AST, potassium

## NURSING CONSIDERATIONS
### Assessment
**Hypertension:**
- **Serious hypersensitivity reactions:** Assess for angioedema, anaphylaxis; facial swelling, difficulty breathing (rare)
- **Heart failure:** Monitor for jugular vein distention, weight, edema, dyspnea, crackles
- Assess B/P, pulse q4hr; note rate, rhythm, quality, notify prescriber of significant changes
- Monitor electrolytes: potassium, sodium, chloride; total $CO_2$, hyperkalemia is more common with other diuretics
- Obtain baselines in renal, liver function tests before therapy begins
- Assess blood studies: BUN, creatinine, liver function tests before treatment
- Monitor for edema in feet, legs daily
- Assess for skin turgor, dryness of mucous membranes for hydration status; for angioedema: facial swelling, dyspnea

**BLACK BOX WARNING:** Assess for pregnancy; pregnancy/breastfeeding: this product can cause fetal death when given in pregnancy, breastfeeding

- Assess for adverse reactions, especially in renal disease

### Patient/family education
- Teach patient not to take the product if breastfeeding or pregnant, or having had an allergic reaction to this product
- If a dose is missed, instruct patient to take as soon as possible, unless it is within 1 hour before next dose
- **Pregnancy/breastfeeding:** Advise patient to inform prescriber if pregnancy is planned or suspected, or if breastfeeding
- **Bleeding:** Advise patient to report bleeding immediately (blood in urine, gums, bruising, feeling faint)
- **Hypersensitivity:** Advise patient to report immediately difficulty breathing, hives, swelling of face, lips
- Advise patient to comply with dosage schedule, even if feeling better
- Teach patient to notify prescriber of fever, swelling of hands or feet, irregular heartbeat, chest pain
- Advise patient that excessive perspiration, dehydration, diarrhea may lead to fall in blood pressure—consult prescriber if these occur
- Inform patient that product may cause dizziness, fainting; light-headedness may occur
- Advise patient to avoid all OTC medications unless approved by prescriber; to inform all health care providers of medication use, full effect 4 wk, onset 2 wk, that product may be taken with or without meals, to store at room temperature
- Caution patient to rise slowly to sitting or standing position to minimize orthostatic hypotension
- Teach proper technique for obtaining B/P and acceptable parameters

**BLACK BOX WARNING:** Teach patient to notify prescriber immediately if pregnant, not to use if breastfeeding

### Evaluation
**Positive therapeutic outcome**
- Decreased B/P, decreased heart failure–related complications, death

**⚠ HIGH ALERT**

## capecitabine (Rx)
(cap-eh-sit'ah-bean)
**Xeloda**
*Func. class.:* Antineoplastic, antimetabolite
*Chem. class.:* Fluoropyrimidine carbamate

**Do not confuse:** Xeloda/Xenical

**ACTION:** Competes with physiologic substrate of DNA synthesis, thus interfering with cell replication in the S phase of cell cycle (before mitosis); also interferes with RNA and protein synthesis; product is converted to 5-fluorouracil (5-FU)

**Therapeutic outcome:** Decreasing symptoms of breast cancer

**USES:** PACLitaxel and anthracycline metastatic breast, colorectal cancer when 5-FU monotherapy is preferred; treatment of patients with colorectal cancer who have undergone complete resection of their primary tumor

## CONTRAINDICATIONS
Pregnancy, infants, hypersensitivity to 5-FU, severe renal impairment (CCr <30 ml/min), DPD deficiency

**Precautions:** Renal/hepatic/cardiac disease, breastfeeding, children, geriatric patients, radiation therapy, DPD deficiency

**BLACK BOX WARNING:** Anticoagulant therapy

## DOSAGE AND ROUTES
**Metastatic breast cancer resistant to both PACLitaxel and anthracycline or resistant to PACLitaxel and when further anthracycline therapy is not indicated**

**Adult:** PO 2500 mg/m²/day divided q12hr after meal ×2 wk, repeat q3wk

### Breast cancer (locally advanced/metastatic) with DOCEtaxel, previously treated with anthracycline

**Adult:** PO 2500 mg/m²/day divided q12hr after a meal on days 1-14, with DOCEtaxel 75 mg/m² IV on day 1

### Advanced/metastatic breast cancer (HER2 positive), who have received anthracycline, taxane, and trastuzumab

**Adult:** PO 2000 mg/m²/day divided q12hr after a meal on days 1-14 with lapatinib 1250 mg/day on days 1-21, repeat q21days

### Metastatic/locally advanced breast cancer, resistant to anthracycline, and a taxane or taxane resistant and when further anthracycline is contraindicated

**Adult:** PO 2000 mg/m²/day divided q12hr on days 1-14 with ixabepilone 40 mg/m² IV over 3 hr, repeat q3wk

### As an adjuvant in Dukes C colorectal cancer with a complete resection when fluoropyrimidine alone is preferred

**Adult:** PO 2500 mg/m²/day divided q12hr within 30 min of a meal ×2 wk, repeat q3wk for 8 cycles

### First-line in metastatic colorectal cancer when fluoropyrimidine alone is preferred

**Adult:** PO 2500 mg/m²/day divided q12hr after a meal ×2 wk repeat q3wk

### Renal dose

**Adult:** PO CCr 30-50 ml/min; decrease initial dose to 75% of usual dose; CCr < 30 ml/min contraindicated

**Available forms:** Tabs 150, 500 mg

### Implementation

- **Dosage adjustments of capecitabine monotherapy based on the most severe toxicity OR when used in combination with ixabepilone based on nonhematologic toxicity:** *Grade 1 toxicity:* Maintain current dosage; *Grade 2 toxicity (1st appearance):* interrupt therapy until toxicity is resolved to grade 0–1; do not replace missed doses, begin the next cycle with 100% of the starting dose; *Grade 2 toxicity (2nd appearance):* interrupt therapy until toxicity is resolved to grade 0–1; do not replace missed doses, begin the next cycle with 75% of the starting dose; *Grade 2 toxicity (3rd appearance):* interrupt therapy until toxicity is resolved to grade 0–1; do not replace missed doses, begin the next cycle with 50% of the starting dose; *Grade 2 toxicity (4th appearance):* discontinue treatment permanently; *Grade 3 toxicity (1st appearance):* interrupt therapy until toxicity is resolved to grade 0-1
- Help patient to rinse mouth tid-qid with water or club soda, brush teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis, use unwaxed dental floss

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, *paresthesia, fatigue,* insomnia
**CV:** Venous thrombosis
**GI:** *Nausea, vomiting, anorexia, diarrhea, stomatitis, abdominal pain, constipation, dyspepsia*, intestinal obstruction, necrotizing enterocolitis, hyperbilirubinemia, hepatic failure, GI bleeding
**HEMA:** Neutropenia, lymphopenia, thrombocytopenia, anemia
**INTEG:** *Hand and foot syndrome,* dermatitis, nail disorder, alopecia, rash
**MISC:** Eye irritation, edema, myalgia, limb pain, *pyrexia,* dehydration, renal impairment
**RESP:** *Cough, dyspnea,* pulmonary embolism

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Readily absorbed, decreased with food |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | 45 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1½ hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Leucovorin: increased toxicity, monitor for toxicity
Phenytoin: increased phenytoin level, monitor phenytoin level

### Drug classifications

Antacids (aluminum, magnesium): increased capecitabine

**BLACK BOX WARNING:** Anticoagulants: increased risk of bleeding, NSAIDs, salicylates, platelet inhibitors, thrombolytics; monitor PT and INR

### Food/drug

Increased absorption; give within 30 min of a meal

### Drug/lab test

Increased: bilirubin
Decreased: Hgb/Hct/RBC, neutrophils, platelets, WBC

## NURSING CONSIDERATIONS

### Assessment

- **Bone marrow suppression:** Monitor CBC, differential, platelet count weekly; withhold product if WBC $<1000/mm^3$ or platelet count is $<50,000/mm^3$ or RBC, Hct, Hgb is low; notify prescriber of results; frequently monitor INR in those receiving warfarin
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding, women should use contraception while taking this product, discontinue breastfeeding or discontinue product
- Assess buccal cavity q8hr for dryness, sores or ulceration, white patches, pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine)
- Assess symptoms indicating severe allergic reaction: rash, pruritus, urticaria, purpuric skin lesions, itching, flushing; product should be discontinued
- Monitor temp q4hr (may indicate beginning of infection)
- **Assess for hand/foot syndrome:** paresthesia, tingling, painful/painless swelling, blistering, erythema with severe pain of hands/feet
- **Assess for toxicity:** severe diarrhea (multiple times/day or at night), nausea, vomiting, stomatitis, adjust dose, stop treatment if severe
- Assess **GI symptoms:** frequency of stools, cramping; if severe diarrhea occurs, fluids/electrolytes may need to be given, those who are elderly are at greater risk of GI symptoms
- Monitor liver function tests before and during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; note jaundice of skin or sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

**BLACK BOX WARNING:** Assess for bleeding: hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr; inflammation of mucosa, breaks in skin, monitor INR and PT in those taking anticoagulants, adjustment of dose may be needed

### Patient/family education

- Advise patient to avoid use of products containing aspirin or ibuprofen, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
- Instruct patient to report signs of **anemia** (fatigue, headache, irritability, faintness, shortness of breath); **infection:** increased temp, sore throat, flulike symptoms
- Advise patient not to become pregnant while taking this product, pregnancy; not to use while breastfeeding, use adequate contraception
- Advise patient not to double dose, if dose is missed, how to take (on for 14 days then 7 days off) then start new cycle; do not crush, cut, to take with water
- Advise patient to report immediately severe diarrhea, vomiting, stomatitis, fever $\geq 100°$ F, hand/foot syndrome, anorexia, stop taking this product
- Advise patient to avoid foods with citric acid, hot or rough texture if stomatitis is present; take with water within 30 min at end of meal

### Evaluation

**Positive therapeutic outcome**

- Prevention of rapid division of malignant cells

## captopril (Rx)

(kap′toe-pril)
**Apo-Capto, Capoten**
*Func. class.:* Antihypertensive
*Chem. class.:* Angiotensin-converting enzyme (ACE) inhibitor

**Do not confuse:** captopril/carvedilol

**ACTION:** Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE; prevents conversion of angiotensin I to angiotensin II

**Therapeutic outcome:** Decreased B/P in hypertension; decreased preload, afterload in HF

**USES:** Hypertension, HF, left ventricular dysfunction (LVD) after MI, diabetic nephropathy, proteinuria

## CONTRAINDICATIONS

Breastfeeding, children, hypersensitivity, heart block, potassium-sparing diuretics, bilateral renal artery stenosis, ACE inhibitors, ACE inhibitor–induced angioedema

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Dialysis patients, hypovolemia, leukemia, scleroderma, LE, blood dyscrasias, HF, diabetes mellitus, renal/hepatic disease, thyroid disease, African descent, pregnancy 1st trimester, collagen-vascular disease, hyperkalemia, hyponatremia

C

## DOSAGE AND ROUTES

### Hypertension

**Adult:** Initial dose: PO 12.5-25 mg bid-tid; may increase to 50 mg bid-tid at 1-2 wk intervals; usual range 25-150 mg bid-tid; max 450 mg/day
**Child:** PO 0.3-0.5 mg/kg/dose, may titrate up to 6 mg/kg/day in 2-4 divided doses

**Neonate:** PO 0.05-0.1 mg/kg bid-tid, may increase as needed

### HF

**Adult:** PO 25 mg tid; may increase to 50 mg bid-tid; after 14 days may increase to 150 mg tid if needed

### Diabetic nephropathy

**Adult:** PO 25 mg tid

### Renal dose

**Adult:** PO CCr >50 ml/min, no change; CCr 10-50 ml/min, decrease dose by 25%; CCr <10 ml/min, decrease dose by 50%

**Available forms:** Tabs 12.5, 25, 50, 100 mg

### Implementation

- Store in air-tight container at 86° F (30° C) or less
- Severe hypotension may occur after first dose of this medication; decreasing hypotension may be prevented by reducing or discontinuing diuretic therapy 3 days before beginning captopril therapy
- Administer 1 hr before or 2 hr after meals
- **Oral sol:** May crush tab and dissolve in water, give within ½ hr, make sure tab is completely dissolved

## ADVERSE EFFECTS

**CNS:** Fever, chills
**CV:** *Hypotension,* postural hypotension, *tachycardia,* angina
**GI:** Loss of taste, increased liver function tests
**GU:** Impotence, dysuria, nocturia, proteinuria, nephrotic syndrome, acute reversible renal failure, polyuria, oliguria, frequency
**HEMA:** Neutropenia, agranulocytosis, pancytopenia, thrombocytopenia, anemia
**INTEG:** Rash, pruritus
**MISC:** Angioedema, hyperkalemia
**RESP:** Bronchospasm, *dyspnea, cough*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses placenta, excreted in breast milk (small amounts) |
| **Metabolism** | Liver (50%) |
| **Excretion** | Kidneys, unchanged (50%) |
| **Half-life** | 2 hr increase in renal disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ¼-1 hr |
| **Peak** | 1 hr |
| **Duration** | 6-12 hr |

## INTERACTIONS

### Individual drugs

Alcohol (acute ingestion): increased hypotension (large amounts)
Digoxin, lithium: increased serum levels, toxicity, monitor blood glucose
Insulin: increased hypoglycemia, monitor individual drug levels

### Drug classifications

Antacids, NSAIDs, salicylates: decreased captopril effect
Antidiabetics (oral): increased hypoglycemia
Antihypertensives, diuretics, nitrates, phenothiazines: increased hypotension
Diuretics (potassium-sparing), potassium supplements: increased toxicity, do not use
Sympathomimetics: do not use

### Drug/herb

Ephedra: decreased antihypertensive effect
Hawthorn: increased antihypertensive effect

### Drug/food

Food: decreased absorption of captopril

### Drug/lab test

Increased: AST, ALT, alkaline phosphatase, bilirubin, uric acid, potassium
Decreased: platelets, WBC, RBC, Hgb/Hct
False positive: urine acetone, ANA titer

## NURSING CONSIDERATIONS

### Assessment

- **Blood dyscrasias:** Monitor blood studies: decreased platelets; WBC with diff baseline q2wk × 3 mo and periodically during 1 yr, periodically q3mo, if neutrophils are <1000/mm$^3$, discontinue treatment
- **Hypertension:** Monitor B/P, check for orthostatic hypotension, syncope; if changes occur, dosage change may be required; notify prescriber of significant changes
- **Heart failure:** Monitor for dyspnea, jugular venous distention, weight gain, edema, rales/crackles in lungs
- Monitor renal studies: protein, BUN, creatinine; watch for increased levels that may indicate nephrotic syndrome and renal failure; monitor renal symptoms: polyuria, oliguria, frequency, dysuria, potassium
- Establish baselines in renal, liver function tests before therapy begins and check periodically; monitor for increased liver function studies; watch for increased uric acid, glucose

• Check potassium levels throughout treatment, although hyperkalemia rarely occurs
• **HF:** Assess for edema, dyspnea, wet crackles, increased B/P, weight gain

**BLACK BOX WARNING: Pregnancy:** discontinue ACE inhibitors when pregnancy is detected, monitor fetal development regularly

• **Angioedema:** Assess for allergic reactions: rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help; swelling of lips, mouth, face, difficulty breathing/swallowing (angioedema), provide supportive care, discontinue product

### Patient/family education

• Caution patient not to discontinue product abruptly; advise patient to tell all persons associated with care
• Teach patient not to use OTC products (cough, cold, allergy) unless directed by prescriber; serious side effects can occur; xanthines such as coffee, tea, chocolate, cola can prevent action of product
• Teach patient importance of complying with dosage schedule, even if feeling better; to continue with medical regimen to decrease B/P: exercise, smoking cessation, decreasing stress, diet modifications
• Emphasize the need to rise slowly to sitting or standing position to minimize orthostatic hypotension; not to exercise in hot weather or increased hypotension can occur
• Teach patient to notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, coughing, shortness of breath
• Caution patient to report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P
• Caution patient that product may cause dizziness, fainting, light-headedness; may occur during first few days of therapy; to avoid activities that may be hazardous, avoid activities that require concentration
• Teach patient how to take B/P, and teach normal readings for age-group; ensure patient takes regularly

**BLACK BOX WARNING:** Advise patient to tell prescriber if pregnancy is suspected or planned, breastfeeding; do not breastfeed

### Evaluation

**Positive therapeutic outcome**
• Decreased B/P in hypertension

## TREATMENT OF OVERDOSE:

0.9% NaCl **IV** infusion, hemodialysis

# carbachol ophthalmic

*See Appendix B*

# carBAMazepine (Rx)

(kar-ba-maz′e-peen)
**Carbatrol, Equetro, Mazepine, Novo-Carbamaz, Tegrol-CR, TEGretol, TEGretol-XR, Teril**
*Func. class.:* Anticonvulsant
*Chem. class.:* Iminostilbene derivative

**Do not confuse:** carBAMazepine/OXcarbazepine/TEGretol/Toradol/Tequin/TRENtal

**ACTION:** Exact mechanism unknown; appears to decrease polysynaptic responses and block posttetanic potentiation

**Therapeutic outcome:** Absence of seizures; decreased trigeminal neuralgia pain

**USES:** Tonic-clonic, complex-partial, mixed seizures; trigeminal neuralgia; bipolar disorder (Equetro only); diabetic neuropathy

**Unlabeled uses:** Neurogenic pain, psychotic behavior with dementia, agitation, hiccups

## CONTRAINDICATIONS

Pregnancy, hypersensitivity to carBAMazepine or tricyclics, bone marrow suppression

**Precautions:** Glaucoma, renal/hepatic/cardiac disease, psychosis, breastfeeding, child <6 yr, alcoholism, hepatic porphyria, AV or bundle branch block

**BLACK BOX WARNING:** Hematologic disease, agranulocytosis, leukopenia, neutropenia, thrombocytopenia, Asian patients or those with positive HLA-B 1502 or HLA-A 3lol alleles

## DOSAGE AND ROUTES/NTI

### Seizures

**Adult and child >12 yr:** PO 200 mg bid; may be increased by 200 mg/day in weekly intervals, give in divided doses q6-8hr; maintenance 800-1200 mg/day; max 1600 mg/day (adult); max child 12-15 yr 1000 mg/day; max child >15 yr 1200 mg/day; adjustment is needed to minimum dose to control seizures; EXT REL give bid; RECT administration of oral SUSP 200 mg/10 ml or 6 mg/kg as a single dose
**Child 6-12 yr:** PO tabs 100 mg bid or SUSP 50 mg qid; may increase by <100 mg qwk, max 1000 mg/day, usual dose 15-30 mg/kg/day; EXT REL tabs daily-bid
**Child <6 yr:** PO 10-20 mg/kg/day in 2-3 divided doses or 4 divided doses (susp), may increase qwk, don't use ext rel

### Trigeminal neuralgia

**Adult:** PO 100 mg/bid; may increase 100 mg q12hr until pain subsides; max 1200 mg/day; maintenance is 200-400 mg bid

### Bipolar disorder

**Adult:** PO (Equetro only) (regular release) 200 mg bid, may adjust dose 3-4 days to achieve carBAMazepine level to 8-12 mcg/ml micro response; max 1600 mg/day

**Available forms:** Chewable tabs 100, 200 mg; oral susp 100 mg/5 ml; ext rel tabs 100, 200, 400 mg; ext rel caps (Carbatrol) 200, 300 mg

### Implementation

- Do not break, crush, or chew ext rel tabs and caps: ext rel caps may be opened and beads mixed with food; chewable tabs should be chewed, not swallowed whole
- When converting from tabs to oral susp give same amount/day, or regular release to extended release same amount
- Give with food for GI symptoms
- Shake oral susp before use
- **Suspension:** Turn off N/G, internal feeding 15 min before and hold for 15 min after; mix an equal amount of water, $D_5W$, 0.9% NaCl when giving by NG tube, flush tube with 15-30 ml of above sol
- Store at room temperature

## ADVERSE EFFECTS

**CNS:** *Drowsiness,* dizziness, confusion, fatigue, paralysis, headache, hallucinations, worsening of seizures, unsteadiness, speech disturbances, suicidal ideation, neuroleptic malignant syndrome (when used with psychotropics), tremor
**CV:** Hypertension, HF, hypotension, aggravation of CAD, dysrhythmias, AV block
**EENT:** Tinnitus, dry mouth, blurred vision, diplopia, nystagmus, conjunctivitis
**ENDO:** Syndrome of inappropriate antidiuretic hormone (SIADH) (geriatric)
**GI:** *Nausea, constipation, diarrhea,* anorexia, vomiting, abdominal pain, stomatitis, glossitis, increased liver enzymes, hepatitis, hepatic porphyria, hypercholesterolemia, pancreatitis
**GU:** Frequency, retention, albuminuria, glycosuria, impotence, increased BUN, renal failure
**HEMA:** Thrombocytopenia, leukopenia, agranulocytosis, leukocytosis, aplastic anemia, eosinophilia, increased pro-time, lymphadenopathy
**INTEG:** *Rash,* Stevens-Johnson syndrome, urticaria, photosensitivity, toxic epidermal necrolysis, DRESS, alopecia, pruritus
**MS:** Osteoporosis
**RESP:** Pulmonary hypersensitivity (fever, dyspnea, pneumonitis)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Slow; completely absorbed |
| **Distribution** | Widely distributed; protein binding 76% |
| **Metabolism** | Extensively, liver, metabolized by CYP3A4 |
| **Excretion** | Urine, feces, breast milk |
| **Half-life** | 18-65 hr, then 8-29 hr after first month |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Slow |
| **Peak** | 4-5 hr (PO), 1.5 hr (susp) |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Benzodiazepines, darunavir, delavirdine, doxycycline, felbamate, haloperidol, nefazodone, OXcarbazepine, PHENobarbitol, phenytoin, primidone: decreased effect of these products
Cimetidine, clarithromycin, danazol, dilTIAZem, erythromycin, FLUoxetine, fluvoxaMINE, isoniazid, propoxyphene, valproic acid, verapamil, voriconazole, SSRIs, tricyclics, adjust dose if needed or do not use together increased carBAMazepine levels
CISplatin, darunavir, delavirdine, DOXOrubicin, felbamate, nefazodone, OXcarbazepine, PHENobarbitol, phenytoin, primidone, rifAMPin, theophylline: decreased carBAMazepine levels
Contraceptives (oral): decreased effect of oral contraceptives
Desmopressin, lithium, hypressin, vasopressin: increased effects of each specific product
Doxycycline: decreased effect of doxycycline
Increase: Lithium: increased CNS toxicity, avoid concurrent use
Phenytoin: increased and decreased plasma levels; decreased carBAMazepine plasma levels
Thyroid hormones: decreased effect of thyroid hormones
Warfarin: decreased effect of warfarin, adjust dose as needed

### Drug classifications

CYP3A4 inducers: decreased carBAMazepine levels
CYP3A4 inhibitors: increased carBAMazepine levels, monitor carBAMazepine effectiveness

- **MAOIs:** fatal reaction; do not use together, do not use within 14 days of beginning carBAMazepine
- **Do not use with:** NNRTIs (non-nucleoside reverse-transcriptase inhibitors), nefazodone

### Drug/herb
Echinacea: decreased carBAMazepine metabolism, increased levels
St. John's wort: decreased anticonvulsant action

### Drug/food
Grapefruit juice: increased peak concentration of carBAMazepine, avoid use

### Drug/lab test
Decreased: serum calcium, sodium
Increased: cholesterol

## NURSING CONSIDERATIONS
### Assessment

**BLACK BOX WARNING:** Serious skin reactions: Asian patient, obtain genetic test prior to administration, these patients may develop toxic epidermal necrolysis, Stevens Johnson syndrome, DRESS may be fatal, avoid using

- **Assess for seizures:** assess character, location, duration, intensity, frequency, presence of aura
- Assess for **trigeminal neuralgia:** facial pain including location, duration, intensity, character, activity that stimulates pain
- Monitor liver function tests (AST, ALT) and urine function tests, BUN, urine protein periodically during treatments; serum calcium may be decreased and lead to osteoporosis; cholesterol periodically
- **DRESS:** Assess for fever, lymphadenopathy with multiorgan development, including liver, kidney, cardiac, discontinue carBAMazepine
- **Bone marrow supression:** Assess blood studies: RBC, Hct, Hgb, reticulocyte counts qwk for 4 wk then q3-6mo if on long-term therapy; if myelosuppression occurs, product should be discontinued
- **Beers:** Avoid use in older adults unless safer alternative is not available, ataxia, impaired psychomotor function may occur
- Check blood levels during treatment or when changing dose; therapeutic level 4-12 mcg/ml
- Assess for **blood dyscrasias:** fever, sore throat, bruising, rash, jaundice, epistaxis (long-term treatment only)
- **Assess mental status:** mood, sensorium, affect, behavioral changes, suicidal thoughts/behaviors
- **Toxicity:** Assess for bone marrow suppression, nausea, vomiting, ataxia, diplopia, CV collapse, Stevens-Johnson syndrome
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding

### Patient/family education
- Teach patient to carry/wear emergency ID stating patient's name, products taken, condition, prescriber's name, phone number
- Caution patient to avoid driving, other activities that require alertness until stabilized on medication, dizziness, drowsiness occurs
- Teach patient not to discontinue medication quickly after long-term use
- Teach patient to use a nonhormonal type of contraception to prevent harm to the fetus
- Advise patient to use sunscreen to prevent burns
- Teach patient to take exactly as prescribed; do not double or omit doses
- Teach patient to report immediately chills, rash, light-colored stools, dark urine, yellowing of skin/eyes, abdominal pain, sore throat, mouth ulcers, bruising, blurred vision, dizziness, skin rash, fever
- **Pregnancy/breastfeeding:** Teach patient to notify if pregnancy is planned or suspected, avoid breastfeeding, if pregnant, patient should register with American Antiepileptic Drug Pregnancy Registry 888-233-2334
- That ophthalmic exams will be needed, to report changes in vision

### Evaluation
**Positive therapeutic outcome**
- Decreased seizure activity

## TREATMENT OF OVERDOSE:
Lavage, VS

**⚠ HIGH ALERT**

## CARBOplatin (Rx)
(kar'boe'pla-tin)
**Paraplatin** 🍁
*Func. class.:* Antineoplastic alkylating agent
*Chem. class.:* Platinum coordination compound

**Do not confuse:** CARBOplatin/CISplatin

**ACTION:** Produces interstrand DNA cross-links and to a lesser extent DNA-protein cross-links; activity is not cell cycle phase specific

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Initial treatment of advanced ovarian cancer in combination with other agents; palliative treatment of recurrent ovarian carcinoma after treatment with other antineoplastic agents

## CONTRAINDICATIONS
Pregnancy, hypersensitivity to this product, breastfeeding, significant bleeding, aluminum products used to prepare or administer CARBOplatin

**BLACK BOX WARNING:** Severe bone marrow depression, platinum compound hypersensitivity

**Precautions:** Geriatric patients, radiation therapy within 1 mo, other cancer, chemotherapy within 1 mo, renal disease, liver disease, hearing impairment, infection

**BLACK BOX WARNING:** Anemia, chemotherapy-induced nausea/vomiting, requires a specialized care setting and experienced clinician

## DOSAGE AND ROUTES

### Dosing with the Calvert equation GFR capped at max 12.5 ml/min

**Adult:** The total CARBOplatin dose (in mg) for adults may be calculated using the Calvert equation: *total dose (mg/m$^2$) = target AUC × (GFR + 25)*

**Child:** Calculate CARBOplatin dose (mg/m$^2$) in children as follows: *total dose (mg/m$^2$) = target AUC × [(0.93 × GFR) + 15]*

### Advanced ovarian cancer

**Adult (single agent): IV** INF initially 300 mg/m$^2$ on day 1 with cyclophosphamide, 600 mg/m$^2$ **IV** on day 1, repeat q4wk × 6 cycles; refractory tumors 360 mg/m$^2$ single dose, may repeat q4wk as needed; do not repeat until neutrophils are >2000 mm$^3$ and platelets are >100,000/mm$^3$

### Renal dose

**Adult:** IV INF CCr 41-59 ml/min 250 mg/m$^2$, CCr 16-40 ml/min 200 mg/m$^2$; do not use in CCr <15 ml/min

**Available forms:** Lyophilized powder for inj 50, 150, 450 mg vials; aqueous sol for inj 50 mg/5 ml vial, 150 mg/15 ml vial, 450 mg/45 mg vial, 600 mg/60 ml vial

### Implementation

**BLACK BOX WARNING:** Antiemetic 30-60 min before giving product to prevent vomiting, and prn

**IV route**

- Do not use needles or IV administration sets containing aluminum; may cause precipitate or loss of potency
- Use cytotoxic handling procedures
- **Reconstitute** CARBOplatin 50, 150, or 450 mg with 5, 15, or 45 ml, respectively, of sterile water for inj, $D_5W$, or NaCl (10 mg/ml); then further **dilute** with the same sol to 0.5-4 mg/ml; **give** over 15 min - 1hr **(intermittent INF)**
- **Continuous IV INF** over 24 hr; max dose based on (GFR = 125 mg/ml)
- Store protected from light at room temperature; reconstituted sol is stable for 8 hr at room temperature

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, caspofungin, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, levorphanol, lidocaine, linezolid injection, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, PENTobarbital, PHENobarbital, phentolamine, piperacillin, piperacillin-tazobactam, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propofol, propranolol, raNITIdine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, topotecan, TPN, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine

**Solution compatibilities:** $D_5$/0.2% NaCl, $D_5$/0.45% NaCl, $D_5$/0.9% NaCl, 0.9% NaCl, $D_5W$, sterile water for inj

**Solution incompatibilities:** Sodium bicarbonate

## ADVERSE EFFECTS

**CNS:** Seizures, central neurotoxicity, peripheral neuropathy, dizziness, confusion
**CV:** Cardiac abnormalities (fatal CV events), stroke
**EENT:** Tinnitus, hearing loss, vestibular toxicity, visual changes
**GI:** Severe nausea, vomiting, diarrhea, weight loss, mucositis, anorexia, constipation, taste change
**HEMA:** Thrombocytopenia, leukopenia, pancytopenia, neutropenia, anemia, bleeding
**INTEG:** Alopecia, dermatitis, rash, erythema, pruritus, urticaria
**META:** Hypomagnesemia, hypocalcemia, hypokalemia, hyponatremia, hyperuremia
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Initial 1-2 hr; postdistribution 2½-6 hr; increased in renal disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½ hr |
| **Peak** | Unknown |
| **Duration** | 4-6 hr |

## INTERACTIONS

### Individual drugs

Amphotericin B: increased nephrotoxicity or ototoxicity
Aspirin, anticoagulants, platelet inhibitors: increased risk of bleeding
Phenytoin: decreased levels, monitor levels
Radiation: increased toxicity, bone marrow suppression

### Drug classifications

Aminoglycosides: ototoxicity, increased nephrotoxicity
Antineoplastics, bone marrow–suppressing products: increased bone marrow suppression, monitor blood counts often
Myelosuppressives: increased myelosuppression
NSAIDs: increased risk of bleeding
Thrombolytic agents: increased risk of bleeding

### Drug/lab test

Increased: AST, BUN, alkaline phosphatase, bilirubin, creatinine
Decreased: platelets, neutrophils, WBC, RBC, Hgb/Hct, calcium, potassium, magnesium, phosphate

## NURSING CONSIDERATIONS

### Assessment

Nausea/vomiting: May occur a few hr after administration, antiemetics are used

**BLACK BOX WARNING:** To be used only by person experienced in the use of chemotherapeutic products, in a specialized care setting

**BLACK BOX WARNING: Bone marrow depression:** Monitor CBC, differential, platelet count weekly; withhold product if neutrophil count is $<2000/mm^3$ or platelet count is $<100{,}000/mm^3$; notify prescriber of results, calcium, magnesium, phosphate, potassium, sodium, uric acid, CCR, bilirubin; creatinine clearance < 60 ml/min may be responsible for increased bone marrow suppression; assess frequently for infection

- **Assess for anaphylaxis:** pruritus, wheezing, tachycardia; may occur within a few minutes of use; notify physician after discontinuing products; resuscitation equipment should be available
- **Peripheral neuropathy:** may be increased in geriatrics
- Delay dental work until blood counts have returned to normal; regular toothbrushes, dental floss and toothpicks should not be used, use soft bristle toothbrush
- Monitor renal function studies: BUN, creatinine, serum uric acid, urine CCr before, during therapy; I&O ratio; report fall in urine output to <30 ml/hr
- Monitor temp q4hr (may indicate beginning of infection)
- Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; note jaundice of skin or sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea
- Assess for **bleeding:** hematuria, stool guaiac, bruising or petechiae, mucosa or orifices; inflammation of mucosa, breaks in skin; avoid all IM injections if platelets $<50{,}000/mm^3$
- Identify effects of alopecia on body image; discuss feelings about body changes

### Patient/family education

- Advise patient to report ringing/roaring in the ears, numbness, tingling in face, extremities, weight gain

• Teach patient to avoid use of products containing aspirin or ibuprofen, NSAIDs, alcohol, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
• Instruct patient to report signs of **anemia** (fatigue, headache, irritability, faintness, shortness of breath); sore throat, bleeding, bruising, chills, back pain, blood in stools, dyspnea
• Instruct patient to report any changes in breathing or coughing even several months after treatment; to avoid crowds and persons with respiratory tract or other infections
• Advise patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
• Caution patient not to have any vaccinations without the advice of the prescriber; serious reactions can occur
• **Pregnancy/breastfeeding:** Teach patient that impotence or amenorrhea can occur; that this is reversible after treatment is discontinued; to notify prescriber if pregnancy is planned or suspected; that contraception should be used if patient is fertile
• Teach patient not to breastfeed
• Teach patient to notify prescriber immediately of fever, fatigue, sore throat, bleeding, bruising, chills, back pain, blood in stools, urine, emesis, dyspnea, tingling in extremities

### Evaluation

**Positive therapeutic outcome**
• Prevention of rapid division of malignant cells

## carisoprodol (Rx)

(kar-i-soe-proe′dole)
**Soma**
*Func. class.:* Skeletal muscle relaxant, central acting
*Chem. class.:* Meprobamate congener
**Controlled substance schedule IV**

**Do not confuse:** Soma/Soma compound

**ACTION:** Depresses CNS by blocking interneuronal activity in descending reticular formation of spinal cord, producing sedation and possibly altering pain perception

**Therapeutic outcome:** Relaxation of skeletal muscles

## USES:

Relieving pain, stiffness in musculoskeletal disorders

## CONTRAINDICATIONS

Hypersensitivity to these products or carbamates, intermittent porphyria

**Precautions:** Pregnancy, breastfeeding, geriatric, renal/hepatic disease, substance abuse, seizure disorder, CNS depression, abrupt discontinuation, Asian patients

## DOSAGE AND ROUTES

**Adult and child ≥16 yr:** PO 250-350 mg tid and at bedtime, max 3 wk of use

**Available forms:** Tabs 250, 350 mg

### Implementation

• Give with meals for GI symptoms
• Have patient use gum, frequent sips of water for dry mouth
• Store in tight container at room temperature
• Use for short term (2-3 wk), potential for habituation

## ADVERSE EFFECTS

**CNS:** *Dizziness, weakness, drowsiness,* headache, tremor, depression, insomnia, ataxia, irritability, seizures, confusion, flushing
**CV:** Postural hypotension, tachycardia
**EENT:** Diplopia, temporary loss of vision
**GI:** Nausea, vomiting, hiccups, epigastric discomfort
**HEMA:** Eosinophilia, pancytopenia
**INTEG:** Rash, pruritus, fever, facial flushing, erythema multiforme
**RESP:** Asthmatic attack
**SYST:** Angioedema, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver, extensively, substrate of CYP2C19 |
| **Excretion** | Kidney, unchanged; breast milk |
| **Half-life** | 8 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½ hr |
| **Peak** | 4 hr |
| **Duration** | 4-6 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Meprobamate: do not use together

### Drug classifications

Antidepressants (tricyclic), barbiturates, opioids, sedative/hypnotics, avoid concurrent use: increased CNS depression
CYP2C19 inhibitors (FLUoxetine, fluvoxaMINE, isoniazid, modafinil): increased carisoprodol effect

CYP2C19 inducers (rifAMPin): decreased carisoprodol metabolite, decreasing carisoprodol effect

### Drug/herb

Kava, valerian: increased CNS depression
St. John's wort: increased metabolism of carisoprodol

### Drug/lab test

Increased: eosinophils
Decreased: RBC, WBC, platelets

## NURSING CONSIDERATIONS

### Assessment

- Pain: Monitor ROM, atrophy, stiffness, and pain in muscles; assess throughout treatment
- **Beers:** Avoid in older adults, may decrease urinary flow, cause retention (men), sedation, anticholinergic effects
- Monitor ECG in seizure patients; poor seizure control has occurred with patients taking this product
- Assess for idiosyncratic reaction within a few min or 1 hr of administration (disorientation, restlessness, weakness, euphoria, blurred vision); patient should be reassured that reaction is temporary, withhold and notify prescriber, usually seen in poor CYP2C19 metabolizers
- **Check for allergic reactions:** rash, fever
- CNS depression: Assess for dizziness, drowsiness, psychiatric symptoms, abuse potential
- **Abrupt discontinuation:** withdrawal reactions do occur but may be mild; dependence may occur
- **Pregnancy/breastfeeding:** Avoid use in pregnancy and breastfeeding

### Patient/family education

- Caution patient not to take with alcohol, other CNS depressants
- Advise patient to avoid altering activities while taking this product, to avoid rapid position changes, postural hypotension occurs, not to use for >2-3 wk
- Caution patient to avoid hazardous activities if drowsiness or dizziness occurs
- Caution patient to avoid using OTC medication such as cough preparations, antihistamines, unless directed by prescriber
- **Teach patient to report allergic reactions immediately:** rash, swelling of tongue/lips, hives, dyspnea
- Advise patient to take with food for GI symptoms

### Evaluation

**Positive therapeutic outcome**

- Decreased pain, spasticity

## TREATMENT OF OVERDOSE:

Lavage, dialysis

## carteolol ophthalmic

*See Appendix B*

**⚠ HIGH ALERT**

## carvedilol (Rx)

(kar-veh′dee-lol)
**Coreg, Coreg CR**
*Func. class.:* Antihypertensive α/β-blocker

**Do not confuse:** carvedilol/Captopril

**ACTION:** A mixture of nonselective β-blocking and α-blocking activity; decreases cardiac output, exercise-induced tachycardia, reflex orthostatic tachycardia; causes reduction in peripheral vascular resistance and vasodilatation

**Therapeutic outcome:** Decreased B/P in hypertension

**USES:** Essential hypertension alone or in combination with other antihypertensives, HF, LV dysfunction following MI, cardiomyopathy

## CONTRAINDICATIONS

Hypersensitivity, asthma, class IV decompensated cardiac failure, 2nd- or 3rd-degree heart block, cardiogenic shock, severe bradycardia, pulmonary edema, severe hepatic disease

**Precautions:** Pregnancy, breastfeeding, children, geriatric, cardiac failure, hepatic injury, peripheral vascular disease, anesthesia, major surgery, diabetes mellitus, thyrotoxicosis, emphysema, chronic bronchitis, renal disease, abrupt discontinuation

## DOSAGE AND ROUTES

### Essential hypertension

**Adult:** PO 6.25 mg bid × 7-14 days if tolerated well, then increase to 12.5 mg bid × 7-14 days if tolerated well, may be increased if needed to 25 mg bid, max 50 mg daily; ext rel cap 20 mg/day, may increase after 7-14 days to 40 mg/day, max 80 mg/day

### Congestive heart failure

**Adult:** PO 3.125 mg bid × 2 wk; if well tolerated, give 6.25 mg bid × 2 wk, then double q2wk to max dose 25 mg bid <85 kg or 50 mg bid >85 kg; ext rel cap (Coreg CR) 10 mg/day × 2 wk, increase to 20, 40, 80 mg/day over successive intervals of 2 wk

### Postmyocardial infarction

**Adult:** PO 6.25 mg bid with food ×3-10 days, a lower starting dose may be used if indicated, titrate upward as tolerated, may increase to 12.5 mg bid, then titrate to 25 mg bid; PO ext rel 20 mg/day with food, a lower starting dose of

10 mg/day may be used and titrate upwards after 3-10 days, increase to 40 mg/day as required

**Available forms:** Tabs 3.125, 6.25, 12.5, 25 mg; ext rel cap 10, 20, 40, 80 mg

### Implementation

- Take apical pulse before use, notify prescriber if <50 bpm and hold dose
- Give with food in morning regular; tablets may be crushed or swallowed whole, give with food to decrease orthostatic hypotension; do not break, crush, or chew ext rel cap; decreased anginal pain
- Administer reduced dosage in renal dysfunction

**BLACK BOX WARNING:** Do not discontinue prior to surgery

- Conversion from immediate release to extended release 3.125 mg bid is 10 mg qday; 6.25 mg bid is 20 mg qday; 12.5 mg bid is 40 mg; 25 mg bid is 8 mg

## ADVERSE EFFECTS

**CNS:** *Dizziness,* somnolence, insomnia, ataxia, hyperesthesia, paresthesia, vertigo, depression, *fatigue, weakness,* headache
**CV:** *Bradycardia, postural hypotension,* dependent edema, *peripheral edema,* AV block, extrasystoles, hypo/hypertension, palpitations, peripheral ischemia, HF, pulmonary edema
**GI:** *Diarrhea,* abdominal pain, increased alkaline phosphatase, increased ALT/AST, nausea, vomiting
**GU:** Decreased libido, *impotence,* UTI
**INTEG:** Rash, Stevens-Johnson syndrome, toxic epidermal necrolysis
**MISC:** Injury, back pain, viral infection, hypertriglyceridemia, thrombocytopenia, *hyperglycemia,* abnormal weight gain, aplastic anemia, anaphylaxis, angioedema
**RESP:** Rhinitis, pharyngitis, dyspnea, bronchospasm, cough, lung edema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Readily and extensively absorbed |
| **Distribution** | >98% protein binding |
| **Metabolism** | Extensively liver, some patients may be poor metabolizers |
| **Excretion** | Via bile into feces |
| **Half-life** | Terminal half-life 7-10 hr, increased in the geriatric, hepatic disease |

### Pharmacodynamics

Onset ext rel 30 min
Peak reg rel 1-2 hr, ext rel 5 hr
Duration: Reg rel 7-9 hr

## INTERACTIONS

### Individual drugs

Increase: Carvedilol level, CYP2D6 inhibitors FLUoxetine, quiNIDine
Alcohol (acute ingestion), cimetidine: increased toxicity, monitor for toxicity
CloNIDine: decreased heart rate, B/P, monitor B/P, pulse frequently
Digoxin: increased concentrations of digoxin
Reserpine, levodopa: increased hypotension, bradycardia
RifAMPin: decreased levels of carvedilol

### Drug classifications

Antihypertensives, nitrates: increased toxicity
Antidiabetic agents: increased hypoglycemia, insulin; monitor blood glucose level, dose of antidiabetics may need to be decreased
Calcium channel blockers: increased conduction disturbance
CYP2D6 inhibitors (FLUoxetine, quiNIDine): increased digoxin
MAOIs: increased bradycardia, hypotension
NSAIDs, thyroid hormones: decreased levels of carvedilol

### Drug/herb

Ephedra: decreased antihypertensive effect
Hawthorn: increased antihypertensive effect

### Drug/lab test

Increased: alk phos, serum creatinine blood glucose, potassium, triglycerides, uric acid, bilirubin, cholesterol, creatinine
Decreased: sodium, HDL

## NURSING CONSIDERATIONS

### Assessment

- Monitor I&O, weight daily
- **Hypertension:** Monitor B/P during beginning treatment and periodically thereafter; pulse q4hr, note rate, rhythm, quality
- Monitor apical/radial pulse before administration; in those with lower heart rate (<55 bpm) dose may need to be lowered, notify prescriber of significant changes, identify orthostatic hypotension when patient rises pulse <50 bpm hold product, notify prescriber
- **HF:** Assess for edema in feet and legs daily, fluid overload: dyspnea, weight gain, jugular vein distention, fatigue, crackles monitor I&O, worsening of heart failure may occur during beginning of treatment, check for compliance
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, no well-controlled studies, discontinue breastfeeding or product, excreted in breast milk

### Patient/family education

- Teach patient not to break, crush, or chew ext rel cap
- Instruct patient to comply with dosage schedule even if feeling better, that improvement may take several weeks, not to crush, chew caps
- Teach patient to rise slowly to sitting or standing position to minimize orthostatic hypotension
- Encourage patient to report bradycardia, dizziness, confusion, depression, fever, weight gain, shortness of breath, cold extremities, rash, sore throat, bleeding, bruising
- Teach patient to take pulse at home; advise when to notify prescriber
- Encourage patient not to discontinue product abruptly, taper over 1-2 wk, life-threatening dysrhythmias may occur
- Advise patient to avoid hazardous activities until stabilized on medication; dizziness may occur
- Teach patient that product may mask hypoglycemia, thyroid symptoms
- Advise patient to avoid all OTC medications unless approved by prescriber
- Advise patient to carry/wear emergency ID with product name, prescriber at all times
- Advise patient to inform all health care providers of products, supplements taken; advise patient to avoid all OTC medications unless approved by prescriber
- Teach patient to report if pregnancy is planned or suspected, pregnancy, do not breastfeed

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P
- Decreased symptoms of HF or angina

## cefaclor

*See cephalosporins—2nd generation*

*See cephalosporins—2nd generation*

## cefpodoxime

*See cephalosporins—3rd generation*

## cefprozil

*See cephalosporins—2nd generation*

## ceftaroline (Rx)

(sef-tar′oh-leen)

**Teflaro**

*Func. class.:* Cephalosporin derivative (fifth generation)

**ACTION:** Inhibits cell wall synthesis through binding to essential penicillin-binding protein (PBP)

**Therapeutic outcome:** Negative C&S, resolution of symptoms of infection

**USES:** Acute bacterial skin/skin structure infections (ABSSI), bacterial community acquired pneumonia

### CONTRAINDICATIONS

Cephalosporin hypersensitivity

**Precautions:** Antimicrobial resistance, breastfeeding, carbapenem/penicillin hypersensitivity, child/infant/neonate, coagulopathy, colitis, dialysis, diarrhea, geriatrics, GI disease, hypoprothrombinemia, IBS, pregnancy, pseudomembranous colitis, renal disease, ulcerative colitis, viral infection, vitamin K deficiency

### DOSAGE AND ROUTES

**Adult: IV** 600 mg q12hr × 5-14 days (skin/skin structure infections), × 5-7 days (bacterial community acquired pneumonia)

**Renal dose**

**Adult:** IV CCr >30-≤50 ml/min 400 mg q12hr; CCr ≥15-≤30 ml/min 300 mg q12hr, CCr <15 ml/min 200 mg q12hr

**Available forms:** Powder for injection 400 mg, 600 mg/vial

### Implementation

- Obtain C&S before use, first dose may be given before results are received
- Visually inspect for particulate matter or discoloration if solution or container permit
- Identify allergies before use

**Intermittent IV infusion route**

- **Reconstitute:** add 20 mg of sterile water to 400 or 600 mg vial (20 ml/ml for 400 mg), (30 mg/ml for 600 mg), mix gently until dissolved: **Dilute:** in 250 ml of 0.9% NaCl, 0.45% NaCl, LR, D5, D2.5, give over 1 hr, do not admix, use within 6 hrs at room temperature or 24 hr refrigerated
- Store reconstituted solution in the refrigerator

### ADVERSE EFFECTS

**CNS:** Dizziness, seizures

**CV:** Bradycardia, palpitations, phlebitis
**ENDO:** Hyperkalemia, hypokalemia
**GI:** Diarrhea, nausea, vomiting, constipation, abdominal pain, pseudomembranous colitis (rare), elevated hepatic enzymes
**HEMA:** Thrombocytopenia, neutropenia, anemia, eosinophilia
**INTEG:** Rash, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Not hepatically metabolized |
| **Excretion** | In urine 88%, feces 6% |
| **Half-life** | 1.6 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

Anticoagulants: increased prothrombin time risk

### Drug/lab test

Increased: LFTs
Decreased: potassium, eosinophils, platelets

## NURSING CONSIDERATIONS

### Assessment

- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, no well-controlled studies, cautious use in breastfeeding, excreted in breast milk
- **Assess for infection:** vital signs, sputum, WBC prior to and during therapy
- **Assess for hypersensitivity:** prior to use, obtain a history of hypersensitivity reactions to cephalosporins, carbapenems, penicillins; cross sensitivity may occur
- **Assess for anaphylaxis (rare):** rash, pruritus, laryngeal edema, dyspnea, wheezing; discontinue and notify health care provider immediately, keep emergency equipment nearby
- **Monitor for pseudomembranous colitis:** diarrhea, abdominal pain, fever, bloody stools; report immediately if these occur, may occur several weeks after terminating therapy

### Patient/family education

- Explain reason for treatment and expected result
- Instruct patient to report immediately rash, itching, difficulty breathing, bloody diarrhea, fever, abdominal pain

### Evaluation

**Positive therapeutic outcome**

- Negative C&S, resolution of symptoms of infection

## cefTAZidime
## ceftibuten
## ceftizoxime
## cefTRIAXone

*See cephalosporins—3rd generation*

## cefuroxime

*See cephalosporins—2nd generation*

**⚠ HIGH ALERT**

## celecoxib (Rx)

(cel-eh-cox'ib)
**CeleBREX**
*Func. class.:* Nonsteroidal antiinflammatory, antirheumatic
*Chem. class.:* COX-2 inhibitor

**Do not confuse:** CeleBREX/CeleXA/Cerebra/Cerebyx

**ACTION:** Inhibits prostaglandin synthesis by selectively inhibiting cyclooxygenase 2 (COX-2), an enzyme needed for biosynthesis

**Therapeutic outcome:** Decreased pain, inflammation

**USES:** Acute, chronic rheumatoid arthritis, osteoarthritis, acute pain, primary dysmenorrhea, ankylosing spondylitis, juvenile rheumatoid arthritis (JRA)

**Unlabeled uses:** Colorectal adenoma prophylaxis

## CONTRAINDICATIONS

Pregnancy (3rd trimester), hypersensitivity to salicylates, iodides, other NSAIDs, sulfonamides, CABG

**Precautions:** Pregnancy (1st/2nd trimester), breastfeeding, children <18 yr, geriatric, renal/hepatic disease, hypertension, severe dehydration, bleeding, GI, cardiac disorders, PVD, asthma

**BLACK BOX WARNING:** GI bleeding/perforation, peptic ulcer disease, MI, stroke

## DOSAGE AND ROUTES

**Do not exceed recommended dose, deaths have occurred**

### Acute pain/primary dysmenorrhea

**Adult:** PO 400 mg initially, then 200 mg if needed on first day, then 200 mg bid prn on subsequent days, if needed; start with ½ dose in poor CYP2C9 metabolizers
**Geriatric:** PO use lowest possible dose

### Osteoarthritis
**Adult:** PO 200 mg/day as a single dose or 100 mg bid; start with ½ dose in poor CYP2C9 metabolizers
**Geriatric:** PO use lowest possible dose

### Rheumatoid arthritis
**Adult:** PO 100-200 mg bid; start with ½ dose in poor CYP2C9 metabolizers

### Ankylosing spondylitis
**Adult:** PO 200 mg daily or in divided dose (bid); start with ½ dose in poor CYP2C9 metabolizers

### Juvenile rheumatoid arthritis (JRA)
**Adolescent and child ≥2 yr (>25 kg):** PO 100 mg bid; start with ½ dose in poor CYP2C9 metabolizers
**Child ≥2 yr (10-25 kg):** PO 50 mg bid; start with ½ dose in poor CYP2C9 metabolizers

### Colorectal adenoma prophylaxis (unlabeled)
**Adult:** PO 200-400 mg bid for up to 3 yr

### Hepatic dose (Child-Pugh class II)
**Adult:** PO reduce dose by 50%; (Child-Pugh C) do not use

**Available forms:** Caps 50, 100, 200, 400 mg

### Implementation
- Do not break, crush, chew, or dissolve caps; caps may be opened and mixed with applesauce, ingest immediately with water
- Administer with food or milk to decrease gastric symptoms
- Do not increase dose

## ADVERSE EFFECTS
**CNS:** *Fatigue, anxiety, depression, nervousness, paresthesia,* dizziness, insomnia, headache
**CV:** Stroke, MI, tachycardia, HF, angina, palpitations, dysrhythmias, hypertension, fluid retention
**EENT:** Tinnitus, hearing loss, blurred vision, glaucoma, cataract, conjunctivitis, eye pain
**GI:** *Nausea, anorexia, vomiting, constipation, dry mouth,* diverticulitis, gastritis, gastroenteritis, hemorrhoids, hiatal hernia, stomatitis, GI bleeding/ulceration
**GU:** Nephrotoxicity: dysuria, hematuria, azotemia, cystitis, UTI, renal papillary necrosis
**HEMA:** Blood dyscrasias, epistaxis, anemia
**INTEG:** Purpura, rash, pruritus, sweating, erythema, petechiae, photosensitivity, alopecia, bruising, hot flashes, serious sometimes fatal Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis
**RESP:** Pharyngitis, shortness of breath, pneumonia, coughing

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO) |
| **Distribution** | Crosses placenta, protein binding ~97% |
| **Metabolism** | Liver by CYP2C9, some patients may be poor metabolizers |
| **Excretion** | Feces/kidneys, small amount |
| **Half-life** | 11 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Aspirin: decreased effectiveness; increased adverse reactions
Fluconazole: increased celecoxib level
Furosemide, cidofovir: decreased effect of each drug
Lithium: increased toxicity
Warfarin: increased anticoagulant effects

### Drug classifications
ACE inhibitors: may decrease effects of ACE inhibitors
Anticoagulants, antiplatelets, SSRIs, salicylates, thrombolytics: increased risk of bleeding
Antineoplastics: increased risk of hematologic toxicity
Bisphosphonates: increased toxicity
Glucocorticoids, NSAIDs: increased adverse reactions
Thiazide diuretics: decreased effectiveness of diuretics

### Drug/herb
Feverfew: decreased effect of feverfew
Garlic, ginger, ginkgo: increased bleeding risk

### Drug/lab test
Increased: ALT, AST, BUN, cholesterol, glucose, potassium, sodium
Decreased: glucose, sodium, WBC, platelets

## NURSING CONSIDERATIONS
### Assessment
- Assess for **pain** of rheumatoid arthritis, osteoarthritis; check ROM, inflammation of joints, characteristics of pain baseline and periodically
- **Beers:** Avoid use in older adults, may increase risk of kidney injury, exacerbate heart failure, increase fluid retention

**BLACK BOX WARNING:** Assess for cardiac disease that may be worse after taking this product; MI, stroke, do not use in coronary artery bypass graft (CABG)

• Monitor CBC during therapy; watch for decreasing platelets; if low, therapy may need to be discontinued, restarted after hematologic recovery; LFTs, serum creatinine BUN

**BLACK BOX WARNING:** Assess for **blood dyscrasias** (thrombocytopenia): bruising, fatigue, bleeding, poor healing

• **Assess for GI toxicity:** black, tarry stools; abdominal pain, monitor stool guaiac
• **Assess for serious skin disorders:** Stevens-Johnson syndrome, toxic epidermal necrolysis; may be fatal, treat symptomatically, may recur after therapy is discontinued, if severe may require discontinuing
• **Pregnancy/breastfeeding:** No well-controlled studies, birth defects and miscarriages are associated with NSAIDs in pregnancy, those who are pregnant and taking this product should register with the Teratology Information Specialists of Autoimmune Disease in Pregnancy Study 877-311-8972, discontinue breastfeeding or product

### Patient/family education

**BLACK BOX WARNING:** Do not exceed recommended dose; notify prescriber, immediately of chest pain, skin eruptions, stop product; hepatotoxicity: nausea, pruritus, yellowing skin, eyes; lethargy, itching, upper abdominal pain

• Teach patient that product must be continued for prescribed time to be effective; to avoid other NSAIDs, sulfonamides

**BLACK BOX WARNING:** Caution patient to report bleeding, bruising, fatigue, malaise, since blood abnormalities do occur; to report GI symptoms: black tarry stools, cramping

• Teach patient to take with a full glass of water to enhance absorption
• Teach patient to check with prescriber to determine when product should be discontinued before surgery; advise patient to notify prescriber if pregnancy is planned or suspected
• Advise patient to report possible respiratory infection: fever, shortness of breath, coughing, painful swallowing
• **Pregnancy/breastfeeding:** Teach patient to report if pregnancy is planned or suspected, do not use in breastfeeding or pregnancy

### Evaluation

**Positive therapeutic outcome**

• Decreased pain in arthritic conditions
• Decreased inflammation in arthritic conditions
• Decreased number of polyps (FAP)

## cephalexin

*See cephalosporins—1st generation*

## CEPHALOSPORINS—1ST GENERATION

**cefadroxil (Rx)**
(sef-a-drox′ill)
**Apo-Cefadroxil** 🍁, **Duricef** 🍁
**ceFAZolin (Rx)**
(sef-a′zoe-lin)
**Ancef** 🍁, **Kefzol** 🍁
**cephalexin (Rx)**
(sef-a-lex′in)
**Keflex** 🍁, **Panixine**

**ACTION:** Inhibits bacterial cell wall synthesis, rendering cell wall osmotically unstable, leading to cell death by binding to cell wall membrane, lysis mediated by cell wall autolytic enzymes

### >> cefadroxil

**Therapeutic outcome:** Bactericidal effects for the following: gram-negative bacilli *Escherichia coli, Proteus mirabilis, Klebsiella pneumoniae* (UTI only); gram-positive organisms *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus/epidermidis*

**USES:** Upper, lower respiratory tract, urinary tract, skin infections; otitis media; tonsillitis, UTI

### >> ceFAZolin

**Therapeutic outcome:** Bactericidal effects for the following: gram-negative organisms *Haemophilus influenzae, Escherichia coli, Proteus mirabilis, Klebsiella;* gram-positive organisms *Staphylococcus aureus*

**USES:** Upper, lower respiratory tract, urinary tract, skin infections; bone, joint, biliary, genital infections; endocarditis, surgical prophylaxis, septicemia; *Streptococcus*

### >> cephalexin

**Therapeutic outcome:** Bactericidal effects for the following: gram-negative organisms *Haemophilus influenzae, Escherichia coli, Proteus mirabilis, Klebsiella pneumoniae;* gram-positive organisms *Streptococcus pneumoniae, Streptococcus pyogenes, Streptococcus agalactiae, Staphylococcus aureus*

**USES:** Upper, lower respiratory tract, urinary tract, skin, bone infections; otitis media

## CONTRAINDICATIONS

Hypersensitivity to cephalosporins, infants <1 mo

**Precautions:** Pregnancy, breastfeeding, hypersensitivity to penicillins, renal disease

## DOSAGE AND ROUTES

### >> cefadroxil

**Adult:** PO 1-2 g daily or divided q12hr, give a loading dose of 1 g initially
**Child:** PO 30 mg/kg/day in divided doses bid, max 2 g/day

#### Catheter-related bloodstream infections caused by methicillin-susceptible *S. aureus* or methicillin-susceptible coagulase staphylococcus

**Adults:** IV 2 g q8hr

#### Renal dose

**Adult:** PO CCr 25-50 ml/min, 1 g, then 500 mg q12hr; CCr 10-24 ml/min, 1 g, then 500 mg q24hr; CCr < 10 ml/min, 1 g, then 500 mg q36hr

**Available forms:** Caps 500 mg; tabs 1 g; oral susp 250, 500 mg/5 ml

### >> ceFAZolin

#### Life-threatening infections

**Adult:** IM/**IV** 1-2 g q6-8hr, max 12 g/day
**Child >1 mo:** IM/**IV** 75-100 mg/kg/day in 3-4 divided doses, max 6 g/day

#### Mild/moderate infections

**Adult:** IM/**IV** 250 mg-1 g q8hr, max 12 g/day
**Child >1 mo:** IM/**IV** 25-50 mg/kg in 3-4 equal doses, max 6 g/day or 2 g as a single dose

#### Renal dose

**Adult:** IM/IV following loading dose CCr 35-54 ml/min dose q8hr; CCr 10-34 ml/min 50% of dose q12hr; CCr <10 ml/min 50% of dose q18-24hr
**Child:** IM/IV CCr >70 ml/min, no dosage adjustment; CCr 40-70 ml/min following loading dose, reduce dose to 7.5-30 mg/kg q12hr; CCr 20-39 ml/min, give 3.125-12.5 mg/kg after loading dose q12hr; CCr 5-19 ml/min, 2.5-10 mg/kg after loading dose q24hr

**Available forms:** Inj 500 mg, 1, 10, 20 g; infusion 500 mg, 1 g/50 ml, 50 mg/500 ml vial

### >> cephalexin

#### Moderate infections

**Adult:** PO 250-500 mg q6hr, max 4 g/day
**Child:** PO 25-100 mg/kg/day in 4 equal doses, max 4 g/day

#### Moderate skin infections

**Adult:** PO 500 mg q12hr

#### Endocarditis prophylaxis

2 g 1 hr before procedure

#### Severe infections

**Adult:** PO 500 mg-1 g q6hr, max 4 g
**Child:** PO 50-100 mg/kg/day in 4 equal doses, max 4 g/day

#### Renal dose

**Adult:** PO CCr 30-59 ml/min max 1000 mg/day; CCr 15-29 ml/min 250 mg q 8-12 hr; CCr 5-14 ml/min 250 mg q 24 hr; CCr 1-4 ml/min 250 mg q 48-60 hrs

**Available forms:** Caps 250, 500, 750 mg; tabs 250, 500 mg, 1 g; oral susp 125, 250 mg/5 ml

### >> cefadroxil

#### Implementation

- Give in even doses around the clock; if GI upset occurs, give with food; product must be given for prescribed time to ensure organism death and prevent superinfection
- Shake susp, refrigerate, discard after 2 wk

### >> ceFAZolin

#### Implementation

**IM route**

- Reconstitute 250-500 mg of product with 2 ml sterile or bacteriostatic water for inj, or 0.9% NaCl; reconstitute 1 g of product with 2.5 ml; give deep in large muscle mass, massage

**IV route**

- Check for irritation, extravasation, phlebitis daily, change site q72hr
- For direct **IV** dilute in 2 ml/500 mg or 2.5 ml/1 g of sterile water for inj; give over 5 min
- For intermittent inf dilute reconstituted sol (500 mg or 1 g) in 50-100 ml $D_5W$, $D_{10}W$, $D_5$/0.25% NaCl, $D_5$/0.45% NaCl, $D_5$/0.9% NaCl, $D_5$/LR, or LR, 0.9% NaCl; give over 30-60 min; may be refrigerated up to 96 hr or stored 24 hr at room temperature

**Syringe compatibilities:** Heparin, Salbutamol, vit B complex

**Syringe incompatibilities:** Ascorbic acid inj, cimetidine, lidocaine, vit B/C

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, cefamandole, cefmetazole, cefonicid,

cefoperazone, cefoTEtan, cefOXitin, cefpirome, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cephalothin, cephapirin, chloramphenicol, cimetidine, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, dilTIAZem, DOCEtaxel, doxacurium, doxapram, DOXOrubicin liposomal, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, esmolol, etoposide, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid (as sodium salt), foscarnet, furosemide, gallium, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, lidocaine, linezolid, LORazepam, LR's injection, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, penicillin G potassium/sodium, peritoneal dialysis solution, perphenazine, PHENobarbital, phenylephrine, phytonadione, piperacillin, Plasma-Lyte M in dextrose 5%, polymyxin B, potassium chloride, procainamide, propofol, propranolol, raNITIdine, remifentanil, Ringer's injection, ritodrine, riTUXimab, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, tenoxicam, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tolazoline, trastuzumab, trimetaphan, urokinase, vasopressin, vecuronium, verapamil, vinCRIStine, vitamin B complex with C, voriconazole, warfarin, zoledronic acid

**Y-site incompatibilities:** Amiodarone, hetastarch, HYDROmorphone, IDArubicin, vinorelbine tartrate

## >> cephalexin

### Implementation

- Do not break, crush, or chew caps
- Give in even doses around the clock; if GI upset occurs, give with food; product must be taken for 10-14 days to ensure organism death and prevent superinfection
- Shake susp, refrigerate, discard after 2 wk, use calibrated oral syringe, spoon or measuring cup

## ADVERSE EFFECTS

**CNS:** Headache, dizziness, weakness, paresthesia, fever, chills, seizures (high doses)
**GI:** Nausea, vomiting, *diarrhea, anorexia,* pain, glossitis, bleeding; increased AST, ALT, bilirubin, LDH, alkaline phosphatase; abdominal pain, pseudomembranous colitis
**GU:** Proteinuria, vaginitis, pruritus, candidiasis, increased BUN, nephrotoxicity, renal failure
**HEMA:** Leukopenia, thrombocytopenia, agranulocytosis, anemia, neutropenia, lymphocytosis, eosinophilia, pancytopenia, hemolytic anemia
**INTEG:** Rash, urticaria, dermatitis
**MS:** Arthralgia, arthritis
**RESP:** Dyspnea
**SYST:** Anaphylaxis, serum sickness, superinfection, Stevens-Johnson syndrome

| **Peak** | 1 hr |
| **Duration** | 6-12 hr |

## INTERACTIONS

### Individual drugs

Probenecid: increased toxicity

### Drug classifications

Aminoglycosides, diuretics (loop): increased toxicity
Anticoagulants: increased protime; use cautiously, monitor INR/PT

### Drug/lab test

Increased: AST, ALT, alkaline phosphatase, LDH, BUN, creatinine, bilirubin
False positive: urinary protein, direct Coombs' test, urine glucose
Interference: cross-matching

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction to penicillins or other cephalosporins; cross-sensitivity between penicillins and cephalosporins is common
- Assess patient for signs and symptoms of **infection** including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, earache, fever; obtain baseline information and during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for anaphylaxis:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction, penicillin risk, cross-allergy may occur
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also check for increased BUN, creatinine
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- **Assess for superinfection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection
- Instruct patient to take all medication prescribed for the length of time ordered, take missed dose as soon as remembered, unless close to next dose, do not take a double dose, use calibrated device for syrup, liquid, suspension
- Advise patient to notify prescriber of diarrhea with blood, pus, mucus, which may indicate pseudomembranous colitis

### Evaluation

**Positive therapeutic outcome**

- Absence of signs/symptoms of infection (WBC <10,000/mm$^3$, temp WNL, absence of red draining wounds, earache)
- Reported improvement in symptoms of infection
- Negative C&S

**TREATMENT OF ANAPHYLAXIS:** EPINEPHrine, antihistamines, resuscitate if needed

**Do not confuse:** **cefaclor**/cephalexin, **Cefotan**/Ceftin, **cefprozil**/ceFAZolin/cefuroxime, **Cefzil**/Ceftin

**ACTION:** Inhibits bacterial cell wall synthesis, rendering cell wall osmotically unstable, leading to cell death by binding to cell wall membrane

### >> cefaclor

**Therapeutic outcome:** Bactericidal effects for the following: gram-negative bacilli *Haemophilus influenzae, Escherichia coli, Proteus mirabilis, Klebsiella;* gram-positive organisms *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus*

**USES:** Lower respiratory tract, urinary tract, skin infections; otitis media; infections

### >> cefoTEtan

**Therapeutic outcome:** Bactericidal effects for the following: gram-negative organisms *Citrobacter, Haemophilus influenzae, Escherichia coli, Enterobacter aerogenes, Proteus mirabilis, Klebsiella, Salmonella, Shigella, Acinetobacter, Bacteroides fragilis, Neisseria, Serratia;* gram-positive organisms *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus*

**USES:** Serious upper or lower respiratory tract, urinary tract, gynecologic, skin, bone, joint, gonococcal, intraabdominal infections

### >> cefOXitin

**Therapeutic outcome:** Bactericidal effects for the following: gram-negative bacilli *Bacteroides fragilis, Haemophilus influenzae, Escherichia coli, Proteus, Klebsiella, Neisseria gonorrhoeae;* gram-positive organisms *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus;* anaerobes including *Clostridium*

**USES:** Lower respiratory tract, urinary tract, skin, bone, gynecologic, gonococcal infections; septicemia, peritonitis

### >> cefprozil

**Therapeutic outcome:** Bactericidal effects for the following: gram-negative bacilli *Haemophilus influenzae, Escherichia coli;* gram-positive organisms *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus*

**USES:** Pharyngitis/tonsillitis, otitis media, secondary bacterial infection of acute bronchitis, and acute bacterial exacerbation of chronic bronchitis and uncomplicated skin and skin structure infections; acute sinusitis

### >> cefuroxime

**Therapeutic outcome:** Bactericidal effects for the following: gram-negative bacilli *Haemophilus influenzae, Escherichia coli, Neisseria, Proteus mirabilis, Klebsiella;* gram-positive organisms: *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus*

**USES:** Serious lower respiratory tract, urinary tract, skin, bone, joint, gonococcal infections; septicemia, meningitis, surgery prophylaxis

## CONTRAINDICATIONS

Hypersensitivity to cephalosporins or related antibiotics, seizures

**Precautions:** Pregnancy, breastfeeding, children, renal/GI disease, diabetes mellitus, coagulopathy, pseudomembranous colitis

## DOSAGE AND ROUTES

### >> cefaclor

**Adult:** PO 250-500 mg q8hr; EXT REL 500 mg q12hr; max 1.5 g/day (cap, oral susp); 1 g/day (EXT REL)

**Child >1 mo:** PO 20-40 mg/kg daily in divided doses q8hr, or total daily dose may be divided and given q12hr, max 1 g/day

**Available forms:** Caps 250, 500 mg; oral susp 125, 187, 250, 375 mg/5 ml; EXT REL tab 500 mg

### >> cefoTEtan

**Adult:** **IV**/IM 1-3 g q12hr × 5-10 days

**Perioperative prophylaxis**

**Adult:** **IV** 1-2 g ½-1 hr before surgery

**Renal dose**

**Adult:** IM/IV CCr 30-50 ml/min 1-2 g, then 1-2 g q8-12hr; CCr 10-29 ml/min 1-2 g, then 1-2 g q12-24hr; CCr 5-9 ml/min 1-2 g, then 0.5-1 g q12-24hr; CCr <5 ml/min 1-2 g, then 0.5-1 g q24-48hr

**Available forms:** Inj 1, 2, 10 g

### >> cefOXitin

**Adult:** IM/**IV** 1-2 g q6-8hr

**Uncomplicated gonorrhea (outpatient)**

**Adult/adolescent/child ≥45 kg:** IM 2 g as single dose with 1 g PO probenecid at same time

### Severe infections
**Adult:** IM/**IV** 2 g q4hr
**Child ≥3 mo:** IM/**IV** 80-160 mg/kg/day divided q4-6hr; max 12 g/day

**Available forms:** Powder for inj 1, 2, 10 g

## >> cefprozil
### Renal dose
CCr <30 ml/min 50% of dose

### Upper respiratory infections
**Adult:** PO 500 mg q24hr × 10 days

### Otitis media
**Child 6 mo-12 yr:** PO 15 mg/kg q12hr × 10 days

### Lower respiratory infections
**Adult:** PO 500 mg q12hr × 10 days

### Skin/skin structure infections
**Adult:** PO 250-500 mg q12hr × 10 days

**Available forms:** Tabs 250, 500 mg; susp 125, 250 mg/5 ml

## >> cefuroxime
Oral tablets and suspension are not bioequivalent

### Lower respiratory tract infections (mild-moderate)/uncomplicated skin/skin structure infections
**Adult/adolescent:** PO 250-500 mg q12hr × 5-10 days; IV/IM 750 mg q8hr
**Child (unlabeled):** PO 125 mg q12hr; 750 mg IV or IM q8hr
**Adolescent/child/infant ≥3 mo:** IV/IM 50-100 mg/kg/day divided q6-8hr (not to exceed adult dose)

### Serious lower respiratory tract infections/serious skin/skin structure infections
**Adult:** IV/IM 0.75-1.5 g q8hr; life-threatening infections or infections caused by less-susceptible organisms, IV 1.5 g q6hr
**Adolescent/child/infant ≥3 mo:** IV/IM 50-150 mg/kg/day divided q6-8hr; max 6 g/day

### Impetigo
**Child:** PO (tab unlabeled) 250 mg PO q12hr
**Child/infant ≥3 mo:** (PO-Susp) 30 mg/kg/day divided into two doses; max 1000 mg/day

### Urinary tract infection (UTI)
**Adult/adolescent:** PO 250 mg q12hr × 7-10 days; IV/IM 0.75-1.5 g q8hr (general) or 0.75 g q8hr (uncomplicated)
**Adolescent/child/infant ≥3 mo:** IV/IM 50-100 mg/kg/day in divided doses q6-8hr (max adult dose)

### Bone and joint infections
**Adult:** IV/IM 1.5 g q8hr; for life-threatening infections or infections caused by less-susceptible organisms, 1.5 g IV q6hr
**Adolescent/child/infant ≥3 mo:** IV/IM 150 mg/kg/day in divided doses q8hr; max 6 g/day

### Upper respiratory tract infections (e.g., pharyngitis, tonsillitis)
**Adult/adolescent:** PO (tabs) 250 mg q12hr × 10 days
**Child/infant ≥3 mo:** PO (susp) 20 mg/kg/day divided into 2 doses × 10 days, max 500 mg/day

### Acute bacterial maxillary sinusitis
**Adult/adolescent:** PO (tabs) 250 mg bid × 10 days
**Child (who can swallow tablets whole):** PO (tabs) 250 mg bid × 10 days
**Child/infant ≥3 mo:** PO (susp) 15 mg/kg bid × 10 days, max 1000 mg/day

### Early Lyme disease
**Adult/adolescent:** PO (tabs) 500 mg q12hr × 20 days
**Child (unlabeled):** PO (susp) 30 mg/kg/day in 2 divided doses (max 1000 mg/day) or 1000 mg/day × 14-21 days

### Acute otitis media
**Child (who can swallow whole tablets):** PO (tabs) 250 mg bid × 10 days
**Child/infant ≥3 mo:** PO (susp) 30 mg/kg/day divided into 2 doses × 10 day, max 1000 mg/day

### Septicemia
**Adult:** IV/IM 1.5-3 g q8hr, max 9 g/day
**Adolescent/child/infant ≥3 mo:** IV/IM 200-240 mg/kg/day divided doses q6-8hr, max 9 g/day

### Renal dose
**Adult:** CCr 10-20 ml/min: IV/IM 0.75-1.5 g, then 750 mg q12hr; CrCl <10 ml/min: IV/IM 0.75-1.5 g, then 750 mg q24hr
**Child:** The frequency of dosing should be modified consistent with the recommendations for adults

**Available forms:** Tabs 125, 250, 500 mg; inj 150, 750 mg, 1.5, 7.5 g; inj 750 mg; 1.5 g powder, susp 125, 250 mg/5 ml

### Implementation

## >> cefaclor
- Do not break, crush, chew, or cut EXT REL tabs
- Give in even doses around the clock; if GI upset occurs, give with food; product must be given for 10-14 days to ensure organism death and prevent superinfection
- Shake susp, refrigerate, discard after 2 wk
- Swallow EXT REL whole

### >> cefoTEtan

**IM route**

- Reconstitute 1 g/2 ml or 2 g/3 ml of sterile or bacteriostatic water for inj; may be diluted with 0.5% of 1% lidocaine to prevent pain; give deep in large muscle mass, massage

**IV route**

- May be stored 96 hr refrigerated or 24 hr at room temperature
- Check for irritation, extravasation, phlebitis daily; change site q72hr
- For direct **IV** dilute in 1 g/10 ml or more and give over 5 min
- For intermittent inf further dilute in 50-100 ml of 0.9% NaCl or $D_5W$; give over 3-5 min; discontinue primary line while running intermittent inf

**Y-site compatibilities:** Allopurinol, amifostine, aztreonam, dilTIAZem, famotidine, filgrastim, fluconazole, fludarabine, heparin, regular insulin, melphalan, meperidine, morphine, PACLitaxel, sargramostim, tacrolimus, teniposide, theophylline, thiotepa

### >> cefOXitin

**IM route**

- Reconstitute 1 g/2 ml of sterile water for inj; may be diluted with 0.5% or 1% lidocaine to prevent pain; give deep in large muscle mass, massage

**IV route**

- Check for irritation, extravasation, phlebitis daily; change site q72hr
- For direct **IV**, dilute 1 g/10 ml or 2 g/20 ml of sterile water for inj; shake, let stand until clear; give over 3-5 min
- For intermittent inf further dilute with 50-100 ml of $D_5W$, $D_{10}W$, $D_5$/0.25% NaCl, $D_5$/0.45% NaCl, $D_5$/0.9% NaCl, 0.9% NaCl $D_5$/LR, $D_5$/0.02%, sodium bicarbonate, Ringer's, or LR; give over 15-30 min; may store 96 hr refrigerated or 24 hr room temperature
- For cont inf dilute in 500-1000 ml; give over prescribed rate

**Y-site compatibilities:** Acyclovir, amifostine, aztreonam, cyclophosphamide, dilTIAZem, famotidine, fluconazole, foscarnet, HYDROmorphone, magnesium sulfate, meperidine, morphine, ondansetron, perphenazine, teniposide, thiotepa

**Y-site incompatibilities:** Hetastarch

### >> cefprozil

**IM route**

- Reconstitute with 1 g/2 ml or 2 g/3 ml of sterile or bacteriostatic water for inj; may be diluted with 0.5% or 1% lidocaine to prevent pain; give deep in large muscle mass, massage

**IV route**

- Check for irritation, extravasation, phlebitis daily; change site q72hr
- For direct **IV**, dilute 1 g/10 ml or more and give over 5 min
- For intermittent inf further dilute with 50-100 ml of 0.9% NaCl or $D_5W$; give over 3-5 min; discontinue primary line while running intermittent inf

**Y-site compatibilities:** Famotidine, fluconazole, fludarabine, regular insulin, meperidine, morphine, sargramostim

### >> cefuroxime

- Give for 10-14 days to ensure organism death, prevent superinfection, discard after 14 days
- Give with food if needed for GI symptoms
- Five after C&S obtained

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, fatigue, paresthesia, fever, chills, confusion

**GI:** *Diarrhea,* nausea, vomiting, anorexia, dysgeusia, glossitis, bleeding; increased AST, ALT, bilirubin, LDH, alkaline phosphatase; abdominal pain, loose stools, flatulence, heartburn, stomach cramps, colitis, jaundice, pseudomembranous colitis

**GU:** Vaginitis, pruritus, candidiasis, increased BUN, nephrotoxicity, renal failure, pyuria, dysuria, reversible interstitial nephritis

**HEMA:** Leukopenia, thrombocytopenia, agranulocytosis, anemia, neutropenia, lymphocytosis, eosinophilia, pancytopenia, hemolytic anemia, leukocytosis, granulocytopenia

**INTEG:** Rash, urticaria, dermatitis, Stevens-Johnson syndrome

**RESP:** Dyspnea

**SYST:** Anaphylaxis, serum sickness, superinfection

### >> cefaclor

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Not metabolized |
| **Excretion** | Unchanged by kidneys (60%-80%); enters breast milk |
| **Half-life** | 36-54 min; increased in renal disease |

#### Pharmacodynamics

| | |
|---|---|
| **Onset** | 15 min |
| **Peak** | ½-1 hr |
| **Duration** | Unknown |

### >> cefoTEtan

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys, unchanged; enters breast milk |
| **Half-life** | 5 hr; increased in renal disease |

#### Pharmacodynamics

| | IM | IV |
|---|---|---|
| **Onset** | Rapid | Immediate |
| **Peak** | 1-3 hr | Infusion's end |
| **Duration** | Unknown | Unknown |

### >> cefOXitin

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys, unchanged; enters breast milk |
| **Half-life** | ½-1 hr; increased in renal disease |

#### Pharmacodynamics

| | IM | IV |
|---|---|---|
| **Onset** | Rapid | Immediate |
| **Peak** | ½ hr | Infusion's end |
| **Duration** | Unknown | Unknown |

### >> cefprozil

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys (60%), unchanged; enters breast milk |
| **Half-life** | 1.3 hr (normal renal function); 2 hr (hepatic disease); 5¼-6 hr (end-stage renal disease) |

#### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Antacids: decreased absorption of cephalosporins
Furosemide: increased effect/toxicity
Plicamycin, valproic acid: increased bleeding
Probenecid: decreased excretion of product and increased blood levels/toxicity

### Drug classifications

Aminoglycosides: increased effect/toxicity
Anticoagulants, antiplatelets, NSAIDs, thrombolytics: increased bleeding (cefoTEtan)

### Drug/lab test

False: increased creatinine (serum urine), urinary 17-KS
False positive: urinary protein, direct Coombs' test, urine glucose (Clinitest)
Interference: cross-matching

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction to penicillins or other cephalosporins; cross-sensitivity between penicillins and cephalosporins is common
- Assess patient for signs and symptoms of **infection** including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, earache, fever; obtain baseline information and during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for anaphylaxis:** rash, urticaria, pruritus, dyspnea, chills, fever, joint pain; angioedema may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also check for increased BUN, creatinine, urine output; if decreasing notify prescriber
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- ***Clostridium difficile*–associated diarrhea (CDAD):** Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- Assess for **overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate **blood dyscrasias** (rare); symptoms of hypersensitivity
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate **superinfection**
- Instruct patient to take all medication prescribed for the length of time ordered; to use yogurt or buttermilk to maintain intestinal flora, decrease diarrhea, take missed dose as soon as remembered unless close to next dose, do not take double dose, use calibrated device for syrup, liquid, suspension
- Advise patient to notify prescriber of diarrhea with blood or pus, which may indicate pseudomembranous colitis

### Evaluation

**Positive therapeutic outcome**

- Absence of signs/symptoms of infection (WBC $<10{,}000/mm^3$, temp WNL, absence of red draining wounds, earache)
- Reported improvement in symptoms of infection
- Negative C&S

**TREATMENT OF ANAPHYLAXIS:** EPINEPHrine, antihistamines, resuscitate if needed

## CEPHALOSPORINS—3RD/4TH GENERATION

**cefdinir (Rx)**
(sef′dih-ner)
**Omnicef**

**cefditoren pivoxil (Rx)**
(sef-dit′oh-ren pih-vox′il)
**Spectracef**

**(4th generation) cefepime (Rx)**
(sef′e-peem)
**Maxipime**

**cefixime (Rx)**
(sef-iks′ime)
**Cefixime, Suprax**

**cefotaxime (Rx)**
(sef-oh-taks′eem)
**Claforan**

**cefpodoxime (Rx)**
(sef-poe-docks′eem)
**Vantin**

**cefTAZidime (Rx)**
(sef′tay-zi-deem)
**Ceptaz, Fortaz, Tazicef**

**ceftibuten (Rx)**
(sef-ti-byoo′tin)
**Cedax**

**ceftizoxime (Rx)**
(sef-ti-zox′eem)
**Cefizox**

**cefTRIAXone (Rx)**
(sef-try-ax′one)
**Rocephin**

*Func. class.:* Broad-spectrum antibiotic
*Chem. class.:* Cephalosporin (3rd generation)

**Do not confuse:** cefTAZidime/ceftizoxime, Vantin/Ventolin

**ACTION:** Inhibits bacterial cell wall synthesis, rendering cell wall osmotically unstable, leading to cell death

### >> cefdinir

**Therapeutic outcome:** Bactericidal effects for the following: *Citrobacter diversus, Escherichia coli, Haemophilus influenzae, Haemophilus parainfluenzae, Klebsiella pneumoniae, Moraxella catarrhalis, Proteus mirabilis, Staphylococcus aureus, Staphylococcus epidermidis, Streptococcus agalactiae* (group B), *Streptococcus pneumoniae, Streptococcus pyogenes,* viridans streptococci alpha

**USES:** Uncomplicated skin and skin structure infections, community-acquired pneumonia, acute exacerbations of chronic bronchitis, acute maxillary sinusitis, pharyngitis, tonsillitis, otitis media

### >> cefditoren pivoxil

**Therapeutic outcome:** Bactericidal effects for the following organisms: *Haemophilus influenzae, Haemophilus parainfluenzae, Streptococcus pneumoniae, Moraxella catarrhalis, Streptococcus pyogenes, Staphylococcus aureus*

**USES:** Acute bacterial exacerbation of chronic bronchitis, pharyngitis/tonsillitis; uncomplicated skin, skin structure infections, community-acquired pneumonia, viridans streptococci

### >> cefepime

**Therapeutic outcome:** Bactericidal effects for the following: *Acinetobacter calcoaceticus, Acinetobacter lwoffii, Aeromonas hydrophila, Citrobacter diversus, Citrobacter freundii, Enterobacter, Escherichia coli, Gardnerella vaginalis, Hafnia alvei, Klebsiella, Moraxella catarrhalis, Morganella morganii, Neisseria gonorrhoeae, Neisseria meningitidis,*

*Proteus, Providencia rettgeri, Providencia stuartii, Pseudomonas aeruginosa, Salmonella, Serratia liquefaciens, Serratia marcescens, Shigella, Staphylococcus epidermidis, Staphylococcus saprophyticus, Streptococcus agalactiae, Streptococcus bovis, viridans streptococci, Yersinia enterocolitica*

**USES:** Lower respiratory tract, urinary tract, skin, bone, febrile neutropenia, intraabdominal infection

### >> cefixime

**Therapeutic outcome:** Bactericidal effects for the following organisms: *Escherichia coli, Proteus mirabilis, Streptococcus pyogenes, Haemophilus influenzae, Moraxella catarrhalis, Streptococcus pneumoniae*

**USES:** Uncomplicated UTI, pharyngitis/tonsillitis, otitis media, acute bronchitis, exacerbations of chronic bronchitis, uncomplicated gonorrhea

### >> cefotaxime

**Therapeutic outcome:** Bactericidal effects for the following: *Haemophilus influenzae, Haemophilus parainfluenzae, Escherichia coli, Enterococcus faecalis, Neisseria gonorrhoeae, Neisseria meningitidis, Proteus mirabilis, Klebsiella, Citrobacter, Serratia, Salmonella, Shigella Pseudomonas;* gram-positive organisms *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus*

**USES:** Lower serious respiratory tract, urinary tract, skin, bone, gonococcal infections; bacteremia, septicemia, meningitis, skin, skin structure infections, CNS infections, perioperative prophylaxis, intraabdominal infections, PID, UTI, ventriculitis

### >> cefpodoxime

**Therapeutic outcome:** Bactericidal effects for the following: *Neisseria gonorrhoeae, Haemophilus influenzae, Escherichia coli, Proteus mirabilis, Klebsiella;* gram-positive organisms *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus*

**USES:** Upper and lower respiratory tract, urinary tract, skin infections; otitis media, STDs

### >> cefTAZidime

**Therapeutic outcome:** Bactericidal effects for the following: *Haemophilus influenzae, Escherichia coli, Enterobacter aerogenes, Proteus mirabilis, Klebsiella, Citrobacter, Enterobacter, Salmonella, Serratia, Pseudomonas aeruginosa, Shigella, Acinetobacter, Bacteroides fragilis, Neisseria; Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus*

**USES:** Serious upper or lower respiratory tract, urinary tract, skin, gynecologic, bone, joint, intraabdominal infections; septicemia, meningitis, febrile neutropenia

### >> ceftibuten

**Therapeutic outcome:** Bactericidal effects for the following: *Haemophilus influenzae, Escherichia coli; Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus*

**USES:** Pharyngitis, tonsillitis, otitis media, secondary bacterial infection of acute bronchitis

### >> ceftizoxime

**Therapeutic outcome:** Bactericidal effects for the following: *Bacteroides, Haemophilus influenzae, Escherichia coli, Enterobacter aerogenes, Proteus mirabilis, Klebsiella, Enterobacter; Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus, Neisseria gonorrhoeae*

**USES:** Serious lower respiratory tract, urinary tract, skin, intraabdominal infections; septicemia, meningitis; bone, joint infections, PID

### >> cefTRIAXone

**Therapeutic outcome:** Bactericidal effects on the following: gram-negative organisms *Haemophilus influenzae, Escherichia coli, Enterobacter aerogenes, Proteus mirabilis, Klebsiella, Citrobacter, Enterobacter, Salmonella, Shigella, Acinetobacter, Bacteroides fragilis, Neisseria, Serratia;* gram-positive organisms *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus*

**USES:** Serious lower respiratory tract, urinary tract, skin, gonococcal, intraabdominal infections; septicemia, meningitis; bone, joint infections, otitis media, PID

## CONTRAINDICATIONS

Hypersensitivity to cephalosporins, infants <1 mo

**Precautions:** Pregnancy, breastfeeding, children, hypersensitivity to penicillins, renal/GI disease, geriatrics, pseudomembranous colitis, viral infection, vit K deficiencies, diabetes

## DOSAGE AND ROUTES

### >> cefdinir

**Uncomplicated skin and skin structure infections/community-acquired pneumonia**

**Adult and child ≥13 yr:** PO 300 mg q12hr × 10 days

**Child 6 mo-12 yr:** PO 7 mg/kg q12hr or 14 mg/kg q24hr × 10 days

### Acute exacerbations of chronic bronchitis/acute maxillary sinusitis

**Adult and child ≥13 yr:** PO 300 mg q12hr or 600 mg q24hr × 10 days

### Pharyngitis/tonsillitis

**Adult and child ≥13 yr:** PO 300 mg q12hr or 600 mg q24hr × 5-10 days
**Child 6 mo-12 yr:** PO 7 mg/kg q12hr × 5-10 days or 14 mg/kg q24hr × 5-10 days

### Renal dose

*(CCr <30 ml/min)*
**Adult:** 300 mg/day
**Child:** 7 mg/kg/day

**Available forms:** Caps 300 mg, oral susp 125 mg/5 ml, 250 mg/5 ml

## >> cefditoren pivoxil

**Adult:** PO 200-400 mg bid × 10-14 days

### Renal dose

**Adult:** PO CCr 30-49 ml/min, max 200 mg bid; CCr <30 ml/min, max 200, 400 mg daily

**Available forms:** Tabs 200 mg

## >> cefepime

### Febrile neutropenia

**Adult/adolescent >16 yr/child ≥40 kg: IV** 2 g q8hr × 7 days or until neutropenia resolves
**Infant ≥2 mo/child/adolescent ≤16 yr and weighing up to 40 kg: IV** 50 mg/kg/dose q8hr × 7-10 days or until resolution

### Urinary tract infections (mild to moderate)

**Adult: IV**/IM 0.5-1 g q12hr × 7-10 days

### Urinary tract infections (severe)

**Adult/adolescent >16 yr/child ≥40 kg: IV** 2 g q12hr × 10 days

### Pneumonia (moderate to severe)

**Adult: IV** 1-2 g q12hr × 10 days

**Available forms:** Powder for inj 500 mg, 1, 2 g; 1 g/50 ml, 2 g/100 ml

## >> cefixime

### Mild to moderate pharyngitis, tonsillitis, bronchitis

**Adult/adolescent/child >45 kg:** PO 400 mg/day divided q12-24hr
**Child ≤45 kg and infant ≥6 mo:** PO 8 mg/kg/day divided q12-24hr

### Uncomplicated urinary tract infection (UTI)

**Adult/adolescent/child >45 kg:** PO 400 mg/day divided q12-24hr
**Child ≤45 kg and infant ≥6 mo:** PO 8 mg/kg/day divided q12-24hr max: 400 mg/day × 7-14 days is recommended by the American Academy of Pediatrics (AAP) for the treatment of initial UTI in febrile infants and young children 2-24 mo
**Infant 2-5 mo (unlabeled):** PO 8 mg/kg/day × 7-14 days is recommended by the American Academy of Pediatrics (AAP) for the treatment of initial UTI in febrile infants and young children

### Mild to moderate otitis media

**Adult/adolescent/child >45 kg:** PO 400 mg/day divided q12-24hr
**Child ≤45 kg:** PO 8 mg/kg/day divided q12-24hr, max: 400 mg/day
**Infant ≥6 mo:** PO 8 mg/kg/day divided q12-24hr

### Gonorrhea of uncomplicated cervicitis, or urethritis due to *N. gonorrhoeae*

**Adult/adolescent:** PO As alternative therapy, 400 mg as a single dose with a regimen effective against uncomplicated genital *C. trachomatis* infection (e.g., azithromycin as a single dose or doxycycline for 7 days) if chlamydial infection is not ruled out. The CDC states that cefixime is only acceptable if IM cefTRIAXone is not an option due to rising cefixime MICs for gonorrhea. If cefixime is used, test-of-cure should be done at the infected site 1 wk after treatment. Cefixime is not recommended for infections of the pharynx.
**Child ≥45 kg:** PO 400 mg as a single dose with a regimen effective against uncomplicated genital *C. trachomatis* infection (e.g., azithromycin as a single dose or doxycycline for 7 days) if chlamydial infection is not ruled out. Cefixime is not recommended for infections of the pharynx. Cefixime is an alternative to cefTRIAXone per the American Academy of Pediatrics (AAP).

### Renal dose

CCr 21-59 ml/min give 65% of dose; CCr <20 ml/min give 50% of dose

**Available forms:** Tabs 400 mg; powder for oral susp 100 mg/5 ml; cap 400 mg

## >> cefotaxime

**Adult/adolescent/child ≥50 kg:** IV/IM (uncomplicated infections) 1 g q12hr, (moderate-severe infections) 1-2 g q8hr, (severe infections) 2 g q6-8hr, (life-threatening infections) 2 g q4hr, max 12 g/day
**Adolescent/child <50 kg and infant:** IV/IM 50-180 mg/kg/day divided q6-8hr, max 2 g/dose, (severe infections 200-225 mg/kg/day divided q4-6hr max 12 g)
**Neonate >7 days:** IV/IM 50 mg/kg/dose q8-12hr

### Renal dose

**Adult:** IM CCr <20 ml/min 50% dose reduction

**Available forms:** Powder for inj 500 mg, 1, 2, 10 g; 1, 2 g premixed frozen

### >> cefpodoxime

**Pneumonia**
**Adult >13 yr:** PO 200 mg q12hr for 14 days

**Skin and skin structure**
**Adult >13 yr:** PO 400 mg q12hr for 7-14 days

**Pharyngitis and tonsillitis**
**Adult >13 yr:** PO 100 mg q12hr for 5-10 days
**Child 5 mo-12 yr:** PO 5 mg/kg q12hr (max 100 mg/dose or 200 mg/day) × 5-10 days

**Uncomplicated UTI**
**Adult >13 yr:** PO 100 mg q12hr for 7 days; dosing interval increased in presence of severe renal impairment

**Acute otitis media**
**Child 5 mo-12 yr:** PO 5 mg/kg q12hr for 5 days

**Available forms:** Tabs 100, 200 mg; granules for susp 50, 100 mg/5 ml

### >> cefTAZidime

**Adult:** **IV**/IM 1-2 g q8-12hr × 5-10 days
**Child:** **IV** 30-50 mg/kg q8hr, max 6 g/day
**Neonate:** **IV** 30-50 mg/kg q8-12hr

**Renal dose**
**Adult:** IV CCr 31-50 ml/min 1 g q12hr; CCr 16-30 ml/min 1 g q24hr; CCr 6-15 ml/min 1 g loading dose, then 0.5 g q24hr; CCr <5 ml/min 1 g loading dose, then 0.5 g q48hr

**Available forms:** Inj 250, 500 mg, 1, 2, 6 g

### >> ceftibuten

**Adult:** PO 400 mg daily × 10 days
**Child 6 mo-12 yr:** PO 9 mg/kg daily × 10 days

**Renal dose**
**Adult:** PO CCr 30-49 ml/min 200 mg q24hr; CCr 5-29 ml/min 100 mg q24hr

**Available forms:** Caps 400 mg; susp 90, 180 mg/5 ml

### >> ceftizoxime

**Adult:** IM/**IV** 1-2 g q8-12hr, may give up to 4 g q8hr in life-threatening infections
**Child >6 mo:** IM/**IV** 50 mg/kg q6-8hr

**Renal dose**
**Adult:** IM/IV CCr 50-79 ml/min; give loading dose 0.5-1 g, then 0.5 g q8h; CCr 5-49 ml/min give loading dose then 250-500, mg q12hr; CCr <5 ml/min give loading dose then 250-500 mg q24hr

**PID**
**Adult:** **IV** 2 g q8hr, may increase to 4 g q8hr in severe infections

**Available forms:** Premixed 1 g, 2 g/50 ml

### >> cefTRIAXone

**Adult:** IM/**IV** 1-2 g daily, max 4 g q24hr
**Child:** IM/**IV** 50-75 mg/kg/day in equal doses q12-24hr

**Uncomplicated gonorrhea**
**Adult:** 250 mg IM as single dose
Reduce dosage in severe renal impairment (CCr <10 ml/min)

**Available forms:** Inj 250, 500 mg, 1, 2, 10 g

**Implementation**

### >> cefdinir

**PO route**
- Give oral susp after adding 39 ml water to the 60 ml bottle; 65 ml water to the 12.0 ml bottle; discard unused portion after 10 days, give without regard to food, do not give within 2 hr of antacids, iron supplements

### >> cefditoren pivoxil

- Give for 10 days to ensure organism death, prevent superinfection
- Give with food if needed, do not give with antacids
- Give after C&S is completed

### >> cefepime

**IV route**
- Check for irritation, extravasation, phlebitis daily; change site q72hr
- For **intermittent inf** dilute with 50-100 ml of $D_5W$, give over 30 min

**Solution compatibilities:** 0.9% NaCl, $D_5$, 0.5, 1.0% lidocaine, bacteriostatic water for inj with parabens/benzyl alcohol

### >> cefixime

- Give for 10-14 days to ensure organism death, prevent superinfection

### >> cefotaxime

**IV route**
- **Dilute** 1 g/10 ml $D_5W$, NS, sterile water for inj and **give** over 3-5 min by Y-tube or 3-way stopcock; may be **diluted further** with 50-100 ml of 0.9% NaCl or $D_5W$; **run** over ½-1 hr; discontinue primary inf during administration; or may be diluted in larger volume of sol and given as a cont inf
- Give for 10-14 days to ensure organism death, prevent superinfection
- Thaw frozen container at room temperature or refrigeration, do not force thaw by immersion or microwave; visually inspect container for leaks

**Y-site compatibilities:** Acyclovir, alfentanil, alprostadil, amifostine, amikacin, aminocaproic

acid, aminophylline, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, caffeine, calcium chloride/gluconate, CARBOplatin, cefamandole, cefmetazole, cefonicid, cefoperazone, cefoTEtan, cefOXitin, cefTAZidime (L-arginine), cefTRIAXone sodium, cefuroxime, cimetidine, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, dilTIAZem, DOCEtaxel, DOPamine, doxacurium, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fludarabine, fluorouracil, folic acid, furosemide, gatifloxacin, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, insulin (regular), isoproterenol, ketorolac, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, normal saline, octreotide, ofloxacin, ondansetron, ornidazole, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pefloxacin, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, peritoneal dialysis solution, perphenazine, PHENobarbital, phenylephrine, phenytoin, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quiNIDine, quinupristin, raNITIdine, remifentanil, Ringer's injection, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, sodium fusidate, sodium lactate, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole

## >> cefpodoxime

**PO route**

- Do not break, crush, or chew tabs due to taste
- Give for 10-14 days to ensure organism death, prevent superinfection
- With food for better absorption, do not give within 2 hr of antacids, $H_2$ receptor antagonists
- Shake susp well, refrigerate, discard after 2 wk

## >> cefTAZidime

**IM route**

- **Fortaz, Tazidime vials:** Reconstitute 500 mg or 1 g with 1.5 or 3 ml, respectively, of sterile or bacteriostatic water for injection, or 0.5%-1% lidocaine (approx. 280 mg/ml)
- **Tazicef vials:** Reconstitute 1 g/3 ml sterile water for injection (approx. 280 mg/ml)
- **Ceptaz vials:** Reconstitute 1 g/3 ml sterile or bacteriostatic water for injection or 0.5%-1% lidocaine (approx. 250 mg/ml)
- Withdraw the dose, making sure the needle remains in the vial; ensure that no $CO_2$ bubbles are present; inject deeply in large muscle mass; aspirate prior to injection

**IV route**

- If possible, visually inspect for particulate matter and discoloration
- **Fortaz, Tazicef, Tazidime packs:** Reconstitute 1 or 2 g/100 ml sterile water for injection or other compatible **IV** sol (10 or 20 mg/ml, respectively). Reconstitution is done in two stages. First, inject 10 ml of the diluents into the pack and shake well to dissolve and become clear; $CO_2$ pressure inside the container will occur; insert a vent needle to release the pressure; add remaining diluents and remove vent needle
- **Fortaz, Tazicef, Tazidime vials:** Reconstitute 500 mg, 1 g, 2 g with 5, 10, 10 ml, respectively, of sterile water for injection or other compatible **IV** sol (100, 95-100, or 170-180 mg/ml, respectively; shake well to dissolve
- **Fortaz, Tazidime-ADD-Vantage vials** (for **IV** only): Reconstitute 1 or 2 g with NS, ½ NS, $D_5W$ in either 50 or 100 ml flexible diluents container; to release $CO_2$ pressure, insert a vent needle after dissolving; remove vent before using
- **Ceptaz packs:** Reconstitute 1 or 2 g/100 ml sterile water for injection or compatible **IV** sol (10 or 20 mg/ml, respectively). Reconstitution is done in two stages. First, inject 10 ml of the diluent into the pack and shake well to dissolve; add the remaining diluents; insert as vent needle before giving
- **Ceptaz vials:** Reconstitute 1 or 2 g/10 ml of sterile water for injection or compatible **IV** sol (90-95, or 170-180 mg/ml, respectively)
- **Ceptaz ADD-Vantage vials** (for **IV** infusion only): Reconstitute 1 or 2 g with NS, ½ NS, or $D_5W$ in either 50 or 100 ml diluent container as appropriate

**Direct intermittent IV infusion route**
• **Vials:** Withdraw the correct dose, making sure the needle opening remains in the solution; make sure there are no $CO_2$ bubbles in the syringe before injection; inject directly over 3-5 min or slowly into the tubing of a free-flowing compatible IV solution

**Intermittent IV infusion route**
• **Vials:** Withdraw the correct dose, making sure the needle opening remains in the solution; make sure there are no $CO_2$ bubbles in the syringe before injection; infusion packs and ADD-Vantage systems are ready for infusion after reconstitution; infuse over 15-30 min

### >> ceftibuten
• Administer for 10 days to ensure organism death, prevent superinfection
• Administer after C&S
• Administer on empty stomach

### >> ceftizoxime
**IM route**
• Reconstitute 250 mg/0.9 ml, 500 mg/1.8 ml, 1 g/3.6 ml, 2 g/7.2 ml; may be diluted with 0.5% or 1% lidocaine to prevent pain; give deep in large muscle mass, massage

**IV route**
• Check for irritation, extravasation, phlebitis daily; change site q72hr
• For intermittent inf reconstitute 250 mg/2.4 ml, 500 mg/4.8 ml, 1 g/9.6 mg/2 g/19.2 ml sterile water for inj, $D_5W$, or 0.9% NaCl; do not use sol with benzyl alcohol for neonates; may be further diluted in 50-100 ml of $D_5W$, $D_{10}W$, 0.9% NaCl, or LR; give over 15-30 min
• May store 96 hr refrigerated, 24 hr room temperature

**Y-site compatibilities:** Acetaminophen, acyclovir, allopurinol, amifostine, argatroban, aztreonam, enalaprilat, esmolol, famotidine, fludarabine, foscarnet, labetalol, melphalan, meperidine, morphine, ondansetron, sargramostim, teniposide, thiotepa, vinorelbine

### >> cefTRIAXone
• Give IM inj deep in large muscle mass
• Give for 10-14 days to ensure organism death, prevent superinfection

**IV route**
• Give **IV** after diluting 250 mg/2.4 ml of 500 mg/4.8 ml, 1 g/9.6 ml, 2 g/19.2 ml $D_5W$, water for inj, 0.9% NaCl; may be further diluted with 50-100 ml of 0.9% NaCl, $D_5W$, $D_{10}W$, shake; run over ½-1 hr
• Do not mix with calcium salts

**Y-site compatibilities:** Acyclovir, allopurinol, aztreonam, cisatracurium, dilTIAZem, DOXOrubicin liposome, fludarabine, foscarnet, heparin, melphalan, meperidine, methotrexate, morphine, PACLitaxel, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, vinorelbine, warfarin, zidovudine

## ADVERSE EFFECTS
**CNS:** Headache, dizziness, weakness, paresthesia, fever, chills, seizures; dyskinesia, neurotoxicity (cefdinir)
**CV:** Heart failure, syncope (cefdinir)
**EENT:** *Oral candidiasis*
**GI:** *Nausea, vomiting, diarrhea, anorexia,* pain, glossitis, bleeding; increased AST, ALT, bilirubin, LDH, alkaline phosphatase; abdominal pain, pseudomembranous colitis, cholestasis (cefotaxime)
**GU:** Proteinuria, vaginitis, pruritus, *candidiasis,* increased BUN, nephrotoxicity, renal failure
**HEMA:** Leukopenia, thrombocytopenia, agranulocytosis, anemia, neutropenia, lymphocytosis, eosinophilia, pancytopenia, hemolytic anemia
**INTEG:** Rash, urticaria, dermatitis
**MS:** Arthralgia (cefditoren)
**RESP:** Dyspnea
**SYST:** Anaphylaxis, serum sickness, Stevens-Johnson syndrome, toxic epidermal necrolysis

### >> cefdinir
#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys, unchanged; enters breast milk |

# INTERACTIONS

## Individual drugs

Many products should not be used with calcium salts (mixed or administered) or $H_2$ blockers antacids (PO)

CycloSPORINE: increased cycloSPORINE levels

Furosemide, probenecid: increased toxicity

Iron: decreased absorption of cefdinir

Plicamycin, valproic acid: increased bleeding

## Drug classifications

Aminoglycosides: increased toxicity

Anticoagulants, NSAIDs, thrombolytics: increased bleeding

## Drug/food

Iron-rich cereal, infants' formula: decreased absorption

## Drug/lab test

Increased: ALT, AST, alkaline phosphatase, LDH, bilirubin, BUN, creatinine

False increase: creatinine (serum urine), urinary 17-KS

False positive: urinary protein, direct Coombs' test, urine glucose

Interference: cross-matching

# NURSING CONSIDERATIONS

## Assessment

- Assess patient for previous sensitivity reaction to penicillins or other cephalosporins; cross-sensitivity between penicillins and cephalosporins is common
- Assess patient for signs and symptoms of **infection** including characteristics of wounds, sputum, urine, stool, WBC $>10{,}000/mm^3$, fever; obtain baseline information and during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for anaphylaxis:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also check for increased BUN, creatinine
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis
- Monitor for **bleeding:** ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- Assess for **overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- Monitor heart rate during direct IV infusion (cefotaxime)

## Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection
- Advise patient to notify prescriber of diarrhea with blood or pus, may indicate pseudomembranous colitis
- To complete full course of treatment, take missed dose as soon as remembered unless close to next dose, do not take a double dose, use calibrated device for syrup, liquid suspension

### Evaluation

**Positive therapeutic outcome**

- Absence of signs/symptoms of infection (WBC $<10{,}000/mm^3$, temp WNL, absence of red draining wounds, earache)
- Reported improvement in symptoms of infection
- Negative C&S

**TREATMENT OF ANAPHYLAXIS:** EPINEPHrine, antihistamines, resuscitate if needed

## cephradine

*See cephalosporins—1st generation*

**⚠ HIGH ALERT**

## ceritinib

(cerr-ah-tin'ib)

**Zykadia**

*Func. class.:* Antineoplastic—Miscellaneous

*Chem. class.:* Protein-tyrosine kinase inhibitor

**ACTION:** A tyrosine kinase inhibitor targeting anaplastic lymphoma kinase (ALK); also targets insulinlike growth factors

**Therapeutic outcome:** Decreased progression of tumor

**USES:** Anaplastic lymphoma kinase (ALK)-positive metastatic non-small cell lung cancer (NSCLC) in patients who have progressed on or are intolerant to crizotinib

### CONTRAINDICATIONS

Pregnancy (**D**), hypersensitivity

**Precautions:** Breastfeeding, children, geriatric patients, cardiac/hepatic disease, GI bleeding, bone marrow suppression, infection, diarrhea, hyperglycemia, diabetes mellitus, nausea/vomiting, pancreatitis, pneumonitis, QT prolongation, torsade de pointes, bradycardia, cardiac arrhythmias, electrolyte imbalances, corticosteroid therapy

### DOSAGE AND ROUTES

**Adults: PO** 750 mg qday on an empty stomach until disease progression or unacceptable toxicity. Avoid the concomitant use of strong 3A4 inhibitors or inducers

#### Hepatic dose

**Adult:** PO ALT or AST >5 times above ULN and total bilirubin ≤ 2 times ULN: Hold product. When ALT/AST return to baseline or ≤ 3 times ULN, resume with a 150-mg dose reduction. Do not resume those unable to tolerate 300 mg qday

**Available forms:** Cap 150 mg

### Implementation

Dosage adjustments due to treatment-related toxicity QTc prolongation: QTc >500 msec on at least 2 separate ECGs: Hold. When QTc returns to <481 msec (or baseline if >481 msec), resume with a 150-mg dose reduction. Do not resume in those unable to tolerate 300 mg qday.

- Any occurrence, QTc prolongation in combination with torsade de pointes or polymorphic ventricular tachycardia or signs/symptoms of serious arrhythmia: Permanently discontinue
- **Bradycardia:** Symptomatic, but not life-threatening: Hold and evaluate other medications that may cause bradycardia. When asymptomatic or heart rate ≥60 bpm, resume with an adjusted dose, do not resume in those unable to tolerate 300 mg qday; life-threatening: discontinue product
- **Lipase or amylase >2 times the upper limit of normal (ULN):** Hold product and monitor serum lipase/amylase. When improved to <1.5 x ULN, resume with a 150-mg dose reduction. Do not resume in those unable to tolerate 300 mg qday
- **Any grade interstitial lung disease (ILD) or pneumonitis:** Permanently discontinue
- **Severe or intolerable nausea, vomiting, or diarrhea despite appropriate medical therapy:** Hold dose; when improved, resume with a 150-mg dose reduction. Do not resume in those unable to tolerate 300 mg qday
- **Persistent hyperglycemia >250 mg/dL despite optimal antihyperglycemic therapy:** Hold dose; when hyperglycemia is controlled, resume with a 150-mg dose reduction. Do not resume in those unable to tolerate 300 mg qday. If blood sugars cannot be controlled medically, discontinue

Dosage guidance in patients on strong CYP3A4 inducers/Inhibitors:

- **Strong CYP3A4 inhibitors:** Avoid concomitant use. If a strong CYP3A4 inhibitor is required, reduce the dose of ceritinib by approximately one-third, rounded to the nearest multiple of 150 mg; close monitoring of the QT interval is recommended. If the strong CYP3A4 inhibitor is discontinued, resume the previous dosage
- **Strong CYP3A4 inducers:** Avoid concomitant use

Take on an empty stomach. Do not give within 2 hr of a meal; swallow tablets whole; do not crush or dissolve; if a dose is missed, take as soon as remembered unless the next dose is due within

12 hr. Do not take 2 doses at the same time if missed; if vomiting occurs, do not give an additional dose. Take the next dose at the next scheduled time
Store at 77°F (25°C)

## ADVERSE EFFECTS

**CNS:** Weakness, fatigue, paresthesias
**CV:** QT prolongation, torsade de pointes, bradycardia
**EENT:** Blurred vision
**GI:** *Nausea,* hepatotoxicity, vomiting, *anorexia,* pancreatitis, GERD, *abdominal pain,* diarrhea
**INTEG:** *Rash*
**META:** Hyperglycemia, hyperphosphatemia, hyperamylasemia
**MISC:** Renal failure
**RESP:** Cough, dyspnea, pneumonitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein 97% |
| **Metabolism** | CYP3A4 |
| **Excretion** | Unknown |
| **Half-life** | 41 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4-6 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Acetaminophen: increased hepatotoxicity
Warfarin: increased plasma concentration of warfarin; avoid use with warfarin; use low molecular weight anticoagulants instead
Simvastatin: increased plasma concentrations of simvastatin

### Drug classifications

CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin): increased ceritinib concentrations
CYP3A4 inducers (dexamethasone, phenytoin, carBAMazepine, rifampin, PHENobarbital): decreased ceritinib concentrations

### Drug/herb

Decreased: ceritinib concentration—St. John's wort

### Drug/lab test

Increased: bilirubin, amylase, LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Pregnancy:** Assess for pregnancy before starting treatment; effective contraception is needed during and for ≥ 2 wk after treatment
- **QT prolongation:** Assess for a history of cardiac arrhythmias, congestive heart failure, bradycardia, electrolyte imbalance, or congenital long QT syndrome. Correct electrolyte abnormalities before starting product
- **Hyperglycemia:** Monitor for hyperglycemia, may be 6-8-fold in diabetic patients
- **Pancreatitis:** Monitor for nausea, vomiting, severe abdominal pain

### Patient/family education

- **Pregnancy:** Teach patient to notify their provider immediately if pregnancy is suspected; effective contraception is needed during and for ≥ 2wk after treatment; if product is used during pregnancy or if the patient becomes pregnant during use, the woman should be apprised of the potential hazard to the fetus
- Teach patient about reason for treatment, expected results
- Teach patient to report adverse reactions immediately: abdominal pain, nausea, vomiting, increased blood glucose in diabetics
- Advise patient to avoid OTC products unless approved by prescriber

### Evaluation

**Positive therapeutic outcome**

- Decreased spread of tumor

## certolizumab pegol (Rx)

(ser'tue-liz'oo-mab) (pegh'ol)
**Cimzia**
*Func. class.:* GI antiinflammatory, antirheumatic
*Chem. class.:* Anti-TNF (tissue necrosis factor) agent

**ACTION:** Monoclonal antibody that neutralizes the activity of tumor necrosis factor-α (TNF-α) found in Crohn's disease; decreased infiltration of inflammatory cells

**Therapeutic outcome:** Absence of fever, mucus in stools

**USES:** Crohn's disease (moderate-severe) that has not responded to conventional therapy, rheumatoid arthritis (moderate-severe), psoriatic arthritis, ankylosing spondylitis

## CONTRAINDICATIONS

Influenza, **IV** administration, sepsis, hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric patients, AIDS, coagulopathy, diabetes, fungal infection, heart failure, hepatitis, human anti-chimeric antibody, immunosuppression,

leukopenia, MS, cancer, neurologic disease, surgery, thrombocytopenia, TB, vaccinations, renal disease

**BLACK BOX WARNING:** Infection, neoplastic disease in children

## DOSAGE AND ROUTES

### Crohn's disease (moderate-severe)

**Adult:** SUBCUT 400 mg given as 2 inj at wk 0, 2, 4; if clinical response occurs, give 400 mg q4wk

### Rheumatoid arthritis (moderate-severe)

**Adult:** SUBCUT 400 mg (as two injections of 200 mg) once, then repeat at wk 2 and 4; maintenance, 200 mg q2wk or 400 mg q4wk

**Available forms:** Solution for inj 200; powder for solution 400 mg kit

### Implementation

- Store in refrigerator; do not freeze

**SUBCUT route**

- Give by SUBCUT only
- Allow reconstitution to warm to room temp; add 1 ml sterile water for inj to each vial; two vials will be needed for Crohn's disease
- Gently swirl; do not shake; full reconstitution may take up to 30 min; reconstituted product may remain at room temp for up to 2 hr or refrigerated up to 24 hr
- Warm to room temperature if reconstituted product has been refrigerated
- Use 2 syringes and 2 20-G needles
- Withdraw reconstituted sol from each vial into separate syringes; each will contain 200 mg; switch 20-G to 23-G needle; inject into 2 separate sites in abdomen or thigh

## ADVERSE EFFECTS

**CNS:** *Dizziness,* syncope, peripheral neuropathy, fever, seizures, demyelinating disease of CNS
**CV:** Heart failure, MI, cardiac dysrhythmia
**EENT:** Optic neuritis, retinal hemorrhage, uveitis
**GI:** Increased LFTs, hepatitis, bowel obstruction
**GU:** UTI, renal disease
**HEMA:** Anemia, aplastic anemia, pancytopenia, thrombocytopenia
**INTEG:** *Rash, urticaria,* angioedema
**RESP:** Dyspnea, URI
**MISC:** *Infection*
**SYST:** Anaphylaxis, malignancies, serum sickness, bleeding, antibody formation, infection, lupus-like symptoms, lymphadenopathy, arthralgia, suicidal ideation

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Terminal 14 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 54-171 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Abatacept, adalimumab, anakinra, etanercept, infliximab, do not use concurrently, rilonacept: increased possible infections
Adalimumab, etanercept, infliximab: increased possible malignancies

### Drug classifications

Immunosuppressive agents: increased possible infections, do not use concurrently
Live vaccines, toxoids: do not administer concurrently

## NURSING CONSIDERATIONS

### Assessment

- Monitor antibody test (ANA), hepatitis B serology, CBC with differential
- Assess rheumatoid arthritis/ankylosing spondylitis: pain, range of motion baseline and during treatment
- Assess GI symptoms: nausea, vomiting, abdominal pain, hepatitis, increased LFTs
- Assess CV status: B/P, pulse, chest pain
- **Assess for allergic reaction, anaphylaxis:** rash, dermatitis, urticaria, dyspnea, hypotension, fever, chills; discontinue if severe, administer EPINEPHrine, corticosteroids, antihistamines; assess for allergies to murine proteins before starting therapy
- **Hepatitis B virus:** Carriers of HBV should be monitored, those at risk for HBV should be evaluated before use

**BLACK BOX WARNING:** Fungal infection: Fever, weight loss, diaphoresis, fatigue, dyspnea; assess **infections:** discontinue if infection occurs; do not administer to patients with active infections

**BLACK BOX WARNING:** Identify TB, risk for HBV before beginning treatment; a TB test should be obtained; if present, TB should be treated prior to receiving inFLIXimab

**BLACK BOX WARNING:** Do not use in children, lymphoma may occur

### Patient/family education

- Instruct patient not to breastfeed while taking this product
- Advise patient to notify prescriber of GI symptoms, hypersensitivity reactions, infections, fluid retention, redness, pain, swelling at injection site
- Caution patient not to operate machinery, drive if dizziness, vertigo occur

### Evaluation

**Positive therapeutic outcome**

- Absence of fever, mucus in stools; decreased inflammation in joints

## cetirizine (Rx)

(se-tear′i-zeen)

**Reactine, ZyrTEC**

*Func. class.:* Antihistamine, peripherally selective (2nd generation)

*Chem. class.:* Piperazine, $H_1$ histamine antagonist

**Do not confuse:** Cetirizine/sertraline/stavudine, ZyrTEC/Xanax/Zantac/Zocor/ZyPREXA/Zerit

**ACTION:** Acts on blood vessels, GI, respiratory system by competing with histamine for $H_1$-receptor site; decreases allergic response by blocking pharmacologic effects of histamine; minimal anticholinergic/sedative action

**Therapeutic outcome:** Absence of allergy symptoms, rhinitis, and chronic idiopathic urticaria

**USES:** Rhinitis, allergy symptoms, and chronic idiopathic urticaria

## CONTRAINDICATIONS

Hypersensitivity to this product or hydrOXYzine, breastfeeding, newborn or premature infants, severe hepatic disease

**Precautions:** Pregnancy, children, geriatric, respiratory disease, closed-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, asthma

## DOSAGE AND ROUTES

Perennial/seasonal allergic rhinitis or idiopathic urticaria

**Adult and child ≥6 yr:** PO 5-10 mg daily

**Child 2-5 yr:** PO 2.5 mg daily, may increase to 5 mg daily or 2.5 mg bid

**Child 1-2 yr:** PO 2.5 mg daily, may increase to 2.5 mg q12hr

**Child 6-11 mo:** PO 2.5 mg daily

**Geriatric:** PO 5 mg daily, may increase to 10 mg/day

### Self-treatment of hay fever/other respiratory allergies

**Adult/adolescent/child ≥6 yr:** PO 10 mg/day, oral SOL 5-10 mg/day

### Renal dose

**Adult:** PO CCr 11-31 ml/min 5 mg daily

### Hemodialysis

**Adult:** PO 5 mg/day

### Hepatic dose

**Adult:** PO 5 mg daily

**Available forms:** Tabs 5, 10 mg; syr 5 mg/5 ml; prefilled spoons 1 mg/ml; oral sol 5 mg/5 ml; liquid filled cap 10 mg; chew tab 5, 10 mg; orally disintegrating tab 10 mg

### Implementation

- Give without regard to meals
- Store in tight, light-resistant container
- **Caps:** swallow whole, do not break, cut, chew, crush
- **Chew tabs:** chew before swallowing, may use without or with water
- **Oral liquid:** use calibrated measuring device

## ADVERSE EFFECTS

**CNS:** *Headache,* stimulation, *drowsiness,* sedation, *fatigue,* confusion, blurred vision, tinnitus, restlessness, tremors, paradoxical excitation in children or geriatric

**GI:** *Dry mouth,* increased liver function tests, constipation

**INTEG:** Rash, eczema, photosensitivity, urticaria

**RESP:** *Thickening of bronchial secretions;* dry nose, throat

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed, rapid |
| **Distribution** | Protein binding 93% |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 8.3 hr, decreased in children, increased in renal/hepatic disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½ hr |
| **Peak** | 1-2 hr |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression

Ritonavir: increased cetirizine effect

### Drug classifications
CNS depressants, opioids, sedative/hypnotics: increased CNS depression
MAOIs: increased anticholinergic effect

### Drug/food
Prolongs absorption by 1.7 hr

### Drug/lab test
False negative: skin allergy tests (discontinue antihistamine 3 days before testing)

## NURSING CONSIDERATIONS
### Assessment
- Assess respiratory status: rate, rhythm; increase in bronchial secretions, wheezing, chest tightness; provide fluids to 2 L/day to decrease secretion thickness
- Assess for **allergy symptoms:** pruritus, urticaria, watering eyes, baseline, during treatment
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education
- Teach all aspects of product uses; to notify prescriber if confusion, sedation, hypotension occur; to avoid driving or other hazardous activity if drowsiness occurs; to avoid alcohol or other CNS depressants that may potentiate effect
- Instruct patient to take without regard to meals
- Instruct patient not to exceed recommended dose; dysrhythmias may occur
- Advise patient to avoid using if breastfeeding
- Advise patient to avoid exposure to sunlight; burns may occur
- Advise patient to use sugarless gum, candy, frequent sips of water to minimize dry mouth
- Advise patient to avoid alcohol, OTC antihistamines, other CNS depressants

### Evaluation
**Positive therapeutic outcome**
- Absence of runny or congested nose, rashes

## TREATMENT OF OVERDOSE:
Lavage, diazePAM, vasopressors, phenytoin IV

**RARELY USED**

**⚠ HIGH ALERT**

## cetrorelix (Rx)
(set-roe-ree'lix)
**Cetrotide**
*Func. class.:* Gonadotropin-releasing
*Chem. class.:* Synthetic decapeptide

**Therapeutic outcome:** Pregnancy

## USES: For inhibition of premature LH surges in women undergoing controlled ovarian hyperstimulation

## CONTRAINDICATIONS
Pregnancy, breastfeeding, hypersensitivity, latex allergy, renal disease, KRA5 mutation

**Precautions:** Geriatric, bronchospasm

## DOSAGE AND ROUTES
### Single-dose regimen
**Adult:** SUBCUT 3 mg when serum estradiol level is at appropriate stimulation response, usually on stimulation day 7; if hCG has not been given within 4 days after inj of 3 mg cetrorelix, give 0.25 mg daily until day of hCG administration

### Multiple-dose regimen
**Adult:** SUBCUT 0.25 mg is given on stimulation day 5 (either morning or evening) or 6 (morning) and continued daily until day hCG is given

### Evaluation
**Positive therapeutic outcome**
- Pregnancy

## cetuximab (Rx)
(se-tux'i-mab)
**Erbitux**
*Func. class.:* Antineoplastic—miscellaneous, monoclonal antibody
*Chem. class.:* Epidermal growth factor receptor inhibitor

## ACTION: Not fully understood; binds to K-RAS wild type epidermal growth factor receptors (EGFRs); inhibits phosphorylation and activation of receptor-associated kinase resulting in inhibition of cell growth

**Therapeutic outcome:** Decrease in tumor size

## USES: Alone or in combination with irinotecan for K-RAS wild type EGFR expressing metastatic colorectal carcinoma, head/neck cancer

## CONTRAINDICATIONS
Hypersensitivity to this product or murine proteins

**Precautions:** Pregnancy, breastfeeding, child, geriatric, CV/renal/hepatic disease, ocular, pulmonary disorders, arrhythmias, CAD, platinum-based therapy infusion-related reactions, radiation, cardiac, respiratory arrest

**BLACK BOX WARNING:** Cardiac arrest

## DOSAGE AND ROUTES
**Adult: IV** INF 400 mg/m$^2$ loading dose given over 120 min, max INF rate 5 ml/min, weekly

maintenance dose (all other infusions) is 250 mg/m$^2$ given over 60 min, max INF rate 5 ml/min (10 mg/min); premedicate with an $H_1$ antagonist (diphenhydrAMINE 50 mg **IV**); dosage adjustments are made for INF reactions or dermatologic toxicity; other protocols are used

**Available forms:** Sol for inj 100 mg/50 ml, 200 mg/100 ml

**Premedicate with diphenhydrAMINE** 50 mg 30-60 min before first dose, use during infusion for reactions

### Implementation

**Intermittent infusion route**

- Administer by **IV** infusion only, do not give by **IV** push or bolus
- Do not shake or dilute
- Do not dilute with other products
- **Infusion pump:** draw up volume of a vial using appropriate syringe/needle (a vented spike or other appropriate transfer device); fill Erbitux into sterile evacuated container/bag, repeat until calculated volume has been put into the container. Use a new needle for each vial; give through in-line filter (low protein binding 0.22-micrometer); affix inf line and prime before starting inf, max rate 5 ml/min; flush line at end of inf with 0.9% NaCl
- **Syringe pump:** Draw up volume of a vial using appropriate syringe/needle (a vented spike); place syringe into syringe driver of a syringe pump and set rate; use an in-line filter 0.22 micrometer (low protein binding); connect inf line and start inf after priming; repeat until calculated volume has been given
- Use a new needle and filter for each vial, max 5 ml/min rate; use 0.9% NaCl to flush line after inf
- Do not piggyback to patient inf line
- Observe patient for adverse reactions for 1hr after inf

**BLACK BOX WARNING:** Inf reactions (bronchospasm, stridor, urticaria, hypotension, MI): if mild (grade 1 or 2) reduce all doses by 50%; if severe (grade 3 or 4) permanently discontinue, monitor for at least 1 hr after completion of therapy, reactions usually occur during first dose, have emergency equipment nearby

- Store refrigerated 36°-46° F, discard unused portions

## ADVERSE EFFECTS

**CNS:** *Headache, insomnia, depression,* aseptic meningitis
**CV:** Cardiac arrest
**GI:** *Nausea, diarrhea, vomiting, anorexia, mouth ulceration, dehydration, constipation, abdominal pain*
**HEMA:** Leukopenia, anemia, neutropenia
**INTEG:** Rash, pruritus, acne, dry skin, toxic epidermal necrolysis, angioedema, *blepharitis, cheilitis, cellulitis, cysts, alopecia, skin/nail disorder,* acute infusion reactions, other skin toxicities
**MISC:** *Conjunctivitis, asthma, malaise, fever,* renal failure, hypomagnesemia
**MS:** *Back pain*
**RESP:** Interstitial lung disease, *cough, dyspnea,* pulmonary embolus, *peripheral edema,* respiratory arrest
**SYST:** Anaphylaxis, sepsis, infection, Stevens-Johnson syndrome, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 114 hrs |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 168-235 g/ml |
| **Duration** | Steady state by 3rd weekly infusion |

## INTERACTIONS

### Drug/lab test

Increase: LFTs

## NURSING CONSIDERATIONS

### Assessment

Monitor pulmonary changes: lung sounds, cough, dyspnea; interstitial lung disease may occur, may be fatal; discontinue therapy if confirmed

**BLACK BOX WARNING:** Cardiac arrest: monitor electrolytes; in those undergoing radiation therapy, electrolytes may be decreased

- Assess for toxic epidermal necrosis, angioedema, anaphylaxis, Stevens-Johnson syndrome
- Assess GI symptoms: frequency of stools, dehydration, abdominal pain, stomatitis
- Obtain **K-RAS mutation** in metastatic colorectal carcinoma; if K-RAS mutation in codon 12 or 13 is detected, then patient should not receive anti-EGFR antibody therapy
- **Pregnancy/breastfeeding:** May cause fetal harm, use only if benefits outweigh fetal risk, do not breastfeed during and for 6 mo after final dose

### Patient/family education

Instruct patient to report adverse reactions immediately: SOB, severe abdominal pain, skin eruptions

- Explain reason for treatment, expected results

**BLACK BOX WARNING:** Instruct patient to use contraception during treatment and for 6 mo after treatment, both female and male, not to breastfeed during and for 6 mo after treatment

- Advise patient to wear sunscreen and hat to limit sun exposure; sun exposure can exacerbate any skin reactions

### Evaluation

**Positive therapeutic outcome**

- Decrease growth, spread of EGFR expressing metastatic colorectal carcinoma

## chlordiazePOXIDE (Rx)

(klor-dye-az-e-pox'ide)

**Librium**

*Func. class.:* Antianxiety

*Chem. class.:* Benzodiazepine, long-acting

**Controlled substance schedule IV**

**Do not confuse:** Librium/Librax

**ACTION:** Potentiates the actions of GABA, an inhibitory neurotransmitter, especially in the limbic system, reticular formation, which depresses the CNS

**Therapeutic outcome:** Decreased anxiety, successful alcohol withdrawal, relaxation

**USES:** Short-term management of anxiety, acute alcohol withdrawal, preoperative relaxation

## CONTRAINDICATIONS

Pregnancy, breastfeeding, child <6 yr, hypersensitivity to benzodiazepines, closed-angle glaucoma, psychosis

**Precautions:** Geriatric, debilitated, renal/hepatic disease, suicidal ideation, abrupt discontinuation, respiratory depression, Parkinson's disease, myasthenia gravis

## DOSAGE AND ROUTES

### Mild anxiety

**Adult:** PO 5-10 mg tid-qid

**Geriatric:** PO 5 mg bid initially, increase as needed

**Child >6 yr:** PO 5 mg bid-qid, max 10 mg bid-tid

### Severe anxiety

**Adult:** PO 20-25 mg tid-qid

### Preoperatively

**Adult:** PO 5-10 mg tid-qid on day before surgery

### Alcohol withdrawal

**Adult:** PO 50-100 mg q4-6hr prn, max 300 mg/day

### Renal disease

**Adult:** PO CCr <10 ml/min give 50% dose

**Available forms:** Caps 5, 25 mg

### Implementation

**PO route**

- Give with food or milk for GI symptoms; do not open capsules; provide sugarless gum, hard candy, frequent sips of water for dry mouth

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, fatigue, depression, insomnia, hallucinations

**CV:** *Orthostatic hypotension,* ECG changes, tachycardia, hypotension, edema

**EENT:** *Blurred vision,* tinnitus, mydriasis

**GI:** Constipation, dry mouth, nausea, vomiting, anorexia, diarrhea

**GU:** Irregular periods, decreased libido

**HEMA:** Agranulocytosis

**INTEG:** Rash, dermatitis, itching

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO); slow, erratic (IM) |
| **Distribution** | Widely distributed; crosses placenta, blood-brain barrier |
| **Metabolism** | Liver extensively |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 5-30 hr (increased in geriatric) |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | 30 min | 15-30 min | 1-5 min |
| **Peak** | Within 2 hr | Unknown | Unknown |
| **Duration** | 4-6 hr | Unknown | Up to 1 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression

Cimetidine, disulfiram, FLUoxetine, isoniazid, ketoconazole, metoprolol, propranolol, valproic acid: increased action of chlordiazePOXIDE

Levodopa: decreased action of levodopa

### Drug classifications

CNS depressants: increased CNS depression

Contraceptives (oral): increased effect of chlordiazePOXIDE

CYP3A4 inhibitors (barbiturates, protease inhibitors, rifamycins): decreased effect of chlordiazePOXIDE

### Drug/lab test

Increased: LFTs
False increase: 17-OHCS
False positive: pregnancy test (some methods)

## NURSING CONSIDERATIONS

### Assessment

- Assess **anxiety reaction:** inability to sleep, apprehension, dread, foreboding, or uneasiness related to unidentified source of danger
- Assess for previous **product dependence** or tolerance; if product dependent or tolerant, amount of medication should be restricted
- Monitor B/P (with patient lying, standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
- Monitor hepatic studies: AST, ALT, bilirubin, creatinine, LDH, alkaline phosphatase during long-term therapy
- **Monitor mental status:** mood, sensorium, affect, sleeping patterns, drowsiness, dizziness, suicidal tendencies, paradoxical reactions such as excitement, stimulation, acute rage
- Assess for pregnancy, product should not be used during pregnancy or breastfeeding

### Patient/family education

- Instruct patient that product may be taken with food; if dose is missed take as soon as remembered; do not double doses
- Tell patient to avoid OTC preparations unless approved by prescriber; to avoid alcohol ingestion or other psychotropic medications unless directed by a prescriber, tolerance occurs
- Caution patient to avoid driving and activities requiring alertness, since drowsiness may occur; until medication response is known, tell patient that drowsiness may worsen at beginning of treatment
- Instruct patient not to discontinue medication abruptly after long-term use; product should be tapered over 1 wk
- Caution patient to rise slowly or fainting may occur, especially in geriatric
- Advise patient that product should be avoided during pregnancy
- Advise patient to report immediately suicidal thoughts/behaviors

### Evaluation

**Positive therapeutic outcome**

- Increased well being
- Decreased anxiety, restlessness, sleeplessness, dread
- Successful alcohol withdrawal

## TREATMENT OF OVERDOSE:

Lavage, VS, supportive care

## chloroquine (Rx)

(klor′oh-kwin)
**Aralen**
*Func. class.:* Antimalarial
*Chem. class.:* Synthetic 4-aminoquinoline derivative

**ACTION:** Inhibits parasite replications, transcription of DNA to RNA by forming complexes with DNA of parasite

**Therapeutic outcome:** Decreased symptoms of malaria, amebiasis

**USES:** Malaria caused by *Plasmodium vivax, Plasmodium malariae, Plasmodium ovale, Plasmodium falciparum* (some strains), amebiasis

## CONTRAINDICATIONS

Hypersensitivity, retinal field changes

**Precautions:** Pregnancy, breastfeeding, children, blood dyscrasias, severe GI, neurologic disease, alcoholism, cardiac/hepatic disease, G6PD deficiency, psoriasis, eczema, seizures, preexisting auditory damage, infection, torsades de pointes, infection

## DOSAGE AND ROUTES

### Acute malaria attacks

**Adult: PO** 1000 mg (600 mg base), then 500 mg (300 mg base) in 6-8 hr, then 500 mg (300 mg base) q day × 2 days for a total of 2.5 g (1.5 g base) in 3 days

**Adult/adolescent of low body weight, child/infant: PO** 16.5 mg (10 mg base)/kg, max 600 mg base, then 8.3 mg (5 mg base)/kg max 300 mg base, 6 hr after 1st dose, then 8.3 mg (5 mg base)/kg, max 300 mg base 24 hr after 1st dose, then 8.3 mg (5 mg base)/kg max 300 mg base 36 hr after 1st dose

### Malaria prophylaxis (in areas with chloroquine–sensitive *P. falciparum)*

**Adult: PO** 500 mg (300 mg base) q wk on same day of each wk, starting 2 wk before travel and 8 wk after leaving

### Extraintestinal amebiasis

**Adult: PO** 1 g (600 mg base) q day × 2 days, then 500 mg (300 mg base) for ≥2-3 wk
**Child (unlabeled): PO** 16.6 mg (10 mg base)/kg (max 300 mg base) q day × 2-3wk

**Available forms:** Tabs 250 mg (150 mg base), 500 mg (300 mg base) phosphate

### Implementation

**PO route**

- Give with meals to decrease GI symptoms; better to take on empty stomach 1 hr before or 2 hr after meals
- Give antiemetic if vomiting occurs
- Give after C&S is completed; monthly to detect resistance

**IM route**

- Give IM after aspirating to prevent inj into bloodstream
- Store in tight, light-resistant container at room temp; keep inj in cool environment

**Additive compatibility:** Promethazine

## ADVERSE EFFECTS

**CNS:** Headache, stimulation, fatigue, seizure, psychosis, hallucinations, insomnia
**CV:** Hypotension, heart block, asystole with syncope, ECG changes, cardiomyopathy
**EENT:** *Blurred vision, corneal changes, retinal changes, difficulty focusing,* tinnitus, vertigo, deafness, photophobia, corneal edema
**GI:** *Nausea, vomiting, anorexia,* diarrhea, cramps
**HEMA:** Thrombocytopenia, agranulocytosis, hemolytic anemia, leukopenia
**INTEG:** Pruritus, pigmentary changes, skin eruptions, lichen planus–like eruptions, eczema, exfoliative dermatitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, feces |
| **Half-life** | 3-5 days |

### Pharmacodynamics

| | PO | IM |
|---|---|---|
| **Onset** | Rapid | Rapid |
| **Peak** | 1-3 hr | 30 min |
| **Duration** | 6-8 hr | Unknown |

## INTERACTIONS

### Individual drugs

Ampicillin, rabies vaccine (ID): decreased effects
Cimetidine: decreased oral clearance, metabolism
Kaolin: decreased absorption
Magnesium: decreased action of chloroquine

### Drug classifications

CYP2D6 inhibitors (amiodarone, chlorpheniramine, FLUoxetine, haloperidol, ritonavir, PAROxetine, terbinafine, ticlopidine), CYP3A4 inhibitors (clarithromycin, dilTIAZem, doxycycline, erythromycin, itraconazole, ketoconazole, verapamil): increased effects
Antacids (aluminum): decreased absorption
Class IA, III antidysrhythmics: increased QT prolongation, torsades de pointes

### Drug/lab test

Decreased: Hgb, platelets, WBC

## NURSING CONSIDERATIONS

### Assessment

- **Assess for infection:** resistance is common, not to be used for *P. falciparum* acquired in areas of resistance or where prophylaxis has failed
- Monitor **ECG,** baseline and periodically during therapy; watch for depression of T waves, widening of QRS complex
- **Assess for allergic reactions:** pruritus, rash, urticaria
- Assess for **ototoxicity:** tinnitus, vertigo, change in hearing; audiometric testing should be done before, after treatment
- Assess for **blood dyscrasias:** malaise, fever, bruising, bleeding (rare)
- Assess mental status often: affect, mood, behavioral changes; psychosis may occur
- **Assess for toxicity:** blurring vision, difficulty focusing, headache, dizziness, decreased knee and ankle reflexes, product should be discontinued immediately
- Screen for Genetic Warning G6PD deficiency, identify risk of hemolysis
- **Pregnancy/breastfeeding:** Avoid use in pregnancy except if suppression of malaria is needed and benefit outweighs fetal risk, do not use in breastfeeding

### Patient/family education

- Advise patient that compliance with dosage schedule, duration is necessary
- Instruct patient that scheduled appointments must be kept or relapse may occur
- Caution patient to avoid alcohol while taking product
- Instruct diabetic to use blood glucose monitor to obtain correct result
- Teach patient to report weakness, fatigue, loss of appetite, nausea, vomiting, yellowing of skin or eyes, tingling/numbness of hands/feet
- Advise patient that urine may turn rust brown color
- Instruct patient to use sunglasses in bright sunlight to prevent photophobia
- Keep away from pets, children; overdose is fatal

### Evaluation

**Positive therapeutic outcome**

- Decreased symptoms of malaria

## TREATMENT OF OVERDOSE:
Induce vomiting, gastric lavage, administer barbiturate (ultrashort-acting), vasopressor; tracheostomy may be necessary

## chlorproMAZINE (Rx)
(klor-proe′ma-zeen)
*Func. class.:* Antipsychotic/neuroleptic/antiemetic
*Chem. class.:* Phenothiazine, aliphatic

**Do not confuse:** chlorproMAZINE/chlorproPAMIDE/chlordiazePOXIDE

**ACTION:** Depresses cerebral cortex, hypothalamus, limbic system, which control activity, aggression; blocks neurotransmission produced by DOPamine at synapse; exhibits a strong α-adrenergic, anticholinergic blocking action; mechanism for antipsychotic effects is unclear

**Therapeutic outcome:** Decreased signs and symptoms of psychosis; control of nausea, vomiting, intractable hiccups, decreased anxiety preoperatively

**USES:** Psychotic disorders, Tourette's syndrome, mania, schizophrenia, anxiety, intractable hiccups (adults), nausea, vomiting, preoperative relaxation, acute intermittent porphyria, behavioral problems in children, nonpsychotic patients with dementia

**Unlabeled uses:** Vascular headache

## CONTRAINDICATIONS
Hypersensitivity, circulatory collapse, liver damage, cerebral arteriosclerosis, coronary disease, coma, child <6 mo

**Precautions:** Pregnancy, breastfeeding, geriatric, seizure disorders, hypertension, hepatic/cardiac disease, prostate enlargement, pulmonary/Parkinson's disease, severe hypo/hypertension, blood dyscrasias, brain damage, bone marrow depression, alcohol and barbiturate withdrawal, closed-angle glaucoma

**BLACK BOX WARNING:** Dementia; increased mortality in elderly patients with dementia-related psychosis

## DOSAGE AND ROUTES
### Psychosis
**Adult:** PO 10-50 mg q1-4hr initially, then increase up to 2 g/day if necessary; IM 10-50 mg q1-4hr, usual dose 300-800 mg/day
**Geriatric:** PO 10-25 mg daily-bid, increased by 10-25 mg/day q4-7day, max 800 mg/day
**Child >6 mo:** PO 0.55 mg/kg q4-6hr; IM 0.5 mg/kg q6-8hr

### Nausea and vomiting
**Adult:** PO 10-25 mg q4-6hr prn; IM 25-50 mg q3hr prn, then 25-50 mg q6-8hr PRN if no hypotension; max 400 mg/day; **IV** 25-50 mg daily-qid
**Child ≥6 mo:** PO 0.55 mg/kg q4-6hr; IM q6-8hr; IM ≤5 yr or ≤22.7 kg 40 mg; max IM 5-10 yr or 22.7-45.5 kg 75 mg

### Intractable hiccups/acute intermittent porphyria
**Adult:** PO 25-50 mg tid-qid; IM 25-50 mg (used only if PO dose does not work); **IV** 25-50 mg in 500-1000 ml saline (only for severe hiccups)

**Available forms:** Tabs 10, 25, 50, 100; inj 25 mg/ml

### Implementation
**PO route**
- Periodically attempt dosage reduction in patients with behavioral problems
- Give with full glass of water, milk; or give with food to decrease GI upset
- Store in tight, light-resistant container, oral sol in amber bottle

**Syrup:** Use calibrated measuring device, do not spill on skin or clothes

**IM route**
- Store in tight, light-resistant container
- Use gloves to prepare product; if product touches skin, wash with soap and water to prevent contact dermatitis
- Inject in deep muscle mass; do not give SUBCUT; may be diluted with 0.9% NaCl, 2%, patient procaine as prescribed; do not administer sol with a precipitate
- Remain lying down after IM inj for at least 30 min

**Rectal route**
- Give after placing in refrigerator for 30 min if too soft to insert; this route is used for nausea, vomiting, hiccups
- Avoid skin contact with injection solution; may cause contact dermatitis

**IV route (surgery only)**
**Direct IV**
- Give by direct **IV** by diluting with 0.9% NaCl to a concentration of 1 mg/1 ml; administer at a rate of 1 mg/2 min, never give undiluted

**Intermittent IV infusion**
- Give by intermittent IV infusion diluting 50 mg/500-1000 ml of $D_5W$, $D_{10}W$, 0.9% NaCl, 0.45% NaCl, LR, Ringer's over ½ hr or combinations (used for intractable hiccups)

**Y-site compatibilities:** Alfentanil, amikacin, amphotericin B lipid complex, amsacrine, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, benztropine, bleomycin sulfate, buprenorphine, butorphanol, calcium

chloride/gluconate, caspofungin, cimetidine, cisatracurium, CISplatin, cladribine, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, isoproterenol, labetalol, levofloxacin, lidocaine, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, methicillin, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, palonosetron, pamidronate, pancuronium, papaverine, penicillin G potassium, pentamidine, pentazocine, phytonadione, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine sulfate, pyridoxine, quiNIDine, quinupristin-dalfopristin, raNITIdine, Ringer's injection, ritodrine, riTUXimab, rocuronium, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tirofiban, TNA, tolazoline, TPN, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Neuroleptic malignant syndrome, dizziness, *extrapyramidal symptoms: pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia,* seizures, *headache*

**CV:** *Orthostatic hypotension,* hypertension, cardiac arrest, ECG changes, tachycardia

**EENT:** Blurred vision, glaucoma, dry eyes

**ENDO:** SIADH

**GI:** *Dry mouth, nausea, vomiting, anorexia, constipation,* diarrhea, cholestatic jaundice, weight gain

**GU:** Urinary retention, enuresis, impotence, amenorrhea, gynecomastia, breast engorgement

**HEMA:** Anemia, leukopenia, leukocytosis, agranulocytosis

**INTEG:** *Rash,* photosensitivity, dermatitis

**RESP:** Laryngospasm, dyspnea, respiratory depression

**SYST:** Death in geriatric patients with dementia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Variable (PO); well absorbed (IM) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver, GI mucosa extensively |
| **Excretion** | Kidneys |
| **Half-life** | 23-37 hr |

### Pharmacodynamics

| | PO | RECT | IM | IV |
|---|---|---|---|---|
| **Onset** | ½-1 hr | 12 hr | Unknown | Rapid |
| **Peak** | Unknown | Unknown | Unknown | Unknown |
| **Duration** | 4-6 hr* | 3-4 hr | 4-8 hr | Unknown |

*Duration PO ext rel is 10-12 hr.

## INTERACTIONS

### Individual drugs

Alcohol: increased effects of both products, oversedation
Aluminum hydroxide, magnesium hydroxide, cimetidine: decreased absorption
Bromocriptine, levodopa: decreased antiparkinsonian activity
EPINEPHrine: increased toxicity
Lithium: decreased chlorproMAZINE levels
Valproic acid: increased valproic acid level
Warfarin: decreased anticoagulant effect

### Drug classifications

Antacids: decreased absorption
Anticholinergics, antidepressants, antiparkinsonian agents: increased anticholinergic effects
Anticonvulsants: decreased seizure threshold
Antidepressants, antihistamines, barbiturate anesthetics, opioids, sedative/hypnotics, MAOIs: increased CNS depression
Antithyroid agents: increased agranulocytosis
Barbiturates: decreased serum chlorproMAZINE
β-Adrenergic blockers: increased effect of both products

### Drug/herb

Increased: CNS depression: kava, chamomile, hops, valerian
Increased: Anticholinergic effect: jimson weed, scopolia

### Drug/lab test

Increased: liver function tests
Decreased: WBC, platelets, Hgb/Hct
False positive: pregnancy tests, PKU
False negative: urinary steroids, 17-OHCS

## NURSING CONSIDERATIONS

### Assessment

**Beers:** Avoid in older adults except in schizophrenia, bipolar disorder, or short-term use as antiemetic in chemotherapy, increased risk for stroke and greater rate of cognitive decline and mortality in dementia

- Assess mental status: AIMS assessment, orientation, mood, behavior, presence of hallucinations, and type before initial administration and monthly; this product should significantly reduce psychotic behavior
- Assess any potentially reversible cause of behavior problems in geriatric before, during therapy
- Monitor I&O ratio; palpate bladder if low urinary output occurs, especially in geriatric; urinalysis recommended before, during prolonged therapy; monitor B/P, pulse lying, sitting, standing
- Monitor bilirubin, CBC, liver function studies, ocular exam; agranulocytosis, glaucoma, cholestatic jaundice may occur
- Assess respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; obtain baseline ECG, Q-wave, and T-wave changes
- Check for dizziness, faintness, palpitations, tachycardia on rising; severe orthostatic hypotension is common
- **Identify for neuroleptic malignant syndrome:** hyperpyrexia, muscle rigidity, increased CPK, altered mental status; product should be discontinued
- Assess for **EPS** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gate); an antiparkinsonian product should be prescribed
- Assess for constipation, urinary retention daily; if these occur, increase bulk, water in diet
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, excreted in breast milk, discontinue breastfeeding or product

### Patient/family education

- Teach patient to use good oral hygiene; frequent rinsing of mouth, sugarless gum, candy, or ice chips for dry mouth
- Caution patient to avoid hazardous activities until product response is determined; dizziness, blurred vision may occur
- Inform patient that orthostatic hypotension occurs often and to rise from sitting or lying position gradually, to remain lying down after IM inj for at least 30 min; tell patient to avoid hot tubs, hot showers, tub baths, since hypotension may occur; tell patient that in hot weather heat stroke may occur; take extra precautions to stay cool
- Advise patient to avoid abrupt withdrawal of this product, or extrapyramidal symptoms may result; product should be withdrawn slowly
- Teach patient to avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber, since serious product interactions may occur; avoid use with alcohol, CNS depressants, since increased drowsiness may occur
- Caution patient to use sunscreen and sunglasses to prevent burns
- Teach patient about extrapyramidal symptoms and necessity of meticulous oral hygiene, since oral candidiasis may occur
- Instruct patient to take antacids 2 hr before or after taking this product
- Instruct patient to report sore throat, malaise, fever, bleeding, mouth sores; if these occur, CBC should be drawn and product discontinued
- Teach that urine may turn pink or reddish-brown
- Teach patient to use contraceptive measures

### Evaluation

**Positive therapeutic outcome**

- Decrease in emotional excitement, hallucinations, delusions, paranoia
- Reorganization of patterns of thought, speech
- Increase in target behaviors

## TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway, *do not induce vomiting or use EPINEPHrine*

## cholecalciferol

*See vitamin D*

## cholestyramine (Rx)

(koe-less-tear'a-meen)

**Prevalite, Questran, Questran Light**

*Func. class.:* Antilipemic

*Chem. class.:* Bile acid sequestrant

**Do not confuse:** Questran/Quarzan

**ACTION:** Adsorbs, combines with bile acids to form an insoluble complex that is excreted through feces; loss of bile acids lowers LDL, cholesterol levels

**Therapeutic outcome:** Decreasing cholesterol levels and low-density lipoproteins, decreased pruritus

**USES:** Primary hypercholesterolemia (especially type IIa/IIb hyperlipoproteinemia), pruritus associated with biliary obstruction

**Unlabeled uses:** Diarrhea caused by excess bile acid

## CONTRAINDICATIONS

Hypersensitivity; complete biliary obstruction; hyperlipidemia III, IV, V

**Precautions:** Pregnancy, breastfeeding, children, PKU, renal disease, coagulopathy

## DOSAGE AND ROUTES

**Adult:** PO 4 g daily-bid, max 24 g/day
**Child:** PO 240 mg/kg/day in 3 divided doses; administer with food or drink, max 8 g/day, titrated up over several weeks to decrease GI effects

**Available forms:** Powder for susp 4 g/cholestyramine/packet or scoop

### Implementation

- Give product daily-bid, at bedtime; give all other medications 1 hr before cholestyramine or 4-6 hr after cholestyramine to avoid poor absorption; do not take dry; mix product with applesauce or stir into beverage (2-6 oz); let stand for 2 min; do not mix with carbonated beverages; avoid inhaling powder, avoid GI tube administration, take with food
- Provide supplemental doses of vit A, D, E, K if levels are low
- Doses are expressed in anhydrous cholestyramine resin; amount of resin varies with each product

## ADVERSE EFFECTS

**CNS:** Headache, dizziness, drowsiness, vertigo, tinnitus, anxiety
**GI:** *Constipation, abdominal pain, nausea,* fecal impaction, hemorrhoids, flatulence, vomiting, steatorrhea, peptic ulcer
**HEMA:** Bleeding, increased pro-time
**INTEG:** Rash, irritation of perianal area, tongue, skin
**META:** Decreased vit A, D, K, red cell folate content, hyperchloremic acidosis
**MS:** Muscle, joint pain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Not absorbed |
| **Distribution** | Not distributed |
| **Metabolism** | Not metabolized; LDL lowered in 4-7 days, serum cholesterol lowered in 1 mo |
| **Excretion** | Binds with bile acids, feces |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 24-48 hr |
| **Peak** | 1-3 wk |
| **Duration** | 2-4 wk |

## INTERACTIONS

### Individual drugs

Acetaminophen, amiodarone, clofibrate, gemfibrozil, glipiZIDE, iron, oral vancomycin, penicillin G, propranolol, thyroid hormones, warfarin: decreased absorption of each specific product

### Drug classifications

Cardiac glycosides, corticosteroids, tetracyclines, thiazides, vit A, D, E, K: decreased absorption

### Drug/lab test

Increased: AST, ALT, alkaline phosphatase
Decreased: Na, K

## NURSING CONSIDERATIONS

### Assessment

- Assess nutrition: fat, protein, carbohydrates, nutritional analysis should be completed by dietitian
- Assess skin integrity after patient has been receiving product; itching, pruritus often occur from bile deposits on skin
- Monitor cardiac glycoside level if both products are being administered; cardiac glycoside levels will be decreased, may need to adjust dose of cardiac glycoside, if this product is increased or decreased
- **Hypercholesterolemia:** Monitor for signs of vit A, D, E, K deficiency; fasting LDL, HDL, total cholesterol, triglyceride levels, electrolytes if on extended therapy, diet history
- Monitor bowel pattern daily; increase bulk, water in diet if constipation develops
- **Pruritus:** Assess for itching
- **Pregnancy/breastfeeding:** No well-controlled studies, may decrease vitamin absorption (fat soluble), only use if benefits outweigh fetal risk, cautious use in breastfeeding

### Patient/family education

- **Teach patient symptoms of hypoprothrombinemia:** bleeding mucous membranes, dark tarry stools, hematuria, petechiae; report immediately
- Teach patient to take with food, never use dry
- Teach patient importance of compliance
- Teach patient that risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
- Have patient mix product with 6 oz of milk, water, fruit juice; do not mix with carbonated beverages; rinse glass to make sure all medication is taken or may mix product in applesauce; allow to stand for 2 min before mixing

### Evaluation

**Positive therapeutic outcome**

- Decreased cholesterol level (hyperlipidemia)
- Decreased diarrhea, pruritus (excess bile acids)

## cidofovir (Rx)

(si-doh-foh'veer)

**Vistide**

*Func. class.:* Antiviral

*Chem. class.:* Nucleotide analog

**ACTION:** Suppresses cytomegalovirus (CMV) replication by selective inhibition of viral DNA synthesis

**Therapeutic outcome:** Decreased symptoms of CMV

**USES:** CMV retinitis in patients with HIV, used with probenecid

## CONTRAINDICATIONS

Hypersensitivity to this product or probenecid; sulfa products, direct intraocular injection, proteinuria, renal disease/failure

**Precautions:** Pregnancy, breastfeeding, children <6 mo, geriatric, preexisting cytopenias, renal function impairment, platelet count <25,000/mm$^3$, dehydration

**BLACK BOX WARNING:** Neutropenia, infertility, secondary malignancy, pregnancy nephrotoxicity

## DOSAGE AND ROUTES

**Adult: IV** CCr Infusion: Induction: 5 mg/kg over 1 hr qwk × 2 wk, maintenance: 5 mg/kg over 1 hr every other wk, give with probenecid

### Renal dose

**Adult:** IV CCr ≤55 ml/min, do not use; SCr increase of 0.3-0.4 mg/dl above baseline, decrease dose to 3 mg/kg; SCr increase of ≥0.5 mg/dl above baseline or ≥2+ proteinuria, discontinue

**Available forms:** Inj 75 mg/ml

### Implementation

- Allow to warm to room temperature
- If product comes in contact with skin, wash with soap and water immediately
- If zidovudine is used, reduce dose to 50% in cidofovir treatment days

**Intermittent IV infusion route**

- **Dilute** in 100 ml 0.9% NaCl sol before administration; give probenecid PO 2 g 3 hr before the cidofovir INF and 1 g at 2 and 8 hr after ending the cidofovir INF; **give** 1 L of 0.9% NaCl sol **IV** with each INF of cidofovir, **give** saline INF over 1-2 hr period immediately before cidofovir; patient should be given a second L if the patient can tolerate the fluid load (second L given at time of cidofovir or immediately afterward and should be given over a 1-3 hr period)

**BLACK BOX WARNING:** Use cytotoxic handling procedures

- **Administer** after diluting in 100 ml of 0.9% NaCl
- **Give** slowly; do not give by BOL **IV, IV,** SUBCUT inj
- **Use** diluted sol within 24 hr, do not refrigerate or freeze; do not use sol with particulate matter or discoloration
- Do not admix

## ADVERSE EFFECTS

**CNS:** *Fever, chills,* coma, confusion, abnormal thought, *dizziness,* bizarre dreams, *headache,* psychosis, tremors, somnolence, paresthesia, *amnesia, anxiety, insomnia,* seizures

**CV:** Dysrhythmias, hypo/hypertension

**EENT:** Retinal detachment in CMV retinitis

**GI:** Abnormal liver function tests, *nausea, vomiting, anorexia, diarrhea,* abdominal pain, hemorrhage

**GU:** Hematuria, increased creatinine, BUN, nephrotoxicity

**HEMA:** Granulocytopenia, thrombocytopenia, irreversible neutropenia, anemia, eosinophilia

**INTEG:** *Rash, alopecia, pruritus, acne,* urticaria, pain at inj site, phlebitis

**RESP:** Dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Terminal 2.6 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** Amphotericin B, foscarnet, pentamidine **IV:** increased nephrotoxicity; wait 7 days after use to begin cidofovir

### Drug/lab test

Increase: AST/ALT, alkaline phosphatase, glucose, cholesterol, BUN, creatinine, urine protein

Decrease: Neutrophils, platelets, calcium, potassium

### Drug classifications

Aminoglycosides, NSAIDs, salicylates: increased nephrotoxicity; wait 7 days after use to begin cidofovir

## NURSING CONSIDERATIONS

### Assessment

• Obtain culture before treatment is initiated; cultures of blood, urine, and throat may all be taken; CMV is not confirmed by this method; the diagnosis is made by an ophthalmic exam

**BLACK BOX WARNING:** Monitor renal, liver function, increased hematopoietic studies and BUN; serum creatinine, AST, ALT, creatinine, CCr, A-G ratio, baseline and drip treatment, blood counts should be done q2wk; watch for decreasing granulocytes, Hgb; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required, renal failure/Fanconi syndrome can also occur

• Assess for GI symptoms: severe nausea, vomiting, diarrhea; severe symptoms may necessitate discontinuing product

• Assess electrolytes and minerals: calcium, phosphorous, magnesium, sodium, potassium; watch closely for tetany during first administration

• **Assess for symptoms of blood dyscrasias (anemia, granulocytopenia); bruising, fatigue, bleeding, poor healing; assess for leukopenia, neutropenia, thrombocytopenia:** WBCs, platelets q2day during 2 × /day dosing and qwk thereafter; check for leukopenias, with daily WBC count in patients with prior leukopenia, with other nucleoside analogs, or for whom leukopenia counts are $<1000$ cells/mm$^3$ at start of treatment

• Assess allergic reactions: flushing, rash, urticaria, pruritus

• Monitor serum creatinine or CCr at least q2wk; give only to those with creatinine levels $\leq 1.5$ mg/dl, CCr $>55$ ml/min, urine protein $<100$ mg/dl

• **Pregnancy/breastfeeding:** May cause fetal harm, use only if benefits outweigh fetal risk, do not use in breastfeeding

### Patient/family education

**BLACK BOX WARNING:** Advise to notify prescriber if sore throat, swollen lymph nodes, malaise, fever occur; may indicate other infections

• Advise to report perioral tingling, numbness in extremities, and paresthesias; report rash immediately, mental/vision changes, urinary problems, abnormal bleeding

• Teach that serious product interactions may occur if OTC products are ingested; check first with prescriber

• Teach that product is not a cure, but will control symptoms

• Advise that regular ophthalmic exams, renal studies must be continued

• Advise that major toxicities may necessitate discontinuing product

**BLACK BOX WARNING:** Advise to use contraception during treatment and that infertility may occur; men should use barrier contraception for 90 days after treatment

### Evaluation

**Positive therapeutic outcome**

• Decreased symptoms of CMV

## TREATMENT OF OVERDOSE:

Discontinue product; use hemodialysis, and increase hydration

## cilastatin

*See imipenem/cilastatin*

**⚠ HIGH ALERT**

## cilostazol (Rx)

(sih-los'tah-zol)

**Pletal**

*Func. class.:* Platelet aggregation inhibitor

*Chem. class.:* Quinolinone derivative

**Do not confuse:** Pletal/Plendil

**ACTION:** Multifactorial effects (antithrombotic, antiplatelet vasodilation)

**Therapeutic outcome:** Increased walking distance

**USES:** Intermittent claudication associated with PVD

## CONTRAINDICATIONS

Hypersensitivity, acute MI, active bleeding conditions, hemostatic conditions

**BLACK BOX WARNING:** HF

**Precautions:** Pregnancy, breastfeeding, children, geriatric, past liver disease, renal/cardiac disease, increased bleeding risk, low platelet count, platelet dysfunction, smoking

## DOSAGE AND ROUTES

**Adult:** PO 100 mg bid taken ≥30 min before or 2 hr after breakfast and dinner or 50 mg bid, if using products that inhibit CYP3A4 and CYP2C19; 12 wk of treatment may be needed for beneficial effect

**Available forms:** Tabs 50, 100 mg

### Implementation

• Give bid ≥1 hr before or 2 hr after meals with a full glass of water; do not give with grapefruit juice

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache*
**CV:** *Palpitations, tachycardia,* nodal dysrhythmia, postural hypotension, chest pain
**EENT:** Blindness, diplopia, ear pain, tinnitus, retinal hemorrhage
**GI:** *Nausea, vomiting, diarrhea, GI discomfort,* colitis, cholelithiasis, ulcer, esophagitis, gastritis, anorexia, *flatulence, dyspepsia*
**GU:** Cystitis, frequency, vaginitis, vaginal hemorrhage, hematuria
**HEMA:** Bleeding (epistaxis, hematuria, retinal hemorrhage, GI bleeding), thrombocytopenia, anemia, polycythemia; aplastic anemia
**INTEG:** *Rash,* urticaria, dry skin, Stevens-Johnson syndrome
**MISC:** *Back pain,* headache, *infection, myalgia, peripheral edema,* chills, fever, malaise, diabetes mellitus
**RESP:** *Cough, pharyngitis, rhinitis,* asthma, pneumonia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 95%-98% protein binding |
| **Metabolism** | Hepatic extensively by CYP450 enzymes (active metabolite) |
| **Excretion** | Urine (74%), feces (20%) |
| **Half-life** | 11-13 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Abciximab, eptifibatide, ticlopidine, tirofiban: increased bleeding tendencies
Clarithromycin, dilTIAZem, erythromycin, omeprazole, verapamil: increased cilostazol levels
Fluconazole, FLUoxetine, fluvoxaMINE, gemfibrozil, isoniazid, itraconazole, ketoconazole, omeprazole, voriconazole: may increase cilostazol levels; exercise caution when coadministering and reduce dose to 50 mg bid

**BLACK BOX WARNING:** Decrease: Survival rates: inamrirone, milrinone in those with heart failure class III, IV

### Drug classifications

Anticoagulants, NSAIDs, thrombolytics: may increase bleeding tendencies
CYP3A4 inducers: decreased cilostazol
Protease inhibitors, CYP3A4 inhibitors, CYP2C19 inhibitors: increased cilostazol levels

### Drug/food

Grapefruit juice: do not use; toxicity may occur
High-fat meals: increased cilostazol action; avoid giving with food

### Drug/herb

Feverfew, garlic, ginger, ginkgo biloba: decreased cilostazol action

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess for underlying CV disease since CV risk is great; for CV lesions with repeated oral use; do not use in heart failure of any severity for severe headache, signs of toxicity

• **Beers:** Avoid in older adults, may promote fluid retention and/or exacerbate heart failure
• Assess for CV lesions with repeated oral administration
• Assess for HF
• Monitor blood studies: CBC, Hct, Hgb, pro-time if patient is on long-term therapy; thrombocytopenia, neutropenia may occur
• **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, excreted in breast milk, discontinue breastfeeding or discontinue product

### Patient/family education

• Teach patient to avoid hazardous activities until effect is known
• Advise patient to report any unusual bleeding to prescriber
• Caution patient to report side effects such as diarrhea, skin rashes, subcutaneous bleeding
• Teach patient that effects may take 2-4 wk, treatment of up to 12 wk may be required for necessary effect
• Teach patients with HF about potential risks
• Advise patient to take ≥1 hr before or 2 hr after meals
• Advise patient that reading patient package insert is necessary
• Advise patient to discontinue tobacco use, not to drink grapefruit juice

• Advise that there are many drug and herb interactions; obtain approval by prescriber before use

### Evaluation
**Positive therapeutic outcome**
• Increased walking distance and duration
• Decreased pain

## cimetidine (OTC, Rx)
(sye-met'i-deen)
**Gaviscon Prevent 🍁, Nu-Cimet 🍁, Tagamet, Tagamet HB**
*Func. class.:* $H_2$-receptor antagonist
*Chem. class.:* Imidazole derivative

**ACTION:** Inhibits histamine at $H_2$-receptor site in the gastric parietal cells, which inhibits gastric acid secretion

**Therapeutic outcome:** Healing of duodenal or gastric ulcers; prevention of duodenal ulcers; decreases symptoms of gastroesophageal reflux disease (GERD) and Zollinger-Ellison syndrome

**USES:** Short-term treatment of duodenal and gastric ulcers and maintenance; management of GERD, Zollinger-Ellison syndrome; prevention of upper GI bleeding; prevent, relieve heartburn, acid indigestion, upper GI bleeding

**Unlabeled uses:** Prevention of aspiration pneumonitis, stress ulcers

## CONTRAINDICATIONS
Hypersensitivity to this product, $H_2$ blockers, benzyl alcohol

**Precautions:** Pregnancy, breastfeeding, child <16 yr, geriatric, organic brain syndrome, renal/hepatic disease

## DOSAGE AND ROUTES
### Treatment of active ulcers
**Adult/adolescent ≥16 yr:** PO 300 mg qid with meals, at bedtime × 8-12 wk or 400 mg bid, 800 mg at bedtime; after 8 wk give at bedtime dose only; **IV** BOL 300 mg/20 ml 0.9% NaCl over 1-2 min q6hr; **IV** INF 300 mg/50 ml $D_5W$ over 15-20 min; IM 300 mg q6hr, max 2400 mg
**Child:** PO 20-40 mg/kg/day, divided q6hr IM/**IV** 5-10 mg/kg q6-8hr

### Prophylaxis of duodenal ulcer
**Adult and child >16 yr:** PO 400 mg at bedtime or 300 mg bid

### GERD
**Adult:** PO 800-1600 mg/day in divided doses × ≤12 wk

### Hypersecretory conditions (Zollinger-Ellison syndrome)
**Adult:** PO/IM/**IV** 300-600 mg q6hr; may increase to 12 g/day if needed; OTC use up to 200 mg daily or bid, max 2 ×/wk

### Upper GI bleeding prophylaxis
**Adult:** **IV** 50 mg/hr; lowered in renal disease

### Heartburn
**Adult/child ≥12 yr:** PO 200 mg Tagamet HB up to bid, may use prior to eating, max 400 mg/day, max daily use up to 2 wk

### Renal dose
**Adult:** PO/IV CCr <30 ml/min 300 mg q12hr

**Available forms:** Tabs 200, 300, 400, 800 mg; liquid 300 mg/5 ml; inj 300 mg/2 ml, 300 mg/50 ml 0.9% NaCl

### Implementation
**PO route**
• Give with meals for lengthened product effect; antacids 1 hr before or 1 hr after cimetidine
**IM route**
• May give undiluted
• Give at end of dialysis
• Inject deeply into large muscle mass, aspirate
**IV route**
• Give by **direct IV** after diluting 300 mg/20 ml of 0.9% NaCl for inj; give over ≥5 min
• Give **intermittent IV** by diluting 300 mg/50 ml of $D_5W$; run over ≥30 min
• Give by **cont inf** after using total daily dose (900 mg) diluted in 100-1000 ml $D_5W$ given over 24 hr
• Store diluted sol at room temperature up to 48 hr

**Y-site incompatibilities:** Amsacrine

**Y-site compatibilities:** Acetaminophen, acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex/liposome, anakinra, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cephalothin, cephapirin, chlorproMAZINE, cisatracurium, CISplatin, cladribine, clarithromycin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin,

dexamethasone, dexmedetomidine, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, DOXOrubicin liposome, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gallium, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepan, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, meropenem, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G sodium/potassium, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin, piperacillin/tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, raNITIdine, remifentanil, Ringer's ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, topotecan, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** *Confusion, headache,* depression, dizziness, anxiety, weakness, psychosis, tremors, seizures
**CV:** Bradycardia, tachycardia, dysrhythmias
**GI:** *Diarrhea,* abdominal cramps, paralytic ileus, *jaundice*
**GU:** Gynecomastia, galactorrhea, impotence, increase in BUN, creatinine
**HEMA:** Agranulocytosis, thrombocytopenia, neutropenia, aplastic anemia, increase in pro-time
**INTEG:** Urticaria, rash, alopecia, sweating, flushing, exfoliative dermatitis
**RESP:** Pneumonia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM); completely absorbed (**IV**) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver (30%) |
| **Excretion** | Kidneys, unchanged (70%); breast milk |
| **Half-life** | 1½-2 hr; increased in renal disease |

### Pharmacodynamics

| | PO | IM/IV |
|---|---|---|
| **Onset** | ½ hr | 10 min |
| **Peak** | 45-90 min | ½ hr |
| **Duration** | 4-5 hr | 4-5 hr |

## INTERACTIONS

### Individual drugs

CarBAMazepine, chloroquine, lidocaine, metroNIDAZOLE, moricizine, phenytoin, quiNIDine, quiNINE, valproic acid, warfarin: increased toxicity (CYP450 pathway)
Carmustine: increased bone marrow suppression
Itraconazole: decreased absorption of itraconazole
Ketoconazole: decreased absorption of ketoconazole
Sucralfate: decreased cimetidine absorption

### Drug classifications

Antacids: decreased absorption of cimetidine
Antidepressants (tricyclic), benzodiazepines, β-adrenergic blockers, calcium channel blockers, phenytoin, sulfonylureas, theophyllines: increased toxicity (CYP450 pathway)

### Drug/lab test

Increased: alkaline phosphatase, AST, creatinine, prolactin
False positive: Hemoccult, Gastroccult tests
False negative: TB skin tests

## NURSING CONSIDERATIONS

### Assessment

- **Ulcer symptoms:** Assess patient with ulcers or suspected ulcers: epigastric or abdominal pain, hematemesis, occult blood in stools, blood in gastric aspirate before and/or throughout treatment
- **Beers:** Avoid in older adults with or at high risk of delirium
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits

outweigh fetal risk, excreted in breast milk, avoid breastfeeding

### Patient/family education

- Advise patient that any gynecomastia or impotence that develops is reversible after treatment is discontinued
- Caution patient to avoid driving, other hazardous activities until stabilized on this medication; drowsiness or dizziness may occur
- Advise patient to avoid black pepper, caffeine, alcohol, harsh spices, extremes in temperature of food; tell patient to avoid OTC preparations: aspirin, cough, cold preparations; condition may worsen, OTC therapy is used for short term (2 wk)
- Advise patient that smoking decreases the effectiveness of the product; smoking cessation should be considered
- Teach patient to use increased fluids, bulk in diet to decrease constipation
- Teach patient that product must be continued for prescribed time to be effective and taken exactly as prescribed; doses are not to be doubled; to take missed dose when remembered up to 1 hr before next dose; if taking OTC, not to use maximum dose >2 wk, unless directed by prescriber
- Instruct patient to report bruising, fatigue, malaise; blood dyscrasias may occur
- Have patient report to prescriber immediately any diarrhea, black tarry stools, sore throat, dizziness, confusion, or delirium

### Evaluation

**Positive therapeutic outcome**

- Decreased pain in abdomen
- Healing of ulcers
- Absence of gastroesophageal reflux
- Gastric pH of ≥5

## cinacalcet (Rx)

(sin-a-kal′set)

**Sensipar**

*Func. class.:* Calcium receptor agonist
*Chem. class.:* Polypeptide hormone

**ACTION:** Directly lowers PTH levels by increasing sensitivity of calcium sensing receptors to extracellular calcium

**Therapeutic outcome:** Decreased symptoms of hypercalcemia

**USES:** Hypercalcemia in parathyroid carcinoma, secondary hyperparathyroidism in chronic kidney disease on dialysis, primary hyperparathyroidism

## CONTRAINDICATIONS

Hypersensitivity, hypocalcemia

**Precautions:** Pregnancy, breastfeeding, children, seizure disorders, hepatic disease

## DOSAGE AND ROUTES

### Parathyroid carcinoma

**Adult:** PO 30 mg bid, titrate q2-4wk, with sequential doses of 30 mg bid, 60 mg bid, 90 mg bid, 90 mg tid-qid to normalize calcium levels

### Secondary hyperparathyroidism

**Adult:** PO 30 mg daily, titrate no more frequently than 2-4 wks with sequential doses of 30, 60, 90, 120, 180 mg daily

**Available forms:** Tabs 30, 60, 90 mg

### Implementation

- Swallow tabs whole; do not break, crush, chew, or divide tabs
- Can be used alone or in combination with vit D sterols and/or phosphate binders
- Take with food or shortly after meal

**Secondary hyperthyroidism**

- Titrate q2-4wk to target iPTH consistent with National Kidney Foundation—Kidney Disease Outcomes Quality Initiative (NKF-K/DOQI) for chronic kidney disease patient on dialysis of 150-300 pg/ml; if iPTH drops below 150-300 pg/ml, reduce dose of cinacalcet and/or vit D sterols or discontinue treatment
- Store at <77° F (25° C)

## ADVERSE EFFECTS

**CNS:** Dizziness, asthenia, seizures, tetany, hallucinations, depression, headache
**CV:** Hypertension, dysrhythmia exacerbation
**GI:** Nausea, diarrhea, vomiting, anorexia
**MISC:** Access infection, noncardiac chest pain, hypocalcemia
**MS:** Myalgia, bone fractures

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 93%-97% bound to plasma |
| **Distribution** | Unknown |
| **Metabolism** | Proteins metabolized by CYP3A4, 2D6, 1A2 |
| **Excretion** | Renal (80% renal, 15% feces) |
| **Half-life** | 30-40 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Flecainide, thioridazine, vinBLAStine: increased levels of CYP2D6 inhibitors; adjustments may be necessary

### Drug classifications
Products metabolized by CYP3A4 inhibitors (erythromycin, itraconazole, ketoconazole): increased cinacalcet levels
Tricyclics: increased levels of CYP2D6 inhibitors)

### Drug/food
High-fat meal: increased action

## NURSING CONSIDERATIONS
### Assessment
• Assess for **hypocalcemia:** cramping, seizures, tetany, myalgia, paresthesia
• Monitor calcium, phosphorous within 1 wk and iPTH 1-4 wk after initiation or dosage adjustment when maintenance is established; measure calcium, phosphorus monthly; iPTH q1-3mo, target range 150-300 pg/ml for iPTH level; biochemical markers of bone formation/resorption, radiologic evidence of fracture; if calcium <8.4 mg/dl, do not start therapy, if calcium is 7.5-8.4 mg/dl give calcium-containing phosphate binders, vitamin D sterols to increase calcium, if calcium <7.5 mg/day or if symptoms of hypocalcemia continue and vitamin D cannot be increased, withhold product until calcium reaches 8.0 mg/dl, symptoms resolve, start product at next lowest dose
• **Renal disease (without dialysis):** These patients should not receive treatment with this product, high risk of hypocalcemia
• **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, pregnant patients should enroll in Amgen's Pregnancy Surveillance Program 800-772-6436, discontinue breastfeeding or products, excretion unknown

### Patient/family education
• Instruct patient to take with food or shortly after a meal, to take tabs whole, not to take any other meds, supplements without prescriber approval
• Instruct patient to immediately report cramping, seizures, muscle pain, tingling, tetany
• Liver studies in those with liver disease

### Evaluation
**Positive therapeutic outcome**
• Calcium levels 9-10 mg/dl, decreasing symptoms of hypercalcemia

## ciprofloxacin (Rx)
(sip-ro-floks'a-sin)
**Cipro, Cipro XR**
*Func. class.:* Antiinfectives, broad-spectrum
*Chem. class.:* Fluoroquinolone

**Do not confuse:** ciprofloxacin/cephalexin

**ACTION:** Interferes with conversion of intermediate DNA fragments into high-molecular-weight DNA in bacteria; DNA gyrase inhibitor

**Therapeutic outcome:** Bactericidal action against the following: gram-positive organisms *Staphylococcus epidermidis,* methicillin-resistant strains of *Staphylococcus aureus;* gram-negative organisms *Escherichia coli, Klebsiella* species, *Enterobacter, Salmonella, Proteus vulgaris, Pseudomonas aeruginosa, Serratia, Campylobacter jejuni*

**USES:** Adult urinary tract infections (including complicated); chronic bacterial prostatitis; acute sinusitis; infectious diarrhea; typhoid fever; complicated intraabdominal infections; nosocomial pneumonia; exposure to inhalation anthrax

## CONTRAINDICATIONS
Hypersensitivity to quinolones

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal disease, seizure disorder, stroke, CV disease, hepatic disease, QT prolongation, hypokalemia, colitis

**BLACK BOX WARNING:** Tendon pain/rupture, tendonitis, myasthenia gravis, neurotoxicity

## DOSAGE AND ROUTES
### Uncomplicated urinary tract infections
**Adult:** PO 250 mg q12hr × 3 days or XL 500 mg q24hr × 3 days

### Complicated/severe urinary tract infections
**Adult:** PO 500 mg q12hr or XL 1000 mg q24hr × 7-14 days; **IV** 400 mg q12hr

### Respiratory, bone, skin, joint infections (mild-moderate)
**Adult:** PO 500-750 mg q12hr × 7-14 days; **IV** 400 mg q12hr

### Nosocomial pneumonia
**Adult:** **IV** 400 mg q8hr × 10-14 days

### Intraabdominal infections, complicated
**Adult:** PO 500 mg q12hr × 7-14 days, **IV** 400 mg q12hr × 7-14 days, usually given with metroNIDAZOLE

### Acute sinusitis, mild/moderate
**Adult:** PO 500 mg q12hr × 10 days; **IV** 400 mg q12hr × 10 days

### Inhalational anthrax (postexposure)
**Adult:** PO 500 mg q12hr × 60 days; **IV** 400 mg q12hr × 60 days

**Child:** PO 15 mg/kg/dose q12hr × 60 days, max 500 mg/dose; **IV,** 10 mg/kg q12hr, max 400 mg/dose

### Infectious diarrhea
**Adult:** PO 500-750 mg q12hr × 5-7 days

### Chronic bacterial prostatitis
**Adult:** PO 500 mg q12hr × 28 days; **IV** 400 mg q12hr × 28 days

### Renal dose
**Adult:** PO CCr 30-50 ml/min PO 250-500 mg q12hr; CCr 5-29 ml/min PO 250-500 mg q18hr; IV 200-400 mg q18-24hr

**Available forms:** Tabs 100, 250, 500, 750 mg; ext rel tabs (XR) 500, 1000 mg; powder for oral susp 5%, 10%; inj 200 mg/20 ml, 400 mg/40 ml, 200 mg/100 ml $D_5$, 400 mg/200 ml $D_5$; oral susp 250, 500 mg/5 ml

### Implementation
Obtain C&S before use, may give first dose before results are received

**PO route**
- Give around the clock to maintain proper blood levels
- Administer 6 hr before or 2 hr after antacids, zinc, iron, calcium; use adequate fluids to prevent crystalluria
- Do not give oral sup by GI tube
- Limit intake of alkaline soda, products with milk, dairy products, alkaline antacids, sodium bicarbonate
- Ext rel and regular release are not interchangeable
- Do not add or stop products without prescriber's approval
- Use calibrated measuring device for suspension

**IV route**
- Check for irritation, extravasation, phlebitis daily
- For **intermittent inf,** dilute to 1-2 mg/ml of $D_5W$, 0.9% NaCl; give over 60 min; it will remain stable under refrigeration for 2 wk, diluted vials can be stored for 14 days at room temperature or in refrigerator, do not freeze

**Y-site incompatibilities:** Argatroban, arsenic, heparin, mezlocillin

## ADVERSE EFFECTS
**CNS:** *Headache,* dizziness, fatigue, insomnia, depression, *restlessness,* seizures, confusion, hallucinations
**GI:** *Nausea,* increased ALT, AST, flatulence, heartburn, *vomiting, diarrhea,* oral candidiasis, dysphagia, dry mouth, abdominal pain, pancreatitis
**GU:** Crystalluria, interstitial neuritis
**HEMA:** Bone marrow depression, agranulocytosis, eosinophilia
**INTEG:** *Rash,* pruritus, urticaria, photosensitivity, flushing, fever, chills, toxic epidermal necrolysis, injection site reactions
**MISC:** Anaphylaxis, Stevens-Johnson syndrome, visual impairment, QT prolongation, pseudotumor cerebri
**MS:** Tremor, arthralgia, tendon rupture

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (75%) (PO) |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver (15%) |
| **Excretion** | Kidneys (40%-50%) |
| **Half-life** | 4 hr; increased in renal disease |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Rapid | Immediate |
| **Peak** | 4 hr | Infusion's end |

## INTERACTIONS
### Individual drugs
Alfuzosin, arsenic trioxide, astemizole, chloroquine, cloZAPine, cyclobenzaprine, dasatinib, dolasetron, droperidol, flecainide, haloperidol, lapatinib, levomethadyl, methadone, octreotide, ondansetron, paliperidone, palonosetron, pentamidine, probucol, propafenone, ranolazine, risperiDONE, sertindole, SUNItinib, tacrolimus, terfenadine, vardenafil, vorinostat, ziprasidone: increased QT prolongation; less likely than other quinolones
CYP1A2 inhibitors: increased levels of CYP1A2 inhibitors
Calcium, enteral feeding, iron, sucralfate, sevelamer, zinc sulfate: decreased ciprofloxacin absorption
CycloSPORINE: increased nephrotoxicity
Probenecid: increased blood levels of ciprofloxacin, increased toxicity
Theophylline: increased theophylline levels, monitor blood levels, reduce dose
Warfarin: increased warfarin effect, monitor blood levels

### Drug classifications
Antacids (containing magnesium, aluminum), iron salts: decreased absorption of ciprofloxacin
β-agonists, class IA/III antidysrhythmics, halogenated anesthetics, local anesthetics, macrolides, phenothiazines, tetracyclines, tricyclics: increased QT prolongation

**BLACK BOX WARNING:** Corticosteroids: increased tendonitis, tendon rupture

### Drug/food
Dairy products, food: decreased absorption

### Drug/lab test
Increased: AST, ALT, bilirubin, BUN, creatinine, alkaline phosphatase, LDH, glucose, proteinuria, albuminuria
Decreased: WBC, glucose

## NURSING CONSIDERATIONS

### Assessment
- Assess patient for previous sensitivity reaction
- Assess patient for signs and symptoms of **infection** including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, fever; obtain baseline information before, during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- Assess for **Stevens Johnson syndrome**, anaphylaxis: rash, urticaria, dyspnea, pruritus, chills, fever, joint pain; discontinue immediately, have emergency equipment nearby may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also check for increased BUN, creatinine
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy

**BLACK BOX WARNING:** Myasthenia gravis: avoid use in these patients, increases muscle weakness

- **QT prolongation:** monitor for changes in QTc if taking other products that increase QT
- Assess for **CNS symptoms:** headache, dizziness, fatigue, insomnia, depression, seizures
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- Assess for **overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

**BLACK BOX WARNING:** Assess for tendon pain, especially in children

**BLACK BOX WARNING:** Tendonitis, tendon rupture: discontinue at first sign of tendon pain, inflammation; increased in those >60 yr, those taking corticosteroids, organ transplant recipients

- **Pseudomotor cerebri:** may occur at excessive doses
- *Clostridium difficile*–associated diarrhea (CDAD); monitor for diarrhea, abdominal pain, cramps, fever, bloody stools, usually occurs several weeks after completion of therapy, report to prescriber immediately
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, excreted in breast milk, discontinue breastfeeding or product

### Patient/family education
- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Teach patient to contact prescriber if adverse reaction occurs or if inflammation or pain in tendon occurs before, 6 hr after
- Teach patient not to crush or chew the extended-release product
- Instruct patient to take all medication prescribed for the length of time ordered; product must be taken around the clock to maintain blood levels; do not give medication to others

**BLACK BOX WARNING:** Teach patient to report tendon pain, chest pain, palpitations

- Advise patient to rinse mouth frequently, use sugarless candy or gum for dry mouth, to drink fluids to prevent crystals in urine
- Teach patient to notify prescriber if rash occurs, discontinue product
- Teach patient to notify prescriber if pregnancy is planned or suspected, do not breastfeed
- Teach patient to contact prescriber if taking theophylline, warfarin

### Evaluation
**Positive therapeutic outcome**
- Absence of signs/symptoms of infection (WBC <10,000/mm$^3$, temp WNL, absence of red draining wounds)
- Reported improvement in symptoms of infection

## ciprofloxacin ophthalmic
*See Appendix B*

**⚠ HIGH ALERT**

## cisatracurium (Rx)

(sis-a-tra-cyoor'ee-um)
**Nimbex**
*Func. class.:* Neuromuscular blocker (nondepolarizing)

**ACTION:** Inhibits transmission of nerve impulses by binding with cholinergic receptor sites, antagonizing action of acetylcholine

**Therapeutic outcome:** Paralysis of body for administration of anesthesia

**USES:** Facilitation of endotracheal intubation, skeletal muscle relaxation during mechanical ventilation surgery, or general anesthesia

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children <2 yr, electrolyte imbalances, dehydration, cardiac/neuromuscular/respiratory disease, metabolic alkalosis, respiratory acidosis, myopathy, myasthenia gravis

## DOSAGE AND ROUTES

**Adult: IV** 0.15 and 0.2 mg/kg depending on desired time to intubate and length of surgery: use peripheral nerve stimulation to evaluate dosage
**Child 2-12 yr: IV** 0.1 mg/kg over 5-10 sec with halothane or opioid anesthesia

**Available forms:** Inj 2, 10 mg/ml

### Implementation

**IV route**
- Use nerve stimulator by anesthesiologist to determine neuromuscular blockade
- Give anticholinesterase to reverse neuromuscular blockade
- Give by slow **IV** only by qualified person; do not administer IM
- Store in light-resistant area
- Reassure if communication is difficult during recovery from neuromuscular blockage

## ADVERSE EFFECTS

**CV:** Bradycardia, tachycardia; increased, decreased B/P
**EENT:** Increased secretions
**INTEG:** Rash, flushing, pruritus, urticaria
**RESP:** Prolonged apnea, bronchospasm, cyanosis, respiratory depression

### Pharmacokinetics

Unknown

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1-3 min |
| **Peak** | 2-5 min |
| **Duration** | 30-40 min |

## INTERACTIONS

### Individual drugs

CarBAMazepine, phenytoin: decreased duration of neuromuscular blockade, dose of cisatracurium may need to be increased
Isoflurane, lithium: increased neuromuscular blockade
Succinylcholine: decreased neuromuscular blockade

### Drug classifications

Aminoglycosides, antibiotics (polymix), β-adrenergic blockers, opioids: increased neuromuscular blockade

## NURSING CONSIDERATIONS

### Assessment

- This product is not an analgesic, treat pain with other agents
- Assess for **electrolyte imbalances** (K, Mg), may lead to increased action of this product
- Assess vital signs (B/P, pulse, respirations, airway) until fully recovered; rate, depth, pattern of respirations; strength of handgrip
- Assess I&O ratio: check for urinary retention, frequency, hesitancy
- Assess **recovery:** decreased paralysis of face, diaphragm, legs, arms, rest of body
- Assess **allergic reactions:** rash, fever, respiratory distress, pruritus; product should be discontinued
- **Malignant hyperthermia:** Assess for malignant hyperthermia in those with a family history; the product should be used cautiously or avoided in these patients
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Evaluation

**Positive therapeutic outcome**
- Paralysis of jaw, eyelid, head, neck, rest of body

## TREATMENT OF OVERDOSE:

Neostigmine, atropine, monitor VS; mechanical ventilation

**⚠ HIGH ALERT**

## CISplatin (Rx)

(sis′pla-tin)

**Platinol** 🍁

*Func. class.:* Antineoplastic alkylating agent

*Chem. class.:* Inorganic heavy metal

**Do not confuse:** CISplatin/CARBOplatin

**ACTION:** Alkylates DNA, RNA; inhibits enzymes that allow synthesis of amino acids in proteins; activity is not cell cycle phase specific

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Advanced bladder cancer; adjunctive in metastatic testicular cancer and metastatic ovarian cancer

## CONTRAINDICATIONS

Pregnancy, breastfeeding

**BLACK BOX WARNING:** Bone marrow suppression, platinum compound hypersensitivity

**Precautions:** Geriatric patients, vaccination, infections, extravasation, peripheral neuropathy, radiation therapy

**BLACK BOX WARNING:** Chemotherapy-induced nausea/vomiting; in children, nephrotoxicity, ototoxicity; requires a specialized care setting and an experienced clinician

## DOSAGE AND ROUTES

Dosage protocols may vary

### Metastatic testicular cancer

**Adult: IV** 20 mg/m$^2$ daily × 5 days, repeat q3wk for 2 cycles or more, depending on response

### Advanced bladder cancer

**Adult: IV** 50-70 mg/m$^2$ q3-4wk

### Metastatic ovarian cancer

**Adult: IV** 100 mg/m$^2$ q4wk or 75-100 mg/m$^2$ q3wk with cyclophosphamide therapy

**Available forms:** Inj 0.5 mg/ml 🍁, 1 mg/ml

### Implementation

**IV route**

- Hydrate patient with 0.9% NaCl over 8-12 hr before treatment
- Give all medications PO, if possible; avoid IM inj when platelets <100,000/mm$^3$
- Give EPINEPHrine, antihistamines, corticosteroids for hypersensitivity reaction; antiemetic 30-60 min before giving product to prevent vomiting, and prn; allopurinol or sodium bicarbonate to maintain uric acid level, alkalinization of urine; antibiotics for prophylaxis of infection; diuretic (furosemide 40 mg **IV**) or mannitol after infusion
- Prepare in biological cabinet using gown, gloves, mask; do not allow product to come in contact with skin; use soap and water if contact occurs, use cytotoxic handling procedures
- Do not use aluminum equipment during any preparation or administration, will form precipitate; do not refrigerate unopened powder or solution; protect from sunlight

**Intermittent IV infusion route**

- Give after **diluting** 10 mg/10 ml or 50 mg/50 ml sterile water for inj; **withdraw** prescribed dose, **dilute** ½ dose with 1000 ml $D_5$ 0.2 NaCl or $D_5$ 0.45 NaCl with 37.5 g mannitol; **IV** inf is **given** over 3-4 hr; use a 0.45 μm filter; total dose 2000 ml over 6-8 hr; check site for irritation, phlebitis; do not use equipment containing aluminum

**Continuous IV infusion route**

- Give over 24 hr × 5 days

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amikacin, aminophylline, amiodarone, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, carmustine, caspofungin, ceFAZolin, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE,

midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, nafcillin, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phenytoin, piperacillin, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quiNIDine, quinupristin-dalfopristin, raNITIdine, remifentanil, riTUXimab, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Solution compatibilities:** $D_5$/0.225% NaCl, $D_5$/0.45% NaCl, $D_5$/0.9% NaCl, $D_5$/0.45% NaCl with mannitol 1.875%, $D_5$/0.33% NaCl with mannitol 1.875%, $D_5$/0.33% NaCl with KCl 20 mEq and mannitol 1.875%, 0.9% NaCl, 0.45% NaCl, 0.3% NaCl, 0.225% NaCl, water

**Solution incompatibilities:** Sodium bicarbonate 5%, 0.1% NaCl, water

## ADVERSE EFFECTS

**CNS:** Seizures, *peripheral neuropathy*
**CV:** Cardiac abnormalities
**EENT:** *Tinnitus, hearing loss, vestibular toxicity*, blurred vision, altered color perception
**GI:** *Severe nausea, vomiting, diarrhea, weight loss*
**GU:** Renal tubular damage, *renal insufficiency,* impotence, sterility, amenorrhea, gynecomastia, hyperuremia
**HEMA:** Thrombocytopenia, leukopenia, pancytopenia, *anemia*
**INTEG:** *Alopecia,* dermatitis
**META:** *Hypomagnesemia, hypocalcemia, hypokalemia*, hypophosphatemia
**RESP:** Fibrosis
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Widely distributed, accumulates in body tissues for several months |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 24 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol, aspirin: increased risk of bleeding
Bumetanide, ethacrynic acid, furosemide: ototoxicity
Phenytoin: decreased phenytoin effect

### Drug classifications

Aminoglycosides, diuretics (loop), salicylates: increased nephrotoxicity
Myelosuppressive agents, radiation: increased myelosuppression
NSAIDs: increased risk of bleeding
Vaccines, live virus: decreased antibody response

### Drug/lab test

Increased: uric acid, BUN, creatinine
Decreased: CCr, calcium, phosphate, potassium, magnesium
Positive: Coombs' test

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Monitor for **bone marrow depression:** CBC, differential, platelet count weekly; withhold product if WBC count is $<4000/mm^3$ or platelet count is $<100{,}000/mm^3$; notify prescriber of results if WBC $<20{,}000/mm^3$, platelets $<150{,}000/mm^3$

**BLACK BOX WARNING:** Monitor **renal toxicity:** BUN, creatinine, serum uric acid, urine CCr before, during therapy; I&O ratio; report fall in urine output to <30 ml/hr; dose should not be given if BUN <25 mg/dl; creatinine <1.5 mg/dl, toxicity is cumulative, withhold until renal function returns to normal

**BLACK BOX WARNING:** Assess for anaphylaxis: wheezing, tachycardia, facial swelling, fainting; discontinue product and report to prescriber; resuscitation equipment should be nearby, may occur within minutes; often EPINEPHrine, corticosteroids, antihistamines may alleviate symptoms

- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding
- Monitor temp q4hr (may indicate beginning of infection)
- Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; note yellowing of skin or sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

• Assess for increased uric acid levels, swelling, joint pain primarily in extremities; patient should be well hydrated to prevent urate deposits
• Assess for **bleeding:** hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr; note inflammation of mucosa, breaks in skin
• Identify dyspnea, crackles, nonproductive cough, chest pain, tachypnea

**BLACK BOX WARNING: Ototoxicity:** more common in genetic variants TPMT 3B and 3C in children; use audiometric testing baseline and before each dose, usually tinnitus or loss of high-frequency sounds are first indication of ototoxicity

• Identify effects of alopecia on body image; discuss feelings about body changes
• Identify edema in feet, joint pain, stomach pain, shaking; prescriber should be notified

### Patient/family education

• Teach patient to avoid use of products containing aspirin or ibuprofen, NSAIDs, alcohol (may cause GI bleeding), razors, commercial mouthwash; to report symptoms of bleeding (hematuria, tarry stools, bruising, petechiae)
• Advise patient to report numbness, tingling in face or extremities, poor hearing or joint pain, swelling
• Instruct patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath)
• Instruct patient to report any changes in breathing or coughing even several months after treatment; to avoid crowds and persons with respiratory tract or other infections
• Advise patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
• Tell patient not to have any vaccinations without the advice of the prescriber; serious reactions can occur
• **Pregnancy/breastfeeding:** caution patient contraception is needed during treatment and for 4 months after the completion of therapy, pregnancy

**BLACK BOX WARNING: Ototoxicity:** teach patient to report loss of hearing, ringing or roaring in the ears

### Evaluation

**Positive therapeutic outcome**
• Prevention of rapid division of malignant cells

## citalopram (Rx)

(sigh-tal′oh-pram)
**CeleXA**
*Func. class.:* Antidepressant
*Chem. class.:* Selective serotonin reuptake inhibitor (SSRI)

**Do not confuse:** CeleXA/CeleBREX/Cerebyx/ZyPREXA

**ACTION:** Inhibits CNS neuron uptake of serotonin but not of norepinephrine; weak inhibitor of CYP450 enzyme system, making it more appealing than other products

**Therapeutic outcome:** Decreased symptoms of depression after 2-3 wk

**USES:** Major depressive disorder

**Unlabeled uses:** Premenstrual disorders, panic disorder, social phobia, obsessive-compulsive disorder in adolescents, anxiety, hot flashes, menopause, adjunct in schizophrenia, PTSD

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, geriatric, renal/hepatic disease, seizure disorder, hypersensitivity to escitalopram, bradycardia, recent MI, abrupt discontinuation, QT prolongation

**BLACK BOX WARNING:** Children, suicidal ideation

## DOSAGE AND ROUTES

### Depression

**Adult:** PO 20 mg daily AM or PM, may increase if needed to 40 mg/day after 1 wk; maintenance: after 6-8 wk of initial treatment, continue for 24 wk (32 wk total)

### Hepatic dose/geriatric

**Adult:** PO 20 mg/day, may increase to 40 mg/day if no response

### Panic disorder (unlabeled)

**Adult:** PO 20-40 mg/day

### Premenstrual dysphoria, social phobia (unlabeled)

**Adult:** PO 10-30 mg/day used intermittently in premenstrual dysphoria

**Available forms:** Tabs 10, 20, 40 mg; oral SOL 10 mg/5 ml

### Implementation

• Give with food or milk for GI symptoms
• Give dosage at bedtime if oversedation occurs during day

• Leave orally disintegrating tabs on tongue and allow to dissolve before swallowing
• Store at room temperature; do not freeze
• Do not give within 14 days of MAOIs

## ADVERSE EFFECTS

**CNS:** *Headache, nervousness, insomnia, drowsiness, anxiety, tremor, dizziness, fatigue, sedation, poor concentration, abnormal dreams, agitation,* seizures, apathy, euphoria, hallucinations, delusions, psychosis, suicidal attempts, malignant neuroleptic-like syndrome reactions
**CV:** *Hot flashes, palpitations,* angina pectoris, hemorrhage, hypertension, tachycardia, 1st-degree AV block, bradycardia, MI, thrombophlebitis, QT prolongation, orthostatic hypotension, torsades de pointes
**EENT:** Vision changes, ear/eye pain, photophobia, tinnitus
**GI:** *Nausea, diarrhea, dry mouth, anorexia, dyspepsia, constipation, cramps, vomiting, taste changes, flatulence, decreased appetite*
**GU:** *Dysmenorrhea, decreased libido, urinary frequency, urinary tract infection,* amenorrhea, cystitis, impotence, urine retention
**INTEG:** *Sweating, rash, pruritus,* acne, alopecia, urticaria, photosensitivity
**MS:** *Pain,* arthritis, twitching
**RESP:** *Infection, pharyngitis, nasal congestion, sinus headache, sinusitis, cough, dyspnea, bronchitis,* asthma, hyperventilation, pneumonia
**SYST:** *Asthenia, viral infection, fever, allergy, chills,* hyponatremia (geriatric patients), serotonin syndrome, neonatal abstinence syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver, by CYP1A2, CYP2D6 several patients are poor metabolizers |
| **Excretion** | Kidneys, steady state 28-35 days |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
CarBAMazepine, cloNIDine: decreased citalopram levels
Lithium, linezolid, methylene blue, tricyclics, fentaNYL, busPIRone, triptans, traMADol, traZODone: increased serotonin syndrome
Pimoside, ziprasidone: increased QTc interval; do not use together

### Drug classifications

Anticoagulants, antiplatelets, NSAIDs, salicylates, thrombolytics: increased risk of bleeding
Antidepressants (tricyclics): increased effect, use cautiously
Antifungals (azole), macrolides: increased citalopram levels
β-Adrenergic blockers: increased plasma levels of β-blockers
Barbiturates, benzodiazepines, CNS depressants, sedatives/hypnotics: increased CNS depression
**MAOIs:** hypertensive crisis, seizures, fatal reactions; do not use together within 14 days
**Quinolones:** increased QTc interval; do not use together
Serotonin receptor agonists, SNRIs, SSRIs: increased serotonin syndrome

### Drug/herb

SAM-e, St. John's wort: serotonin syndrome; do not use with citalopram; fatal reaction may occur
Yohimbe: increased CNS stimulation

### Drug/lab test

Increased: serum bilirubin, blood glucose, alkaline phosphatase
Decreased: VMA, 5-HIAA
False increase: increased urinary catecholamines

## NURSING CONSIDERATIONS

### Assessment

• Monitor B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product and notify prescriber; take vital signs q4hr in patients with cardiovascular disease
• Monitor blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy; check platelets; bleeding can occur
• Monitor hepatic studies: AST, ALT, bilirubin
• Check weight qwk; appetite may increase with product
• Assess ECG for flattening of T wave, bundle branch block, AV block, dysrhythmias in cardiac patients, torsades de pointes, QT prolongation (effect is dose dependent)
• Assess EPS primarily in geriatric: rigidity, dystonia, akathisia

**BLACK BOX WARNING:** Assess mental status: mood, sensorium, affect, suicidal tendencies; increase in psychiatric symptoms: depression, panic, risk for suicide is greater in children and those ≤ 24 yr, these patients should be evaluated q4wk and q3wk × 4 wk

• Monitor urinary retention, constipation; constipation is more likely to occur in children or geriatric

- **Assess for serotonin syndrome:** increased heart rate, sweating, dilated pupils, tremors, twitching, hyperthermia, agitation, hyperreflexia, nausea, vomiting, diarrhea, coma, hallucinations; may be worse in those taking (SSRIs, SNRIs, triptans)
- Identify patient's alcohol consumption; if alcohol is consumed, hold dose until AM
- **Beers:** Avoid in older adults unless safer alternative is not available, may cause ataxia, impaired psychomotor function
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, excreted in breast milk, discontinue breastfeeding or product

### Patient/family education

- Teach patient that therapeutic effects may take 4-6 wk, not to discontinue abruptly
- Instruct patient to use caution in driving or other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing, especially geriatric patients

**BLACK BOX WARNING:** Advise that suicidal ideas, behavior may occur in children or young adults, to watch closely for suicidal thoughts, behaviors, notify prescriber immediately

- Caution patient to avoid alcohol ingestion, other CNS depressants
- To use sunscreen, protective clothing to prevent photosensitivity
- Teach patient to notify prescriber if planned or suspected pregnancy, not to breastfeed
- Instruct patient to increase fluids, bulk in diet if constipation, urinary retention occur, especially geriatric
- Advise patient to take gum, hard sugarless candy, or frequent sips of water for dry mouth
- Teach patient how to use orally disintegrating tabs
- **Teach patient to report serotonin syndrome:** sweating, dilated pupils, tremors, twitching, extreme heat, agitation

### Evaluation

**Positive therapeutic outcome**

- Decrease in depression
- Absence of suicidal thoughts

## clarithromycin (Rx)

(clare-i-thro-mye'sin)

**Biaxin, Biaxin XL**

*Func. class.:* Antiinfective

*Chem. class.:* Macrolide

**ACTION:** Binds to 50S ribosomal subunits of susceptible bacteria and suppresses protein synthesis

**Therapeutic outcome:** Bactericidal action against the following: *Streptococcus pneumoniae, Streptococcus pyogenes, Mycoplasma pneumoniae, Corynebacterium diphtheriae, Bordetella pertussis, Listeria monocytogenes, Haemophilus influenzae, Staphylococcus aureus, Mycobacterium avium (MAC), Legionella pneumophila, Moraxella catarrhalis, Neisseria gonorrhoeae,* complex infections in AIDS patients, *Helicobacter pylori* in combination with omeprazole, *Helicobacter parainfluenzae*

**USES:** Mild to moderate infections of the upper respiratory tract, lower respiratory tract; uncomplicated skin and skin structure infections

## CONTRAINDICATIONS

Hypersensitivity to this product or other macrolides, torsades de pointes, QT prolongation

**Precautions:** Pregnancy, breastfeeding, geriatric, renal/hepatic disease, QT prolongation

## DOSAGE AND ROUTES

### Acute exacerbation of chronic bronchitis

**Adult:** PO 250-500 mg q12hr × 7-14 days or 1000 mg/day × 7 days (XL)

### Pharyngitis/tonsillitis

**Adult:** PO 250 mg q12hr × 10 days

### Community-acquired pneumonia

**Adult:** PO 250 mg q12hr × 7-14 days or 1000 mg/day × 7 days (XL)

### Endocarditis prophylaxis

**Adult:** PO 500 mg 1 hr before procedure

### MAC prophylaxis/treatment

**Adult:** PO 500 mg bid, will require an additional antiinfective for active infection

### *H. pylori* infection

**Adult:** PO 500 mg with 30 mg lansoprazole and 1 g amoxicillin together q12hr × 10-14 days or 500 mg with omeprazole 20 mg and 1 g amoxicillin together q12hr × 10 days or 500 mg q8hr and omeprazole 40 mg q d × 14 days, continue omeprazole for 14 more days

### Acute maxillary sinusitis

**Adult:** PO 500 mg q12hr × 14 days

### Most infections

**Child:** PO 7.5 mg/kg q12hr × 10 days, max 500 mg/dose for MAC

### Renal dose

**Adult:** PO CCr 30-60 ml/min; decrease dose by 50% if using with ritonavir; CCr < 30 ml/min reduce dose by 50%, if used with ritonavir, reduce by 75%

**Available forms:** Tabs 250, 500 mg; oral susp 125, 250 mg/5 ml; ext rel tab (XL) 500 mg

### Implementation

- Do not break, crush, or chew ext rel tab
- Ensure adequate fluid intake (2 L) during diarrhea episodes
- Give q12hr to maintain serum level
- Store at room temperature
- **Susp:** Shake well, store at room temperature, discard after 2 wk
- **Ext Rel:** Give with food

## ADVERSE EFFECTS

**CV:** Ventricular dysrhythmias, QT prolongation
**GI:** Nausea, vomiting, diarrhea, hepatotoxicity, abdominal pain, stomatitis, heartburn, anorexia, abnormal taste, pseudomembranous colitis, tooth/tongue discoloration, pancreatitis
**GU:** Vaginitis, moniliasis, interstitial nephritis, azotemia
**HEMA:** Leukopenia, thrombocytopenia, increased INR
**INTEG:** Rash, urticaria, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis
**MISC:** Headache, hearing loss

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 50% |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, unchanged (20%-30%) |
| **Half-life** | 5-7 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr; Ext release: 5-7 hr; |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

ALPRAZolam, busPIRone, carBAMazepine, cycloSPORINE, digoxin, disopyramide, felodipine, fluconazole, omeprazole, tacrolimus, theophylline: increased levels, increased toxicity
CarBAMazepine: increased toxicity, from increased levels of carBAMazepine
Increase: Myopathy risk: atorvastatin, pravastatin, use lowest effective dose
Increase: Rhabdomyolysis risk: lovastatin, simvastatin, do not use concurrently
Cisapride, pimozide: increased effect, increased dysrhythmias
Theophylline: increased toxicity from increased levels of theophylline, increased oral anticoagulant effect
Increase: Bleeding risk with warfarin, monitor INR
Increase: Levels of sildenafil, tadalafil, vardenafil, avoid concurrent use

### Drug classifications

All products metabolized by CYP3A enzyme system: increased action, risk of toxicity
Antidiabetics: increased toxicity
Digoxin: increased blood levels of digoxin, increased digoxin effects
Calcium channel blockers, benzodiazepines: increased effects
Class IA, III antidysrhythmics, quiNIDine, procainamide, dofetilide, sotalol, amiodarone or other products that prolong QT: increased QT prolongation
Ergots: increased levels, increased toxicity
Oral anticoagulants: increased effects of oral anticoagulants

### Drug/food

Do not use with grapefruit juice

### Drug/herb

Decrease: Clarithromycin effect: St. John's wort

### Drug/lab test

Increased: AST, ALT, BUN, creatinine, LDH, total bilirubin, INR, PT

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for signs and symptoms of **infection** including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, earache, fever; obtain baseline information before, during treatment; obtain C&S before beginning product therapy to identify if correct treatment has been initiated, product may be given as soon as culture is taken, repeat after treatment
- Bleeding: check INR if anticoagulants are taken
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Assess for overgrowth of infection: perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- **Assess for QT prolongation, ventricular dysrhythmias:** monitor ECG, cardiac status in those with cardiac abnormalities
- **Assess for serious skin reaction:** Stevens-Johnson syndrome, toxic epidermal necrolysis, product should be discontinued immediately, may occur after therapy is concluded
- ***Clostridium difficile*–associated diarrhea (CDAD):** Monitor for diarrhea, cramping, blood in stools, fever, report immediately to prescriber, may start up to several weeks after conclusion of treatment

• **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, excreted in breast milk, cautious use in breastfeeding

### Patient/family education

• Advise patient to contact physician if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection
• Instruct patient to take all medication prescribed for the length of time ordered, ext rel with food
• Advise prescriber if pregnancy is planned or suspected
• Teach patient to notify prescriber of diarrhea, dark urine, pale stools, yellowing of eyes/skin, severe abdominal pain

### Evaluation

**Positive therapeutic outcome**

• Absence of signs/symptoms of infection: WBC $<10,000/mm^3$, temp WNL, absence of red draining wounds
• Reported improvement in symptoms of infection

## clavulanate

*See amoxicillin/clavulanate, ticarcillin/clavulanate*

## clevidipine (Rx)

(klev-id'i-peen)
**Cleviprex**
*Func. class.:* Calcium channel blocker (L-type)
*Chem. class.:* Dihydropyridine

**ACTION:** L-type calcium channels mediate the influx of calcium during depolarization in arterial smooth muscle; reduces mean arterial B/P by decreasing systemic vascular resistance

**Therapeutic outcome:** Decreased B/P

**USES:** Treatment of hypertension when oral therapy is not feasible

## CONTRAINDICATIONS

Hypersensitivity to this product, eggs, or soya lecithin; defective lipid metabolism; severe aortic stenosis; pancreatitis

**Precautions:** Pregnancy, breastfeeding, children <18 yr, heart failure, hyperlipidemia, hypertension, labor, pheochromocytoma

## DOSAGE AND ROUTES

**Adult:** CONT **IV** 1-2 mg/hr; dose may be doubled q90sec initially; as B/P reaches goal, adjust dose less frequently (5-10 min) with smaller increases in dose; most patients require 4-6 mg/hr, max 32 mg/hr; no more than 1000 ml should be infused per 24 hr period due to lipid load restrictions

**Available forms:** Single dose vial 50, 100 ml (0.5 mg/ml)

### Implementation

**Intermittent IV infusion route**

• Do not give through same line as other medications, do not dilute, do not filter
• Gently invert several times before use; do not use if discolored or if particulate matter is present
• Give through central or peripheral line at 1-2 mg/hr, use infusion device
• Store vials in refrigerator, do not freeze; leave vials in carton until use; product is photosensitive but protection from light during administration is not required

**Solution compatibilities:** Water for injection, 0.9% NaCl, D5W, D%W/ 0.9% NaCl, D5/LR, LR 10% amino acid

## ADVERSE EFFECTS

**CNS:** Headache
**CV:** Hypotension, reflex tachycardia, hypotension, rebound hypertension, syncope, atrial fibrillation
**GI:** Nausea, vomiting
**GU:** Renal failure
**MS:** Arthralgia
**GU:** Acute renal failure

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding >99% |
| **Metabolism** | By esterases in blood, extravascular tissues |
| **Excretion** | Urine 63%-74%, feces 7%-22% |
| **Half-life** | Initially 1 min; terminal 15 min; increased in hepatic disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 2-4 min |
| **Peak** | 6-12 hr |
| **Duration** | Unknown |

## NURSING CONSIDERATIONS

### Assessment

• Assess cardiac status: B/P, pulse, respiration, ECG; some patients have developed severe angina, acute MI after calcium channel blockers if obstructive CAD is severe; if not transitioned to

other antihypertensive therapies following clevidipine infusion, patients should be monitored ≥8 hr for rebound hypertension; monitor for rebound hypertension following drug stoppage
- **Renal failure:** Monitor I&O ratio, weight daily; peripheral edema, dyspnea, jugular vein distention, crackles (perioperative hypertensive patients)
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, excretion unknown, cautious use in breastfeeding

### Patient/family education
- Instruct patient to notify prescriber immediately if neurological symptoms, visual changes, or symptoms of HF occur
- To inform the patient of reason for product, expected result
- Instruct patient to continue follow-up for hypertension in those with hypertension
- Teach patient to notify prescriber if pregnancy is planned or suspected or if breastfeeding

### Evaluation
**Positive therapeutic outcome**
- Decreased B/P

## clindamycin HCl (Rx)
(klin-dah-my'sin)
**Cleocin HCl, Dalacin C** 🍁
## clindamycin palmitate (Rx)
**Cleocin Pediatric, Dalacin C Flavored Granules** 🍁
## clindamycin phosphate (Rx)
**Cleocin Phosphate, Dalacin C phosphate Sterile Solution** 🍁
*Func. class.:* Antiinfective—miscellaneous
*Chem. class.:* Lincomycin derivative

**ACTION:** Binds to 50S subunit of bacterial ribosomes; suppresses protein synthesis

**Therapeutic outcome:** Absence of infection

**USES:** Infections caused by staphylococci, streptococci, *Rickettsia, Fusobacterium, Actinomyces, Peptococcus, Bacteroides, Pneumocystis jiroveci*

## CONTRAINDICATIONS
Hypersensitivity to this product or lincomycin, tartrazine dye, ulcerative colitis/enteritis

**BLACK BOX WARNING:** Pseudomembranous colitis

**Precautions:** Pregnancy, breastfeeding, geriatric, renal/liver/GI disease, asthma, allergy

**BLACK BOX WARNING:** Diarrhea

C

## DOSAGE AND ROUTES
**Adult:** PO 150-450 mg q6hr, max 2.7 g/day; IM/**IV** 1.2-2.7 g/day in 2-4 divided doses q6-12hr, max 4.8 g/day
**Child >1 mo:** PO 8-25 mg/kg/day in divided doses q6-8hr; IM/**IV** 20-40 mg/kg/day in divided doses q6-8hr in 3-4 equal doses
**Neonate:** 15-20 mg/kg/day divided q6-8hr

### PID
**Adult:** **IV** 900 mg q8hr plus gentamicin

### Bacterial endocarditis prophylaxis
**Adult:** 600 mg 1 hr before procedure

### *P. jiroveci* pneumonia (unlabeled)
**Adult:** PO 1200-1800 mg/day in divided doses with 15-30 mg primaquine/day × 21 days

**Available forms: Phosphate:** inj 150, 300, 600 mg base/4 ml; 900 mg base/6 ml; inj inf in $D_5$ 300, 600, 900 mg; **HCl:** caps 75, 150, 300 mg; **palmitate:** oral sol 75 mg/5 ml

### Implementation
- Obtain C&S before use

**PO route**
- Do not break, crush, or chew caps
- Give with 8 oz of water; give with meals for GI symptoms
- Shake liquids well
- Do not refrigerate oral preparations; stable at room temperature for 2 wk

**Oral sol**
- Do not refrigerate reconstituted product, store at room temperature ≤2 wk
- Reconstitute granules with most of 75 ml of water, shake well, add remaining water, shake well (75 mg/5 ml)

**IM route**
- If more than 600 mg must be given, divide into 2 inj
- Give deeply in large muscle mass; rotate sites

**IV route**
- Visually inspect parenteral products for particulate matter and discoloration prior to use
- **Vials:** Dilute 300 and 600 mg doses with 50 ml of a compatible diluent. Dilute 900 mg doses with 50-100 ml of a compatible diluent. Dilute 1200 mg doses with 100 ml of a compatible diluent, final concentration max 18 mg/ml
- **ADD-Vantage vials:** Dilute 300 and 600 mg ADD-Vantage containers with 50 or 100 mg, respectively, of NS or $D_5W$

• **Storage:** When diluted in $D_5W$, NS, or LR, solutions with concentrations of 6, 9, or 12 mg/ml are stable for 16 days at room temperature or 32 days under refrigeration when stored in glass bottles or minibags. When diluted in $D_5W$, solutions with a concentration of 18 mg/ml are stable for 16 days at room temperature

**Intermittent IV infusion**

• Infuse over at least 10-60 min, infusion rates max 30 mg/min and ≤1.2 g should be infused in a 1 hr period

• Infuse 300 mg doses over 10 min; 600 mg doses over 20 min, 900 mg doses over 30 min, and 1200 mg doses over 40 min

**Continuous IV infusion**

• Give first dose rapidly, and then follow with continuous infusion; rate is based on desired serum clindamycin levels

• To maintain serum concentrations above 4 mcg/ml, use a rapid infusion rate of 10 mg/min for 30 min and a maintenance rate of 0.75 mg/min; to maintain serum concentrations above 5 mcg/ml, use a rapid infusion rate of 15 mg/min for 30 min and a maintenance rate of 1 mg/min; to maintain serum concentrations above 5 mcg/ml, use a rapid infusion rate of 20 mg/min for 30 min and a maintenance rate of 1.25 mg/min

**Y-site compatibilities:** Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B lipid complex, amsacrine, anakinra, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefpirome, ceftAZidime, ceftizoxime, ceftobiprole, cefuroxime, cephalothin, cephapirin, chloramphenicol, cimetidine, cisatracurium, CISplatin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, dilTIAZem, diphenhydrAMINE, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, milrinone, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium/sodium, pentazocine, perphenazine, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, potassium chloride, procainamide, propofol, propranolol, protamine, pyridoxine, raNITIdine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** IDArubicin

## ADVERSE EFFECTS

**GI:** *Nausea, vomiting, abdominal pain, diarrhea,* pseudomembranous colitis, *anorexia, weight loss,* increased AST, ALT, bilirubin, alkaline phosphatase, jaundice

**GU:** *Vaginitis,* urinary frequency

**INTEG:** Rash, urticaria, pruritus, erythema, pain, abscess at inj site

**SYST:** Stevens-Johnson syndrome, exfoliative dermatitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM), minimal (TOP) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 2½ hr |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | Rapid | Rapid | Rapid |
| **Peak** | 6-8 hr | 1½ hr | Infusion's end |

## INTERACTIONS

### Individual drugs

Erythromycin, decreased action of clindamycin, avoid using together
Kaolin/pectin: decreased absorption

### Drug/lab test

Increased: alkaline phosphatase, bilirubin, CPK, AST, ALT

## NURSING CONSIDERATIONS

### Assessment

• Assess patient for signs and symptoms of infection including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, fever; obtain baseline information before, during treatment; complete C&S testing before beginning product therapy; this will identify if correct treatment has been initiated, give product as soon as culture is taken, monitor appearance of wounds, sputum, stools, urine baseline and periodically
• Assess for allergic reactions: rash, urticaria, pruritus, chills, fever, joint pain; may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available in case of an anaphylactic reaction
• Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also look for increased BUN and creatinine levels
• Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
• Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy

**BLACK BOX WARNING:** Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued; may indicate **pseudomembranous colitis**, may occur several weeks after therapy is terminated

• Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy, may occur several weeks after therapy is terminated, use this product in serious infections only
• Assess for overgrowth of infection: perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
• **Assess for serious skin infections:** Stevens-Johnson syndrome, exfoliative dermatitis (monitor for rash), discontinue at first appearance of rash, may occur after conclusion of therapy
• **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, excreted in breast milk, not recommended in breastfeeding

### Patient/family education

• Tell patient to take oral product with full glass of water; may take with food if GI symptoms occur; antiperistaltic products may worsen diarrhea
• Teach patient aspects of product therapy: need to complete entire course of medication to ensure organism death (10-14 days); culture may be taken after medication course has been completed
• Advise patient to report sore throat, fever, fatigue; may indicate superinfection
• Advise patient that product must be taken at equal intervals around clock to maintain blood levels

**BLACK BOX WARNING:** Teach patient to report diarrhea with pus, mucus, rash

### Evaluation

**Positive therapeutic outcome**

• Decreased temp, negative C&S

**TREATMENT OF HYPERSENSITIVITY:** Withdraw product; maintain airway; administer EPINEPHrine, aminophylline, $O_2$, **IV** corticosteroids

## clindamycin topical

*See Appendix B*

## clobetasol topical

*See Appendix B*

## clomiPHENE (Rx)

(kloe'mi-feen)
**Clomid**
*Func. class.:* Ovulation stimulant
*Chem. class.:* SERM (selective estrogen receptor modulator)

**Do not confuse:** clomiPHENE/clomiPRAMINE, Serophene/Sarafem

**ACTION:** Increases LH, FSH release from the pituitary, which increases maturation of ovarian follicle, ovulation, development of corpus luteum

**Therapeutic outcome:** Pregnancy

**USES:** Female infertility (ovulatory failure)

**CONTRAINDICATIONS**

Pregnancy, hypersensitivity, hepatic disease, undiagnosed uterine bleeding, uncontrolled thyroid or adrenal dysfunction, intracranial lesion, ovarian cysts, endometrial carcinoma

**Precautions:** Hypertension, depression, seizures, diabetes mellitus, abnormal ovarian enlargement, ovarian hyperstimulation

## DOSAGE AND ROUTES

**Adult:** PO 50-100 mg daily × 5 days or 50 mg daily beginning on day 5 of the menstrual cycle, may increase to 100 mg/day × 5 days with next cycle; may be repeated until conception occurs or 3 (max 6) cycles of therapy have been completed

**Available forms:** Tabs 50 mg

### Implementation

- Give after discontinuing estrogen therapy
- Give at same time daily to maintain product level; begin on 5th day of menstrual cycle
- Avoid heat, moisture, light, store at room temperature
- Give without regard to food

## ADVERSE EFFECTS

**CNS:** *Headache, depression,* restlessness, anxiety, nervousness, fatigue, insomnia, dizziness, flushing
**CV:** Vasomotor flushing, phlebitis, deep vein thrombosis
**EENT:** Blurred vision, diplopia, photophobia
**GI:** *Nausea, vomiting, constipation,* abdominal pain, bloating
**GU:** Polyuria, frequency of urination, birth defects, spontaneous abortions, multiple ovulation, breast pain, oliguria, abnormal uterine bleeding, ovarian cyst, hypertrophy of ovary, hot flashes
**INTEG:** *Rash, dermatitis,* urticaria, alopecia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well distributed |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively |
| **Excretion** | Feces |
| **Half-life** | 5 days |

### Pharmacodynamics

Unknown

## NURSING CONSIDERATIONS

### Assessment

- Verify infertility workup, pelvic exam
- Determine liver function tests before therapy: AST, ALT, alkaline phosphatase
- Monitor serum progesterone, urinary excretion of pregnanediol to identify occurrence of ovulation
- Pelvic exam should be done to determine ovary size, condition of cervix
- Endometrial biopsy may be done in women over 35 to rule out endometrial carcinoma
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Advise patient that multiple births are common after product is taken
- Instruct patient to notify prescriber immediately if low abdominal pain occurs; may indicate ovarian cyst, cyst rupture; ovarian hyperstimulation syndrome (OHSS) symptoms (abdominal bloating, nausea, diarrhea, weight gain, vomiting, dark urine)
- Advise patient to notify prescriber of photophobia, blurred vision, diplopia, abnormal bleeding
- Teach patient if dose is missed, double at next time; if more than one dose is missed, call prescriber
- Instruct patient that response usually occurs 4-10 days after last day of treatment
- Teach patient method for taking, recording basal body temp to determine whether ovulation has occurred; if ovulation can be determined (there is a slight decrease in temp, then a sharp increase for ovulation), to attempt coitus 3 days before and every other day until after ovulation
- Teach patient if pregnancy is suspected, to notify prescriber immediately, do not use in pregnancy, breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Fertility

## clomiPRAMINE (Rx)

(klom-ip'ra-meen)
**Anafranil**
*Func. class.:* Tricyclic antidepressant
*Chem. class.:* Tertiary amine

**Do not confuse:** clomiPRAMINE/ clomiPHENE

**ACTION:** Potentiates serotonin and norepinephrine uptake; moderate anticholinergic effect

**Therapeutic outcome:** Decreased signs and symptoms of obsessive-compulsive disorder, decreased depression

**USES:** Obsessive-compulsive disorder

**Unlabeled uses:** Dysphoria, anxiety, agoraphobia and other phobias

## CONTRAINDICATIONS

Hypersensitivity to this product, carBAMazepine, tricyclics, immediately after MI, MAOI therapy

**Precautions:** Pregnancy, breastfeeding, geriatric, seizures, cardiac disease, glaucoma, prostatic hypertrophy, urinary retention

**BLACK BOX WARNING:** Suicidal ideation, children

## DOSAGE AND ROUTES

### Obsessive-compulsive disorder

**Adult:** PO 25 mg at bedtime; increase gradually over 4 wk to a dosage of 75-250 mg/day in divided doses

**Child 10-18 yr:** PO 25 mg/day gradually increased max over 2 wk 3 mg/kg/day or 200 mg/day, whichever is smaller

**Available forms:** Caps 25, 50, 75 mg

### Implementation

- Do not break, crush, or chew caps
- Give without regard to food; during initial dosing and titration, give with meals
- Store in tight container, at room temperature; do not freeze

## ADVERSE EFFECTS

**CNS:** *Dizziness, tremors, mania,* seizures, aggressiveness, drowsiness, headache, EPS, neuroleptic malignant syndrome, insomnia, agitation, anxiety, impaired memory
**CV:** Hypotension, tachycardia, cardiac arrest, hypertension, palpitations
**EENT:** Blurred vision, altered taste, tinnitus, increased intraocular pressure
**ENDO:** Galactorrhea, hyperprolactinemia
**GI:** *Constipation, dry mouth, nausea, dyspepsia,* weight gain, hepatic toxicity
**GU:** *Delayed ejaculation, anorgasmia,* retention, decreased libido
**HEMA:** Agranulocytosis, neutropenia, pancytopenia
**INTEG:** Diaphoresis, photosensitivity, abnormal skin odor, flushing, rash, pruritus
**META:** Hyponatremia
**RESP:** Pharyngitis, rhinitis, bronchospasm
**SYST:** Suicide in children/adolescents

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 20-32 hr; steady state 1-2 wk |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ≥2 wk |
| **Peak** | 2-6 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
CarBAMazepine: decreased clomiPRAMINE action
Cimetidine, FLUoxetine, fluvoxaMINE, sertraline: increased clomiPRAMINE level; do not use together
CloNIDine, EPINEPHrine, norepinephrine: severe hypertension; avoid use
CloNIDine, haloperidol, levodopa: decreased effect of droperidol, mefloquine, mesoridazine, moxifloxacin, pentamide, pimozide, tacrolimus, ziprasidone: Increased QT prolongation these products
Phenytoin: decreased clomiPRAMINE action

### Drug classifications

Barbiturates: decreased clomiPRAMINE levels
CNS depressants, general anesthetics: increased effects; do not use together
CYP1A2, CYP2D6: increased clomiPRAMINE level
**MAOIs:** hypertensive crisis, seizures; do not use together
**SSRIs, SNRIs:** increased serotonin syndrome
**Antidysrhythmics, other tricyclics, phenothiazines, quinolones:** QT prolongation
Skeletal muscle relaxants, opiates: decreased action of these products

### Drug/herb

**SAM-e, St. John's wort:** serotonin syndrome, do not use together

### Drug/lab test

Increased: prolactin, TBG, AST, ALT, blood glucose
Decreased: serum thyroid hormone ($T_3$, $T_4$)

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P (with patient lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg hold product, notify prescriber; take VS q4hr in patients with cardiovascular disease
- Monitor blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy and signs of blood dyscrasias
- **Serotonin syndrome:** hyperpyrexia, rigidity, irregular pulse, diaphoresis
- **Monitor hepatic studies:** AST, ALT, bilirubin
- Check weight weekly; appetite may increase with product
- Assess ECG for flattening of T wave, QTc prolongation bundle branch block, AV block,

dysrhythmias in cardiac patients, may lead to cardiac collapse
- Assess for EPS primarily in geriatric: rigidity, dystonia, akathisia
- **Beers:** Avoid in older adults with or at high risk for delirium or orthostatic hypotension

**BLACK BOX WARNING:** Assess mental status: mood, sensorium, affect, suicidal tendencies; increase in psychiatric symptoms: depression, panic, frequency of obsessive-compulsive behaviors

- Monitor urinary retention, constipation; constipation is more likely to occur in children or geriatric
- Assess for **withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; do not usually occur unless product was discontinued abruptly
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, discontinue breastfeeding or product
- Identify alcohol consumption; if alcohol is consumed, hold dose until morning

### Patient/family education
- Teach patient that therapeutic effects may take 4-6 wk
- Teach patient to use caution in driving or other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing, especially geriatric
- Teach patient to avoid alcohol ingestion, other CNS depressants
- Teach patient not to discontinue medication quickly after long-term use: may cause nausea, headache, malaise
- Teach patient to wear sunscreen or large hat, since photosensitivity occurs
- Teach patient to increase fluids, bulk in diet if constipation, urinary retention occur, especially geriatric
- **Serotonin syndrome:** teach patient to report immediately sweating, diarrhea, twitching
- **Abrupt discontinuation:** do not stop abruptly
- Teach patient to take gum, hard sugarless candy, or frequent sips of water for dry mouth
- Advise patient to notify prescriber if pregnancy is planned or suspected

**BLACK BOX WARNING:** Teach patient that suicidal ideas, behavior may occur in children/young adults, report immediately

### Evaluation
**Positive therapeutic outcome**
- Decrease in depression
- Absence of suicidal thoughts

## TREATMENT OF OVERDOSE:
ECG monitoring, induce emesis, lavage, administer anticonvulsant

**⚠ HIGH ALERT**

## clonazePAM (Rx)
(kloe-na'zi-pam)
**KlonoPIN, Rivotril**
*Func. class.:* Anticonvulsant
*Chem. class.:* Benzodiazepine derivative
**Controlled substance schedule IV**

**Do not confuse:** clonazePAM/LORazepam/cloNIDine, KlonoPIN/cloNIDine

**ACTION:** Inhibits spike, wave formation in absence seizures (petit mal), decreases amplitude, frequency, duration, spread of discharge in minor motor seizures

**Therapeutic outcome:** Decreased frequency, severity of seizures

**USES:** Absence, atypical absence, akinetic, myoclonic seizures, Lennox-Gastaut syndrome, panic disorder

## CONTRAINDICATIONS
Pregnancy hypersensitivity to benzodiazepines, acute closed-angle glaucoma, psychosis, severe liver disease

**Precautions:** Open-angle glaucoma, chronic respiratory disease, renal/hepatic disease, breastfeeding, geriatric

## DOSAGE AND ROUTES
### Lennox-Gastaut syndrome/atypical absence seizures/akinetic and myoclonic seizures
**Adult:** PO 1.5 mg/day in 3 divided doses; may be increased 0.5-1 mg q3day until desired response; max 20 mg/day
**Child <10 yr or <30 kg:** PO 0.01-0.03 mg/kg/day in divided doses q8hr, max 0.05 mg/kg/day; may be increased 0.25-0.5 mg q3day until desired response; max 0.1-0.2 mg/kg/day
**Geriatric:** PO 0.25 daily-bid initially, increase by 0.25 daily q7-14day as needed

### Panic disorder
**Adult:** PO 0.25 mg bid, increase to 1 mg/day after 3 days, max 4 mg/day

**Available forms:** Tabs 0.5, 1, 2 mg; **orally disintegrating tabs** 0.125, 0.25, 0.5, 1, 2 mg

### Implementation

**PO route**

- Give on empty stomach for best absorption

**Rectal route**

- **IV** sol may be used rectally, 1 ml syringe inserted 3 cm into rectum
- Oral susp may be used rectally (1 mg/ml of product with 1 ml of water), use plastic tube (volume 2.2-3.3 ml)
- Store at room temperature

## ADVERSE EFFECTS

**CNS:** *Drowsiness,* dizziness, confusion, behavioral changes, tremors, insomnia, headache, suicidal tendencies, slurred speech, anterograde amnesia, fatigue, poor coordination
**CV:** Palpitations, bradycardia, tachycardia
**EENT:** *Increased salivation, nystagmus, diplopia,* abnormal eye movements
**GI:** *Nausea, constipation,* polyphagia, anorexia, xerostomia, diarrhea, gastritis, sore gums, blurred vision
**GU:** Dysuria, enuresis, nocturia, retention, libido changes
**HEMA:** Thrombocytopenia, leukocytosis, anorexia, eosinophilia
**INTEG:** Rash, alopecia, hirsutism
**RESP:** Respiratory depression, dyspnea, congestion
**MS:** Myalgia, muscle weakness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Crosses blood-brain barrier, placenta |
| **Metabolism** | Liver, protein binding 85% |
| **Excretion** | Kidneys |
| **Half-life** | 18-50 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½-1 hr |
| **Peak** | 1-2 hr |
| **Duration** | 6-12 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
CarBAMazepine: decreased clonazePAM effect
Cimetidine, clarithromycin, dilTIAZem, erythromycin, FLUoxetine: increased clonazePAM effect
PHENobarbitol: decreased clonazePAM effect
Phenytoin: decreased clonazePAM levels, monitor effect

### Drug classifications

Anticonvulsants, antidepressants, barbiturates, general anesthetics, opiates, sedative/hypnotics: increased CNS depression
Azoles, oral contraceptives: increased clonazePAM effect, adjust dosages
CYP3A4 inducers: decreased clonazePAM effect

### Drug/herb

Ginkgo, melatonin: increased clonazePAM effect
Ginseng, St. John's wort: decreased clonazePAM effect
Kava, chamomile, valerian: increased sedative effect

### Drug/lab test

Increased: AST, alkaline phosphatase
Decreased: platelets, WBC

## NURSING CONSIDERATIONS

### Assessment

- Assess for **blood dyscrasias:** fever, sore throat, bruising, rash, jaundice, epistaxis (long-term treatment only)
- Assess **seizures:** Monitor duration, type, intensity, with or without aura
- **Assess mental status:** mood, sensorium, affect, memory (long, short), especially geriatric; behavioral changes, suicidal thoughts/behaviors
- Assess seizure activity including type, location, duration, and character; provide seizure precaution
- Assess renal studies: urinalysis, BUN, urine creatinine
- Monitor blood studies: RBCs, Hct, Hgb, reticulocyte counts weekly for 4 wk, then monthly
- Monitor hepatic studies: ALT, AST, bilirubin, creatinine
- **Beers:** May be appropriate in older adults for seizure disorders, rapid eye movement sleep disorders, benzodiazepine/ethanol withdrawal; avoid in those with or at high risk of delirium
- **Abrupt discontinuation:** do not discontinue abruptly, seizures may increase
- Assess for signs of physical withdrawal if medication suddenly discontinued
- Assess eye problems: need for ophthalmic examinations before, during, after treatment (slit lamp, fundoscopy, tonometry)
- Assess allergic reaction: red raised rash; if this occurs, product should be discontinued
- **Monitor for toxicity:** bone marrow depression, nausea, vomiting, ataxia, diplopia, cardiovascular collapse; monitor drug levels during initial treatment (therapeutic 20-80 ng/ml)

### Patient/family education

- Teach patient to carry/wear emergency ID card stating patient's name, products taken, condition, physician's name, phone number, discuss tolerance, withdrawal, to continue with follow-up exams, lab work
- Caution patient to avoid driving, other activities that require alertness

• Caution patient to avoid alcohol ingestion or CNS depressants; increased sedation may occur
• Teach patient not to discontinue medication quickly after long-term use; taper off over several weeks

**Pregnancy/breastfeeding:**
• Teach patient to notify prescriber if pregnancy is planned or suspected or if breastfeeding to register with North American Antiepileptic Drug Pregnancy Registry 888-233-2334, do not use in pregnancy/breastfeeding
• Teach patient to notify prescriber of yellowing skin/eyes, pale stools, bleeding, fever, extreme fatigue, sore throat, suicidal thoughts/behaviors
• Teach patient to notify prescriber immediately if suicidal thoughts, behaviors occur

### Evaluation
**Positive therapeutic outcome**
• Decreased seizure activity

## TREATMENT OF OVERDOSE:
Lavage, VS, flumazenil, monitor electrolytes, sodium bicarbonate

## cloNIDine (Rx)
(klon'i-deen)
**Catapres, Catapres-TTS, Dixanit, Diyaril, Duraclon, Kapvay**
*Func. class.:* Antihypertensive, centrally acting analgesic
*Chem. class.:* Centrally acting α-adrenergic agonist

**Do not confuse:** cloNIDine/KlonoPIN/clonazePAM

**ACTION:** Inhibits sympathetic vasomotor center in CNS, which reduces impulses in sympathetic nervous system; B/P, pulse rate, cardiac output decreased; prevents pain signal transmission in CNS by α-adrenergic receptor stimulation of the spinal cord

**Therapeutic outcome:** Decreased B/P in hypertension

**USES:** Mild to moderate hypertension, used alone or in combination; severe pain in cancer patients (epidural), attention-deficit/hyperactivity disorder (ADHD)

**Unlabeled uses:** Opioid withdrawal, prevention of vascular headaches, treatment of menopausal symptoms, dysmenorrhea, attention-deficit/hyperactivity disorder (ADHD), autism, cycloSPORINE nephrotoxicity prophylaxis, diabetic neuropathy, ethanol/nicotine/opiate agonist withdrawal, Tourette's syndrome, hypertensive emergency, neonatal abstinence syndrome, scleroderma renal crisis

## CONTRAINDICATIONS
Hypersensitivity; (epidural) bleeding disorders, anticoagulants

**Precautions:** Pregnancy, breastfeeding, child <12 yr (transdermal), geriatric, MI (recent), diabetes mellitus, chronic renal failure, Raynaud's disease, thyroid disease, depression, COPD, asthma, noncompliant patients

**BLACK BOX WARNING:** Labor (transdermal)

## DOSAGE AND ROUTES
### Hypertension
**Adult:** PO 0.1 mg bid, then increase by 0.1-0.2 mg/day at weekly intervals, until desired response; range 0.2-0.6 mg/day in divided doses or transdermal **q7 days,** start 0.1 mg and adjust q1-2wk
**Geriatric:** PO 0.1 mg at bedtime, may increase gradually
**Child:** PO 5-10 mcg/kg/day in divided doses q8-12hr, max 0.9 mg/day

### Opioid withdrawal (unlabeled)
**Adult:** PO 0.3-1.2 mg/day; may decrease by 50% × 3 days, then decrease by 0.1-0.2 mg/day or discontinue

### Severe pain
**Adult:** CONT EPIDURAL INF 30 mcg/hr
**Child:** CONT EPIDURAL INF 0.5 mcg/kg/hr, then titrate to response

### Menopausal symptoms (unlabeled)
**Adult:** TD 0.1 mg patch q1wk; PO 0.05-0.4 mg daily

### ADHD/TIC disorders in children/autism (unlabeled)
**Adolescent/child ≥6 yr:** PO 0.05 mg/kg/day in 3-4 divided doses; may increase by 0.1 mg/day qwk up to 0.4 mg/day; EXT REL (Kapvay): 0.1 mg at bedtime, increase dose by 0.1 mg/day up to 0.4 mg/day

### Tourette's syndrome (unlabeled)
**Adult:** PO 0.15-0.2 mg/day

**Available forms:** Tabs 0.025, 0.1, 0.2, 0.3 mg; transdermal sys 2.5, 5, 7.5 mg delivering 0.1, 0.2, 0.3 mg/24 hr, respectively; inj 100, 500 mcg/ml, ext rel tab 0.1 mg (Kapvay), 0.17 mg (Nexiclon)

### Implementation
**PO route**
• Give last dose at bedtime
• Do not crush, cut, chew, or break ER tabs; Kapvay is not interchangeable with other products

**Transdermal route**
• Apply patch weekly; remove old patch and wash off residue; apply to site without hair; best absorption over chest or upper arm; rotate sites with each application; clean site before application; apply firmly, especially around edges, may secure with adhesive tape if loose; fold sticky sides together and discard
• Should be removed before MRI
• Store patches in cool environment, tabs in tight container

**BLACK BOX WARNING:** Do not use for labor

## ADVERSE EFFECTS

**CNS:** *Drowsiness, sedation, headache, fatigue,* nightmares, insomnia, mental changes, anxiety, depression, hallucinations, delirium, syncope, dizziness
**CV:** *Orthostatic hypotension, palpitations,* HF, ECG abnormalities, sinus tachycardia
**EENT:** Taste change, parotid pain
**ENDO:** Hyperglycemia
**GI:** *Nausea, vomiting, malaise,* constipation, *dry mouth*
**GU:** Impotence, dysuria, *nocturia,* gynecomastia
**INTEG:** *Rash,* alopecia, facial pallor, pruritus, hives, edema, burning papules, excoriation (TD patches)
**MISC:** *Withdrawal symptoms*
**MS:** Muscle, joint pain, leg cramps

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, TD) |
| **Distribution** | Widely distributed; crosses blood-brain barrier |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, unchanged (45%) |
| **Half-life** | 12-21 hr |

### Pharmacodynamics

| | PO | TD |
|---|---|---|
| **Onset** | ½-1 hr | 3 days |
| **Peak** | 2-4 hr | Unknown |
| **Duration** | 8-12 hr | 8 hr (after removal) |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Levodopa: decreased levodopa effect
Prazosin: decreased hypotensive effects
Verapamil, dilTIAZem: AV block

### Drug classifications

Amphetamines, appetite suppressants, MAOIs, tricyclics: decreased hypotensive effects
Increase: Bradycardia, amphetamines, beta blockers, digoxin, dilTIAZem, MAOI inhibitors, verapamil
Anesthetics, opiates, sedatives/hypnotics: increased CNS depression
Antidepressants (tricyclic), β-adrenergic blockers: life-threatening increase in B/P
Diuretics, nitrates: increased hypotensive effects

### Drug/herb

Aconite: increased toxicity, death
Ephedra, ginseng: decreased antihypertensive effect
Hawthorn: increased antihypertensive effect

### Drug/lab test

Increased: blood glucose
Decreased: VMA, urinary catecholamines, aldosterone
Positive: Coomb's test

## NURSING CONSIDERATIONS

### Assessment

• Assess **cancer pain:** location, intensity, character, alleviating, aggravation factors, baseline and frequency
• Perform blood studies: neutrophils, decreased platelets
• **Perform renal studies:** protein, BUN, creatinine; watch for increased levels that may indicate nephrotic syndrome: polyuria, oliguria, frequency
• Monitor baselines for renal/liver function tests before therapy begins; check potassium levels, although hyperkalemia rarely occurs
• Monitor B/P, pulse if the product is being used for **hypertension;** notify prescriber of changes
• Assess for **opiate withdrawal** (unlabeled) in patients receiving the product for opioid withdrawal, including fever, diarrhea, nausea, vomiting, cramps, insomnia, shivering, dilated pupils, weakness
• Check for edema in feet, legs daily; monitor I&O; check for decreasing output
• Assess **allergic reaction:** rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help
• ADHD: monitor B/P, pulse, palpitations, syncope
• Assess for symptoms of **HF:** edema; dyspnea, wet crackles, B/P, weight gain, report significant changes, more common in the elderly

**BLACK BOX WARNING:** Pregnancy/breastfeeding: Do not use for labor (epidural), excreted in breast milk, discontinue breastfeeding or product

• **Beers:** Avoid as first line in older adults, high risk of CNS effects, bradycardia, orthostatic hypotension

### Patient/family education

• **Instruct patient not to discontinue product abruptly, or withdrawal symptoms may occur:** anxiety, increased B/P, headache, insomnia, increased pulse, tremors, nausea, sweating
• Caution patient not to use OTC (cough, cold, or allergy), alcohol or CNS depressant products unless directed by prescriber
• Teach patient to comply with dosage schedule even if feeling better; product controls symptoms, does not cure
• Caution patient to change position slowly, to rise slowly to sitting or standing position to minimize orthostatic hypotension, especially geriatric
• Instruct patient to notify physician of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, signs of angioedema, increased weight
• Teach patient about excessive perspiration, dehydration, vomiting; diarrhea may lead to fall in B/P; consult prescriber if these occur
• Tell patient that product may cause dizziness, fainting; light-headedness may occur during first few days of therapy; use hard candy, saliva product, or frequent rinsing of mouth for dry mouth
• **Transdermal:** teach patient how to use patch; that patch comes in two parts: product patch and overlay to keep patch in place; not to trim or cut patch; remove for MRI; can use during bathing, swimming
• Advise patient that compliance is necessary; not to skip or stop product unless directed by prescriber
• Teach patient that product may cause skin rash or impaired perspiration
• Teach patient that response may take 2-3 days if product is given TD; instruct on administration of patch; return demonstration
• Teach patient to avoid hazardous activities, since product may cause drowsiness, dizziness
• Teach patient to administer 1 hr before meals

### Evaluation

**Positive therapeutic outcome**

• Decrease in B/P in hypertension
• Decrease in withdrawal symptoms
• Decrease in pain
• Decrease in vascular headaches
• Decrease in dysmenorrhea
• Decrease in menopausal symptoms

## TREATMENT OF OVERDOSE:

Supportive treatment; administer atropine, DOPamine prn

**⚠ HIGH ALERT**

## clopidogrel (Rx)

(klo-pid'oh-grel)

**Plavix**

*Func. class.:* Platelet aggregation inhibitor
*Chem. class.:* Thienopyridine derivative

**Do not confuse:** Plavix/Paxil/Elavil

## ACTION:

Inhibits first and second phases of ADP-induced effects in platelet aggregation

**Therapeutic outcome:** Decreased possibility of stroke, MI by decreasing platelet aggregation

## USES:

Reducing the risk of stroke, MI, vascular death, peripheral arterial disease in high-risk patients, acute coronary syndrome, transient ischemic attack (TIA), unstable angina

## CONTRAINDICATIONS

Hypersensitivity, active bleeding

**Precautions:** Pregnancy, breastfeeding, children, past liver disease, increased bleeding risk, neutropenia, agranulocytosis, renal disease, Asian/Black/Caucasian patients

**BLACK BOX WARNING:** CYP2C19 allele (poor metabolizers)

## DOSAGE AND ROUTES

### Recent MI, stroke, peripheral arterial disease, TIA

**Adult:** PO 75 mg daily with aspirin

### Acute coronary syndrome

**Adult:** PO loading dose 300 mg then 75 mg daily with aspirin

**Available forms:** Tabs 75, 300 mg

### Implementation

• Give with food to decrease gastric symptoms
• Product should be discontinued 5 days before elective surgery if an antiplatelet action is not desired

## ADVERSE EFFECTS

**CNS:** Headache, dizziness, depression, confusion, hallucinations, fatal intracranial bleeding
**CV:** Edema, hypertension, chest pain
**GI:** Nausea, vomiting, diarrhea, GI discomfort, GI bleeding, pancreatitis, hepatic failure
**GU:** Glomerulonephritis

**HEMA:** *Epistaxis,* purpura, bleeding (major/minor from any site), neutropenia, aplastic anemia, agranulocytosis, thrombotic thrombocytopenic purpura
**INTEG:** Rash, pruritus
**MISC:** UTI, hypercholesterolemia, chest pain, fatigue, intracranial hemorrhage, toxic epidermal necrolysis, Stevens-Johnson syndrome, flu-like syndrome, anaphylaxis
**MS:** Arthralgia, back pain
**RESP:** Upper respiratory tract infection, dyspnea, rhinitis, bronchitis, cough, bronchospasm

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively, protein binding 95%, CYP2B6, CYP1A2, CYP2C8 |
| **Excretion** | Kidneys, unchanged product |
| **Half-life** | 6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Abciximab, aspirin, eptifibatide, rifAMPin, ticlopidine, tirofiban, treprostinil, SNRIs, prasugrel: increased bleeding tendencies
Fluvastatin, phenytoin, tamoxifen, TOLBUTamide, torsemide, warfarin: increased action of each specific product

### Drug classifications

Anticoagulants, NSAIDs, SSRIs, thrombolytics: increased bleeding tendencies
CYP3A4 inhibitors/substrates (atorvastatin, cerivastatin, esomeprazole, omeprazole, simvastatin): decreased effects

**BLACK BOX WARNING:** CYP2C19 inhibitors (omeprazole, esomeprazole): avoid use

NSAIDs: increased action of some NSAIDs
Proton pump inhibitors (PPIs): decreased clopidogrel effect

### Drug/herb

Bilberry, saw palmetto: decreased clopidogrel effect
Feverfew, fish oil, garlic, ginger, ginkgo biloba, green tea, horse chestnut, omega-3 fatty acids: increased clopidogrel effect

### Drug/lab test

Increased: AST, ALT, bilirubin, uric acid, total cholesterol, nonprotein nitrogen (NPN)

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** CYP2C19 allele (poor metabolizers): Consider using another antiplatelet product, higher CV reaction occurs after acute coronary syndrome or PCI, tests are available to determine CYP2C19 allele

- Assess for thrombotic/thrombocytic purpura: fever, thrombocytopenia, neurolytic anemia
- Monitor liver function tests: AST, ALT, bilirubin, creatinine if patient is on long-term therapy (4 mo or more)
- Monitor blood studies: CBC, Hct, Hgb, protime, cholesterol if patient is on long-term therapy; thrombocytopenia, hemolytic anemia, neurologic changes occur (rare)

### Patient/family education

- **Pregnancy/breastfeeding:** Use only if clearly needed
- Advise patient that blood work will be necessary during treatment
- Advise patient to report any unusual bleeding to prescriber, that it may take longer to stop bleeding
- Teach patient to take without regard to food
- Caution patient to report diarrhea, skin rashes, subcutaneous bleeding, chills, fever, sore throat, yellowing of skin, eyes, weakness
- Teach patient to tell all health care providers that clopidogrel is being used; may be held for 5 days before surgery, restart as soon as remembered
- **Pregnancy/breastfeeding:** If pregnancy is planned or suspected, if breastfeeding, do not breastfeed
- **Hypersensitivity:** Rash, angioedema may occur

### Evaluation

**Positive therapeutic outcome**

- Absence of stroke

## clotrimazole topical

*See Appendix B*

## clotrimazole vaginal antifungal

*See Appendix B*

## cloZAPine (Rx)

(kloz'a-peen)
**Clozaril, Fazaclo, Versacloz**
*Func. class.:* Antipsychotic
*Chem. class.:* Tricyclic dibenzodiazepine derivative

**Do not confuse:** Clozaril/Colazal/cloZAPine/cloNIDine/clofazimine/clonazePAM/KlonoPIN

**ACTION:** Interferes with DOPamine receptor binding with lack of EPS and tardive dyskinesia; also acts as an adrenergic, cholinergic, histaminergic, serotoninergic antagonist

**Therapeutic outcome:** Decreased psychotic behavior

**USES:** Management of psychotic symptoms in schizophrenic patients for whom other antipsychotics have failed, recurrent suicidal behavior; orally disintegrating tabs are not used for recurrent suicidal behavior

**Unlabeled uses:** Agitation, bipolar disorder, dementia, psychosis in Parkinson's disease

## CONTRAINDICATIONS

Hypersensitivity, severe granulocytopenia (WBC $<3500/mm^3$ before therapy), comaileus

**Precautions:** Pregnancy, breastfeeding, children <16 yr, geriatric, renal/hepatic/cardiac/CV/pulmonary disease, seizures, prostatic enlargement, closed-angle glaucoma, stroke

**BLACK BOX WARNING:** Bone marrow suppression, hypotension, myocarditis, orthostatic hypotension, elderly patients with dementia-related psychosis, seizures, syncope

## DOSAGE AND ROUTES

### Schizophrenia

**Adult:** PO 12.5 mg daily or bid; may increase by 25-50 mg/day; normal range 300-450 mg/day 1-2 ×/wk; do not increase dosage more than 2 times/wk; dose > 500 mg requires 3 divided doses; max 900 mg/day; use lowest dosage to control symptoms; if dose is to be discontinued, taper over 1-2 wk

**Adolescent, child ≥9 yr (unlabeled):** PO 6.25-12.5 mg initially slowly titrate

### Dementia with multiple behavioral disturbances (unlabeled)

**Geriatric:** PO 12.5 mg qd at bedtime, may increase by 12.5 mg every other day; max 50 mg/day

**Available forms:** Tabs 12.5, 25, 50, 100, 200 mg; orally disintegrating tabs 12.5, 25, 100 150, 200 mg; oral suspension 50 mg/ml

### Implementation

- Decrease dosage in geriatric since metabolism is slowed
- Give with full glass of water, milk; or give with food to decrease GI upset
- Store in tight, light-resistant container; oral sol in amber bottle
- Patient-specific registration is required before administration; if WBC <3500 cells/$mm^3$ or ANC <2000 cells/$mm^2$, therapy should not be started, pharmacist may only dispense the 7, 14, 28 day supply upon receipt of lab report that is appropriate
- **Orally disintegrating tab:** do not push through foil, leave in foil blister until ready to take, peel back foil, place tab in mouth, allow to dissolve, swallow; water is not needed
- **Oral suspension:** Shake before using, use oral syringe and syringe adapter

## ADVERSE EFFECTS

**CNS:** *Sedation, salivation, dizziness, headache, tremors, sleep problems, akinesia, fever,* seizures, *sweating, akathisia, confusion, fatigue, insomnia, depression, slurred speech, anxiety,* neuroleptic malignant syndrome, agitation, dystonia, obsessive-compulsive symptoms

**CV:** *Tachycardia, hypo/hypertension,* chest pain, ECG changes, orthostatic hypotension

**EENT:** Blurred vision

**GI:** *Drooling or excessive salivation, constipation, nausea, abdominal discomfort, vomiting, diarrhea,* anorexia, weight gain, dry mouth, heartburn, dyspepsia, gastroesophageal reflux

**GU:** *Urinary abnormalities,* incontinence, ejaculation dysfunction, frequency, urgency, retention, dysuria

**HEMA:** Leukopenia, neutropenia, agranulocytosis, eosinophilia

**MS:** Weakness; pain in back, neck, legs; spasm; rigidity

**RESP:** Dyspnea, nasal congestion, lower respiratory tract infection

**OTHER:** Diaphoresis

**SYST:** Death in geriatric patients with dementia, aggravation of diabetes mellitus

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses blood-brain barrier, placenta; 95% protein binding |
| **Metabolism** | Liver, CYP1A2, 2D6, 3A4 |
| **Excretion** | Kidneys (50%), feces (30%) (metabolites) |
| **Half-life** | 8-12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | 8-12 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Caffeine, citalopram, erythromycin, FLUoxetine, fluvoxaMINE, ketoconazole, risperiDONE, ritonavir, sertraline: increased cloZAPine levels
CarBAMazepine, omeprazole, PHENobarbital, rifAMPin: decreased cloZAPine level
Digoxin: increased plasma concentration of digoxin
Warfarin: increased plasma concentrations

### Drug classifications

Benzodiazepines: increased hypotension, respiratory, cardiac arrest, collapse
Increase: Bone marrow suppression: antineoplastic radiation therapy
Increase: Seizures: lithium
β-blockers, class IA/III antidysrhythmics, and other drugs that increase QT: increased QT prolongation
CNS depressants, psychoactives, antihistamines, opioids, sedatives/hypnotics: increased CNS depression
CYPIA2 inducers: decreased cloZAPine levels
CYP1A2 inhibitors, CYP3A4 inhibitors: increased cloZAPine level
Highly protein-bound products: increased plasma concentrations

### Drug/food

Caffeine: increased cloZAPine levels

### Drug/lab test

Increased: Triglycerides, cholesterol, blood glucose
Decreased: WBC
False positive: pregnancy tests, PKU
False negative: urinary steroids, 17-OHCS

## NURSING CONSIDERATIONS

### Assessment

- Assess for **myocarditis** if suspected, discontinue; myocarditis usually occurs during first month of treatment
- AIMS assessment, blood glucose, CBC differential, glycosylated hemoglobin A1C, LFTs, neurologic function, pregnancy test, serum creatinine, electrolytes, lipid profile, prolactin, thyroid function tests, weight

**BLACK BOX WARNING:** Assess for **seizures;** usually occurs with higher doses (>600 mg/day) or dosage change >100 mg/day; do not use in uncontrolled seizure disorder; use cautiously in those with a predisposition to seizures

- Assess mental status: orientation, mood, behavior, presence of hallucinations, and type before initial administration and monthly; this product should significantly reduce psychotic behavior
- Check for swallowing of PO medication; check for hoarding or giving of medication to other patients

**BLACK BOX WARNING: Bone marrow depression:** Monitor bilirubin, CBC, liver function test monthly; discontinue treatment if WBC <3000-3500/mm$^3$ or if ANC <1500/mm$^3$; test qwk; may resume when normal; if WBC <2000/mm$^3$ or ANC <1000/mm$^3$, discontinue; if agranulocytosis develops, never restart product

- Assess affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances

**BLACK BOX WARNING: Hypotension, bradycardia, syncope:** Monitor B/P with patient sitting, standing, and lying; take pulse and respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg

- Check for dizziness, faintness, palpitations, tachycardia on rising
- **Assess for neuroleptic malignant syndrome:** hyperpyrexia, muscle rigidity, increased CPK, altered mental status; product should be discontinued
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, do not breastfeed
- **Beers:** Avoid in older adults except for schizophrenia, bipolar disorder, increased risk of stroke and cognitive decline
- Assess for **EPS** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gate)
- Assess for constipation, urinary retention daily; if these occur, increase bulk, water in diet

### Patient/family education

- Teach patient to use good oral hygiene; frequent rinsing of mouth, sugarless gum for dry mouth
- Caution patient to avoid hazardous activities until product response is determined
- Inform patient that orthostatic hypotension occurs often and to rise from sitting or lying position gradually
- Caution patient to avoid hot tubs, hot showers, tub baths, since hypotension may occur

• Teach patient to avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber, since serious product interactions may occur; avoid use with alcohol, CNS depressants; increased drowsiness may occur
• Teach patient about EPS and necessity of meticulous oral hygiene, since oral candidiasis may occur
• Teach patient to report sore throat, malaise, fever, bleeding, mouth sores; if these occur, CBC should be performed and product discontinued
• Advise patient that in hot weather, heat stroke may occur; take extra precautions to stay cool

**BLACK BOX WARNING:** Teach patient symptoms of agranulocytosis and need for blood test qwk for 6 mo, then q2wk; report flulike symptoms

### Evaluation

**Positive therapeutic outcome**

• Decrease in emotional excitement, hallucinations, delusions, paranoia
• Reorganization of patterns of thought, speech

**TREATMENT OF ANAPHYLAXIS:** Withdraw product, maintain airway; if diabetic, check blood glucose levels

**⚠ HIGH ALERT**

## codeine (Rx)

(koe′deen)

*Func. class.:* Opiate, phenanthrene derivative

**Controlled substance schedule II, III, IV, V (depends on content)**

**Do not confuse:** codeine/Lodine/Iodine

**ACTION:** Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors; decreases cough reflex, GI motility

**Therapeutic outcome:** Pain relief, decreased cough, decreased diarrhea depending on route

**USES:** Mild to moderate to severe pain

**Unlabeled uses:** Diarrhea, nonproductive cough

## CONTRAINDICATIONS

Hypersensitivity to opiates, respiratory depression, increased intracranial pressure, seizure disorders, severe respiratory disorders, breastfeeding

**BLACK BOX WARNING:** Children (tonsillectomy/adenoidectomy), ultra-rapid metabolizers

**Precautions:** Pregnancy, geriatric, cardiac dysrhythmias, prostatic hypertrophy, bowel impaction

## DOSAGE AND ROUTES

### Pain

**Adult:** PO IM/IV/SUBCUT 15-60 mg q4hr prn; use phosphate product for IM/IV
**Child:** PO 6-17 yr 3 mg/kg/day in divided doses q4hr prn

### Renal dose

**Adult:** PO CCr 10-50 ml/min 75% of dose; CCr <10 ml/min 50% of dose

### Cough (unlabeled)

**Adult:** PO 10-20 mg q4-6hr, max 120 mg/day

### Diarrhea (unlabeled)

**Adult:** PO 30 mg; may repeat qid prn

**Available forms:** Tabs 15, 30 mg; oral sol 30, 60 mg/5 ml; inj 15, 30 mg/ml; syrup 5 mg/ml

### Implementation

• Give with antiemetic if nausea, vomiting occur
• Administer when pain is beginning to return, determine dosage interval by patient response; continuous dosing of medication is more effective given prn; explain analgesic effect
• Medication should be slowly withdrawn after long-term use to prevent withdrawal symptoms, use stool softener, laxative for constipation
• Store in light-resistant container at room temp

**PO route**

• May be given with food or milk to lessen GI upset

**IM/SUBCUT route**

• Do not give if cloudy, or a precipitate has formed

## ADVERSE EFFECTS

**CNS:** *Drowsiness, sedation,* dizziness, agitation, dependency, lethargy, restlessness, euphoria, seizures, hallucinations, headache, confusion
**CV:** Bradycardia, palpitations, orthostatic hypotension, tachycardia, circulatory collapse
**GI:** *Nausea, vomiting, anorexia, constipation,* dry mouth
**GU:** Urinary retention
**INTEG:** Flushing, rash, urticaria, pruritus
**RESP:** Respiratory depression, respiratory paralysis, dyspnea
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Bioavailability 60%-90% |
| **Distribution** | Widely distributed; crosses placenta, protein binding 7% |
| **Metabolism** | Liver, extensively by CYP3A4 to morphine; altered in ethnic groups |
| **Excretion** | Kidneys (up to 15%), breast milk |
| **Half-life** | 3-4 hr |

### Pharmacodynamics

| | PO | IM | SUBCUT |
|---|---|---|---|
| **Onset** | 30-60 min | 30-60 min | 15-30 min |
| **Peak** | 1-2 hr | 30-60 min | Unknown |
| **Duration** | 4 hr | 4 hr | 4 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression

### Drug classifications

Antipsychotics, CYP2D6, sedative, hypnotics, opiates, skeletal muscle relaxants: increased CNS depression

MAOIs: increased toxicity; use cautiously

### Drug/lab test

Increased: amylase, lipase

Decrease: Opioid effect: opioid antagonists

## NURSING CONSIDERATIONS

### Assessment

- Assess **pain:** intensity, type, alleviating factors, type, location, need for pain medication, tolerance, use pain scoring
- Assess GI function: nausea, vomiting, constipation
- Assess **cough:** type, duration, ability to raise secretion for productive cough; do not use to suppress a productive cough
- Monitor VS after parenteral route; note muscle rigidity, product history, renal/hepatic function tests, respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min
- Monitor CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction

**BLACK BOX WARNING:** Child (tonsillectomy/adenoidectomy) and are ultra-rapid metabolizers: deaths have occurred, use is contraindicated

- Monitor allergic reactions: rash, urticaria
- Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min, shallow
- **Beers:** Avoid in older adults unless safer alternative is not available, may cause ataxia, impaired psychomotor function

### Patient/family education

- Teach patient to report any symptoms of CNS changes, allergic reactions; to avoid CNS depressants: alcohol, sedative/hypnotics for at least 24 hr after taking this product
- Discuss with patient that dizziness, drowsiness, and confusion are common
- Advise patient to avoid getting up without assistance
- Discuss in detail with patient all aspects of the product
- Teach patient to use increased fiber in diet, water for constipation
- Teach patient that physical dependency may result after extended periods
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, infants born to those using opioids are at risk of neonatal opiate withdrawal, do not breastfeed

### Evaluation

**Positive therapeutic outcome**

- Decreased pain
- Decreased cough
- Decreased diarrhea

## TREATMENT OF OVERDOSE:

Naloxone 0.4 ampule diluted in 10 ml 0.9% NaCl and given by direct **IV** push 0.02 mg q2min (adult)

## colchicine (Rx)

(kol'chih-seen)

**Colcrys, ColciGel, Mitigare**

*Func. class.:* Antigout agent

*Chem. class.:* *Colchicum autumnale* alkaloid

**Do not confuse colchicine/Cortrosym**

**ACTION:** Inhibits microtubule formation of lactic acid in leukocytes, which decreases phagocytosis and inflammation in joints

**Therapeutic outcome:** Decreased pain, inflammation of joints

**USES:** Gout, gouty arthritis (prevention, treatment); to arrest progression of neurologic disability in multiple sclerosis

**Unlabeled uses:** Hepatic cirrhosis, familial Mediterranean fever, pericarditis, amyloidosis, Behçet's syndrome, biliary cirrhosis, dermatitis herpetiformis, idiopathic thrombocytopenic purpura, Paget's disease, pseudogout, pulmonary fibrosis

## CONTRAINDICATIONS

Hypersensitivity; serious GI disorders, severe renal/hepatic/cardiac disorders

**Precautions:** Pregnancy, breastfeeding, children, geriatric, blood dyscrasias, hepatic disease

## DOSAGE AND ROUTES

### Gout prevention

**Adult:** PO 0.6-1.8 mg in 1-2 divided doses daily depending on severity

### Gout treatment

**Adult:** PO 1.2 mg initially, then 0.6 mg 1 hr later (1.8 mg); those on strong CYP3A4 inhibitor (past 14 days) 0.6 mg initially, then 0.3 mg 1 hr later

### Renal dose

**Adult:** PO CCr <30 ml/min for acute gout, do not repeat course for 2 wk; familial Mediterranean fever 0.3 mg daily, increase cautiously

### Pericarditis (unlabeled)

**Adult:** PO 0.5 mg bid

### Mediterranean fever (unlabeled)

**Adult:** PO (on no interacting products): 1.2-2.4 mg/day in 1-2 divided doses; *strong CYP3A4 inhibitor/increase cautiously; P-glycoprotein inhibitors within 14 days:* max 0.6 mg/day in 1-2 divided doses; *moderate CYP3A4 inhibitors with 14 day max* 1.2 mg/day in 1-2 divided doses

**Adolescent:** PO 1.2-2.4 mg/day in 1-2 divided doses, titrate by 0.3 mg/day

**Child 6-12 yr:** PO 0.9-1.8 mg/day in 1-2 divided doses

**Child 4-6 yr:** PO 0.3-1.8 mg/day in 1-2 divided doses

**Available forms:** Tabs 0.6 mg; caps 0.6 mg; topical route

### Implementation

**PO route**

- Give without regard to food
- Cumulative doses ≤4 mg, renal patients ≤2 mg, when reached, administer only for 3 wks

## ADVERSE EFFECTS

**GI:** *Nausea, vomiting, anorexia, malaise,* metallic taste, cramps, peptic ulcer, diarrhea
**GU:** Hematuria, oliguria, renal damage
**HEMA:** Agranulocytosis, thrombocytopenia, aplastic anemia, pancytopenia
**INTEG:** Chills, dermatitis, pruritus, purpura, erythema
**MISC:** Myopathy, alopecia, reversible azoospermia, peripheral neuritis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | WBCs |
| **Metabolism** | Deacetylates in liver |
| **Excretion** | Feces (metabolites/active product) |
| **Half-life** | 4.4 hr |

### Pharmacodynamics

| | PO |
|---|---|
| **Onset** | Unknown |
| **Peak** | ½-2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CycloSPORINE, radiation: increased bone marrow depression
Ethanol: increased GI effects
Vitamin $B_{12}$: decreased action of vit $B_{12}$; may cause reversible malabsorption

### Drug classifications

Bone marrow depressants: increased bone marrow depression
HMG-COA reductase inhibitors Increase: rhabdomyolysis
Moderate/strong CYP3A4 inhibitors, (atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, ritonavir, saquinavir, telithromycin); P-glycoprotein inhibitors reduce dose: increased colchicine level/toxicity
NSAIDs: increased GI effects

### Drug/food

Grapefruit juice: increased colchicine level

### Drug/lab test

Increased: alkaline phosphatase, AST
Decreased: platelets, WBC, granulocytes
False positive: urine Hgb
Interference: urinary 17-hydroxycorticosteroids

## NURSING CONSIDERATIONS

### Assessment

- **Gout:** Assess pain and mobility of joints, uric acid levels returning to normal, monitor response to treatment q1hr
- Familial Mediterranean fever: Chest pain, fever, joint pain, lesions, baseline and periodically monitor I&O ratio; observe for decrease in urinary output; CBC, platelets, reticulocytes before, during therapy (q3mo); may cause aplastic anemia, agranulocytosis, decreased platelets
- **Assess for toxicity:** weakness, abdominal pain, nausea, vomiting, diarrhea, product should be discontinued, report symptoms immediately

• **Beers:** Reduce dose in older adults, monitor for adverse reactions
• **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected

### Patient/family education

• Caution patient to avoid alcohol, OTC preparations that contain alcohol
• Instruct patient to report any pain, redness, or hard area, usually in legs; rash, sore throat, fever, bleeding, bruising, weakness, numbness, tingling, nausea, vomiting, abdominal pain, muscle pain, weakness
• **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, neonatal codeine withdrawal may occur, don't use in labor (premature infant), excreted in breast milk, avoid breastfeeding
• Teach patient importance of complying with medical regimen (diet, weight loss, product therapy); bone marrow depression may occur
• Advise patient to tell all providers of product use, surgery may increase possibility of acute gout symptoms

### Evaluation

**Positive therapeutic outcome**

• Decreased stone formation on x-ray
• Decreased pain in kidney region
• Absence of hematuria
• Decreased pain in joints, reduced familial Mediterranean fever episodes

## TREATMENT OF OVERDOSE:

Discontinue medication, may need opioids to treat diarrhea

## colesevelam (Rx)

(coal-see-vel'am)
**Welchol**
*Func. class.:* Antilipemic
*Chem. class.:* Bile acid sequestrant

**ACTION:** Adsorbs, combines with bile acids to form insoluble complex that is excreted through feces; loss of bile acids lowers cholesterol levels

**Therapeutic outcome:** Decreasing LDL cholesterol

**USES:** Elevated LDL cholesterol, alone or in combination with HMG-coA reductase inhibitor; type 2 diabetes (adjunct)

## CONTRAINDICATIONS

Hypersensitivity, bowel disease, primary biliary cirrhosis, triglycerides >300 mg/dl, bowel obstruction, pancreatitis, biliary obstruction; dysphagia, fat-soluble vitamin deficiency

**Precautions:** Pregnancy, breastfeeding, children

C

## DOSAGE AND ROUTES

### Monotherapy

**Adult:** PO 3 625 mg tabs bid with meals or 6 tabs daily with a meal; may increase to 7 tabs if needed

### Combination therapy

**Adult:** PO 3 tabs bid with meals or 6 tabs daily with a meal given with an HMG-coA reductase inhibitor

### Type 2 diabetes, adjunct (to improve glycemic control)

**Adult and geriatric:** PO approx 3.8 g (6 tabs)/day or approx 1.9 g (3 tabs) bid

### Heterozygous familial hypercholesterolemia

**Females (postmenarchal and >10 yr) and males ≥10 yr:** PO 1.875 g packet bid or 3.75 g packet q day dissolved in 4-8 oz of water with a meal

**Available forms:** Tabs 625 mg, powder for oral susp 3.75 g/packet

### Implementation

• Give product daily, bid with meals; give all other medications 4 hr before colesevelam to avoid poor absorption; take with liquid
• Give supplemental doses of vit A, D, K if levels are low

**Powder for oral susp**

• Empty contents of packet into a cup/glass; add ½-1 cup (4-8 oz) of water, fruit juice, or diet soda; stir well before drinking

## ADVERSE EFFECTS

**GI:** *Constipation, abdominal pain, nausea,* fecal impaction, hemorrhoids, flatulence, vomiting, GI obstruction
**MISC:** Hypertriglycerides, hypoglycemia
**MS:** Muscle, joint pain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Feces |
| **Half-life** | Unknown |

### Pharmacodynamics

LDL decreased in 4-7 days

## INTERACTIONS

### Individual drugs

Digoxin, dilTIAZem, gemfibrozil, glyBURide, fluoroquinolones, iron, mycophenolate, penicillin G, phenytoin, propanolol, warfarin: decreased absorption of each specific product

Thyroid hormones: decreased absorption of thyroid

### Drug classifications

Corticosteroids: decreased corticosteroid action

Oral contraceptives: decreased action of oral contraceptives, give ≥ 4 hr before colesevelam

Tetracyclines: decreased absorption of tetracyclines

Thiazides: decreased absorption of thiazides

Vitamins (fat-soluble): decreased absorption of fat-soluble vitamins

### Drug/lab test

Increased: liver function tests

## NURSING CONSIDERATIONS

### Assessment

- Assess cardiac glycoside level if both products are being administered
- Assess for signs of vit A, D, K deficiency
- **Hypercholesterolemia:** monitor fasting LDL, HDL, total cholesterol, triglyceride levels baseline and q4wk after initiation of treatment and periodically, electrolytes if on extended therapy
- Monitor bowel pattern daily; increase bulk, $H_2O$ in diet for constipation
- **Diabetes:** Assess for hypoglycemia (weakness, hunger, dizziness, diaphoresis), can result from use of this product

### Patient/family education

- To take with meal and fluids
- Teach the importance of compliance; toxicity may result if doses missed, timing of dose 4 hr after other meds
- Teach that risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding, insulin may be used in diabetes during pregnancy; to use another form of contraception other than oral contraceptives

### Evaluation

**Positive therapeutic outcome**

- Decreased cholesterol level (hyperlipidemia); diarrhea, pruritus (excess bile acids), collagenase *Clostridium histolyticum*

## conivaptan (Rx)

(kon-ih-vap'tan)

**Vaprisol**

*Func. class.:* Vasopressin receptor antagonist

**ACTION:** Dual arginine vasopressin (AVP) antagonist with affinity for $V_{1A}$, $V_2$ receptors; level of AVP in circulating blood is critical for regulation of water, electrolyte balance and is usually elevated in euvolemic/hypervolemic hyponatremia

**Therapeutic outcome:** Correct serum sodium levels

**USES:** Euvolemia hyponatremia in those hospitalized, not indicated for HF, hypervolemia, hyponatremia

## CONTRAINDICATIONS

Hypersensitivity, hypovolemia

**Precautions:** Pregnancy, breastfeeding, orthostatic/renal disease, heart failure, rapid correction of serum sodium

## DOSAGE AND ROUTES

**Adult: IV** INF loading dose 20 mg given over 30 min, then CONT **IV** over 24 hr; after 1 day, give for an additional 1-3 days as a CONT INF of 20 mg/day total, can be titrated up to 40 mg/day if serum sodium is not rising at the desired rate; max time 4 days

### Hepatic/renal dose

**Adult:** IV Child-Pugh A-C or CCr 30-60 ml/min: Give IV loading dose over 10 min, then cont IV INF 10 mg over 24 hr × 2-4 days

**Available forms:** Injection (premixed) 0.2 mg/ml in 100 ml $D_5W$

### Implementation

**Intermittent IV infusion**

- Withdraw 4 ml (20 mg) of conivaptan, add to 100 ml $D_5W$, gently invert several times to mix, give over 30 min; in large vein, change site q24hr to minimize vascular irritation

**Continuous IV infusion route**

- Withdraw 4 ml (20 mg) of conivaptan, add to 250 ml $D_5W$, gently invert several times to mix, give over 24 hr; or 40 mg in 250 ml $D_5W$, gently invert several times to mix, give over 24 hr

## ADVERSE EFFECTS

**CNS:** Headache, confusion, insomnia

**CV:** Atrial fibrillation, hypo/hypertension, orthostatic hypotension, phlebitis

**GI:** Nausea, vomiting, constipation, dry mouth

**GU:** Hematuria, polyuria, UTI, pollakiuria

**HEMA:** Anemia
**INTEG:** Erythema, inj site reaction
**META:** Dehydration, hypo/hyperglycemia, hypokalemia, hypomagnesia, hyponatremia
**MISC:** Oral candidiasis, pain, peripheral edema, pneumonia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 99% |
| **Metabolism** | By CYP3A4 |
| **Excretion** | Unknown |
| **Half-life** | Terminal 5 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

CYP3A4 substrates (alfuzosin, ARIPiprazole, bexarotene, bortezomib, bosentan, bupivacaine, buprenorphine, carBAMazepine, cevimeline, cilostazol, cinacalcet, clopidogrel, colchicine, cyclobenzaprine, dapsone, darifenacin, disopyramide, DOCEtaxel, donepezil, DOXOrubicin, dutasteride, eletriptan, eplerenone, ergots, erlotinib, eszopiclone, ethinyl estradiol, ethosuximide, etoposide, fentaNYL, galantamine, gefitinib, halofantrine, ifosfamide, irinotecan, levobupivacaine, levomethadyl, lidocaine, loperamide, loratadine, mefloquine, methadone, modafinil, PACLitaxel, pimozide, praziquantel, quiNIDine, quiNINE, ramelteon, reboxetine, repaglinide, rifabutin, sibutramine, sildenafil, sirolimus, SUFentanil, SUNItinib, tacrolimus, tamoxifen, teniposide, testosterone, tiaGABine, tinidazole, trimetrexate, vardenafil, vinca alkaloids, ziprasidone, zolpidem, zonisamide): increased effects, do not use concurrently

## NURSING CONSIDERATIONS

### Assessment

- Monitor renal/hepatic function
- Assess frequent sodium volume status; overly rapid correction of sodium concentration (>12 mEq/L per 24 hr) may result in osmotic demyelination syndrome
- Assess neurologic status: confusion, headache
- Assess CV status: atrial fibrillation, hyper/hypotension, orthostatic hypotension; monitor B/P, pulse
- Monitor other electrolytes (magnesium and potassium)
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, may cause fetal harm discontinue breastfeeding or product, excretion unknown

### Patient/family education

- Advise patient to report neurologic changes: headache, insomnia, confusion
- Teach patient administration procedure and expected result
- Advise patient to report inj site pain, redness, swelling

### Evaluation

**Positive therapeutic outcome**

- Correction of serum sodium levels

## CONTRACEPTIVES, HORMONAL

**MONOPHASIC, ORAL**

**ethinyl estradiol/desogestrel (Rx)**
**Apri, Apri-28, Desogen, Emoquette, Mircette, Ortho-Cept, Reclipsen, Solia, Velivet**

**ethinyl estradiol/drospirenone (Rx)**
**Beyaz, Gianvil Loryna, Nikki, Ocella, Yasmin, Safyral, Syeda, Vestura, Yaz 28, Yaela, Zarah**

**Biphasic, Kariva, Mircette, Viorelle, Triphasic Cyclessa, Velivel**

**ethinyl estradiol/ethynodiol (Rx)**
**Kelnor 1/35, Zovia 1/35, Zovia 1/50**

**ethinyl estradiol/levonorgestrel (Rx)**
**Aviane-28, Altavera, Aubra Chateal, Enpresse, Falmina, Kuruelo, Jolessa, Lessina, Levlen, Levora, Lutera, Marlissa, Nordette, Portia, Quasense, Seasonique, Sronyx, Vienva**

**ethinyl estradiol/norethindrone (Rx)**
**Alyacen 1/35, Brevicon, Briellin, Cyclafem 1/35, Dasetta 1/35, Femcon Fe, Femhrt, Generess Fe 0.5/35, Genora 1/35, Junel 21 1/20, Junel 21 1.5/20, Larin 1/20, Lorin 1.5/30, Larin Fe 1/20, Larin Fe 1.5/30, Loestrin 21 1.5/30, Loestrin 21 1/20, Microgestin, Modicon, Necon 0.5/35, N.E.E 1/35, Nelova 0.5/35E, Nelova 1/35E, Norcept-E 1/35, Norethin**

IMPLANT

**etonogestrel (Rx)**

Implanon, Nexplanon

VAGINAL RING

**ethinyl estradiol/etonogestrel (Rx)**

Nuva Ring

TRANSDERMAL

**ethinyl estradiol/norelgestromin (Rx)**

Yulane

**ACTION:** Prevents ovulation by contraceptives suppressing FSH, LH; *monophasic:* estrogen/progestin (fixed dose) used during a 21-day cycle; ovulation is inhibited by suppression of FSH and LH; thickness of cervical mucus and endometrial lining prevents pregnancy; *biphasic:* ovulation is inhibited by suppression of FSH and LH; alteration of cervical mucus, endometrial lining prevents pregnancy; *triphasic:* ovulation is inhibited by suppression of FSH and LH; change of cervical mucus, endometrial lining prevents pregnancy; variable doses of estrogen/progestin combinations may be similar to natural hormonal fluctuations; *extended cycle:* estrogen/progestin continuous for 84 days, off for 7 days, result 4 menstrual periods/yr; *progressive estrogen:* constant progestin with 3 progressive doses of estrogen; *progestin-only pill, implant, intrauterine:* change of cervical mucus and endometrial lining prevents pregnancy; ovulation may be suppressed

**Therapeutic outcome:** Prevention of pregnancy, decreased severity of endometriosis, hypermenorrhea

**USES:** To prevent pregnancy, regulation of menstrual cycle, treatment of acne in women >14 yr that other treatment has failed, emergency contraception; *injection:* inhibits gonadotropin secretion, ovulation, follicular maturation; *emergency:* inhibits ovulation and fertilization, decreases transport of sperm and egg from fallopian tube to uterus; *vaginal ring, transdermal:* inhibits ovulation, prevents sperm entry into uterus; *antiacne:* may decrease sex hormone binding globulin, results in decreased testosterone

## CONTRAINDICATIONS

Pregnancy, breastfeeding, women 40 yr and over, reproductive cancer, thrombophlebitis, MI, hepatic tumors, hepatic disease, CAD, CVA, breast cancer, jaundice, stroke, vaginal bleeding

**Precautions:** Depression, hypertension, renal disease, seizure disorders, lupus erythematosus, rheumatic disease, migraine headache, amenorrhea, irregular menses, gallbladder disease, diabetes mellitus, heavy smoking, acute mononucleosis, sickle cell disease

**BLACK BOX WARNING:** Tobacco smoking

## DOSAGE AND ROUTES

### Monophasic

**Adult:** PO take first tab on Sunday after start of menses × 21 days; skip 7 days; then repeat cycle; start on 1st day of menses × 21 days; skip 7 days, then repeat cycle; may contain 7 placebo tabs, where 1 tab is taken daily

### Biphasic

**Adult:** PO Take 10 days of small progestin, then large progestin; estrogen is the same during cycle; skip 7 days, then repeat cycle; may contain 7 placebo tabs, where 1 tab is taken daily

### Triphasic

**Adult:** PO estrogen dose remains constant, progestin changes throughout 21 day cycle, some products contain 28 tabs per month

### Extended cycle

**Adult:** PO start taking on first day of menses; continue for 84 days of active tab, then 7 days of placebo; repeat cycle

### Progestin

**Adult:** PO start on 1st day of menses, then daily and continuously

### Progressive estrogen

**Adult:** PO progestin dose remains constant, estrogen increases q7days throughout 21-day cycle, may include 7 placebo tabs for 28-day cycle

### Emergency

**Adult and adolescent:** Give within 72 hr of intercourse, repeat 12 hr later; Plan B 1 tab, then 1 tab 12 hr later; Preven 2 tab, then 2 tab 12 hr later; Ovral 2 white tabs; Lo/Ovral 4 white tabs; Levlen, Nordette 4 orange tabs; Triphasil, Tri-Levlen 4 yellow tabs; ulipristal 1 tab as soon as possible within 120 hr

### Injectable

**Adult:** IM (Depo-Provera) 150 mg within 5 days of start of menses, or within 5 days postpartum (must not be breastfeeding); if breastfeeding, give 6 wk postpartum, repeat q3mo

### Intrauterine

**Adult:** To be inserted using the levonorgestrel-releasing intrauterine system (LRIS) by those trained in procedure; inserted into uterine cavity within 7 days of the onset of menstruation; use should not exceed 5 years per implant

### Vaginal ring

**Adult:** VAG insert 1 ring on or prior to day 5 of cycle, leave in place 3 wk; remove for 1 wk, then repeat

### Transdermal

**Adult:** Transdermal apply patch within 7 days of menses, change weekly × 3 wk; no patch wk 4, repeat cycle

### Implant

**Adult:** Subdermal in inner side of upper arm on days 1-5 of menses, replace q3yr

### Acne

**Adult:** PO (Ortho Tri-Cyclen) take daily × 21 days, off 7 days

### Implementation

**PO route**

- If GI symptoms occur, medication may be taken with food; take at same time each day

**Implant route**

- Inject 6 cap subdermally
- Implant is effective for 5 yr, should be removed after that

**IM route**

- Administer inj deep in large muscle mass after shaking susp well; ensure pregnancy has not occurred if inj are 2 wk or more apart

## ADVERSE EFFECTS

**CNS:** Depression, fatigue, dizziness, nervousness, anxiety, headache

**CV:** Increased B/P, cerebral hemorrhage, thrombosis, pulmonary embolism, fluid retention, edema, MI

**EENT:** Optic neuritis, retinal thrombosis, cataracts

**ENDO:** Decreased glucose tolerance, increased TBG, PBI, $T_4$, $T_3$, temporary infertility

**GI:** *Nausea,* vomiting, cramps, diarrhea, bloating, constipation, change in appetite, cholestatic jaundice, weight change
**GU:** Breakthrough bleeding, amenorrhea, spotting, dysmenorrhea, galactorrhea, endocervical hyperplasia, vaginitis, cystitis-like syndrome, breast change
**HEMA:** Increased fibrinogen, clotting factor
**INTEG:** *Chloasma, melasma,* acne, rash, urticaria, erythema, pruritus, hirsutism, alopecia, photosensitivity

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Griseofulvin, rifAMPin: decreased effectiveness of oral contraceptive

### Drug classifications

Analgesics, antibiotics, anticonvulsants, antihistamines: decreased action of oral contraceptives
Anticoagulants (oral): decreased action of oral anticoagulants

### Drug/herb

Black cohosh: altered action
Saw palmetto, St. John's wort: decreased oral contraceptive effect

### Drug/food

Grapefruit juice: increased peak level

### Drug/lab test

Increased: pro-time; clotting factors VII, VIII, IX, X; TBG, PBI, $T_4$, platelet aggregation, BSP, triglycerides, bilirubin, AST, ALT
Decreased: $T_3$, antithrombin III, folate, metyraPONE test, GTT, 17-OHCS

## NURSING CONSIDERATIONS

### Assessment

- Assess for reproductive changes: change in breasts, tumors, positive Pap smear; product should be discontinued if changes occur
- Monitor glucose, thyroid function, liver function tests, B/P
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Teach patient about detection of clots using Homans' sign; teach monitoring technique for heat, redness, pain, swelling
- Teach patient to use sunscreen or to avoid sunlight; photosensitivity can occur
- Teach patient to take at same time each day to ensure equal product level; to take another tab as soon as possible if one is missed
- Teach patient that after product is discontinued, pregnancy may not occur for several mo
- Instruct patient to report GI symptoms that occur after 4 mo
- Advise patient to use another birth control method during first 3 wk of oral contraceptive use
- Teach patient to report abdominal pain, change in vision, shortness of breath, change in menstrual flow, spotting, breakthrough bleeding, breast lumps, swelling, headache, severe leg pain, mental changes; that continuing medical care is needed: Pap smear and gynecologic exam q6mo

**BLACK BOX WARNING:** Teach patient not to smoke, increased risk of CV side effects

- Teach patient to notify physicians and dentist of oral contraceptive use

### Evaluation

**Positive therapeutic outcome**

- Absence of pregnancy
- Decreased severity of endometriosis
- Decreased severity of hypermenorrhea

## cotrimoxazole

*See trimethoprim/sulfamethoxazole*

**⚠ HIGH ALERT**

## crizotinib

(kriz-oh'ti-nib)
**XALKORI**
*Func. class.:* Antineoplastic; biologic response modifiers

**ACTION:** An inhibitor of receptor tyrosine kinases (anaplastic lymphoma kinase (ALK), hepatocyte growth factor receptor (HGFR, c-Met), recepteur d'origine nantais (RON).

**Therapeutic outcome:** Decreased spread of malignancy

**USES:** Locally advanced or metastatic non–small-cell lung cancer (NSCLC) that is anaplastic lymphoma kinase (ALK)-positive as detected by an FDA-approved test

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity

**Precautions:** Pneumonitis, severe hepatic disease, congenital long QT syndrome, neonates, infants, children, adolescents, severe renal impairment, end-stage renal disease, vision disorders

## DOSAGE AND ROUTES

**Adult: PO** 250 mg bid; continue as long as is beneficial

### Dose adjustments for hematologic toxicities

For Grade 1-2: No dosage adjustment needed

For Grade 3: Interrupt treatment until toxicity resolves to grade ≤2, then, continue with the same dosage schedule. In case of recurrence after a grade 4 event with dose reduction, interrupt treatment until toxicity resolves to grade ≤2; when resuming treatment, reduce dosage to 250 mg PO daily

For Grade 4: Interrupt treatment until toxicity resolves to grade ≤2; when resuming treatment, reduce dosage to 200 mg PO bid. In case of grade 4 recurrence, permanently discontinue treatment

### Dose adjustment for hepatic laboratory abnormalities

For Grade 1: No dosage adjustment necessary:

For Grade 2 ALT/AST elevations with grade ≤1 total bilirubin elevations: No dosage adjustment necessary

For Grade 3-4 ALT/AST elevations with grade ≤1 total bilirubin elevations: Interrupt treatment until toxicity resolves to grade ≤1 or baseline; when resuming treatment, reduce dosage to 200 mg PO bid; in case of recurrence, interrupt treatment until toxicity resolves to grade ≤1, and when resuming treatment, reduce dosage to 250 mg PO daily; permanently discontinue treatment in case of further recurrence

For Grade 2-4 ALT/AST elevations with concurrent Grade 2-4 total bilirubin elevations (in the absence of cholestasis or hemolysis): Permanently discontinue treatment

### Dose adjustment for pneumonitis not attributable to NSCLC progression, other pulmonary disease, infection, or radiation effect

For any grade pneumonitis: Permanently discontinue

### Dose adjustment for QTc prolongation

For Grade 1–2 QTc prolongation: No dosage adjustment necessary

For Grade 3 QTc prolongation: Interrupt treatment until toxicity resolves to grade ≤1; when resuming treatment, reduce dosage to 200 mg PO bid; in case of recurrence, interrupt treatment until toxicity resolves to grade ≤1 and when resuming treatment, reduce dosage to 250 mg PO daily; permanently discontinue in case of further recurrence

For Grade 4 QTc prolongation: Permanently discontinue

**Available forms:** Caps 200, 250 mg

### Implementation

- May be taken orally with or without food
- Have the patient swallow capsule whole; do not crush or chew
- If a dose is missed, it can be taken up to 6 hr before the next dose is due to maintain the twice daily regimen. Do not take both doses at the same time
- Store capsules at room temperature

## ADVERSE EFFECTS

**CNS:** Dizziness, balance disorder, presyncope, neuropathy (motor and sensory), burning sensation, dysesthesia, hyperesthesia, hypoesthesia, neuralgia, paresthesias, peripheral neuropathy (motor and sensory), headache, insomnia

**CV:** QT prolongation, disseminated intravascular coagulation (DIC), septic shock, bradycardia

**EENT:** *Diplopia, photopsia,* photophobia, *blurred vision,* visual field defect, *vitreous floaters,* visual brightness, *reduced visual acuity,* esophageal disorders, dyspepsia

**GI:** *Nausea, diarrhea, vomiting, constipation,* decreased appetite, dysgeusia, abdominal pain, abdominal discomfort/pain, stomatitis, oral ulceration, elevated hepatic enzymes, hyperbilirubinemia, glossodynia, glossitis, cheilitis, mucosal inflammation, oropharyngeal pain/discomfort, oral pain, esophageal disorder, dysphagia, epigastric discomfort/pain, burning, esophagitis, esophageal obstruction/pain/spasm, esophageal ulceration, gastroesophageal reflux, odynophagia, and reflux esophagitis

**HEMA:** Grade 3/4 neutropenia, thrombocytopenia, lymphopenia

**MISC:** Fatigue, fever, *edema,* localized/peripheral edema, chest pain (unspecified), chest discomfort, musculoskeletal chest pain, arthralgia, back pain, rash

**RESP:** Severe, life-threatening pneumonitis, pneumonia, hypoxia, acute respiratory distress syndrome (ARDS), dyspnea, empyema, pulmonary hemorrhage, pulmonary embolism, upper respiratory tract infection (nasopharyngitis, pharyngitis, rhinitis), cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 43% |
| **Distribution** | Steady state 15 days, protein binding 91%, distribution tissue, plasma |
| **Metabolism** | By 3YPA4/5, oxidation to metabolites |
| **Excretion** | 63% feces, unchanged 53%; 22% urine, unchanged 2, 3% |
| **Half-life** | Terminal 42 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4-6 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

CYP2B6 substrates (prasugrel, selegiline, cyclophosphamide): increased action of these products

β-agonists, Class IA antiarrhythmics (disopyramide, procainamide, quiNIDine), Class III antiarrhythmics (amiodarone, dofetilide, ibutilide, sotalol), halogenated anesthetics, local anesthetics, tricyclic antidepressants: increased QT prolongation, torsades de pointes

CYP3A4 inhibitors (ketoconazole, atazanavir, indinavir, itraconazole, nefazodone, nelfinavir, ritonavir, voriconazole, boceprevir, delavirdine, isoniazid, dalfopristin-quinupristin, tipranavir): increased crizotinib

CYP3A4 inducers (rifAMPin, carBAMazepine, PHENobarbital, phenytoin, rifabutin); antacids, H2-blockers, proton pump inhibitors (PPIs): decreased crizotinib

CYP3A4 substrates (alfentanil, cycloSPORINE, ergotamine, dihydroergotamine fentaNYL, sirolimus, colchicine): avoid concurrent use

### Individual drugs

Abarelix, alfuzosin, amoxapine, apomorphine, arsenic trioxide, asenapine, chloroquine, ciprofloxacin, citalopram, clarithromycin, cloZAPine, cyclobenzaprine, dasatinib, dolasetron, dronedarone, droperidol, eriBULin, erythromycin, ezogabine, flecainide, fluconazole, gatifloxacin, gemifloxacin, grepafloxacin, halofantrine, haloperidol, iloperidone, indacaterol, lapatinib, levofloxacin, levomethadyl, lopinavir/ritonavir, magnesium sulfate, maprotiline, mefloquine, methadone, moxifloxacin, nilotinib, norfloxacin, octreotide, ofloxacin, OLANZapine, ondansetron, paliperidone, palonosetron, pentamidine, certain phenothiazines (chlorproMAZINE, mesoridazine, thioridazine, fluPHENAZine, perphenazine, prochlorperazine, trifluoperazine), pimozide, posaconazole, potassium sulfate, probucol, propafenone, QUEtiapine, quiNIDine, ranolazine, rilpivirine, risperiDONE, saquinavir, sodium, sparfloxacin, SUNItinib, tacrolimus, telavancin, **telithromycin**, tetrabenazine, troleandomycin, vardenafil, **vemurafenib**, venlafaxine, vorinostat, ziprasidone: increased QT prolongation, torsades de pointes

Midazolam: increased midazolam action

### Drug/herb

Do not use with St. John's wort

### Drug/food

Do not use with grapefruit juice

## NURSING CONSIDERATIONS

### Assessment

- **Severe, life-threatening, or fatal treatment-related pneumonitis:** All cases occurred within 2 months of treatment initiation; monitor for pulmonary symptoms that may indicate pneumonitis and other causes of pneumonitis should be excluded; permanently discontinue in patients with treatment-related pneumonitis
- **Hepatic disease:** Liver function test (LFT) abnormalities, altered bilirubin levels, may occur during treatment; monitor LFTs and bilirubin levels prior to treatment, then monthly; more frequent testing is needed in those presenting with grade 2 or greater toxicities; Laboratory alterations should be managed with dose reduction, treatment interruption, or discontinuation
- **QT prolongation:** has been reported with the use of crizotinib; crizotinib should be avoided in these patients. Monitor ECG and electrolytes in those with HF, bradycardia, electrolyte imbalance (hypokalemia, hypomagnesemia), or in those who are taking concomitant medications known to prolong the QT interval; treatment interruption, dosage adjustment, or treatment discontinuation may be needed in those who develop QT prolongation
- **Vision disorders:** Generally started within 2 weeks of the start of therapy; ophthalmologic evaluation should be considered, particularly if patients experience photopsia or new/ increased vitreous floaters; caution should be used when driving or operating machinery by patients who experience vision disorders
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, do not use in pregnancy, avoid breastfeeding
- CBC with differential; BUN/creatinine

### Patient/family education
- Missed doses can be taken up to 6 hr before the next dose is due to maintain the twice daily regimen
- Teach patient to use reliable contraception; both women and men of childbearing age should use adequate contraceptive methods during therapy and for at least 90 days after completing treatment; pregnancy
- Teach patient to report immediately shortness of breath, cough, fatigue, visual changes
- Teach patient not to take with grapefruit juice
- Teach patient to avoid activities requiring mental alertness until effects are known
- Teach patient to report signs of QT prolongation (abnormal heartbeats, dizziness, syncope)
- Teach patient to swallow caps whole and avoid contact with broken cap

### Evaluation
**Positive therapeutic outcome**
- Decreased spread of malignancy

## crofelemer
(kroe-fel′e-mer)
**Mytesi**
*Func. class.:* Antidiarrheal
*Chem. class.:* Red sap of *Croton lechleri* plant

**ACTION:** Blocks chloride channel and high volume water loss in diarrhea

**Therapeutic outcome:** Decreasing diarrhea

**USES:** Noninfectious diarrhea in those with HIV/AIDS using antiretrovirals

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, Black patients, children/ adolescents, GI disease, infection, malabsorption syndrome, pancreatitis

## DOSAGE AND ROUTES
**Adult: PO** 125 mg bid

**Available forms:** Del rel tabs 125 mg

### Implementation
**PO route**
- Do not break, crush, or chew
- Give without regard to meals

## ADVERSE EFFECTS
**CNS:** Dizziness, depression
**GI:** Nausea, constipation, abdominal pain, anorexia, flatulence, hyperbilirubinemia
**INTEG:** Acne vulgaris, contact dermatitis
**MISC:** Arthralgia, cough, increased urinary frequency

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Alosetron: increased serious constipation, bowel obstruction

### Drug classifications
Antimuscarinics, opiate agonists: increased constipation

## NURSING CONSIDERATIONS
### Assessment
- Stools: volume, color, characteristic frequency; bowel pattern before protein rebound constipation
- Electrolytes (K, Na, Cl), hydration status
- Monitor effect in Black patients; may be less effective
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk

### Patient/family education
- Instruct patient to avoid OTC products unless directed by prescriber
- Instruct patient not to operate machinery if drowsiness occurs

### Evaluation
**Positive therapeutic outcome:**
- Decreased diarrhea

## cyclobenzaprine (Rx)
(sye-kloe-ben′za-preen)
**Amrix**
*Func. class.:* Skeletal muscle relaxant, central acting
*Chem. class.:* Tricyclic amine salt

**Do not confuse:** cyclobenzaprine/ cyproheptadine

**ACTION:** Reduction of tonic muscle activity at the brain stem; may be related to antidepressant effects

**Therapeutic outcome:** Relaxation of skeletal muscle

## USES:
Adjunct for relief of muscle spasm and pain in musculoskeletal conditions

**Unlabeled uses:** Fibromyalgia

## CONTRAINDICATIONS
Acute recovery phase of MI, dysrhythmias, heart block, HF, hypersensitivity, child <12 yr, intermittent porphyria, thyroid disease

**Precautions:** Pregnancy, breastfeeding, geriatric, renal/hepatic disease, addictive personality

## DOSAGE AND ROUTES
### Musculoskeletal disorders
**Adult/adolescent ≥15 yr:** PO 5 mg tid × 1 wk, max 30 mg/day × 3 wk
**Adult:** EXT REL 15 mg q day, max 30 mg q day × 3 wk
**Geriatric:** PO 5 mg tid

### Hepatic dose
**Adult (mild hepatic disease):** PO 5 mg, titrate slowly

### Fibromyalgia (unlabeled)
**Adult:** PO 10 mg at bedtime, titrated up

**Available forms:** Tabs 5, 7.5, 10 mg; ext rel tab 15, 30 mg

### Implementation
- Give without regard to meals, give with food for GI symptoms
- Store in airtight container at room temperature

## ADVERSE EFFECTS
**CNS:** *Dizziness, weakness, drowsiness,* headache, tremor, depression, insomnia, confusion, paresthesia, nervousness
**CV:** Postural hypotension, tachycardia, dysrhythmias
**EENT:** Diplopia, temporary loss of vision, blurred vision
**GI:** *Nausea,* vomiting, hiccups, dry mouth, constipation, hepatitis
**GU:** Urinary retention, frequency, change in libido
**INTEG:** Rash, pruritus, fever, facial flushing, sweating

### Pharmacokinetics

| | |
|---|---|
| **Distribution** | Well |
| **Metabolism** | Liver, partially |
| **Excretion** | Kidney (unchanged) |
| **Half-life** | 1-3 days, 32 hr ext rel |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1 hr |
| **Peak** | 3-8 hr |
| **Duration** | 12-24 hr |

## INTERACTIONS
### Individual drugs
Alcohol: increased CNS depression
TraMADol: do not use within 14 days

### Drug classifications
Antidepressants (tricyclic), barbiturates, opiates, sedative/hypnotics: increased CNS depression
**MAOIs:** do not use within 14 days
**Serotonin syndrome—SSRIs, SNRIs, tricyclics, triptans, fentaNYL, busPIRone, traMADol:** increased action of these products

### Drug/herb
Kava, chamomile, hops, valerian: increased CNS depression

## NURSING CONSIDERATIONS
### Assessment
- **Serotonin syndrome:** if using with SSRIs, SNRIs, monitor closely; if syndrome occurs, discontinue both products immediately
- Assess pain periodically: location, duration, mobility, stiffness, baseline
- Monitor ECG in epileptic patients; poor seizure control has occurred in patients taking this product
- Check for allergic reactions: rash, fever, respiratory distress
- Check for severe weakness, numbness, in extremities
- Assess for CNS depression: dizziness, drowsiness, psychiatric symptoms
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if clearly needed, use cautiously in breastfeeding
- **Beers:** Avoid use in older adults, anticholinergic effects

### Patient/family education
- Teach patient not to discontinue medication quickly; insomnia, nausea, headache, spasticity, tachycardia will occur; product should be tapered off over 1-2 wk
- Caution patient not to take with alcohol, other CNS depressants
- Advise to avoid altering activities while taking this product
- Caution patient to avoid hazardous activities if drowsiness/dizziness occurs
- Caution patient to avoid using OTC medication: cough preparations, antihistamines, unless directed by prescriber

• Teach patient to use gum, frequent sips of water for dry mouth
• Teach patient to notify prescriber of serotonin syndrome

### Evaluation

**Positive therapeutic outcome**

• Decreased pain, spasticity; muscle spasms of acute, painful musculoskeletal conditions are generally short term; long-term therapy is seldom warranted

## TREATMENT OF OVERDOSE:

Empty stomach with emesis, gastric lavage, then use anticonvulsants if indicated; monitor cardiac function

## cyclopentolate ophthalmic

*See Appendix B*

**⚠ HIGH ALERT**

## cyclophosphamide (Rx)

(sye-kloe-foss′fa-mide)
**Cytoxan, Procytox** 🍁
*Func. class.:* Antineoplastic alkylating agent
*Chem. class.:* Nitrogen mustard

**Do not confuse:** cyclophosphamide/cycloSPORINE

**ACTION:** Alkylates DNA; responsible for cross-linking DNA strands; activity is not cell cycle phase specific

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Hodgkin's disease, lymphomas, leukemia, multiple myeloma, neuroblastoma, retinoblastoma, Ewing's sarcoma, cancer of female reproductive tract, breast, nephrotic syndrome

## CONTRAINDICATIONS

Pregnancy, hypersensitivity, prostatic hypertrophy, bladder neck obstruction

**Precautions:** Radiation therapy, cardiac disease, anemia, dysrhythmias, child, dental disease/work, dialysis, geriatrics, heart failure, hematuria, infections, leukopenia QT prolongation, secondary malignancy surgery, tumor lysis syndrome, vaccinations, breastfeeding, severely depressed bone marrow function

## DOSAGE AND ROUTES

### Acute lymphocytic leukemia (ALL) (induction therapy)

**Adult/adolescent/child:** IV 300-1500 mg/m² have been used with induction, intensification, and consolidation regimens that may include prediSONE, vinCRIStine and others; PO 1-5 mg/kg/day adjusted to response

### Neuroblastoma

**Adult/child:** **IV** For induction, 40-50 mg/kg in divided doses over 2-5 days or 10-15 mg/kg q7-10 days, 3-5 mg/kg 2 times/wk or 1-5 mg/kg daily
**Child and infant:** PO 150 mg/m²/day, days 1-7 with DOXOrubicin (**IV** 35 mg/m² on day 5) q21days × 5 cycles
**Child:** **IV** 70 mg/kg/day with hydration on days 1 and 2 with DOXOrubicin and vinCRIStine q21days for courses 1, 2, 4, 6, alternating with CISplatin and etoposide q21days for courses 3, 5, 7

### Breast cancer

**Adult:** PO 100-200 mg/m²/day or 2 mg/kg/day × 4-14 days; **IV** 500-1000 mg/m² on day 1 in combination with fluorouracil and methotrexate or DOXOrubicin, or DOXOrubicin alone; also cyclophosphamide 600 mg/m², may be given dose-dense on day 1 of q14day with DOXOrubicin (60 mg/m²) with growth factor support

### Operable node-positive breast cancer

**IV (TAC regimen) Adult:** 500 mg/m² with DOXOrubicin (50 mg/m² **IV**) then DOCEtaxel (75 mg/m²) **IV** given 1 hr later × 6 cycles q3wk

### Nephrotic syndrome

**Child:** PO 2.5-3 mg/kg q day × 60-90 days

**Available forms:** Inj **IV** 200 🍁, 500 mg, 1, 2 g; vials 25, 50 mg

### Implementation

• Give fluids **IV** or PO before chemotherapy to hydrate patient
• Give antacid before oral agent, after PM meals, before bedtime; antiemetic 30-60 min before giving product to prevent vomiting and prn; antibiotics for prophylaxis of infection
• Give top or syst analgesics for pain; give in AM so product can be eliminated before bedtime
• Use cytotoxic handling procedures

**PO route**

• To be taken on empty stomach; do not crush, break, chew tab, wash hands immediately if in contact with tab
• May be taken as a single dose or divided doses
• Take in AM or afternoon, avoid evening

**Direct IV**

• Reconstitute with NS only
• Store in tight container at room temperature

**Intermittent IV infusion route**
- Use cytotoxic handling procedures
- Give **IV** after diluting 100 mg/5 ml of sterile or bacteriostatic water; shake; let stand until clear; may be further diluted in up to 250 ml $D_5$ 0.9% NaCl, 0.45% NaCl, give 100 mg or less/min through 3-way stopcock of glucose or saline inf
- Use 21-, 23-, or 25-G needle; check site for irritation, phlebitis

**Y-site compatibilities:** Amifostine, amikacin, ampicillin, azlocillin, aztreonam, bleomycin, cefamandole, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefOXitin, cefuroxime, cephalothin, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, CISplatin, cladribine, clindamycin, dexamethasone, diphenhydrAMINE, DOXOrubicin, doxycycline, droperidol, erythromycin, famotidine, filgrastim, fludarabine, fluorouracil, furosemide, gallium, ganciclovir, gentamicin, granisetron, heparin, HYDROmorphone, IDArubicin, kanamycin, leucovorin, LORazepam, melphalan, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, mezlocillin, minocycline, mitoMYcin, moxalactam, nafcillin, ondansetron, oxacillin, PACLitaxel, penicillin G potassium, piperacillin, piperacillin/tazobactam, prochlorperazine, promethazine, propofol, raNITIdine, sargramostim, sodium bicarbonate, teniposide, tetracycline, thiotepa, ticarcillin, ticarcillin-clavulanate, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vinBLAStine, vinCRIStine, vinorelbine

**Solution compatibilities:** Amino acids 4.25%/$D_{25}$, $D_5$/0.9% NaCl, $D_5$W, 0.9% NaCl

## ADVERSE EFFECTS

**CNS:** Headache, dizziness
**CV:** Cardiotoxicity (high doses), myocardial fibrosis, congestive heart failure, pericarditis
**ENDO:** Syndrome of inappropriate antidiuretic hormone (SIADH), gonadal suppression
**GI:** *Nausea, vomiting, diarrhea, weight loss,* colitis, hepatotoxicity
**GU:** Hemorrhagic cystitis, hematuria, neoplasms, amenorrhea, azoospermia, sterility, ovarian fibrosis, renal tubular fibrosis
**HEMA:** Thrombocytopenia, leukopenia, pancytopenia, myelosuppression
**INTEG:** *Alopecia,* dermatitis
**META:** Hyperuricemia
**MISC:** Secondary neoplasms, anaphylaxis
**RESP:** Pulmonary fibrosis, interstitial pneumonia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO) |
| **Distribution** | Widely distributed; crosses placenta, blood-brain barrier (50%) |
| **Metabolism** | Liver to active product |
| **Excretion** | Kidneys, unchanged (30%) |
| **Half-life** | 4-6½ hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Allopurinol: increased bone marrow suppression
Chloramphenicol: decreased cyclophosphamide effect
Digoxin: decreased digoxin levels
Insulin: increased hypoglycemia
Succinylcholine: increased neuromuscular blockade
Warfarin: increased warfarin action

### Drug classifications

Diuretics (thiazides): increased bone marrow suppression
Barbiturates: increased toxicity of cyclophosphamide
Corticosteroids: decreased cyclophosphamide effect
Live virus vaccines: decreased antibody reaction

### Drug/herb

St. John's wort: increased toxicity

### Drug/lab test

Increased: uric acid
Decreased: pseudocholinesterase
False positive: Pap smear
False negative: PPD, mumps trichophytin, *Candida, Trichophyton,* Pap smear

## NURSING CONSIDERATIONS

### Assessment

- **Assess symptoms indicating severe allergic reaction:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing
- Assess for tachypnea, ECG changes, dyspnea, edema, fatigue
- **Bone marrow suppression:** Monitor CBC, increase fluid intake to 3 liters/day (adults) differential, platelet count weekly; withhold product if WBC count is $<2500/mm^3$ or platelet count is $<75{,}000/mm^3$; notify prescriber of results

- **Assess for hemorrhagic cystitis:** renal function studies including BUN, creatinine, serum uric acid, urine CCr before, during therapy; I&O ratio; report fall in urine output to <30 ml/hr, monitor
- Monitor temp q4hr (elevated temp may indicate beginning of infection)
- **Hepatotoxicity:** Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; note jaundice of skin or sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea
- **Beers:** Avoid in older adults, delirium, dementia may occur; avoid in men due to decreased urine flow, retention
- **Assess for bleeding:** hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr
- Pulmonary fibrosis/interstitial pneumonia: Identify dyspnea, crackles, unproductive cough, chest pain, tachypnea
- Identify effects of alopecia on body image; discuss feelings about body changes

### Patient/family education

- Teach patient to avoid use of products containing aspirin or ibuprofen, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools, bruising)
- Instruct patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath)
- Teach patient to report any changes in breathing or coughing even several months after treatment
- Advise patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture, skin, fingernails may become darker
- Advise patient on proper handling and disposal of chemotherapy drugs
- Teach patient not to have any vaccinations without the advice of the prescriber; serious reactions can occur
- **Pregnancy/breastfeeding:** Advise patient contraception is needed during treatment and for several months (men use condoms); 1 yr (women) after the completion of therapy
- Teach patient to take adequate fluids to eliminate product

### Evaluation

**Positive therapeutic outcome**

- Prevention of rapid division of malignant cells
- Increased appetite, increased weight

## cycloSPORINE (Rx)

(sye-kloe-spor'een)

**SandIMMUNE**

## cycloSPORINE, modified

**Gengraf, Neoral**

*Func. class.:* Immunosuppressant (antirheumatic, DMARD)

*Chem. class.:* Fungus-derived peptide

**Do not confuse:** cycloSPORINE/CycloSERINE/cyclophosphamide, SandIMMUNE/SandoSTATIN

**ACTION:** Produces immunosuppression by inhibiting T lymphocytes

**Therapeutic outcome:** Absence of transplant rejection

**USES:** Organ transplants (liver, kidney, heart, GVHD) to prevent rejection, rheumatoid arthritis, psoriasis

**Unlabeled uses:** Recalcitrant ulcerative colitis, aplastic anemia, Crohn's disease, thrombocytopenia purpura, lupus, nephritis, myasthenia gravis, psoriatic arthritis

## CONTRAINDICATIONS

Hypersensitivity to polyoxyethylated castor oil (inj only), psoriasis or rheumatoid arthritis in renal disease (Neoral/Gengraf), Gengraf/Neoral used with PUVA/UVB; methotrexate, coal tar, breastfeeding, ocular infections

**BLACK BOX WARNING:** Neoplastic disease, sunlight (UV) exposure, renal disease/failure, uncontrolled, malignant hypertension; radiation in psoriasis

**Precautions:** Pregnancy, geriatric, severe renal/hepatic disease

**BLACK BOX WARNING:** Immunosuppression, requires a specialized care setting and experienced clinician, nephrotoxicity, skin cancer

## DOSAGE AND ROUTES/NTI

### Prevention of transplant rejection (unmodified)

**Adult and child:** PO 15 mg/kg 4-12 hr before surgery, daily for 2 wk, reduce dosage by 2.5 mg/kg/wk to 5-10 mg/kg/day; **IV** 5-6 mg/kg 4-12 hr before surgery, daily, switch to PO form as soon as possible

### Prevention of transplant rejection (modified)

**Adult and child:** PO 4-12 mg/kg/day divided q12hr, depends on organ transplanted

### Rheumatoid arthritis (Neoral/Gengraf)
**Adult:** PO 2.5 mg/kg/day divided bid, may increase 0.5-0.75 mg/kg/day after 8-12 wk, max 4 mg/kg/day

### Psoriasis (Neoral/Gengraf)
**Adult:** PO 2.5 mg/kg/day divided bid × 4 wk, then increase by 0.5 mg/kg/day q2wk, max 4 mg/kg/day

### Idiopathic thrombocytopenia purpura (unlabeled)
**Adult:** PO 1.25-2.5 mg/kg bid

### Severe aplastic anemia (unlabeled)
**Adult and child:** PO 12 mg/kg/day or 15 mg/kg/day (child) with antithymocyte globulin (ATG)

**Available forms:** Oral sol (Neoral) 100 mg/ml; soft gel cap 25, 50, 100 mg; inj 50 mg/ml

### Implementation
**PO route**
- Some brands are not interchangeable
- Do not break, crush, or chew caps
- Use pipette provided to draw up oral sol; may mix with milk or juice, wipe pipette, do not wash (Neoral)
- Give for several days before transplant surgery with corticosteroids
- Microemulsion products (Neoral) and other products are not interchangeable
- Give with meals for GI upset or place product in chocolate milk (SandIMMUNE)

**Intermittent IV infusion route**
- Give **IV** after diluting each 50 mg/20-100 ml of 0.9% NaCl or $D_5W$; run over 2-6 hr; use an inf pump, glass inf bottles only

**Continuous IV infusion route**
- May run over 24 hr
- **For SandIMMUNE parenteral:** give 1/3 of PO dose, initial dose 4-12 hr prior to transplantation as a single **IV** dose 5-6 mg/kg/day, continue the single daily dose until PO can be used

**Y-site compatibilities:** Abciximab, alatrofloxacin, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, levofloxacin, lidocaine, linezolid, LORazepam, mannitol, mechlorethamine, meperidine, meropenem, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins injection, nafcillin, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, raNITIdine, ritodrine, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, zoledronic acid

**Solution compatibilities:** $D_5W$, NaCl 0.9%

## ADVERSE EFFECTS
**CNS:** *Tremors, headache,* seizures, confusion, progressive multifocal leukoencephalopathy, encephalopathy
**GI:** Nausea, vomiting, diarrhea, *oral candida, gum hyperplasia,* hepatotoxicity, pancreatitis
**GU:** Albuminuria, hematuria, proteinuria, renal failure, hemolytic uremic syndrome, nephrotoxicity
**INTEG:** Rash, acne, *hirsutism,* pruritus
**META:** Hyperkalemia, hypomagnesemia, hyperlipidemia, hyperuricemia
**MISC:** *Infection, hypertension*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poorly absorbed (PO) |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver to mercaptopurine |
| **Excretion** | Kidney, minimal |
| **Half-life** | Biphasic 1.2 hr, 25 hr |

### Pharmacodynamics

| | PO |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Allopurinol, amiodarone, amphotericin B, bromocriptine, carvedilol, cimetidine, colchicine, foscarnet, imipenem-cilastatin, melphalan, metoclopramide: increased action, cycloSPORINE toxicity

Aminoglycosides, ciprofloxacin, NSAIDs, fibric acid derivatives, vancomycin, melphalan, ketoconazole

Digoxin: increased digoxin level

Etoposide: increased etoposide level

Methotrexate: increased methotrexate level

Nafcillin, orlistat, PHENobarbital, phenytoin, terbinafine, ticlopidine, trimethoprim/sulfamethoxazole: decreased cycloSPORINE action

Sirolimus: increased sirolimus level

Tacrolimus: increased tacrolimus level

### Drug classifications:

Androgens, antifungals (azole), β-blockers, calcium channel blockers, contraceptives (oral), corticosteroids, fluoroquinolones, macrolides, NSAIDs, selective serotonin reuptake inhibitors: increased cycloSPORINE levels, toxicity

Anticonvulsants, rifamycins: decreased cycloSPORINE levels

HMG-CoA reductase inhibitors, diuretics (potassium-sparing): increased effects of each product

Live virus vaccines: decreased antibody reaction

Potassium-sparing diuretics, potassium supplements, ACE inhibitors: increase renal dysfunction

### Drug/food

Grapefruit juice, food: increased slowed metabolism of product

## NURSING CONSIDERATIONS

### Assessment

- **Posterior reversible, encephalopathy:** Assess for impaired cognition, seizures, vision changes including blindness, loss of motor function, movement disorders, psychiatric changes; dosage reduction or discontinuation may be needed in severe cases
- **Progressive multifocal leukoencephalopathy (PML):** Apathy, confusion, cognitive changes, may be fatal, withhold dose, notify prescriber immediately
- Monitor renal studies: BUN, creatinine at least monthly during treatment, 3 mo after treatment
- Monitor liver function studies: alkaline phosphatase, AST, ALT, bilirubin
- Monitor product blood levels during treatment (Therapeutic range: 100-400 mg/ml)

**BLACK BOX WARNING:** Assess for hepatotoxicity: dark urine, jaundice, itching, light-colored stools; product should be discontinued

- **Assess for nephrotoxicity:** 6 wk postop, CyA trough level >200 ng/ml, intracapsular pressure <40 mm Hg, rise in creatinine 0.15 mg/dl/day

### Patient/family education

- Advise patient to report fever, rash, severe diarrhea, chills, sore throat, fatigue, since serious infections may occur; also to report clay-colored stools, cramping (may indicate hepatotoxicity); tremors, bleeding gums, increased B/P

**BLACK BOX WARNING:** Advise patient to limit UV exposure

- **Pregnancy/breastfeeding:** Caution patient to use contraceptive measures during treatment and for 12 wk after ending therapy; product is teratogenic, to notify prescriber if pregnancy is planned or suspected
- Caution patient to avoid crowds and persons with known infections to reduce risk of infection
- Teach patient to take at the same time of day, every day; do not skip or double a missed dose; not to use with grapefruit juice or receive vaccines; there are many drug interactions, do not add or discontinue products without prescriber approval
- Teach patient that treatment is lifelong to prevent rejection; to identify signs of rejection
- Advise patient to report severe diarrhea as drug loss may result in rejection

**BLACK BOX WARNING:** Nephrotoxicity: Teach patient to notify prescriber of increased B/P, tremors of the hands, change in gums, increased hair on body/face

- Advise patient to continue with lab work and follow-up appointment
- Teach patient types of products are not interchangeable

• Teach patient not to wash syringe/container with water; a variation in dose may result
• Teach patient to notify prescriber of all medications, herbal, supplements that are taken

### Evaluation

**Positive therapeutic outcome**

• Absence of graft rejection, decreased pain in rheumatoid arthritis

**⚠ HIGH ALERT**

## cytarabine (Rx)

(sye-tare'a-been)
**Cytosar**

## cytarabine liposomal (Rx)

**Depo Cyt**

*Func. class.:* Antineoplastic, antimetabolite
*Chem. class.:* Pyrimidine nucleoside

**Do not confuse:** Cytosar/Cytovene/Cytoxan

**ACTION:** Competes with physiologic substrate of DNA synthesis, thus interfering with cell replication in the S phase of the cell cycle (before mitosis)

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Acute myelocytic leukemia, acute lymphocytic leukemia, chronic myelocytic leukemia, lymphomatous meningitis (IT/intraventricular)

**Unlabeled uses:** Hodgkin's/non-Hodgkin's lymphoma

## CONTRAINDICATIONS

Pregnancy, hypersensitivity

**Precautions:** Renal/hepatic disease, breastfeeding, children, tumor lysis syndrome, infection, hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia

**BLACK BOX WARNING:** Bone marrow suppression, arachnoiditis, abdominal pain, chemotherapy-induced nausea/vomiting, diarrhea, hepatotoxicity, stomatitis, requires a specialized care setting and experienced clinician

## DOSAGE AND ROUTES

### Regimens vary acute myelogenous leukemia (AML)

**Adult:** cont **IV** infusion 100 mg/m²/day × 7 days q2wk as a single agent or 2-3 divided doses × 5-10 days until remission used in combination; maintenance 70-200 mg/m²/day × 2-5 days qmo; **SUBCUT** maintenance 100 mg/m²/day × 5 days q28days

**Adult/child: IV** For induction, 40-50 mg/kg in divided doses over 2-5 days or 10-15 mg/kg q7-10 days, 3-5 mg/kg 2 times/wk or 1-5 mg/kg daily

### Meningeal leukemia

**Adult and child:** Intrathecal For induction 50 mg (liposomal) q14 days × 2 doses (wk 1, 3); consolidation 50 mg (liposomal) q14 days × 3 doses (wk 5, 7, 9) then another dose at wk 13; maintenance 50 mg (liposomal) q28 days (wks 17, 21, 25, 29)

### Carcinomatous meningitis (liposoma)

**Adult:** Intrathecal 50 mg over 1-5 min q14days, during induction and consolidation wk 1, 3, 5, 7, 9, give another 50 mg wk 13; maintenance 50 mg q28days on wk 17, 21, 25, 29 use with dexamethasone 4 mg PO/IV × 5 days on each day of cytarabine

### Renal dose

**Adult** CCr ≤60 ml/min, serum creatinine 1.5-1.9 mg/dl or increase of 0.5-1.2 mg/dl from baseline: during treatment reduce to 1 g/m²/dose; serum creatinine ≥2 mg/dl or change from baseline serum creatinine was 1.2 mg/dl reduce to 100 mg/m²/day

**Available forms:** Powder for inj 100, 500 mg, 1, 2 g vials; sus rel (Depo Cyt) liposomal for intrathecal use 10 mg/ml

### Implementation

• Avoid contact with skin; very irritating; wash completely to remove
• Give fluids **IV** or PO before chemotherapy to hydrate patient
• Give antiemetic 30-60 min before giving product to prevent vomiting, and prn; antibiotics for prophylaxis of infection
• Increase fluids to 3 L/day
• Give in AM so product can be eliminated before bedtime
• Use cytotoxic handling precautions

**IM/SUBCUT route**

• **Reconstitute** 100 mg/5 ml or 500 mg/10 ml with bacteriostatic water for inj with benzyl alcohol 0.9%; do not use sol with precipitate; stable for 48 hr

**Intrathecal route**

• **Liposomal: withdraw** product immediately before use; **use** within 4 hr, do not save unused portions or use in-line filter; **give** directly into CSF by intraventricular reservoir or by direct inj into lumbar site
• **Give** slowly over 1-5 min; follow with lumbar puncture; instruct patient to lie flat; **give** dexamethasone 4 mg bid PO or **IV** × 5 days beginning on day of liposomal inj

**Direct IV route**
• **Dilute** 100 mg/5 ml of sterile water for inj, **give** over 1-3 min through a free-flowing IV
**Intermittent IV infusion route**
• May be further diluted in 50-100 ml NS or $D_5W$ and **give** over 30 min-24 hr, depending on dose
**Continuous IV infusion route**
• May be given as continuous IV infusion

**Y-site compatibilities:** Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, amsacrine, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin-dalfopristin, raNITIdine, rapacuronium, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Additive incompatibilities:** Carbenicillin, fluorouracil, heparin, regular insulin, nafcillin, oxacillin, penicillin G sodium

**Solution compatibilities:** Amino acids, 4.25%/$D_{25}$, $D_5$/LR, $D_5$/0.2% NaCl, $D_5$/0.9% NaCl, $D_{10}$/0.9% NaCl, $D_5W$, invert glucose 10% in electrolyte #1, Ringer's LR, 0.9% NaCl, sodium lactate 1/6 mol/L, TPN #57

## ADVERSE EFFECTS

**CNS:** Neuritis, dizziness, headache, cerebellar syndrome, personality changes, ataxia, mechanical dysphasia, coma; chemical arachnoiditis (IT)
**CV:** Chest pain, cardiopathy
**EENT:** Sore throat, conjunctivitis
**GI:** *Nausea, vomiting, anorexia, diarrhea, stomatitis,* hepatotoxicity, abdominal pain, hematemesis, GI hemorrhage
**GU:** Urinary retention, renal failure, hyperuricemia
**HEMA:** Thrombophlebitis, bleeding, thrombocytopenia, leukopenia, myelosuppression, anemia
**INTEG:** *Rash, fever,* freckling, cellulitis
**META:** Hyperuricemia
**MISC:** Cytarabine syndrome—fever, myalgia, bone pain, chest pain, rash, conjunctivitis, malaise (6-12 hr after administration)
**RESP:** Pneumonia, dyspnea, pulmonary edema (high doses)
**SYST:** Anaphylaxis, tumor lysis syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Widely distributed; crosses blood-brain barrier, placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | Distribution 10 min; elimination 1-3 hr; IT 100-236 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Digoxin oral: decreased digoxin effects
Filgrastim, G-CSF, GM-CSF, sargramostim: do not use within 24 hr
Flucytosine, methotrexate: increased toxicity, immunosuppression
Gentamicin: decreased effects
Radiation: increased toxicity, bone marrow suppression

### Drug classifications

Anticoagulants, NSAIDs, platelet inhibitors, salicylates, thrombolytics: increased bleeding risk
Immunosuppressants, antineoplastics: increased toxicity, bone marrow suppression
Live virus vaccines: do not use together

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess buccal cavity q8hr for dryness, sores or ulceration, white patches, pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine)

- **Assess symptoms indicating anaphylaxis:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing; resuscitation equipment should be nearby

**BLACK BOX WARNING:** Assess for chemical arachnoiditis (IT): headache, nausea, vomiting, fever; neck rigidity/pain, meningism, CSF pleocytosis; may be decreased by dexamethasone

- Assess tachypnea, dyspnea, edema, fatigue; identify dyspnea, crackles, unproductive cough, chest pain, tachypnea; pulmonary edema may be fatal (rare)
- **Assess for cytarabine syndrome 6-12 hr after infusion:** fever, myalgia, bone pain, chest pain, rash, conjunctivitis, malaise; corticosteroid may be ordered

**BLACK BOX WARNING: Bone marrow suppression:** Monitor CBC (RBC, Hct, Hgb), differential, platelet count weekly; withhold product if WBC count is $<1000/mm^3$ or platelet count is $<50,000/mm^3$ or if RBC, Hct, Hgb are low; notify prescriber of results

- Assess for increased uric acid levels, swelling, joint pain primarily in extremities; patient should be well hydrated to prevent urate deposits
- Monitor renal function studies: BUN, creatinine, serum uric acid, urine CCr before and during therapy; I&O ratio; report fall in urine output to $<30$ ml/hr
- Monitor temp q4hr (may indicate beginning of infection)

**BLACK BOX WARNING:** Hepatotoxicity: Monitor liver function tests before and during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; note yellowing of skin or sclera, dark urine, clay-colored stools, pruritus, abdominal pain, fever, diarrhea; an antispasmodic may be used for GI symptoms

- Assess for bleeding: hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr; identify inflammation of mucosa, breaks in skin

### Patient/family education

- **Pregnancy/breastfeeding:** Advise patient that contraceptive measures are recommended during and 4 mo after therapy, do not use in pregnancy, breastfeeding
- Teach patient to avoid use of products containing aspirin or ibuprofen, NSAIDs, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
- Advise that fever, headache, nausea, vomiting are likely to occur but to continue using dexamethasone with IT administration
- Provide liquid diet: carbonated beverages; gelatin may be added if patient is not nauseated or vomiting
- Provide rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
- Advise patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath)
- Advise patient to avoid foods with citric acid, hot flavor, or rough texture if stomatitis is present, to use sponge brush and rinse with water after each meal; to report stomatitis: any bleeding, white spots, ulcerations in mouth; tell patient to examine mouth daily, report any symptoms
- Instruct patient to report any changes in breathing or coughing even several months after treatment; to avoid crowds and persons with respiratory tract or other infections; neurotoxicity
- Caution patient not to have any vaccinations without the advice of the prescriber; serious reactions can occur
- Advise patient to take 3 L/day fluids to prevent renal damage

### Evaluation

**Positive therapeutic outcome**

- Prevention of rapid division of malignant cells

## dabigatran (Rx)

(da-bye-gat'ran)
**Pradaxa**
*Func. class.:* Anticoagulant
*Chem. Class.:* Thrombin inhibitor

**ACTION:** Direct thrombin inhibitor that inhibits both free and clot-bound thrombin, prevents thrombin-induced platelet aggregation and thrombus formation by preventing conversion of fibrinogen to fibrin

**Therapeutic outcome:** Decreased thrombus formation/extension, absence of emboli, postthrombotic effects

**USES:** Stroke/systemic embolism prophylaxis with nonvalvular atrial fibrillation, DVT, pulmonary embolism in hip replacement

## CONTRAINDICATIONS

Hypersensitivity, bleeding

**Precautions:** Abrupt discontinuation, anticoagulant therapy, breastfeeding, pregnancy, children, geriatrics, labor, obstetric delivery, renal disease, surgery

**BLACK BOX WARNING:** Abrupt discontinuation, epidural/spinal anesthesia, lumbar puncture

## DOSAGE AND ROUTES

### Stroke prophylaxis

**Adult:** PO 150 mg bid
CCr more than 30 ml/min: No dosage adjustment; CCr 15 to 30 ml/min: 75 mg bid;
CCr <15 ml/min: Dosing recommendations are not provided by the manufacturer

### With concomitant use of P-glycoprotein (P-gp) inhibitors:

CCrl 30 to 50 ml/min: 75 mg bid when used with the P-gp inhibitors dronedarone or ketoconazole; dose adjustment is not necessary when used with other P-gp inhibitors; CCr <30 ml/min: Avoid use

### For conversion from dabigatran to parenteral anticoagulants

**Adult:** PO discontinue dabigatran, start parenteral anticoagulant 12 hr (CCR ≥30 ml/min), 24 hr (CCR <30 ml/min) after the last dabigatran dose

### Deep vein thrombosis/pulmonary embolism/treated with a parenteral anticoagulant × 5-10 days

**Adult:** PO 150 mg bid
CCr >30 ml/min: No change; CCr 30 ml/min or less: Dosing recommendations are not provided by the manufacturer

### With concomitant use of P-glycoprotein (P-gp) inhibitors:

CCr <50 ml/min: Avoid use

**Available forms:** Cap 75, 150 mg

### Implementation

- Before surgery, discontinue product, restart after surgery is completed
- Do not crush, break, chew, or empty contents of capsule
- Take without regard to food
- Store in original package until time of use at room temperature, discard after 30 days, protect from moisture

## ADVERSE EFFECTS

**CV:** Myocardial infarction
**GI:** Abdominal pain, dyspepsia, peptic ulcer, esophagitis, GERD, gastritis
**HEMA:** Bleeding (any site)
**SYST:** Anaphylaxis (rare), angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 7% |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Feces 86% |
| **Half-life** | 12-17 hr (extended in renal disease) |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr; high-fat meal delays peak |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Amiodarone, clopidogrel, ketoconazole, quiNIDine, verapamil: increased bleeding risk, avoid use in those with renal disease (CCr 15-30 ml/min)
RifAMPin: decreased dabigatran effect, avoid use

### Drug classifications

Anticoagulants, antiplatelets, antifibrinolytics; NSAIDs (chronic use), thrombolytics: increased bleeding risk, dose should be reduced to 150 mg/day (75 mg bid) in those with CCr 30-50 ml/min

### Drug/herb

Garlic, ginger, Ginkgo biloba: Increased bleeding risk, avoid use
St. John's wort: decreased dabigatran effect, avoid use

## NURSING CONSIDERATIONS

### Assessment

- **Assess for bleeding:** blood in urine or emesis, dark tarry stools, lower back pain. Caution with arterial/venous punctures, catheters, NG tubes. Monitor vital signs frequently. The elderly are more prone to serious bleeding
- **Assess for thrombosis/MI/emboli:** swelling, pain, redness, difficulty breathing, chest pain, tachypnea, cough, coughing up blood, cyanosis

**BLACK BOX WARNING:** Epidural/spinal anesthesia, lumbar puncture

- Teach patient risk of hematoma that may cause paralysis, indwelling epidural catheters and products that cause coagulation may increase the risk of paralysis
- **Assess for postthrombotic syndrome:** pain, heaviness, itching/tingling, swelling, varicose veins, brownish/reddish skin discoloration, ulcers; ambulation, compression stockings and adequate anticoagulation can prevent this syndrome
- Monitor serum creatinine

**BLACK BOX WARNING:** Do not discontinue abruptly

### Patient/family education

- Explain the purpose and expected results of this product, store in original container, protect from moisture

**BLACK BOX WARNING: Neurologic changes:** To report bladder or bowel changes, numbness in lower extremities, back pain; notify prescriber immediately

- If dose is missed take as soon as remembered if on the same day, do not administer if <6 hr before next dose
- Instruct patient to report if bleeding or bruising is present, check with prescriber about when to discontinue
- Advise patient not to use any other OTC products, herbs without prescriber approval
- Inform patient that lab tests will be required during treatment
- Advise patient to keep dry, do not use other containers

### Evaluation

#### Positive therapeutic outcome

- Decreased thrombus formation/extension, absence of emboli, postthrombotic effects

## dabrafenib

(da-braf'e-nib)

**Tafinlar**

*Func. class.:* Antineoplastic

*Chem. class.:* Signal transduction inhibitor, kinase inhibitor

**ACTION:** Inhibits kinase, inhibitor against mutated forms of BRAF kinases in melanoma cells

**Therapeutic outcome:** Decrease in melanoma progression

**USES:** Unresectable or metastatic BRAD V600E-mutated malignant melanoma, or *V600K*-mutated melanoma in combination with trametinib

## CONTRAINDICATIONS

Pregnancy, hypersensitivity

**Precautions:** Breastfeeding, children, infection, dehydration, diabetes mellitus, fever, G6PD deficiency, hemolytic anemia, hyperglycemia, hypotension, infertility, iritis, renal failure, secondary malignancy

## DOSAGE AND ROUTES

**Adult: PO** 150 mg q12hr until disease progression, avoid strong CYP3A4/CYP2C8 inhibitors or inducers

**Available forms:** Caps 50, 75 mg

### Implementation

**PO route**

- Swallow whole
- If dose is missed, take within 6 hr of missed dose, if >6 hr have passed, skip dose
- Space doses q12hr
- Take at least 1 hr before or 2 hr after a meal

## ADVERSE EFFECTS

**EENT:** Uveitis, retinal detachment
**CNS:** Headache, fever
**GI:** Pancreatitis
**CV:** Cardiomyopathy
**INTEG:** Rash, alopecia
**MISC:** Arthralgia, back pain, **hand-foot syndrome**, hyperglycemia, hypophosphatemia, hyponatremia, myalgia, secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 99.7% |
| **Metabolism** | Unknown |
| **Excretion** | 71% (feces), 23% (urine) |
| **Half-life** | 8 hr (dabrafenib), 10 hr, 21-22 hr metabolites |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Antacids, CYP3A4 inducers (dexamethasone, phenytoin, carBAMazepine, rifAMPin, PHENobarbital), proton-pump inhibitors: decreased dabrafenib concentrations

CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin): altered dabrafenib concentrations

### Drug/food

Grapefruit juice: increased dabrafenib effect; avoid use while taking product

### Drug/herb

St. John's wort: decreased dabrafenib concentrations

## NURSING CONSIDERATIONS

### Assessment

- **Secondary malignancy:** Has been reported with monotherapy; cutaneous squamous cell carcinoma (cuSCC), keratoacanthoma, and new primary malignant melanomas are increased when used in combination with trametinib, usually within 9 wk (cutaneous squamous cell carcinoma); basal cell carcinoma (4-36 wk). Perform a dermatologic evaluation before therapy, q2mo while on therapy, and for up to 6 mo after discontinuing therapy
- **Serious fever and febrile reaction:** Hypotension, rigors/chills, dehydration, renal failure may occur; the incidence and severity of fever are higher when given with trametinib. Interruption of therapy, a dose reduction, or permanent therapy discontinuation may be needed. Monitor for signs and symptoms of infection. If a severe fever or febrile reaction occurs, monitor renal function (BUN/serum creatinine) during and after the event and give antipyretic agents when therapy is resumed. In those who develop a febrile reaction that does not resolve within 3 days of onset, give corticosteroids (prednisone 10 mg/day PO) for at least 5 days; ensure there is no evidence of active infection before starting corticosteroids
- **Hyperglycemia:** The incidence and severity of hyperglycemia were higher when given with this product. Those with diabetes mellitus may require more intensive hypoglycemic therapy. Monitor serum glucose levels at baseline and as clinically indicated; advise patients to report symptoms of severe hyperglycemia (excessive thirst, increased urinary frequency)
- **Uveitis, iritis, and iridocyclitis:** Steroid and mydriatic ophthalmic drops may provide symptomatic relief for these conditions. Monitor for visual signs and symptoms of uveitis (blurred vision, photophobia, and eye pain). Continue at the same dose in iritis. Hold for mild or moderate uveitis that does not respond to ocular therapy, severe uveitis, or iridocyclitis; initiate treatment as indicated. Permanently discontinue in those who develop persistent grade 2 or higher uveitis that lasts longer than 6 wk
- **Bleeding:** Major intracranial bleeding/GI bleeding can occur when used in combination with trametinib. Monitor for signs of bleeding; evaluate any unexplained fall in hematocrit, hypotension
- **Cardiomyopathy:** A decrease in left ventricular ejection fraction (LVEF) of 10% or greater from baseline and below the lower limit of normal (LLN) may occur and was higher when given in combination with trametinib. Obtain an echocardiogram or multigated acquisition (MUGA) scan before starting combination therapy, 1 month after starting dabrafenib, and then q2-3mo during treatment. Hold dabrafenib for symptomatic congestive heart failure or LVEF below the LLN with an absolute decrease of greater than 20% from baseline. Resume dabrafenib at the same dose if LVEF improves to the institutional LLN and an absolute decrease of 10% or less from baseline
- **Palmar-plantar erythrodysesthesia syndrome (hand and foot syndrome):** May occur when given in combination with trametinib, usually within 37 days; hospitalization may be required due to a secondary infection of the skin. Interruption of therapy, a dose reduction, or permanent therapy discontinuation may be needed in those who develop severe skin toxicity
- **Pregnancy:** Identify if pregnancy is planned or suspected, if contraception is used, or if breastfeeding

### Patient/family education

- Advise patient to notify prescriber of new lesions
- Teach patient to notify all providers of all OTC, Rx, herbal products taken
- Teach patient to take as prescribed 1 hr before or 2 hr after meals, take a missed dose within 6 hr of next dose
- **Pregnancy:** Identify if pregnancy is planned or suspected, and contraception used, if breastfeeding
- Instruct patient to report adverse reactions immediately
- Teach patient about reason for treatment, expected results

• **Pregnancy:** Instruct patient to use effective nonhormonal contraception during treatment, after discontinuing treatment, do not breastfeed

### Evaluation

**Positive therapeutic outcome**
• Decrease in melanoma progression

**⚠ HIGH ALERT**

## dacarbazine (Rx)

(da-kar'ba-zeen)
**DTIC ✱, DTIC-Dome**
*Func. class.:* Antineoplastic—miscellaneous agent
*Chem. class.:* Imidazole

**ACTION:** Alkylates DNA, RNA; inhibits RNA, DNA synthesis; also responsible for breakage, cross-linking DNA strands; activity is not cell cycle phase specific

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Hodgkin's disease, malignant melanoma

**Unlabeled uses:** Malignant pheochromocytoma in combination with cyclophosphamide and vinCRIStine, metastatic soft tissue sarcoma in combination with other agents, carcinoma meningitis, neuroblastoma

## CONTRAINDICATIONS

Hypersensitivity, breastfeeding

**Precautions:** Renal disease, infection

**BLACK BOX WARNING:** Pregnancy (1st trimester), radiation therapy, hepatic disease, bone marrow suppression, secondary malignancy, requires an experienced clinician

## DOSAGE AND ROUTES

### Metastatic malignant melanoma

**Adult: IV** 2-4.5 mg/kg daily × 10 days or 100-250 mg/m² daily × 5 days; repeat q3wk depending on response

### Hodgkin's disease

**Adult: IV** 150 mg/m² daily × 5 days with other agents, repeat q4wk or 375 mg/m² on days 1 and 15 when given in combination, repeat q28day

### Osteogenic sarcoma (unlabeled)

**Adult and child: IV** 250 mg/m²/day as a cont INF × 4 days in combination with other agents q28day

### Soft tissue sarcoma (unlabeled)

**Adult and child: IV** 250-300 mg/m²/day as a cont INF × 3 days q21-28day

**Available forms:** Powder for inj 10, 100, 200 mg

### Implementation

• Give fluids **IV** or PO before chemotherapy to hydrate patient
• Nausea/vomiting may be severe and last several hours
• Give antiemetic 30-60 min before giving product to prevent vomiting, and prn; antibiotics for prophylaxis of infection
• Provide liquid diet: carbonated beverages; gelatin may be added if patient is not nauseated or vomiting
• Clarify all orders, double-check original order, may be fatal if wrong dose is given

**Direct IV route**
• After diluting 100 mg/9.9 ml or 200 mg/19.7 ml of sterile water for inj (10 mg/ml), give by direct **IV** over 2-3 min through Y-tube or 3-way stopcock

**Intermittent IV infusion route**
• May be further diluted in 50-250 ml of $D_5W$ or normal saline for inj and given over 30 min
• Watch for extravasation; stop infusion, apply ice to area
• Store in light-resistant container in a dry area

**Y-site compatibilities:** Amifostine, aztreonam, filgrastim, fludarabine, granisetron, melphalan, ondansetron, PACLitaxel, sargramostim, teniposide, thiotepa, vinorelbine

## ADVERSE EFFECTS

**CNS:** Facial paresthesia, flushing, fever, malaise, confusion, headache, seizures, cerebral hemorrhage, blurred vision (high doses)
**GI:** *Nausea, anorexia, vomiting,* hepatotoxicity
**HEMA:** Thrombocytopenia, leukopenia, anemia
**INTEG:** *Alopecia,* dermatitis, pain at inj site, photosensitivity, severe sun reactions (high doses)
**MISC:** Flulike symptoms, malaise, fever, myalgia, hypotension
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability (**IV**) |
| **Distribution** | Widely distributed; concentrates in liver |
| **Metabolism** | Liver (50%, 5% protein bound) |
| **Excretion** | Kidneys, unchanged (50%) |
| **Half-life** | Terminal 19 min; 5 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

PHENobarbital, phenytoin: increased metabolism; decreased dacarbazine effect
Radiation: bone marrow suppression, toxicity

### Drug classifications

Aminoglycosides: increased nephrotoxicity
Anticoagulants, NSAIDs, salicylates: increased risk of bleeding
Antineoplastics, bone marrow–suppressing products: increased toxicity, bone marrow suppression
Diuretics, loop: increased ototoxicity
Live virus vaccines: increased adverse reactions; decreased antibody reaction

### Drug/Lab

Increase: BUN, AST, ALT
Decrease: Platelets, WBC, RBC

## NURSING CONSIDERATIONS

### Assessment

- **Assess symptoms indicating severe allergic reaction:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing; product should be discontinued

**BLACK BOX WARNING: Assess for bone marrow suppression:** Monitor CBC, differential, platelet count weekly; withhold product if WBC is $<4000/mm^3$ or platelet count is $<75,000/mm^3$

- Monitor renal function tests: BUN, creatinine, urine CCr before, during therapy; I&O ratio; report fall in urine output to <30 ml/hr
- Monitor temp q4hr (may indicate beginning of infection), I&O, for nausea, appetite

**BLACK BOX WARNING: Hepatotoxicity:** Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; note jaundice of skin or sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea; hepatotoxicity can be serious and fatal

- Assess for **bleeding:** hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr; check for inflammation of mucosa, breaks in skin

**BLACK BOX WARNING:** Product must be administered by those experienced in the use of cancer chemotherapy

- Assess IV site for irritation, redness, pain; if infiltration occurs use hot packs at site
- Identify effects of alopecia on body image; discuss feelings about body changes

**BLACK BOX WARNING: Secondary malignancy:** Assess for secondary malignancy that may occur with this product

### Patient/family education

- Teach patient to avoid use of products containing aspirin or ibuprofen, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
- Advise patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
- Caution patient not to have any vaccinations without the advice of prescriber; serious reactions can occur

**BLACK BOX WARNING: Pregnancy: to notify prescriber if pregnancy is planned or suspected.** Advise patient contraception is needed during treatment and for several months after the completion of therapy; product has teratogenic properties

- **Teach patient to report signs of infection:** fever, sore throat, flulike symptoms

### Evaluation

**Positive therapeutic outcome**

- Prevention of rapid division of malignant cells

## daclatasvir

(dak-lat'-as-vir)
**Daklinza**
*Func. class.:* Antiviral, antihepatitis agent

**ACTION:** Active against chronic infections caused by genotype 3 hepatitis C virus (HCV); prevents viral RNA replication by impairing protein function

**Therapeutic outcome:** Decreased symptoms of chronic hepatitis C

**USES:** Chronic hepatitis C, genotype 3 with complicated liver disease

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy (**UK**) breastfeeding, antimicrobial resistance, hepatic disease, hepatitis C with HIV coinfection, liver transplant

## DOSAGE AND ROUTES

### For the treatment of chronic hepatitis C infection (HCV)

Daclatasvir must be administered in combination with sofosbuvir; certain patients may also require treatment with ribavirin. If sofosbuvir is permanently discontinued, daclatasvir must also be discontinued

### For the treatment of chronic HCV genotype 1 infection

Cirrhotic patients infected with HCV genotype 1a should undergo testing for the presence of NS5A resistance-associated polymorphisms before initiating therapy; specifically, polymorphisms at amino acid positions M28, Q30, L31, and Y93

The optimal treatment duration has not been established for genotype 1–infected patients with decompensated (Child-Pugh C) cirrhosis

**Adults without cirrhosis or who have compensated (Child-Pugh A): PO** 60 mg once daily in combination with sofosbuvir 400 mg PO once daily for 12 wk. Dosing includes patients coinfected with HIV

**Adults receiving strong CYP3A inhibitors who do not have cirrhosis or who have compensated (Child-Pugh A) cirrhosis: PO** 30 mg once daily in combination with sofosbuvir 400 mg PO once daily for 12 wk. Dosing includes patients coinfected with HIV

**Adults receiving moderate CYP3A inducers who do not have cirrhosis or who have compensated (Child-Pugh A) cirrhosis: PO** 90 mg once daily in combination with sofosbuvir 400 mg PO once daily for 12 wk. Dosing includes patients coinfected with HIV

**Adults who have decompensated cirrhosis or who have undergone liver transplantation: PO** 60 mg once daily in combination with sofosbuvir (400 mg PO once daily) and ribavirin (600 mg PO once daily) for 12 wk. Ribavirin must be administered with food, and the dose may be increased to 1000 mg PO daily if tolerated; consider decreasing ribavirin dose for abnormal hemoglobin or creatinine clearance. Dosing includes patients coinfected with HIV

**Adults receiving strong CYP3A inhibitors who have decompensated cirrhosis or who have undergone liver transplantation: PO** 30 mg once daily in combination with sofosbuvir (400 mg PO once daily) and ribavirin (600 mg PO once daily) for 12 wk. Ribavirin must be administered with food, and the dose may be increased to 1000 mg PO daily if tolerated; consider decreasing ribavirin dose for abnormal hemoglobin or creatinine clearance. Dosing includes patients coinfected with HIV

**Adults receiving moderate CYP3A inducers who have decompensated cirrhosis or who have undergone liver transplantation:** 90 mg once daily in combination with sofosbuvir (400 mg PO once daily) and ribavirin (600 mg PO once daily) for 12 wk. Ribavirin must be administered with food, and the dose may be increased to 1000 mg PO daily if tolerated; consider decreasing ribavirin dose for abnormal hemoglobin or creatinine clearance. Dosing includes patients coinfected with HIV

### For the treatment of chronic HCV genotype 3 infection

The optimal treatment duration has not been established for genotype 3–infected patients with cirrhosis.

**Adults without cirrhosis: PO** 60 mg once daily in combination with sofosbuvir 400 mg PO once daily for 12 wk. Dosing includes patients coinfected with HIV

**Adults without cirrhosis receiving strong CYP3A inhibitors: PO** 30 mg once daily in combination with sofosbuvir 400 mg PO once daily for 12 wk. Dosing includes patients coinfected with HIV

**Adults without cirrhosis receiving moderate CYP3A inducers: PO** 90 mg once daily in combination with sofosbuvir 400 mg PO once daily for 12 wk. Dosing includes patients coinfected with HIV

**Adults with compensated cirrhosis: PO** 60 mg once daily in combination with sofosbuvir (400 mg PO once daily) and ribavirin for 12 wk. Ribavirin must be administered with food in two divided doses, and the dose is based on weight as follows: less than 75 kg, give 500 mg PO twice daily; 75 kg or more, give 600 mg PO twice daily. Dosing includes patients coinfected with HIV

**Adults receiving strong CYP3A inhibitors who have compensated cirrhosis: PO** 30 mg once daily in combination with sofosbuvir (400 mg PO once daily) and ribavirin for 12 wk. Ribavirin must be administered with food in two divided doses, and the dose is based on weight as follows: less than 75 kg, give 500 mg PO twice daily; 75 kg or more, give 600 mg PO twice daily. Dosing includes patients coinfected with HIV

**Adults receiving moderate CYP3A inducers who have compensated cirrhosis: PO** 90 mg once daily in combination with sofosbuvir (400 mg PO once daily) and ribavirin for 12 wk. Ribavirin must be administered with food in two divided doses, and the dose is based on weight as follows: less than 75 kg, give 500 mg PO twice daily; 75 kg or more, give 600 mg PO twice daily. Dosing includes patients coinfected with HIV

**Adults with decompensated cirrhosis or who have undergone liver transplantation: PO** 60 mg once daily in combination with sofosbuvir (400 mg PO once daily) and ribavirin

(600 mg PO once daily) for 12 wk. Ribavirin must be administered with food, and the dose may be increased to 1000 mg PO daily if tolerated; consider decreasing ribavirin dose for abnormal hemoglobin or creatinine clearance. Dosing includes patients coinfected with HIV

**Adults receiving strong CYP3A inhibitors who have decompensated cirrhosis or who have undergone liver transplantation: PO** 30 mg once daily in combination with sofosbuvir (400 mg PO once daily) and ribavirin (600 mg PO once daily) for 12 wk. Ribavirin must be administered with food, and the dose may be increased to 1000 mg PO daily if tolerated; consider decreasing ribavirin dose for abnormal hemoglobin or creatinine clearance. Dosing includes patients coinfected with HIV

**Adults receiving moderate CYP3A inducers who have decompensated cirrhosis or who have undergone liver transplantation:** 90 mg once daily in combination with sofosbuvir (400 mg PO once daily) and ribavirin (600 mg PO once daily) for 12 wk. Ribavirin must be administered with food, and the dose may be increased to 1000 mg PO daily if tolerated; consider decreasing ribavirin dose for abnormal hemoglobin or creatinine clearance. Dosing includes patients coinfected with HIV

**Adults: PO** 60 mg qday with sofosbuvir 400 mg qday × 12 wk

**Adults receiving strong CYP3A inhibitors: PO** 30 mg qday with sofosbuvir 400 mg qday × 12 wk

**Adults receiving moderate CYP3A inducers: PO** 90 mg qday with sofosbuvir 400 mg qday × 12 wk

**Available forms:** Tabs 30, 60 mg

### Implementation

- Give by mouth without regard to food
- Do not use as monotherapy, must be given with sofosbuvir

## ADVERSE EFFECTS

**CNS:** Headache, fatigue
**GI:** Diarrhea, nausea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 99% protein binding |
| **Metabolism** | Liver, by CYP3A4, affected by P-glycoprotein (P-gp), organic anion transporting polypeptides (OATP1B1 and OATP1B3), breast cancer resistance protein (BCRP) |
| **Excretion** | Feces 88% |
| **Half-life** | Terminal half-life 12-15 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Do not use with potent CYP3A4 inducers
P-glycoprotein(P-gp) substrates: increase of each product
Potent CYP3A4 inhibitors: Increased daclatasvir effect, reduce dose of daclatasvir
Moderate CYP3A4 inducers. Decreased daclatasvir effect, increase dose of daclatasvir

## NURSING CONSIDERATIONS

### Assessment

- **Liver transplant/cirrhosis:** May have lower sustained virologic response rates in cirrhosis and use in prior liver transplant is unknown
- **HIV/ hepatitis C coinfection:** All patients with HIV infection should be tested for hepatitis C, with continued annual screening advised for those persons considered high risk for acquiring hepatitis C. If hepatitis C and HIV coinfection is identified, consider treating both viral infections concurrently.
- **Pregnancy/breastfeeding:** Unknown, give careful consideration for use in pregnancy and breastfeeding
- **Strong CYP3A4 inducers:** Do not use concurrently, may lead to treatment failure, review patient's medication profile for potential drug interactions before starting treatment
- **Hepatitis C:** Monitor plasma hepatitis C RNA and plasma HIV RNA baseline and during treatment

### Patient/family education

- Teach patient that optimal duration of treatment is 12 wk; that product is not a cure; that transmission may still occur and must be taken with sofosbuvir
- Inform patient to avoid use with other medications, herbs, supplements unless approved by prescriber
- Teach patient not to stop abruptly unless directed; worsening of hepatitis may occur
- Advise patient to notify prescriber if pregnancy is planned or suspected or if breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Therapeutic response: decreased symptoms of chronic hepatitis C

## daclizumab

(dah-klihzyoo-mab)

**Zinbryta**

*Func. class.:* Immunosuppressive, interleukin inhibitor

**ACTION:** Binds to a subunit of the interleukin (IL)-2 receptor (IL-2Rα) and inhibits the binding of IL-2 to IL-2Rα. By inhibiting the binding of IL-2 to this receptor, T-cell activation is blocked

**Therapeutic outcome:** Improvement in symptoms of multiple sclerosis

**USES:** Relapsing multiple sclerosis, kidney transplant prophylaxis with other agents

## CONTRAINDICATIONS

Murine protein hypersensitivity

**BLACK BOX WARNING:** Hepatic disease, hepatitis

## PRECAUTIONS

Breastfeeding, children, depression, eczema, infection, lymphoma, neoplastic disease, pregnancy, psoriasis, requires a specialized care setting, requires an experienced clinician, suicidal ideation, vaccination, varicella

## DOSAGE AND ROUTES

**Adult: SUBCUT** 150 mg injected monthly

### Kidney transplant rejection prophylaxis

**Adult/adolescent/child/infant 11 months and older:** 1 mg/kg **IV**, followed by 4 more doses of 1 mg/kg **IV** q2wk; the initial dose should be given not more than 24 hr before transplantation

**Available forms:** Injection 150 mg/ml

### Implementation

**Subcut route: Zinbryta formulation**

- Visually inspect parenteral products for particulate matter and discoloration before administration whenever solution and container permit
- Prefilled syringes are for single use only
- Allow to warm to room temperature 30 min before use. Do not use external heat sources. Do not place back in the refrigerator after allowing to warm to room temperature
- Do not use if the solution is cloudy or there are visible particles
- Inject into the thigh, abdomen, or back of the upper arm
- If a dose is missed, inject it as soon as possible. If a dose is more than 2 wk late, skip the missed dose and take the next dose on schedule

## ADVERSE EFFECTS

**CNS:** *Depression*
**EENT:** *Pharyngitis*
**Integ:** *Rash*
**Misc:** Infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Bioavailability 90%, steady state by 4th dose |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Elimination half-life 20 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 5-7 days |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

- Do not use with vaccines
- Increased: infection, immunosuppressives, antineoplastics, tumor necrosis factors

## NURSING CONSIDERATIONS

### Assessment

- **Multiple sclerosis:** Product should only be used in those who have not responded to other treatment. Monitor symptoms, including muscle weakness, gait, respiratory changes.
- **Infection:** Opportunistic infections occur often with this product, monitor temperature, sore throat, cough, injection-site reactions. Evaluate patients at high risk for TB before use, for those who test positive for TB, treat by standard clinical practices before starting treatment. Do not use in those with TB or other severe active infection. If serious infection develops, consider withholding treatment until the infection resolves. Some infections may be fatal.

**BLACK BOX WARNING: Hepatic disease:** Monitor ALT or AST; if these results are at least 2 times the upper limit of normal (ULN), or if patient has a history of autoimmune hepatitis or other autoimmune disease involving the liver, do not use. Monitor ALT, AST, total bilirubin qmo × 6 mo after the last dose. Modify treatment if any of these occur: If ALT or AST >5 times ULN, total bilirubin >2 times the ULN, or ALT or AST ≥3 but <5 times ULN and total bilirubin >1.5 but <2 times ULN, interrupt therapy. If a patient develops clinical signs or symptoms of hepatic dysfunction (nausea, vomiting, abdominal pain, fatigue, jaundice, dark urine), measure serum transaminases and total bilirubin or discontinue treatment. Discontinue if autoimmune hepatitis is suspected; treatment with immunosuppressant drugs may be necessary. Concomitant use of hepatotoxic drugs, including nonprescription drugs, dietary supplements, or herbal products, may increase the risk for liver injury

- **Depression:** Assess for depression, suicidal ideation, or suicide attempts. Advise patients and/or caregivers to report any symptoms of new or worsening depression and/or suicidal ideation to their health care provider

### Patient/family education

- **Infection:** Teach patient to report fever, sore throat, cough, injection-site reactions
- **Depression:** Advise patients and/or caregivers to report any symptoms of new or worsening depression and/or suicidal ideation to their health care provider

**BLACK BOX WARNING: Hepatic disease:** Advise patient to report to provider nausea, vomiting, abdominal pain, fatigue, jaundice, dark urine, lab tests will be needed

### Evaluation

- Improvement in symptoms of multiple sclerosis

## dalbavancin

(dal-ba-van'sin)

**Dalvance**

*Func. class.:* Antiinfective-glycopeptide

**ACTION:** Binds to the bacterial cell walls, inhibiting their synthesis

**Therapeutic outcome:** Decreased symptoms of infection, negative C&S

**USES:** Treatment of acute bacterial skin and skin structure infections caused by gram-positive organisms (cellulitis, major abscess, wound infections)

**CONTRAINDICATIONS:** Hypersensitivity

**Precautions:** Antimicrobial resistance, breastfeeding, colitis, diarrhea, GI disease, inflammatory bowel disease, infusion-related reactions, pregnancy, pseudomembranous colitis, ulcerative colitis, vancomycin hypersensitivity, viral infection

D

## DOSAGE AND ROUTES

**Adult: IV** 1000 mg once, then 500 mg **IV** 1 wk later

### Renal dose

**Adult:** IV CCr <30 ml/min, 1125 mg as a single dose or 750 mg once then 375 mg 1 week later

**Available forms:** Powder for injection 500 mg

### Implementation

**IV infusion route**

- Visually inspect parenteral products for particulate matter and discoloration
- **Reconstitution:** Reconstitute each 500 mg/25 ml sterile water for injection; to avoid foaming, alternate between gentle swirling and inversion until completely dissolved, do not shake; further dilution is required
- **Storage:** Refrigerate or store at room temperature. Do not freeze. Total time from reconstitution to dilution to use should not exceed 48 hr
- **Dilution:** Transfer the dose of reconstituted solution from the vial(s) to an IV bag or bottle containing $D_5W$ (1-5 mg/ml)

**Intermittent IV INF**

- Give over 30 min, do not infuse with other medications or electrolytes
- Saline-based infusion solutions may cause precipitation and should not be used
- If a common IV line is being used to administer other drugs, the line should be flushed before and after each dose

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, flushing
**GI:** Nausea, vomiting, pseudomembranous colitis, GI bleeding, abdominal pain, diarrhea
**HEMA:** Thrombocytopenia, neutropenia, leukopenia, anemia
**INTEG:** Rash, urticaria, infusion-related reactions, pruritus
**SYST:** Red man syndrome, hypersensitivity reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 93%, primarily to albumin |
| **Metabolism** | Decreased in renal disease |
| **Excretion** | Feces and urine |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Oral contraceptives: decreased with prolonged use

### Drug/lab test

Increased: LFTs, INR, alkaline phosphatase
Decrease: Platelets, WBC

## NURSING CONSIDERATIONS

### Assessment

- **Assess:** BUN/creatinine, lower dose may be required in severe renal disease
- **Pseudomembranous colitis:** bowel pattern daily, if severe diarrhea occurs, product should be discontinued
- IV site for INF-site reactions
- **Anaphylaxis:** rash, urticaria, pruritus, wheezing, may occur a few days after administration
- Red man–like syndrome: flushing, rash over upper torso and neck, may occur after a few minutes of infusion, may be treated with antihistamines and a slower infusion

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain (blood dyscrasias), diarrhea with mucus, blood (pseudomembranous colitis), rash, pruritus, wheezing, hypersensitivity reactions
- **Pregnancy/breastfeeding.** Advise patient to use nonhormonal contraceptive if on long-term therapy
- Teach patient to notify all prescribers of all OTC, Rx, herbals

### Evaluation

#### Positive therapeutic outcome

- Decreased symptoms of infection, negative C&S

## dalfampridine (Rx)

(dal-fam′pri-deen)
**Ampyra, Fampyra**
*Func. class.:* Neurological agent—MS
*Chem. class.:* Broad-spectrum potassium channel blocker

**ACTION:** Mechanism of action is not fully understood, a broad-spectrum potassium channel blocker inhibits potassium channels and increased action potential conduction in demyelinated axons

**Therapeutic outcome:** Ability to walk at improved speed in MS

**USES:** For improved walking in patients with multiple sclerosis

## CONTRAINDICATIONS

Renal failure (CCr <50 ml/min), seizures

**Precautions:** Pregnancy, breastfeeding, renal disease, elderly

## DOSAGE AND ROUTES

**Adult:** PO 10 mg q12hr

### Renal dose

**Adult:** PO CCr 51-80 ml/min no dosage adjustment needed, but seizure risk is unknown; CCr ≤50 ml/min, do not use

**Available forms:** Ext rel tab 10 mg

### Implementation

- Do not break, crush, or chew; give without regard to meals
- Do not give closer together than q12hr, seizures may occur
- Do not double doses, if a dose is missed, skip it

## ADVERSE EFFECTS

**CNS:** Seizures, paresthesias, headache, dizziness, asthenia, insomnia
**GI:** Nausea, constipation, dyspepsia
**GU:** Urinary tract infection
**MS:** Back pain
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Bioavailability 96% |
| **Distribution** | Largely unbound to plasma proteins |
| **Metabolism** | Unknown |
| **Excretion** | 96% is recovered in the urine |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3-4 hr (fasting), longer if taken with food |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Fampridine: do not use together

### Drug classifications

4-aminopyridine (4-AP)-containing products: do not use together

## NURSING CONSIDERATIONS

### Assessment

- **Multiple sclerosis:** assess walking, including speed
- **Assess for seizures:** more common in those with previous seizure disorder, risk increases with higher doses
- **Anaphylaxis:** Wheezing, rash, urticaria, pruritus, angioedema
- **Pregnancy/breastfeeding:** No well-controlled studies, avoid use in pregnancy, breastfeeding

### Patient/family education

- Advise patient to notify prescriber if pregnancy is planned or suspected, do not breastfeed
- Teach patient about expected results, side effects including seizures
- Teach patient to notify prescriber of all OTC/Rx/herbals taken
- **Anaphylaxis:** Teach patient to notify prescriber immediately of wheezing, throat tightening, rash, swelling of face, lips
- **Seizures:** Teach patient to notify prescriber immediately

### Evaluation

#### Positive therapeutic outcome

- Ability to walk at improved speed in MS

**⚠ HIGH ALERT**

## dalteparin (Rx)

(dahl′ta-pear-in)

**Fragmin**

*Func. class.:* Anticoagulant

*Chem. class.:* Low-molecular-weight heparin

**ACTION:** Inhibits factor Xa/IIa (thrombin), resulting in anticoagulation

**Therapeutic outcome:** Absence of deep vein thrombosis

**USES:** Unstable angina/non-Q-wave MI; prevention/treatment of deep vein thrombosis in abdominal surgery, hip replacement patients or those with restricted mobility during acute illness; pulmonary embolism

**Unlabeled uses:** Antiphospholipid antibody, arterial thromboembolism (after heart valve surgery), cerebral thromboembolism, acute MI

## CONTRAINDICATIONS

Hypersensitivity to this product, heparin, pork products; active major bleeding, hemophilia, leukemia with bleeding, thrombocytopenic purpura, cerebrovascular hemorrhage, cerebral aneurysm, those undergoing regional anesthesia for unstable angina, non–Q-wave MI, dalteparin-induced thrombocytopenia

**Precautions:** Hypersensitivity to benzyl alcohol, pregnancy, recent childbirth, breastfeeding, child, geriatric, hepatic disease, severe renal/cardiac disease, blood dyscrasias, bacterial endocarditis, acute nephritis, peptic ulcer disease, pericarditis, pericardial effusion, recent lumbar puncture, vasculitis, other diseases where bleeding is possible, uncontrolled hypertension; recent brain, spine, eye surgery; congenital or acquired disorders, hemorrhagic stroke, history of HIT

**BLACK BOX WARNING:** Epidural/spinal anesthesia, lumbar puncture

## DOSAGE AND ROUTES

### Deep vein thrombosis/pulmonary embolism

**Adult:** SUBCUT 200 international units/kg/day during 1st month (max single dose 18,000 international units), then 150 IU/kg/day in month 2-6 (max single dose 18,000 international units), use prefilled syringe that is closest to calculated dose; if platelets are 50,000-100,000/mm$^3$ reduce dose by 2500 international units until platelets ≥100,000/mm$^3$; if platelets <50,000/mm$^3$ discontinue until >50,000/mm$^3$

### Hip replacement surgery/DVT prophylaxis

**Adult:** SUBCUT 2500 international units 2 hr before surgery and 2nd dose in the evening the day of surgery (4-8 hr postop), then 5000 international units SUBCUT 1st postop day and daily 5-10 days

### Unstable angina/non-Q-wave MI

**Adult:** SUBCUT 120 international units/kg q12hr × 5-8 days; max 10,000 international units q12hr × 5-8 days with concurrent aspirin, continue until stable

### Deep vein thrombosis, prophylaxis for abdominal surgery

**Adult:** SUBCUT 2500 international units 1-2 hr prior to abdominal surgery and repeat daily × 5-10 days; in high-risk patients >3400 international units should be used

### Renal dose

**Adult:** SUBCUT cancer patient with CCr <30 ml/min, monitor and adjust based on anti-factor Xa

**Available forms:** Prefilled syringes, 2500, 5000 international units/0.2 ml; 7500 international units/0.3 ml, 10,000, 12,500, 15,000, 18,000 international units/ml

### Implementation

**SUBCUT route**

- **Cannot be used interchangeably unit for unit with unfractionated heparin or other LMWHs**
- Do not give IM or **IV** product route; approved in SUBCUT only; do not mix with other inj or sol
- Give by SUBCUT only; have patient sit or lie down; SUBCUT inj may be 2 in from umbilicus in a U-shape, upper outer side of thigh, around navel, or upper outer quadrangle of the buttocks; rotate inj sites
- Change inj site daily, use at same time of day

## ADVERSE EFFECTS

**CNS:** Intracranial bleeding
**HEMA:** Thrombocytopenia
**INTEG:** Alopecia, pruritus, superficial wound infection, skin necrosis, injection site reaction
**SYST:** Hypersensitivity, hemorrhage, anaphylaxis possible, hematoma

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 87% |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidney |
| **Half-life** | 3-5 hr elimination |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Aspirin: increased bleeding risk

### Drug classifications

Anticoagulants, NSAIDs, platelet inhibitors, some cephalosporins, salicylates, thrombolytics: increased risk of bleeding

### Drug/herb

Angelica, capsicum, chamomile, dandelion, danshen, feverfew, garlic, ginger, ginkgo, horse chestnut: increased bleeding risk

### Drug/lab test

Increase: AST/ALT
Decrease: Platelets

## NURSING CONSIDERATIONS

### Assessment

- Assess for bleeding (Hct, occult blood in stools) during treatment since bleeding can occur
- Assess for bleeding gums, petechiae, ecchymosis, black tarry stools, hematuria, epistaxis, decrease in Hct, B/P; may indicate bleeding, possible hemorrhage; notify prescriber immediately; product should be discontinued
- **Assess for hypersensitivity:** fever, skin rash, urticaria; notify prescriber immediately
- Assess for needed dosage change q1-2wk; dosage may need to be decreased if bleeding occurs

**BLACK BOX WARNING:** Epidural/**spinal** anesthesia: Assess for neurologic impairment frequently when neuraxial anesthesia has been used, spinal/epidural hematomas can occur, with paralysis; numbness in lower extremities, bowel or bladder changes, back pain, notify prescriber immediately, those at greater risk are those taking products causing increased bleeding risk

- **Pregnancy/breastfeeding:** No well-controlled studies, use only if clearly needed, do not use benzyl alcohol product in pregnancy, cautious use in breastfeeding

### Patient/family education

- Advise patient to avoid OTC preparations that contain aspirin, other anticoagulants; serious product interactions may occur
- Advise patient to use soft-bristle toothbrush to avoid bleeding gums, avoid contact sports, use electric razor, avoid IM inj
- **Bleeding; Instruct patient to report any signs of bleeding:** gums, under skin, urine, stools; unusual bruising

### Evaluation

**Positive therapeutic outcome**

- Absence of deep vein thrombosis

## TREATMENT OF OVERDOSE:
Protamine sulfate 1% given **IV**; 1 mg protamine/100 anti-Xa international units of dalteparin given

**⚠ HIGH ALERT**

# dantrolene (Rx)
(dan′troe-leen)
**Dantrium, Revonto, Ryanodex**
*Func. class.:* Skeletal muscle relaxant, direct acting
*Chem. class.:* Hydantoin

**Do not confuse:** Dantrium/danazol

## ACTION:
Interferes with intracellular release from the sarcoplasmic reticulum of calcium necessary to initiate contraction; slows catabolism in malignant hyperthermia

**Therapeutic outcome:** Decreased muscle spasticity; absence of malignant hyperthermia

## USES:
Spasticity in multiple sclerosis, stroke, spinal cord injury, cerebral palsy, prevention and treatment of malignant hyperthermia

**Unlabeled uses:** Neuroleptic malignant syndrome

## CONTRAINDICATIONS
Hypersensitivity, hepatic disease, hepatitis

**Precautions:** Pregnancy, breastfeeding, geriatric, peptic ulcer disease, renal/cardiac/hepatic, stroke, seizure disorder, diabetes mellitus, ALS, COPD, MS, mannitol/gelatin hypersensitivity, labor, lactase deficiency, extravasation

**BLACK BOX WARNING:** Hepatotoxicity

## DOSAGE AND ROUTES
### Spasticity
**Adult:** PO 25 mg/day; may increase to 25-100 mg bid-qid, max 400 mg/day, may be increased q7days as needed
**Child:** PO 0.5 mg/kg/day given in divided doses bid; may be increased q7days as needed; max 400 mg daily

### Malignant hyperthermia
**Adult and child:** **IV** 1 mg/kg; may repeat to total dose of 10 mg/kg; PO 4-8 mg/kg/day in 4 divided doses × 1-3 days to prevent further hyperthermia; postcrisis follow-up 4-8 mg/kg/day for 1-3 days

### Prevention of malignant hyperthermia
**Adult and child:** PO 4-8 mg/kg/day in 3-4 divided doses × 1-2 days before procedures; give last dose 4 hr preoperatively; **IV** 2.5 mg/kg prior to anesthesia

### Neuroleptic malignant syndrome (unlabeled)
**Adult:** PO 100-300 mg/day in divided doses, **IV** 1.25-1.5 mg/kg

**Available forms:** Caps 25, 50, 100 mg; powder for inj 20 mg/vial, 250 mg/vial

### Implementation
**PO route**
- Do not crush or chew caps; caps may be opened and mixed with juice and swallowed; drink immediately after mixing
- Give with meals for GI symptoms
- Store in airtight container at room temperature

**IV route**
- Administer **IV** after diluting 20 mg/60 ml sterile water for inj without bacteriostatic agent (333 mcg/ml); shake until clear; give by rapid **IV** push through Y-tube or 3-way stopcock; follow by prescribed doses immediately; may also give by intermittent inf over 1 hr before anesthesia; assess site for extravasation, phlebitis
- Protect diluted sol from light; use reconstituted sol within 6 hr
- Considered incompatible in sol or syringe, compatibility unknown

## ADVERSE EFFECTS
**CNS:** *Dizziness, weakness, fatigue, drowsiness,* headache, disorientation, insomnia, paresthesias, tremors, seizures
**CV:** Hypotension, chest pain, palpitations, tachycardia
**EENT:** Nasal congestion, blurred vision, mydriasis, excessive lacrimation
**GI:** Hepatic injury, *nausea,* constipation, vomiting, increased AST and alkaline phosphatase, abdominal pain, dry mouth, anorexia, hepatitis, dyspepsia
**GU:** Urinary frequency, nocturia, impotence, crystalluria, hepatitis
**HEMA:** Eosinophilia, aplastic anemia, leukopenia, thrombocytopenia/lymphoma
**INTEG:** Rash, pruritus, photosensitivity, extravasation (tissue necrosis), phlebitis
**RESP:** Pleural effusion, pulmonary edema

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | PO (30%-35%), poor |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidney |
| **Half-life** | 9 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Unknown | Immediate |
| **Peak** | 5 hr | 5 hr |
| **Duration** | Dose related | Dose related |

## INTERACTIONS

• Considered incompatible in sol or syringe; compatibility unknown

### Individual drugs

Alcohol: increased CNS depression
Verapamil: increased dysrhythmias

### Drug classifications

Antidepressants (tricyclic), antihistamines, barbiturates, opiates, sedative/hypnotics: increased CNS depression, traMADol
Estrogens, hepatotoxic agents: increased hepatotoxicity

## NURSING CONSIDERATIONS

### Assessment

• Monitor I&O ratio; check for urinary retention, frequency, hesitancy, especially geriatric
• **Seizures:** Monitor ECG in epileptic patients; poor seizure control has occurred with patients taking this product; assess for increased seizure activity in epilepsy patient

**BLACK BOX WARNING: Active hepatic disease:** Monitor hepatic function by frequent determination of AST, ALT, bilirubin, alkaline phosphatase, GGTP; renal function studies; CBC; use lowest dose possible; check for jaundice, dark urine, diarrhea, weakness; product should be discontinued, occurs with oral form

• **Assess for allergic reactions:** rash, fever, respiratory distress
• Monitor for severe weakness, numbness in extremities; prescriber should be notified, product discontinued
• Assess for CNS depression: dizziness, drowsiness, psychiatric symptoms
• **Pregnancy/breastfeeding:** No well-controlled studies, avoid use in pregnancy, breastfeeding

### Patient/family education

• Caution patient not to discontinue product quickly, hallucinations, spasticity, tachycardia will occur; product should be tapered over 1-2 wk; notify prescriber of abdominal pain, jaundiced sclera, clay-colored stools, change in color of urine, rash, itching
• Caution patient not to take with alcohol, other CNS depressants; severe CNS depression can occur; avoid using OTC medication (cough preparations, antihistamines, alcohol, other CNS depressants), unless directed by prescriber, to take with meals
• Tell patient that if improvement does not occur within 6 wk, prescriber may discontinue
• Caution patient to avoid hazardous activities if drowsiness, dizziness, blurred vision occurs; wait several days to identify patient response to medication
• Advise patient to report severe weakness, seizures, signs of liver insufficiency
• Teach patient to use sunscreen, protective clothing for photosensitivity
• Instruct patient to take medication as prescribed; do not double doses; take missed dose within 1 hr of scheduled time
• **Malignant hyperthermia:** These patients should use a medical ID stating condition, products used

### Evaluation

**Positive therapeutic outcome**
• Decreased pain, spasticity
• Absence or decreased symptoms of malignant hyperthermia

## dapagliflozin

(dap′a-gli-floe′zin)
**Farxiga**
*Func. class.:* Oral antidiabetic
*Chem. class.:* SGLT-2 inhibitor (sodium-glucose cotransporter 2 inhibitor)

**Do not confuse:** Farxiga/Fetzima

**ACTION:** Blocks reabsorption of glucose by the kidneys, increases glucose excretion, lowers blood glucose concentrations

**Therapeutic outcome:** Improved signs/symptoms of diabetes mellitus (decreased polyuria, polydipsia, polyphagia; clear sensorium, absence of dizziness, stable gait); HbA1c WNL

**USES:** Type 2 diabetes mellitus, with diet and exercise

## CONTRAINDICATIONS

Dialysis, renal failure, hypersensitivity, breastfeeding, diabetic ketoacidosis

**Precautions:** Pregnancy, children, renal/hepatic disease, hypothyroidism, hyperglycemia, hypotension, bladder cancer, hypercholesterolemia, pituitary insufficiency, type 1 diabetes mellitus, malnutrition, fever, dehydration, adrenal insufficiency, geriatrics, genital fungal infections, hypoglycemia

## DOSAGE AND ROUTES

**Adult: PO** 5 mg in AM; may increase to 10 mg/day if needed

### Renal dose

**Adult:** PO eGFR ≥60 ml/min/1.73m$^2$, no change; eGFR<60 ml/min, do not use

**Available forms:** Tabs 5, 10 mg

### Implementation

**PO route**

- Give once/day in AM without regard to food in AM
- Store at room temperature

## ADVERSE EFFECTS

**CNS:** Dizziness, fatigue

**GI:** Abdominal pain, pancreatitis, constipation, nausea

**GU:** Cystitis, candidiasis, urinary frequency, polydipsia, polyuria, increased serum creatinine, renal impairment/failure, infections

**META:** Hypercholesterolemia, lipidemia, hypoglycemia, hyperkalemia, hypomagnesemia, hypophosphatemia/hyperphosphatemia

**MISC:** Bone fractures, hypotension, dehydration, orthostatic hypotension, hypersensitivity, new bladder cancer; increased hematocrit

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 91% protein binding |
| **Metabolism** | Primarily metabolized by O-glucuronidation by UGT1A9; minor CYP3A4 |
| **Excretion** | Urine |
| **Half-life** | 12.9 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Less than 2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs:

Baclofen, cycloSPORINE, isoniazid, tacrolimus: decreased effect, hyperglycemia

Bortezomib, lithium: increased or decreased glycemic control

Gatifloxacin: do not use concurrently

### Drug classifications

Androgens, quinolones: increased or decreased glycemic control

ACE inhibitors, angiotensin II receptor antagonists, bile acid sequestrates, β-blockers, fibric acid derivatives, insulins, MAOIs, salicylates, sulfonylureas: increased hypoglycemia, adjust antidiabetics

Atypical antipsychotics, carbonic anhydrase inhibitors, corticosteroids, digestive enzymes, estrogen, intestinal absorbents, loop diuretics, oral contraceptives, phenothiazines, progestins, protease inhibitors, sympathomimetics, thiazide diuretics: decrease effect, hyperglycemia

### Drug/lab test

Decrease: eGFR

Increase: Hct, LDL

## NURSING CONSIDERATIONS

### Assessment

- Hypoglycemia when used with other agents (assess hunger, dizziness, tremors, anxiety, tachycardia, sweating, weakness), hyperglycemia when used with other agents; even though product does not cause hyperglycemia, if patient is on sulfonylureas or insulin, hypoglycemia may be additive; if hypoglycemia occurs, treat with dextrose, or, if severe, with IV glucagon; monitor HbA1C, lipid panel, blood glucose, BUN, creatinine, discontinue if renal function is reduced
- **Hypotension:** More frequent in those with poor renal function, monitor volume status, B/P, usually in those with eGFR <60 ml/min/1.73 m$^2$
- **Ketoacidosis:** Monitor for increased urine/serum ketone levels, may occur without increased glucose levels, may occur more frequently in those with reduced intake of food, fluids, or serious conditions
- **Pregnancy/breastfeeding:** Avoid use in pregnancy, do not breastfeed

### Patient/family education

- Teach patient the symptoms of hypoglycemia and hyperglycemia, what to do about each
- Instruct patient that medication must be taken as prescribed; explain consequences of discontinuing medication abruptly; that insulin may need to be used for stress, including trauma, fever, surgery
- Instruct patient to avoid OTC medications and herbal supplements unless approved by health care provider
- Instruct patient that diabetes is a lifelong illness; that the diet and exercise regimen must be followed; that this product is not a cure
- Instruct patient to carry emergency ID and glucose source
- Instruct patient that blood glucose monitoring is required to assess product effect and periodic lab tests
- Instruct patient that GI side effects may occur
- Instruct patient that there is a risk of renal impairment, dehydration, and new bladder cancer

• **Ketoacidosis:** Report immediately confusion, abdominal pain, fatigue, trouble breathing

### Evaluation

**Positive therapeutic outcome**

• Improved signs/symptoms of diabetes mellitus (decreased polyuria, polydipsia, polyphagia); clear sensorium, absence of dizziness, stable gait; HbA1c WNL within normal limits

## DAPTOmycin (Rx)

(dap'toe-mye-sin)

**Cubicin**

*Func. class.:* Antiinfective—miscellaneous

*Chem. class.:* Lipopeptides

**ACTION:** New class of antiinfective; binds to the bacterial membrane and results in a rapid depolarization of the membrane potential, leading to inhibition of DNA, RNA, and protein synthesis

**Therapeutic outcome:** Absence of infections

**USES:** Complicated skin, skin structure infections caused by *Staphylococcus aureus,* (MRSA, MSSA) including methicillin-resistant strains, *Streptococcus pyogenes, S. agalactiae, S. dysgalactiae* (vancomycin-susceptible strains only), *Streptococcus pyogenes* (group A beta hemolytic), *Staphylococcus aureus, Staphylococcus epidermidis,* bone, joint infection, infectious arthritis, orthopedic device-related infection, osteomyelitis

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatrics, GI/renal disease, myopathy, ulcerative/pseudomembranous colitis, rhabdomyolysis, eosinophilic pneumonia

## DOSAGE AND ROUTES

**Complicated skin or skin structure infection (SSRI) caused by susceptible strains of *S. aureus* (including MRSA), *Streptococcus, Pyogenes, S. agalactiae, S. disgalactiae, Enterococcus faecalis* (vancomycin-susceptible strains only)**

**Adult: IV** INF 4-6 mg/kg over ½ hr diluted in 0.9% NaCl, give q24hr × 7-14 days

**Adolescent/child/infant ≥5 mo (unlabeled): IV** 4-6 mg/kg/day

***Staphylococcus aureus* bacteremia, including right-sided infective endocarditis**

**Adult: IV INF** 6 mg/kg/day × 2-6 wk, up to 8-10 mg/kg/day, treatment failures should use another agent

### Renal dose

**Adult:** IV CCr <30 ml/min; hemodialysis, CAPD 4 mg/kg q48hr, 6 mg/kg q48hr (bacteremia)

**Available forms:** Lyophilized powder for inj 500 mg

### Implementation

• Obtain culture and sensitivity, can begin treatment before results

**Intermittent IV infusion route**

• Give after reconstitution with 10 ml 0.9% NaCl (500 mg/10 ml), further dilution is needed with 0.9% NaCl; infuse over ½ hr

**Direct IV route**

• Give reconstituted sol (50 mg/ml) by direct **IV** inj over 2 min

• Refrigerate vials, for single use only, discard unused portion; prepared solutions are stable for 12 hr at room temperature or 48 hr refrigerated

**Y-site compatibilities:** Alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin-sulbactam, argatroban, arsenic trioxide, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, dacarbazine, DACTINomycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, diazePAM, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lepirudin, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, midazolam, milrinone, mitoXANtrone, mivacurium, morphine, moxifloxacin, mycophenolate mofetil, nafcillin, nalbuphine,

naloxone, niCARdipine, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, PHENobarbital, phenylephrine, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin-dalfopristin, raNITIdine, rocuronium, sodium acetate/bicarbonate/citrate/phosphates, succinylcholine, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethobenzamide, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Solution compatibilities:** 0.9% NaCl, LR

## ADVERSE EFFECTS

**CNS:** Headache, insomnia, dizziness, confusion, anxiety, fatigue, fever
**CV:** Hypo/hypertension, heart failure, chest pain
**GI:** Nausea, constipation, diarrhea, vomiting, dyspepsia, pseudomembranous colitis, abdominal pain, stomatitis, xerostomia, anorexia
**GU:** Nephrotoxicity: increased BUN
**HEMA:** Leukocytosis, anemia, thrombocytopenia
**INTEG:** Rash, pruritus
**META:** Electrolyte imbalances
**MISC:** Fungal infections, UTI, anemia, hypoglycemia
**MS:** Muscle pain or weakness, arthralgia, pain, rhabdomyolysis, myopathy
**RESP:** Cough, eosinophilic pneumonia, dyspnea
**SYST:** Anaphylaxis, DRESS, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 92% |
| **Metabolism** | Unknown |
| **Excretion** | Breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

Individual drugs: Warfarin, monitor PT, INR, or discontinue, may alter anticoagulant levels
Increase: DAPTOmycin action-tobramycin
Increase: tobramycin levels
HMG-CoA reductase inhibitors: myopathy

### Drug/lab test

Increased: CPK, AST, ALT, BUN, creatinine, albumin, LDH
Increased/decreased: glucose
Decreased: alk phos, magnesium, phosphate, bicarbonate

## NURSING CONSIDERATIONS

### Assessment

- Assess signs of infection, C&S, product may be given as soon as culture is taken
- **Rhabdomyolysis:** check for myopathy CPK >1000 U/L (5×ULN), discontinue product, muscle pain, weakness
- **Nephrotoxicity:** Monitor any patient with compromised renal system: BUN, creatinine; toxicity may occur
- **Bowel function:** Assess for diarrhea, fever, abdominal pain; report to prescriber; Pseudomembranous colitis may occur
- **Monitor I&O ratio:** report hematuria, oliguria; nephrotoxicity may occur
- **Eosinophilic pneumonia:** Assess for dyspnea, fever, cough, shortness of breath, if left untreated can lead to respiratory failure and death
- Monitor blood tests: CBC
- Monitor C&S, product may be given as soon as culture is taken
- Monitor B/P during administration; hypo/hypertension may occur
- Identify allergies before treatment, reaction of each medication
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, avoid use in pregnancy or breastfeeding, lack of controlled studies
- Teach patient may cause dizziness, to avoid driving, hazardous activities until response is known

### Patient/family education

- Teach all aspects of product therapy
- Advise patient to report sore throat, fever, fatigue; could indicate superinfection; shortness of breath; diarrhea; muscle weakness, pain
- Instruct patient to avoid breastfeeding, and pregnancy

### Evaluation

#### Positive therapeutic outcome

- Negative culture, resolution of infection

**⚠ HIGH ALERT**

## darbepoetin (Rx)

(dar'bee-poh'-eh-tin)

**Aranesp**

*Func. class.:* Hematopoietic agent

*Chem. class.:* Recombinant human erythropoietin

**ACTION:** Stimulates erythropoiesis by the same mechanism as endogenous erythropoietin; in response to hypoxia, erythropoietin is produced in the kidney and released into the bloodstream, where it interacts with progenitor stem cells to increase red cell production

**Therapeutic outcome:** Decreased anemia with increased RBCs

**USES:** Anemia associated with chronic renal failure in patients on and not on dialysis and anemic in nonmyeloid malignancies receiving coadministered chemotherapy

## CONTRAINDICATIONS

Hypersensitivity to hamster proteins, human albumin, polysorbate 80; uncontrolled hypertension, red cell aplasia

**Precautions:** Pregnancy, breastfeeding, children, seizure disorder, porphyria, hypertension, sickle cell disease, vit $B_{12}$, folate deficiency, chronic renal failure, dialysis, latex hypersensitivity, CABG, angina, anemia

**BLACK BOX WARNING:** Hgb >11 g/dl, neoplastic disease, MI, stroke, thrombolic disease

## DOSAGE AND ROUTES

### Correction of anemia in chronic renal failure

**Adult:** SUBCUT/**IV** 0.45 mcg/kg as a single inj, titrate max target Hgb of 11 g/dl

### Chemotherapy treatment

**Adult:** SUBCUT 2.5 mcg/kg/wk or 500 mcg q3wk

### Epoetin alfa to darbepoetin conversion

**Adult:** SUBCUT/**IV** (epoetin alfa <2500 units/wk) 6.25 mcg/wk; (epoetin alfa 2500-4999 units/wk) 12.5 mcg/wk; (epoetin alfa 5000-10,999 units/wk) 25 mcg/wk; (epoetin alfa 11,000-17,999 units/wk) 40 mcg/wk; (epoetin alfa 18,000-33,999 units/wk) 60 mcg/wk; (epoetin alfa 34,000-89,999 units/wk) 100 mcg/wk; (epoetin alfa >90,000 units/wk) 200 mcg/wk

**Available forms:** Sol for inj 25, 40, 60, 100, 150, 200, 300, 500 mcg/ml

### Implementation

- Transfusions may still be required for anemia, use iron supplements with this product

**IV/SUBCUT route**

- Do not shake, do not dilute, do not mix with other products or solutions
- Check for discoloration, particulate matter; do not use if present; discard unused portion; do not pool unused portion
- Store refrigerated, do not freeze, protect from light

## ADVERSE EFFECTS

**CNS:** Seizures, sweating, headache, dizziness, stroke

**CV:** *Hypo/hypertension,* cardiac arrest, *angina pectoris,* thrombosis, HF, acute MI, dysrhythmias, chest pain, transient ischemic attacks, edema

**GI:** *Diarrhea, vomiting, nausea, abdominal pain, constipation*

**HEMA:** Red cell aplasia

**MISC:** *Infection, fatigue, fever,* death, *fluid overload,* vascular access hemorrhage, dehydration, sepsis

**MS:** *Bone pain, myalgia, limb pain, back pain*

**RESP:** *Upper respiratory infection, dyspnea, cough, bronchitis,* pulmonary embolism

**SYST:** Allergic reactions, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Slow, rate-limiting (SUBCUT) |
| **Distribution** | Vascular space |
| **Metabolism** | Metabolized in body (**IV**), extent unknown |
| **Excretion** | Unknown |
| **Half-life** | 49 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Onset of increased reticulocyte count 1-6 wk |
| **Peak** | 34 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

- Do not use epoetin alfa with this product

### Drug classifications

Androgens: increased darbepoetin alfa effect

### Drug/lab test

Increased: WBC, platelets, Hgb
Decreased: bleeding time

## NURSING CONSIDERATIONS

### Assessment

• **Assess for serious allergic reactions:** rash, urticaria; if anaphylaxis occurs, stop product, administer emergency treatment (rare)

**BLACK BOX WARNING:** Hemoglobin >11 g/dl: monitor Hgb before and weekly × 4 wk or after change in dose and then often after target range has been reached, a rise >1 g/dl over 2 wk may increase risks, reduce dose

**BLACK BOX WARNING:** Assess blood studies: ferritin, transferrin monthly; transferrin sat ≥20%, ferritin ≥100 ng/ml; Hgb 2 ×/wk until stabilized in target range (30%-33%), then at regular intervals; those with endogenous erythropoietin levels of <500 units/L respond to this agent, if there is lack of response, obtain folic acid, iron, $B_{12}$ levels

**BLACK BOX WARNING:** Assess renal studies: urinalysis, protein, blood, BUN, creatinine, those with renal dysfunction may be at greater risk of death, keep Hgb <10 g/dl in chronic kidney disease

• Assess B/P, Hct; check for rising B/P as Hct rises; antihypertensives may be needed

**BLACK BOX WARNING:** Assess CV status: hypertension may occur rapidly, leading to hypertensive encephalopathy; Hgb >11 g/dl may lead to death

• Assess I&O ratio; report drop in output to <50 ml/hr

• Assess for **seizures** if Hgb is increased within 2 wk by 4 points, institute seizure precautions

**BLACK BOX WARNING:** Assess CNS symptoms: cold sensation, sweating, pain in long bones

**BLACK BOX WARNING:** Assess **dialysis patients** for thrill, bruit of shunts; monitor for circulation impairment

**BLACK BOX WARNING:** **Neoplastic disease:** breast, non-small cell lung, head and neck, lymphoid or cervical cancers, increased tumor progression, use lowest dose to avoid RBC transfusion. Facility must be enrolled in the ESA APPRISE oncology program (866-284-8089) to use this product in cancer treatment

• **Pregnancy/breastfeeding:** Avoid use in pregnancy/breastfeeding, those who become pregnant should register with Amgen's Pregnancy Surveillance program 800-772-6436

### Patient/family education

• Caution patient to avoid driving or hazardous activity during beginning of treatment

• Advise patient to monitor B/P, max Hgb 11 g/dl

• Advise patient to take iron supplements, vit $B_{12}$, folic acid as directed

**BLACK BOX WARNING:** Advise patient to report chest pain, shortness of breath, swelling/pain in legs, confusion, inability to speak to prescriber, to comply with treatment regimen

• Teach patient that menses may return, use contraception

• Teach home administration and review information for patients and caregivers if home administration is deemed appropriate

**BLACK BOX WARNING:** Seizures: discuss injury prevention in those that are prone to seizures

### Evaluation

**Positive therapeutic outcome**

• Increased reticulocyte count, Hgb/Hct

• Increased appetite

• Enhanced sense of well-being

**TREATMENT OF OVERDOSE:** If polycythemia occurs, discontinue product temporarily; perform phlebotomy if clinically indicated

## darifenacin

(da-ree-fen'ah-sin)

**Enablex**

*Func. class.:* Antispasmodic/GU anticholinergic

**Do not confuse:** Enablex/Effexor XR

**ACTION:** Bladder smooth muscle relaxation by decreasing the action of muscarinic receptors, thereby relieving overactive bladder

**Therapeutic outcome:** Decreasing urgency, frequency of urination

**USES:** Urge incontinence, frequency, urgency in overactive bladder

**CONTRAINDICATIONS**

Hypersensitivity, urinary retention, narrow-angle glaucoma (uncontrolled)

**Precautions:** Severe hepatic disease (Child-Pugh), GI/GU obstruction, controlled narrow-angle glaucoma, ulcerative colitis, myasthenia gravis, moderate hepatic disease (Child-Pugh B), elderly patients

## DOSAGE AND ROUTES

**Adult:** PO 7.5 mg/day, initially, may increase to 15 mg/day after 14 days if needed

### With taking a potent CYP3A4 inhibitor

**Adult:** PO Max 7.5 mg/day

### Hepatic dose

**Adult:** PO (Child-Pugh B) max 7.5 mg, do not use in severe hepatic disease

**Available forms:** Tabs, EXT REL 7.5, 15 mg

### Implementation

**PO route**

- Give without regard to meals
- Do not crush, break, chew EXT REL tabs
- Store at room temperature

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, confusion
**EENT:** Blurred vision, drying eyes, sinusitis, rhinitis
**GI:** Constipation, dry mouth, abdominal pain, nausea, vomiting, dyspepsia
**GU:** UTI, urine retention, vaginitis
**INTEG:** Rash, pruritus, skin drying
**MISC:** Bronchitis, flulike symptoms, angioedema
**MS:** Back pain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Excretion** | Unknown |
| **Metabolism** | Extensively metabolized by CYP2D, less metabolism in poor metabolizers; some metabolism by CYP3A4 |
| **Half-life** | 12-19 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 7 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Anticholinergics: increased anticholinergic effect
CYP3A4 and CYP2D6 inhibitors: (ketoconazole, itraconazole, ritonavir) increased darifenacin levels
Drugs metabolized by CYP2D6 (fluoxetine, tricyclics): increased levels of these products

## NURSING CONSIDERATIONS

### Assessment

- **Urinary function:** Assess for urgency, frequency, retention in bladder outflow obstruction
- Bowel pattern: Assess for constipation, abdominal pain

### Patient/family education

- **Angioedema:** Teach patient to report facial swelling or large tongue
- Instruct patient to advise prescriber if pregnancy is planned or suspected; avoid breastfeeding
- Teach patient about anticholinergic symptoms (dry mouth, constipation, dry eyes, heat prostration), not to become overheated, not to use other products unless approved by prescriber
- Teach patient to avoid hazardous activities until reaction is known, dizziness, blurred vision may occur

### Evaluation

**Positive therapeutic outcome**

- Decreasing urgency, frequency of urination

**⚠ HIGH ALERT**

# DAUNOrubicin (Rx)

(daw-noe-roo'bi-sin)
**Cerubidine**

# DAUNOrubicin citrate liposome (Rx)

**DaunoXome**

*Func. class.:* Antineoplastic, antibiotic
*Chem. class.:* Anthracycline glycoside

**Do not confuse:** DAUNOrubicin/DOXOrubicin

**ACTION:** Inhibits DNA synthesis, primarily; derived from *Streptomyces coeruleorubidus;* replication is decreased by binding to DNA, binds DNA causing confirmational changes; a vesicant

**Therapeutic outcome:** Prevention of rapidly growing malignant cells; immunosuppression

**USES:** Acute lymphocytic leukemia (ALL), acute myelogenous leukemia (AML); liposomal Kaposi's sarcoma

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, systemic infections, cardiac disease, bone marrow depression

**BLACK BOX WARNING:** IM/Subcut use

**Precautions:** Renal/hepatic disease, gout, tumor lysis syndrome, MI, infection, thrombocytopenia

**BLACK BOX WARNING:** Bone marrow suppression, cardiac disease, extravasation, renal failure, hepatic disease, requires a specialized care setting and an experienced clinician

## DOSAGE AND ROUTES

Use decreased dose for those >60 yr

### >> DAUNOrubicin

#### In combination

**Adult:** **IV** 45-60 mg/m$^2$/day × 3 days, then 2 days of subsequent courses in combination, max 400-600 mg/m$^2$ total cumulative dose

**Child:** **IV** 25-60 mg/m$^2$ depending on cycle (AML); ≤2 yr or <0.5 m$^2$: 1 mg/kg on day 1 weekly in combination with vinCRIStine and predniSONE, base dose on body weight, not surface area (ALL); >2 yr or 0.5 m$^2$: 25 mg/m$^2$ day 1 q wk in combination with vinCRIStine and predniSONE (ALL)

### >> DAUNOrubicin citrate liposome

**Adult:** **IV** 40 mg/m$^2$ q2wk (Kaposi's sarcoma); **IV** 100-140 mg/m$^2$ q3wk (non-Hodgkin's lymphoma, unlabeled; IV escalating doses of 75, 100, 125, 135, 150 mg/m$^2$/day × 3 days (AML, unlabeled)

#### Renal dose

**Adult:** IV serum Cr >3 mg/dl reduce dose by 50%

#### Hepatic dose

**Adult:** IV serum bilirubin 1.2-3 mg/dl reduce dose by 50%; bilirubin >3 mg/dl reduce dose by 75%; bilirubin >5 mg/dl omit dose

**Available forms:** Inj 20 mg powder/vial, sol for inj 5 mg/ml (DaunoXome); liposome: dispersion for inj 2 mg/ml

#### Implementation

- Avoid contact with skin; very irritating; wash completely to remove
- Give fluids **IV** or PO before chemotherapy to hydrate patient; give antiemetic 30-60 min before giving product to prevent vomiting, and prn; antibiotics for prophylaxis of infection
- Provide liquid diet: carbonated beverages; gelatin may be added if patient is not nauseated or vomiting

**BLACK BOX WARNING:** To be used in a care setting with emergency equipment available; to be used by a clinician knowledgeable in cytotoxic therapy, do not give by IM/SUBCUT route

- Help patient rinse mouth tid-qid with water, club soda, brush teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis, use unwaxed dental floss
- Product should be prepared by experienced personnel using proper precautions
- Do not give by IM/SUBCUT inj

### >> Cerubidine

**IV route**

- Give after diluting 20 mg/4 ml sterile water for inj (5 mg/ml); rotate; further dilute in 10-15 ml 0.9% NaCl; give over 3-5 min by direct **IV** through Y-tube or 3-way stopcock of inf of $D_5W$ or 0.9% NaCl, may use premix vial 5 mg/ml

**Intermittent IV infusion route**

- Dilute further in 50-100 ml 0.9% NaCl, LR, $D_5W$; give over 15 min (50 ml), 30 min (100 ml) for extravasation

**Y-site compatibilities:** Amifostine, anidulafungin, atenolol, bivalirudin, bleomycin, CARBOplatin, caspofungin, CISplatin, codeine, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, etoposide, fenoldopam, filgrastim, gemcitabine, gemtuzumab, granisetron, melphalan, meperidine, methotrexate, nesiritide, octreotide, ondansetron, oxaliplatin, PACLitaxel, palonosetron, quinupristin-dalfopristin, riTUXimab, sodium acetate/bicarbonate, teniposide, thiotepa, tigecycline, trastuzumab, vinCRIStine, vinorelbine, voriconazole, zoledronic acid

**Y-site incompatibilities:** Fludarabine

**Solution compatibilities:** $D_{3.3}$/0.3% NaCl, $D_5W$, Normosol-R, Ringer's, 0.9% NaCl

### >> DaunoXome

**IV route**

- Dilute with $D_5W$ (1 mg/ml), give over 60 min, do not use in-line filter, reconstituted sol may be stored ≤6 hr refrigerated; do not admix

## ADVERSE EFFECTS

### >> DAUNOrubicin

**CNS:** Fever, chills

**CV:** HF, pericarditis, myocarditis, peripheral edema, fatal myocarditis, left ventricular failure, QT prolongation, ST-T wave changes, QRS voltage changes, tachycardia, SVT, PVCs

**GI:** *Nausea, vomiting, anorexia, mucositis,* hepatotoxicity

**GU:** Impotence, sterility, amenorrhea, gynecomastia

**HEMA:** Thrombocytopenia, leukopenia, anemia

**INTEG:** *Rash, extravasation,* dermatitis, reversible alopecia, cellulitis, thrombophlebitis at inj site
**MISC:** Anaphylaxis, tumor lysis syndrome, secondary malignancies

### >> DAUNOrubicin citrate liposome

**CNS:** Fatigue, headache, depression, insomnia, dizziness, malaise, neuropathy
**CV:** Chest pain, edema
**GI:** Abdominal pain, nausea, vomiting, *diarrhea,* constipation, stomatitis
**INTEG:** *Alopecia,* sweating, *pruritus*
**MISC:** *Allergic reactions, chest pain, fever,* edema, flulike symptoms
**MS:** *Rigors,* arthralgia, back pain
**RESP:** *Cough, dyspnea, rhinitis, sinusitis*

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Biliary (40%-50%) |
| **Half-life** | 18½ hr, liposome 55½ hr |

#### Pharmacodynamics

Unknown

## INTERACTIONS

Arsenic trioxide, chloroquine, clarithromycin, dasatinib, dolasetron, droperidol, erythromycin, flecainide, halofantrine, haloperidol, levomethadyl, methadone, ondansetron, palonosetron, pentamide, propafenone, risperiDONE, sparfloxacin, vorinstat, ziprasidone: increase QT prolongation, torsades de pointes

### Individual drugs

Cyclophosphamide, radiation: increased toxicity

### Drug classifications

Antineoplastics: increased toxicity
Class IA/III antidysrhythmics, some phenothiazines, tricyclic antidepressants (high doses): increased QT prolongation, torsades de pointes
Live virus vaccines: decreased antibody reaction
NSAIDs, salicylates: increased risk of bleeding, anticoagulants, platelet inhibitors, thrombolytics
Hematopoietic progenitor cells: given within 24 hr: decreased DAUNOrubicin given within 24 hr

### Drug/lab test

Increased: uric acid

## NURSING CONSIDERATIONS

### Assessment

- Assess buccal cavity q8hr for dryness, sores or ulceration, white patches, pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine)
- **Assess symptoms indicating severe allergic reaction:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing; product should be discontinued

**BLACK BOX WARNING: Cardiac toxicity:** assess chest x-ray, echocardiography, radionuclide angiography, MUGA, ECG; watch for ST-T wave changes, low QRS and T, QT prolongation possible, dysrhythmias (sinus tachycardia, heart block, PVCs); watch for HF (jugular vein distention, weight gain, edema, crackles), may occur after 2-6 mo of treatment, cumulative dose (400-550 mg/m$^2$), 450 mg/m$^2$ if used in combination with radiation, cyclophosphamide

**BLACK BOX WARNING:** Monitor CBC, **bone marrow suppression,** differential, platelet count weekly, leukocyte nadir within 2 wk after administration, recovery within 3 wk; do not administer if absolute granulocyte count is $<$750/mm$^3$ (liposome)

- Assess for increased uric acid levels, swelling, joint pain primarily in extremities; patient should be well hydrated to prevent urate deposits
- **Acute renal failure, uric acid nephropathy:** Monitor renal function tests: BUN, creatinine, serum uric acid, urine CCr baseline and before each dose; I&O ratio; report fall in urine output to $<$30 ml/hr, provide aggressive alkalinization of the urine as use of allopurinol can prevent urate nephropathy
- Monitor temp q4hr (may indicate beginning of infection)
- **Hepatotoxicity:** Monitor liver function tests baseline and before each dose (bilirubin, AST, ALT, LDH) as needed or monthly; note jaundice of skin or sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea; hepatotoxicity can be severe
- Assess for bleeding: hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr; check for inflammation of mucosa, breaks in skin
- Identify effects of alopecia on body image; discuss feelings about body changes
- **Tumor lysis syndrome:** hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia

**BLACK BOX WARNING: Extravasation:** swelling, pain, decreased blood return, if extravasation occurs stop infusion, remove tubing, attempt to aspirate the drug prior to removing the needle, elevate area, treat with ice

### Patient/family education

- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding
- Teach patient to avoid use of products containing aspirin or ibuprofen, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
- Instruct patient to report signs of **anemia** (fatigue, headache, irritability, faintness, shortness of breath); signs of **infection;** bleeding, bruising, shortness of breath, swelling, change in heart rate; to avoid crowds, those with known infections
- Advise patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
- Caution patient not to have any vaccinations without the advice of the prescriber; serious reactions can occur
- Advise patient that contraception is needed during treatment and for 4 mo after the completion of therapy
- Advise patient to avoid alcohol, aspirin, NSAIDs
- Inform patient that urine and other body fluids may be red-orange for 48 hr
- Teach patient to avoid crowds, those with known infections

### Evaluation

**Positive therapeutic outcome**

- Prevention of rapid division of malignant cells

**⚠ HIGH ALERT**

## delavirdine (Rx)

(de-la-veer′deen)

**Rescriptor**

*Func. class.:* Antiretroviral

*Chem. class.:* Nonnucleoside reverse transcriptase inhibitor (NNRTI)

**ACTION:** Binds directly to reverse transcriptase and blocks RNA, DNA-dependent polymerase activities causing a disruption of the enzyme's site

**Therapeutic outcome:** Improvement of HIV-1 infection

**USES:** HIV-1 in combination with at least 2 other antiretrovirals

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, hepatic disease, exfoliative dermatitis, hepatitis, immune reconstitution syndrome, achlorhydria, antimicrobial resistance

## DOSAGE AND ROUTES

**Adult and child ≥16 yr:** PO 400 mg tid; max 1200 mg/day

**Available forms:** Tabs 100, 200 mg

### Implementation

- Add 4 tabs/3-4 oz of water, let stand, stir, swallow, rinse glass, swallow; use only 100 mg tabs for dispersion
- Do not give within 1 hr of antacids or didanosine
- Take in equal intervals around the clock
- Always use as combination therapy; this product is not recommended for initial treatment; due to inferior, virologic effect, it is no longer listed as part of any preferred regimens

## ADVERSE EFFECTS

**CNS:** Headache, fatigue, anxiety, insomnia, fever
**GI:** Diarrhea, anorexia, abdominal pain, nausea, vomiting, dyspepsia, hepatotoxicity
**GU:** Nephrotoxicity
**HEMA:** Neutropenia, leukopenia, thrombocytopenia, anemia, granulocytopenia
**INTEG:** Rash, pruritus
**MISC:** Cough
**MS:** Pain, myalgia, rhabdomyolysis
**SYST:** Stevens-Johnson syndrome, immune reconstitution syndrome (combination therapy)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well |
| **Distribution** | 98% protein bound |
| **Metabolism** | Liver, extensively by CYP3A4 |
| **Excretion** | Kidneys, feces |
| **Half-life** | 2-11 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr |
| **Duration** | 8 hr |

## INTERACTIONS

### Individual drugs

ALPRAZolam, amprenavir, atorvastatin, clarithromycin, dapsone, felodipine, indinavir, lovastatin, midazolam, NIFEdipine, saquinavir, simvastatin: increased level of each specific product

ALPRAZolam, astemizole, cisapride, midazolam, pimozide, sildenafil, terfenadine, triazolam: life-threatening reactions; do not combine
Clarithromycin, quiNIDine, warfarin: increased level of both products
Didanosine: decreased delavirdine levels, decreased action of didanosine, $H_2$ blockers, PPIs
FLUoxetine, ketoconazole: increased level of delavirdine

### Drug classifications

Amphetamines, antidysrhythmics, benzodiazepines, calcium channel blockers, ergots, sedative/hypnotics, opiates: increased serious life-threatening adverse reaction
Antacids, anticonvulsants, protease inhibitors, rifamycins: decreased delavirdine levels
**Contraceptives (oral):** decreased action of oral contraceptives
CYP3A4, 2D6 inhibitors: increased levels
Ergots: increased levels of ergots

### Drug/herb

St. John's wort, avoid use: decreased delavirdine level

### Drug/lab test

Increase: ALT/AST, alkaline phosphatase, bilirubin, creatinine, CK, lipase, CGT, eosinophils, PT, PTT
Decrease: RBC, WBCs, platelets, granulocytes

## NURSING CONSIDERATIONS

### Assessment

- Assess CBC, blood chemistry, plasma HIV RNA, absolute $CD4^+$/$CD8^+$/cell counts/%, serum $\beta_2$ microglobulin, serum ICD+24 antigen levels
- Assess signs of infection, anemia
- Assess liver function tests: ALT, AST; renal studies
- Assess C&S before product therapy; product may be taken as soon as culture is taken; repeat C&S after treatment; determine the presence of other STDs
- Assess bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- Assess allergies before treatment, reaction to each medication; place allergies on chart
- Assess plasma delavirdine concentrations (trough 10 mcm)
- HIV: Obtain hepatitis B virus (HBV) screening to ensure proper treatment, if co-infected, a fully suppressive antiretroviral regimen with productions against both
- **Serious skin reactions: Stevens-Johnson syndrome;** any rash may occur within 1-3 wk of beginning treatment; if rash is not severe, manage with diphenhydrAMINE, hydrOXYzine, topical corticosteroids
- **Immune reconstitution syndrome:** When treated with combination therapy; development of opportunistic infections (Mycobacterium avium complex [MAC]), cytomegalovirus (CMV), Pneumocystis jiroveci pneumonia (PCP), or TB
- **Delavirdine toxicity:** severe nausea, vomiting, maculopapular rash
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, use in pregnancy only if benefits outweigh fetal risk, if pregnant; patient should register with the antiretroviral Pregnancy Registry 800-258-4263, not to breastfeed

### Patient/family education

- Advise patient to take as prescribed; if dose is missed, take as soon as remembered up to 1 hr before next dose; do not double dose, separate by 1 hr, do not take antacids concurrently
- Advise patient that product must be taken in equal intervals around the clock to maintain blood levels for duration of therapy
- Advise patient that tabs may be dissolved; drink right away (100 mg only), rinse cup with water, and drink that to get all medication
- Instruct patient to make sure health care provider knows of all the medications being taken
- Advise patient that if severe rash, mouth sores, swelling, aching muscles/joints, or eye redness occur, stop taking and notify health care provider
- Advise patient not to breastfeed if taking this product
- Teach patient that this product is not a cure, only controls symptoms

### Evaluation

#### Positive therapeutic outcome

- Increased $CD4^+$ cell count
- Decreased viral load
- Improvement in symptoms of HIV

## denosumab (Rx)

(den-oh'sue-mab)
**Prolia, Xgeva**
*Func. class.:* Bone resorption inhibitor
*Chem. class.:* Monoclonal antibody, bone resorption

**ACTION:** Neutralizes activity of receptor activator nuclear factor kappa-B ligand (RANKL) by binding to it and blocking its interaction with cell surface receptors, use of a RANKL inhibitor may reduce bone turnover and decrease tumor burden

**Therapeutic outcome:** Increased/maintained bone density

**USES:** Osteoporosis in postmenopausal women or men at high risk for fractures, who are receiving androgen deprivation therapy for prostate cancer, and women receiving aromatase inhibitor therapy for breast cancer; prevention of skeletal-related events in bone metastases from solid tumors; giant cell tumor of bone (Xgeva); increase bone mass

## CONTRAINDICATIONS

Hypersensitivity, hypocalcemia, pregnancy

**Precautions:** Anemia, breastfeeding, child/infant/neonate, coagulopathy, diabetes mellitus, dialysis, eczema, hypoparathyroidism, immunosuppression, latex hypersensitivity, malabsorption syndrome, neonates, neoplastic disease, pancreatitis, parathyroid disease, pregnancy, dental/renal/thyroid disease, TB, vitamin D deficiency

## DOSAGE AND ROUTES

### Postmenopausal osteoporosis (Prolia)

**Adult female:** SUBCUT 60 mg q6mo with 1000 mg calcium and 400 international units vitamin D, max 60 mg q6mo

### Bone metastases from solid tumors

**Adult:** SUBCUT 120 mg q4wk, max 120 mg q4wk; administer with calcium and vitamin D as necessary to prevent hypocalcemia

### Giant cell tumor of bone (Xgeva)

**Adult:** SUBCUT 120 mg on days 1, 8, 15, then 120 mg q4wk; use calcium, vitamin D as needed

**Available forms:** Solution for injection 60 mg/ml (Prolia); 120 mg/1.7 ml (Xgeva)

### Implementation

**SUBCUT route**

- Give acetaminophen before and for 72 hr after to decrease pain
- Do not use if particulate matter or discoloration is present; solution is clear and colorless to slightly yellow with small white/opalescent particles, remove from refrigerator and allow to warm to room temperature (15-30 min)
- **Use of prefilled syringe with needle safety guard:** Leave green guard in original position until after administration, remove and discard needle cap immediately before injection, give by SUBCUT injection in upper arm, thigh, or abdomen; after injection, point needle away from people and slide green guard over needle
- **Use of single-use vials:** Use 27G needle, give in upper arm/thigh, or abdomen, do not re-insert needle in vial, discard supplies as appropriate
- Avoid direct sunlight/heat, do not freeze, use within 14 days after removal from refrigerator, store unopened containers in refrigerator

## ADVERSE EFFECTS

**CNS:** Chills, fever, flushing, headache, vertigo, neuropathic pain
**CV:** Angina, atrial fibrillation
**GI:** Abdominal pain, constipation, *diarrhea,* flatulence, GERD, *vomiting, nausea*
**GU:** Cystitis, lactation suppression
**HEMA:** Anemia, neutropenia
**INTEG:** Atopic dermatitis, pruritus
**META:** Hypercholesterolemia, hypocalcemia, hypophosphatemia
**MS:** Back/bone pain, MS pain, myalgia, osteonecrosis of the jaw
**RESP:** Cough, *dyspnea*
**SYST:** Infection, secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Bioavailability 62% |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 25.4 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Maximum serum concentration 3-21 days |
| **Duration** | Steady state 6 months |

## INTERACTIONS

### Drug classifications

Immunosuppressives (except cytarabine liposomal), corticosteroids: possible increased infection
Antineoplastics, corticosteroids: possible increased osteonecrosis of the jaw

### Drug/lab test

Increase: cholesterol

## NURSING CONSIDERATIONS

### Assessment

- **Assess for acute acute-phase reaction:** fever, myalgia, headache, flulike symptoms, for 72 hr after injection, usually resolves after 72 hr
- Monitor blood tests: serum calcium/creatinine/BUN/magnesium/phosphate; provide adequate calcium D, magnesium
- **Assess for hypocalcemia (may be fatal):** paresthesia, twitching, laryngospasm, Chvostek's/Trousseau's signs; preexisting hypocalcemia prior to treatment; patient with vitamin D deficiency may require higher doses of vitamin D

• **Assess for hypercalcemia:** nausea, vomiting, anorexia, weakness, thirst, constipation, dysrhythmias
• **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected, women who become pregnant should enroll in Amgen's Pregnancy Surveillance Program (800-772-6436), do not use in pregnancy, breastfeeding
• **Monitor dental status:** correct dental complications prior to product use, good oral hygiene should be maintained; if dental work is to be performed, antiinfectives should be given to prevent osteonecrosis of the jaw
• **Assess for infection:** Do not start treatment in those with active infections, infections should be resolved first

### Patient/family education

• Advise patient to report hypercalcemic relapse: nausea, vomiting, bone pain, thirst
• Teach patient to notify prescriber immediately of rash, infection, cramps, twitching
• Teach patient to continue with dietary recommendations including additional calcium 1000 mg/day and vitamin D ≥ 400 units (Prolia product labeling)
• **Pregnancy:** Advise patient not to use in pregnancy and breastfeeding, notify prescriber if pregnancy is planned or suspected, to use contraception during and for 5 mo after completion of therapy, males should use contraception if partner is pregnant
• Instruct patient to use acetaminophen prior to and for 72 hrs after injection to lessen bone pain
• Explain the purpose of this product and expected results
• Advise patient to avoid OTC, Rx, or herbs and supplements unless approved by prescriber
• Teach patient to use regular exercise, stop smoking, and avoid alcohol to maintain bone health
• Advise patient to inform all health care providers of product use, avoid dental procedures/surgery if possible, practice good oral hygiene
• Teach patient that lab tests and follow-up exams will be required

### Evaluation

#### Positive therapeutic outcome

• Increased/maintained bone density

## desipramine (Rx)

(dess-ip'ra-meen)
**Norpramin**
*Func. class.:* Antidepressant, tricyclic
*Chem. class.:* Dibenzazepine, secondary amine

**Do not confuse desipramine/** disopyramide

**ACTION:** Blocks reuptake of norepinephrine, serotonin into nerve endings, increasing action of norepinephrine, serotonin in nerve cells

**Therapeutic outcome:** Decreased depression

**USES:** Depression

**Unlabeled uses:** Chronic pain, ADHD, bulimia, diabetic neuropathy, panic disorder, social phobia

## CONTRAINDICATIONS

Hypersensitivity to tricyclics, carBAMazepine; closed-angle glaucoma, acute MI, MAOIs

**Precautions:** Pregnancy, breastfeeding, geriatric, severe depression, increased intraocular pressure, seizure disorder, CV disease, urinary retention, cardiac dysrhythmias, cardiac conduction disturbances, family history of sudden death, prostatic hypertrophy, thyroid disease

**BLACK BOX WARNING:** Suicidal patients, children <18 yr

## DOSAGE AND ROUTES

### Major depression

**Adult:** PO 50-75 mg/day in 1-4 divided doses; titrate by 25-50 mg qwk up to 300 mg/day in single or divided doses (inpatient), 200 mg/day (outpatient)
**Geriatric:** PO 25 mg/day at bedtime, titrate qwk; may increase to 150 mg/day
**Child >12 yr:** PO 25-50 mg/day in divided doses, max 150 mg/day
**Child 6-12 yr:** PO 1-3 mg/kg/day in divided doses, give >3 mg/kg/day with close medical monitoring; max 5 mg/kg/day

**Available forms:** Tabs 10, 25, 50, 75, 100, 150 mg

### Implementation

• Increase fluids, bulk in diet for constipation, especially in geriatric
• Take with food or milk for GI symptoms

• Crush if patient is unable to swallow medication whole, without regard to food
• Give dosage at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric may not tolerate once a day dosing
• Store at room temperature
• Provide assistance with ambulation during beginning of therapy for drowsiness/dizziness
• Provide safety measures, primarily in the geriatric
• Check to see that PO medication is swallowed

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric), increased psychiatric symptoms, paresthesia, suicidal ideation, impaired memory, seizures, serotonin syndrome
**CV:** *Orthostatic hypo/hypertension,* ECG changes, *tachycardia, palpitations*
**EENT:** *Blurred vision,* tinnitus, mydriasis, ophthalmoplegia
**ENDO:** SIADH
**GI:** *Diarrhea, dry mouth,* nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis, constipation, weight gain
**GU:** *Retention,* acute renal failure
**HEMA:** Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia
**INTEG:** Rash, urticaria, sweating, pruritus, photosensitivity

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well |
| **Distribution** | Widely, protein binding 92% |
| **Metabolism** | Extensively, liver by CYP2D6, 7% of population may be poor metabolizers |
| **Excretion** | Unknown |
| **Half-life** | 12-24 hr |

### Pharmacodynamics

| | |
|---|---|
| Onset | Unknown |
| Peak | 4-6 hr |
| Duration | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Cimetidine, dilTIAZem, fluvoxaMINE, FLUoxetine, PARoxetine, sertraline, verapamil: increased desipramine level
CloNIDine: increased life-threatening B/P elevations, do not use concurrently
EPINEPHrine, norepinephrine: increased hypertension
Gatifloxacin, levofloxacin, moxifloxacin, sparfloxacin, SUNItinib, vorinostat, ziprasidone: increased serotonin syndrome, neuroleptic malignant syndrome

### Drug classifications

Barbiturates, opioids, CNS depressants: increased CNS depression, skeletal muscle relaxants
**MAOIs:** increased hyperpyrexia, seizures, excitation; do not use within 14 days of MAOIs
SSRIs, SNRIs, serotonin-receptor agonists, other tricyclic antidepressants: increased serotonin syndrome, neuroleptic malignant syndrome
Class IA/III dysrhythmics, tricyclic antidepressants: increased QT interval

### Drug/herb

Kava, valerian: increased CNS depression
St. John's wort: may increase serotonin syndrome; avoid concurrent use

### Drug/lab test

Increase: serum bilirubin, blood glucose, alkaline phosphatase
Decreased: sodium

## NURSING CONSIDERATIONS

### Assessment

• **Pain: Before and periodically**
• Monitor B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take vital signs q4hr in patients with CV disease
• Monitor blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy
• Monitor hepatic studies: AST, ALT, bilirubin, monitor leukocytes, differential counts; monitor blood glucose and cholesterol in those who are overweight
• Check weight qwk, BMI initially and periodically; appetite may increase with this product
• Monitor ECG for flattening T wave, bundle branch block, AV block, dysrhythmias in cardiac patients
• Assess for **EPS** primarily in geriatric: rigidity, dystonia, akathisia
• Assess for **seizure activity** in those with a history of seizures, may be before cardiac events

**BLACK BOX WARNING: Depression:** assess mental status: mood, sensorium, affect, **suicidal tendencies,** increase in psychiatric symptoms: depression, panic; this product is not indicated for children, monitor mental status baseline and during first few months of treatment

• Assess for urinary retention, constipation; constipation most likely in children
• Assess for **withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; not usual unless product is discontinued abruptly
• Assess for alcohol consumption; if consumed, hold dose until morning

### Patient/family education

• Advise patient that therapeutic effects may take 2-3 wk
• **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefit outweighs fetal risk, avoid breastfeeding, excretion unknown
• **Beers:** Avoid in older adults with or at high risk for delirium, assess for confusion; highly anticholinergic

**BLACK BOX WARNING:** Teach patient that suicidal thoughts and behavior may occur, notify prescriber immediately

• Advise patient to use caution in driving, other activities requiring alertness because of drowsiness, dizziness, blurred vision
• Teach patient to avoid alcohol ingestion, other CNS depressants
• Teach patient not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise
• Teach patient to wear sunscreen or large hat, since photosensitivity occurs

### Evaluation

**Positive therapeutic outcome**
• Decreased depression

## TREATMENT OF OVERDOSE:

ECG monitoring; induce emesis; lavage, administer anticonvulsant

## desmopressin (Rx)

(des-moe-press'in)
**DDAVP, DDAVP Rhinal Tube, DDAVP Rhinyle Drops Minirin, Noctiva, Octostim, Stimate**
*Func. class.:* Pituitary hormone
*Chem. class.:* Synthetic antidiuretic hormone

## ACTION:

Promotes reabsorption of water by action on renal tubular epithelium in the kidney; causes smooth muscle constriction and increase in plasma factor VIII levels, which increases platelet aggregation resulting in vasopressor effect; similar to vasopressin

**Therapeutic outcome:** Prevention of nocturnal enuresis, decreased bleeding in hemophilia A, von Willebrand's disease type 1, control and stabilization of water in diabetes insipidus

## USES:

Hemophilia A, von Willebrand's disease type 1, nonnephrogenic diabetes insipidus, symptoms of polyuria/polydipsia caused by pituitary dysfunction, nocturnal enuresis

## CONTRAINDICATIONS

Hypersensitivity, nephrogenic diabetes insipidus, severe renal disease

**BLACK BOX WARNING:** Hyponatremia

**Precautions:** Pregnancy, breastfeeding, CAD, hypertension, cystic fibrosis, thrombus, electrolyte imbalances, male infertility

## DOSAGE AND ROUTES

### Primary nocturnal enuresis (unlabeled)

**Adult and child ≥6 yr:** INTRANASAL 20 mcg (half in each nostril) at bedtime, may increase to 40 mcg; PO 0.2 mg at bedtime, may be increased to max 0.6 mg at bedtime

### Nephrogenic diabetes insipidus temporary polyuria, polydipsia, related to pituitary trauma

**Adult:** INTRANASAL 10-40 mcg in divided doses (1-4 sprays with pump); SUBCUT/**IV** 2-4 mcg/day or SUBCUT in 2 divided daily in divided doses
**Child 3 mo-12 yr:** INTRANASAL 5-30 mcg in divided doses

### Hemophilia/von Willebrand's disease

**Adult and child >3 mo: IV** 0.3 mcg/kg in NaCl over 15-30 min; may repeat if needed
**Adult/child >11 mo:** Nasal spray: 33 mcg (1 spray in each nostril), give 2 hr before surgery

### Antihemorrhagic

**Adult and child >3 mo: IV** 0.3 mcg/kg
**Adult and child <50 kg:** INTRANASAL 1 spray in one nostril
**Adult and child >50 kg:** 1 spray each nostril
**Adult:** SUBCUT/IV 0.2-0.4 mcg/kg dose

### Noctiva

**Adults:** 50-64 yr, Noctiva nasal spray 1 spray in each nostril 30 min before going to bed (use in those not at increased risk for hyponatremia)

**Available forms:** Inj 4, 15 mcg/ml, Rhinal Tube delivery 2.5 mg/vial (0.1 mg/ml); tabs 0.1, 0.2 mg; nasal spray pump (DDAVP) 10 mcg/spray (0.1 mg/ml); nasal spray (Stimate) 1.5 mg/ml (150 mcg/dose)

### Implementation

**PO route**

- Store at room temperature
- Draw medication into tube, insert tube into nostril to instill product and blow on other end to deliver sol into nasal cavity; rinse after use
- Store in refrigerator or cool environment

**Nasal route**

- DDAVP and Stimate are not interchangeable
- Prime prior to first dose (press down 4 times), pump stays primed for 1 wk; to reprime, press down 1 time
- Noctiva: Do not shake bottle, prime by pumping 5 times into the air, away from the face, if not used >3 days, reprime with 2 actuations, have patient blow nose, tilt head back slightly, close then open nostril, inhale while pumping 1 time, wipe applicator, and replace cap

**IV, direct route**

- Give undiluted over 1 min in diabetes insipidus

**Intermittent IV infusion route**

- Give single dose diluted in 50 ml of 0.9% NaCl (adult and child >10 kg); a single dose/10 ml as an **IV** inf over 15-30 min in von Willebrand's disease or hemophilia A
- Store in refrigerator

## ADVERSE EFFECTS

**CNS:** Drowsiness, headache, lethargy, flushing, seizures
**CV:** Increased B/P, palpitations, tachycardia
**EENT:** Nasal irritation, congestion, rhinitis
**GI:** Nausea, heartburn, cramps
**GU:** *Vulval pain*
**META:** Hyponatremia, hyponatremia-induced seizures
**SYST:** Anaphylaxis (IV)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Nasal (up to 20%) |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown; breast milk |

### Pharmacodynamics

| | PO | Intranasal | SUBCUT/IV |
|---|---|---|---|
| **Onset** | 1 hr | 1 hr | Rapid |
| **Peak** | 4-7 hr | 1-4 hr | 15-30 min |
| **Duration** | Unknown | 8-20 hr | 3 hr |

## INTERACTIONS

### Individual drugs

Alcohol, demeclocycline, EPHINEPHrine (large doses), heparin, lithium: decreased antidiuretic action
CarBAMazepine, chlorproPAMIDE, clofibrate: increased antidiuretic action, SSRIs, lamoTRIgine

### Drug classifications

Pressor products: increased pressor effect

## NURSING CONSIDERATIONS

D

### Assessment

- Monitor I&O ratio, urine osmolality, specific gravity, weight daily; check for edema in extremities; if water retention is severe, diuretic may be prescribed; check pulse, B/P when giving product **IV** or SUBCUT
- **Assess for water intoxication:** lethargy, behavioral changes, disorientation, neuromuscular excitability, dehydration, poor skin turgor, severe thirst, dry skin, tachycardia
- Assess intranasal use: nausea, congestion, cramps, headache; usually decreased with decreased dosage
- Assess for allergic reaction, including anaphylaxis **(IV route)**, notify prescriber, discontinue use
- Assess for nasal mucosa changes: congestion, edema, discharge, scarring (nasal route)
- **Diabetes insipidus:** Monitor urine volume osmolality and plasma osmolality, monitor for dry skin, poor turgor, thirst (dehydration)
- Nocturia enuresis: Identify how often enuresis is occurring, avoid use in those prone to water intoxication or sodium depletion
- **Hemophilia/Von Willebrand's disease:** Monitor factor VIII coagulant activity before using for hemostasis, assess for bleeding frank and occult
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefit outweighs fetal risk, cautious use in breastfeeding, excretion is unknown

### Patient/family education

- Use demonstration, return demonstration to teach technique for nasal instillation, clear nasal passage before use
- Teach patient to notify prescriber of dyspnea, vomiting, cramping, drowsiness, headache, nasal congestion
- Caution patient to avoid OTC products (cough, hay fever), since these preparations may contain EPINEPHrine and decrease product response; do not use with alcohol
- Advise patient to carry/wear emergency ID or other identification specifying disease and medication used
- Advise patient if dose is missed, take when remembered, up to 1 hr before next dose; do not double doses; avoid fluids from 1 hr to up to 8 hr after PO dose

- Teach patient to report upper respiratory infection, nasal congestion
- How to use subcut, rotate sites

### Evaluation

**Positive therapeutic outcome**
- Absence of severe thirst
- Decreased urine output, osmolality
- Absence of bleeding (hemophilia)

## desonide topical
*See Appendix B*

## desoximetasone topical
*See Appendix B*

## desoxyribonuclease
*See fibrinolysin/desoxyribonuclease*

## desvenlafaxine (Rx)
**Khedezla, Pristiq**

*Func. class.:* Antidepressant, serotonin-receptor norepinephrine reuptake inhibitor (SNRI)

**Do not confuse:** Pristiq/PriLOSEC

**ACTION:** May work by blocking the central presynaptic reuptake of 5-HT and NE, resulting in an increased sustained level of these neurotransmitters.

**Therapeutic outcome:** Decreased depression, increased sense of well-being and renewed interest in activities

**USES:** Major depressive disorder

**Unlabeled uses:** Vasomotor symptoms (hot flashes) associated with menopause

## CONTRAINDICATIONS
Hypersensitivity to this product or venlafaxine, MAOI therapy

**Precautions:** CNS depression, abrupt discontinuation, hypertension, hepatic/renal disease, hyponatremia, geriatric patients, pregnancy, labor and delivery, breastfeeding, angina, bleeding, cardiac dysrhythmias, MI, stroke, mania, hypovolemia, dehydration, increased intraocular pressure

**BLACK BOX WARNING:** Children, suicidal ideation

## DOSAGE AND ROUTES
### Major depressive disorder
**Adult: PO** Initially, 50 mg daily; max 400 mg/day with adjustments as needed

**Available forms:** Ext rel tabs 25, 50, 100 mg

### Renal/hepatic dose
**Adult:** PO CCr 30-50 ml/min 50 mg daily; CCr <30 ml/min or end-stage renal disease 50 mg every other day; moderate to severe hepatic disease, max 100 mg/day

## ADVERSE EFFECTS
**CNS:** *Dizziness,* drowsiness, *headache*, tremor, paresthesias, asthenia, suicidal thoughts and behaviors, seizures, chills, yawning, hot flashes, flushing, *irritability, insomnia, anxiety, abnormal dreams, fatigue*

**CV:** Palpitations, sinus tachycardia, increased blood pressure, orthostatic hypotension

**EENT:** Blurred vision, mydriasis, tinnitus, bruxism

**GI:** *Nausea,* xerostomia, *diarrhea*, constipation, vomiting, anorexia, weight loss, dysgeusia, hypercholesterolemia, hypertriglyceridemia

**GU:** Urinary retention/hesitancy, orgasm dysfunction, decreased libido, impotence, proteinuria

**HEMA:** Impaired platelet aggregation

**INTEG:** Photosensitivity, hyperhidrosis, diaphoresis

**SYST:** Serotonin syndrome, neuroleptic malignant syndrome-like symptoms, toxic epidermal necrolysis, rash, Stevens-Johnson syndrome, erythema multiforme, angioedema; neonatal abstinence syndrome (fetal exposure)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 30%; enters breast milk |
| **Metabolism** | Liver, 55% |
| **Excretion** | Urine, unchanged, 45% |
| **Half-life** | Elimination 11 hr, increased in hepatic/renal disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 7.5 hr |
| **Duration** | 24 hr |

## INTERACTIONS
### Individual drugs
Dexfenfluramine, dexmethylphenidate, dextromethorphan, fenfluramine, linezolid, lithium, nefazodone, meperidine, methylphenidate, mirtazapine, pentazocine, phentermine, promethazine, sibutramine, SUMAtriptan, traZODone, tryptophan: do not administer concurrently; increased serotonin syndrome, neuroleptic malignant syndrome-like reactions

Zolpidem: increased hallucinations, delusions, disorientation

### Drug classifications

Anticoagulants, NSAIDs, platelet inhibitors, salicylates, thrombolytics: increased bleeding risk

Alcohol, antihistamines, opioids, sedatives/hypnotics: increased CNS depression

Ergots, MAOIs, serotonin receptor agonists (almotriptan, eletriptan, frovatriptan, methylene blue IV, naratriptan, rizatriptan, SUMAtriptan, ZOLMitriptan), SSRIs, other SNRIs, TCAs, tricyclics: do not administer concurrently; increased serotonin syndrome, neuroleptic malignant syndrome-like reactions

### Drug/herb

Kava, valerian: increased desvenlafaxine action

### Drug/lab test

Increased: sodium, cholesterol, triglycerides
False positive: amphetamine, phencyclidine

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Suicidal thoughts/behaviors:** Assess mental status and mood, identify suicidal ideation

- **Serotonin syndrome, neuroleptic malignant syndrome-like symptoms:** Assess for nausea/vomiting, sedation, dizziness, diaphoresis (sweating), facial flush, hallucinations, mental status changes, myoclonia, restlessness, shivering, elevated blood pressure, hyperthermia, muscle rigidity, autonomic instability, and mental status changes; if serotonin syndrome occurs discontinue desvenlafaxine, and any other serotonergic agents
- **Serious skin reactions:** assess during treatment and after, discontinue product immediately if rash develops
- Monitor B/P baseline and periodically during treatment, lipid levels, signs of glaucoma
- Assess appetite and nutritional intake, weight loss is common, change diet as need to support weight
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, discontinue breastfeeding or product

### Patient/family education

- Teach patient to take as directed, not to double or skip doses; if a dose is missed, take as soon as remembered unless close to next dose, do not discontinue abruptly, decreased gradually

**BLACK BOX WARNING:** Advise patient to report immediately suicidal thoughts or behaviors, have family members look for symptoms of suicidal ideation

- Inform patient not to operate machinery or engage in hazardous activities until reaction ins known, may cause dizziness, drowsiness
- Teach patient to avoid all others products unless approval by prescriber
- Teach patient to report if pregnancy is planned or suspected, pregnancy, or if breastfeeding
- **Serious skin reactions:** Teach patient to report immediately allergic reactions including, rash, hives, difficulty breathing, or swelling of face, lips
- Advise patient that continuing follow-up exams will be needed
- **Serotonin syndrome, neuroleptic malignant syndrome:** Teach patient to report immediately nausea, vomiting, sedation, dizziness, sweating, facial flush

### Evaluation

**Positive therapeutic outcome**

- Decreased depression, increased sense of well-being and renewed interest in activities

## dexamethasone (Rx)

(dex-ah-meth'ah-sone)
**Dexasone**

## dexamethasone sodium phosphate (Rx)

*Func. class.:* Corticosteroid, synthetic
*Chem. class.:* Glucocorticoid, long-acting

**Do not confuse:** Decadron/Percodan

**ACTION:** Decreases inflammation by suppressing migration of polymorphonuclear leukocytes, fibroblasts, reversing increased capillary permeability and lysosomal stabilization, suppresses normal immune response, no mineralocorticoid effects

**USES:** Inflammation, allergies, neoplasms, cerebral edema, septic shock, collagen disorders, dexamethasone suppression test for Cushing syndrome, adrenocortical insufficiency, TB, meningitis, acute exacerbations of MS

## CONTRAINDICATIONS

Psychosis, hypersensitivity to corticosteroids, sulfites, or benzyl alcohol, idiopathic thrombocytopenia, acute glomerulonephritis, amebiasis, fungal infections, nonasthmatic bronchial disease, child <2 yr, AIDS, TB, glaucoma, ocular infection

**Precautions:** Pregnancy, breastfeeding, diabetes mellitus, osteoporosis, seizure disorders, ulcerative colitis, HF, myasthenia gravis, renal disease, peptic ulcer, esophagitis, recent MI, hypertension, TB, active hepatitis, psychosis, sulfite hypersensitivity, thromboembolic disorders, abrupt discontinuation, coagulopathy, ulcerative colitis, seizure disorders

## DOSAGE AND ROUTES

### Inflammatory condition/neoplasias

**Adult:** PO 0.75-9 mg/day, in divided doses q6-12hr; or phosphate IM 0.5-9 mg/day divided q6-12hr
**Child:** PO 0.024-0.34 mg/kg/day in divided doses q6-12hr

### Shock

**Adult:** **IV** (phosphate) single dose 1-6 mg/kg or **IV** 40 mg q2-6hr as needed up to 72 hr

### Airway edema/extubation

**Adult:** PO/IM/IV 0.5-2 mg/kg/day divided q6hr, use 24 hr before extubation

### Chemotherapy-induced vomiting

**Adult:** PO/IV 10-28 mg 15-30 min before chemotherapy or 10 mg q12hr on each treatment day
**Child:** IV 5-20 mg 15-30 min before chemotherapy

### Cerebral edema

**Adult:** **IV** (phosphate) 10 mg, then 4-6 mg IM q6hr × 2-4 days, then taper over 1 wk
**Child:** PO/IM/**IV** loading dose 1-2 mg/kg, then 1-1.5 mg/kg/day, max 16 mg/day divided q4-6hr for 2-4 days, then taper down qwk

### Palliative management of recurrent or inoperable brain tumors

**Adult:** IM/IV 2 mg bid-tid maintenance

### Adrenocortical insufficiency

**Adult:** PO 0.75-9 mg/day in divided doses
**Child:** PO 0.03-0.3 mg/kg/day divided in 2-4 doses

### Suppression test for Cushing's syndrome

**Adult:** PO 1 mg at 11 PM or 0.5 mg q6hr × 48 hr

**Available forms:** **Dexamethasone:** tabs 0.5, 0.75, 1, 1.5, 2, 4, 6 mg; elix 0.5 mg/5 ml; oral sol 0.5 mg/5 ml, 1 mg/ml; **sodium phosphate** 4, 10 mg/ml; ophth implant 0.7 mg; ophth susp drops/sol 0.1%

### Implementation

**PO route**

- Give with food or milk to decrease GI symptoms
- Provide assistance with ambulation in patient with bone tissue disease to prevent fractures, give once a day in AM for less toxicity, less adverse reactions

**IM route**

- IM inj deep in large muscle mass; rotate sites; avoid deltoid; use 21-G needle
- In one dose in AM to prevent adrenal suppression; avoid SUBCUT administration, may damage tissue

**Intraarticular/intralesion**

- Use rarely as injections may damage joints

**Direct IV route (sodium phosphate)**

- **IV** undiluted direct over 1 min or less
- Titrated dose; use lowest effective dose

**Intermittent IV infusion route**

- Diluted with 0.9% NaCl or $D_5W$ and give as an **IV** inf at prescribed rate

### Dexamethasone sodium phosphate

**Y-site compatibilities:** Acetaminophen, acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome, amsacrine, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, CARBOplatin, carmustine, ceFAZolin, cefepime, cefonicid, cefoTEtan, cefOXitin, cefpirome, ceftaroline, cefTAZidime, ceftizoxime, cefTRIAXone, chloramphenicol, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin liposome, dexmedetomidine, digoxin, dilTIAZem, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, eptifibatide, ertapenem, etoposide, etoposide phosphate, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, fosaprepitant, foscarnet, furosemide, ganciclovir, gatifloxacin, gemcitabine, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, liposome, LORazepam, LR, mannitol, mechlorethamine, melphalan, meropenem, metaraminol, methadone, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, milrinone, morphine, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin,

oxyCODONE, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, penicillin G potassium/sodium, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, potassium chloride, procainamide, propofol, propranolol, pyridoxine, raNITIdine, remifentanil, Ringer's, ritodrine, riTUXimab, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tolazoline, topotecan, trastuzumab, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** *Depression, flushing, sweating,* headache, mood changes, euphoria, psychosis, seizures, insomnia, pseudotumor cerebri
**CV:** *Hypertension,* circulatory collapse, thromboembolism, heart failure, dysrhythmias, tachycardia, edema, cardiomyopathy
**EENT:** Fungal infections, increased intraocular pressure, blurred vision, cataracts, glaucoma
**ENDO:** Hypothalmic-pituitary-adrenal axis suppression, hyperglycemia, sodium, fluid retention
**GI:** *Diarrhea, nausea, abdominal distention,* GI hemorrhage, *increased appetite,* pancreatitis
**HEMA:** Thrombocytopenia, transient leukocytosis, thromboembolism
**INTEG:** Acne, poor wound healing, ecchymosis, petechiae, hirsutism, angioedema
**META:** Hypokalemia
**MS:** Fractures, osteoporosis, weakness, arthralgia, myopathy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 1-2 days |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | 1 hr | 1 hr | 1 hr |
| **Peak** | 1-2 hr | 1 hr | 1 hr |
| **Duration** | 2½ days | 6 days-3 wk | Varies |

## INTERACTIONS

### Individual drugs

Alcohol, amphotericin B, cycloSPORINE, digoxin, indomethacin: increased side effects
Ambemonium, isoniazid, neostigmine, sometrem: decreased effects of each specific product
Bosentan, carBAMazepine, cholestyramine, colestipol, ePHEDrine, ethotoin, phenytoin, rifAMPin, theophylline: decreased action of dexamethasone
CycloSPORINE, tacrolimus: increased effect of each drug
Ketoconazole, NSAIDs: increased action of dexamethasone

### Drug classifications

Antacids, barbiturates: decreased action of dexamethasone
Antibiotics (macrolide), contraceptives (hormonal), estrogens, salicylates: increased action of dexamethasone
Anticholinesterases, anticoagulants, anticonvulsants, antidiabetics, salicylates, toxoids/vaccines: decreased effects of each specific product
Antidiabetics: increased effect of these products
Diuretics, NSAIDs, salicylates: increased side effects
Quinolones: increased risk of tendinitis, tendon rupture
Thiazide diuretics: decreased potassium levels/loop, amphotericin B

### Drug/lab test

Increased: cholesterol, Na, blood glucose, uric acid, Ca, urine glucose
Decreased: Ca, potassium, $T_4$, $T_3$, thyroid $^{131}I$ uptake test, urine 17-OHCS, 17-KS, PBI
False negative: skin allergy tests

## NURSING CONSIDERATIONS

### Assessment

- Monitor K, blood, urine glucose while on long-term therapy; hypokalemia and hyperglycemia
- Monitor weight daily; notify prescriber of weekly gain >5 lb
- Monitor B/P, pulse; notify prescriber of chest pain
- Monitor I&O ratio; be alert for decreasing urinary output, increasing edema
- **Epidural injections (unlabeled):** may cause rare events (vision loss, paralysis, stroke, death)
- Monitor plasma cortisol levels during long-term therapy (normal: 138-635 nmol/L when assessed at 8 AM), prolonged use can cause **cushingoid symptoms** (buffalo hump, moon face, increased B/P)
- **Assess infection:** fever, WBC even after withdrawal of medication; product masks infection
- **Assess potassium depletion:** paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness

• Assess edema, hypertension, cardiac symptoms
• Assess mental status: affect, mood, behavioral changes, aggression
• **Abrupt withdrawal:** acute adrenal insufficiency and death may occur following abrupt discontinuation of systemic therapy; withdraw gradually
• **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, discontinue breastfeeding or product

### Patient/family education
• Advise that emergency ID as corticosteroid user should be carried or worn
• Teach to notify prescriber if therapeutic response decreases; dosage adjustment may be needed
• Teach not to discontinue abruptly or adrenal crisis can result
• Teach to avoid OTC products: salicylates, alcohol in cough products, cold preparations unless directed by prescriber
• Instruct patient to contact prescriber if surgery, trauma, stress occurs, dosage may need to be adjusted
• Teach patient all aspects of product use, including cushingoid symptoms
• Instruct patient to notify prescriber of infection
• Teach patient to take with food or milk
• Teach patient that bruising may occur easily
• Teach patient that if on long-term therapy, a high-protein diet may be needed
• Teach symptoms of adrenal insufficiency: nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain
• Advise patient to avoid exposure to chickenpox or measles, persons with infections

### Evaluation
**Positive therapeutic outcome**
Decreased inflammation

## dexamethasone ophthalmic
*See Appendix B*

## dexlansoprazole (Rx)
(dex-lan-so-prey′zole)
**Dexilant**
*Func. class.:* Anti-ulcer–proton pump inhibitor
*Chem. class.:* Benzimidazole

**ACTION:** Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in gastric parietal cell; characterized as gastric acid pump inhibitor, since it blocks final step of acid production

**Therapeutic outcome:** Reduction in gastric pain, swelling, fullness

**USES:** Gastroesophageal reflux disease (GERD), severe erosive esophagitis, heartburn

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, proton-pump hypersensitivity, gastric cancer, hepatic disease, vit $B_{12}$ deficiency, colitis

## DOSAGE AND ROUTES
### Erosive esophagitis
**Adult: PO** 60 mg qd for up to 8 wk; maintenance: PO 30 mg qd for up to 6 mo

### GERD
**Adult: PO:** 30 mg qd × 4 wk

### Hepatic disease
**Adult:** PO (Child-Pugh B): max 30 mg/day

**Available forms:** Del rel caps 30, 60 mg

### Implementation
• Swallow del rel cap whole; do not break, crush, chew; caps may be opened and contents sprinkled on food, use immediately; do not chew contents of caps, give without regard to food

## ADVERSE EFFECTS
**CNS:** Headache, dizziness, confusion, agitation, amnesia, depression, anxiety, seizures, insomnia
**CV:** Chest pain, angina, bradycardia, palpitations, CVA, hypertension, MI
**EENT:** Tinnitus
**GI:** Diarrhea, abdominal pain, vomiting, nausea, constipation, flatulence, colitis, dysgeusia, pseudomembranous colitis
**HEMA:** Anemia, neutropenia, thrombocytopenia, pernicious anemia, thrombosis
**INTEG:** Rash, urticaria, pruritus
**META:** Gout
**MS:** Arthralgia, myalgia
**RESP:** Upper respiratory infections, cough, epistaxis, dyspnea
**SYST:** Anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, pneumonia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 57%-64% |
| **Distribution** | Protein binding 97% |
| **Metabolism** | Liver extensively by CYP2C19/CYP3A4; 15%-20% of Asian patients, 3%%-5% of Black and Caucasian patients are poor metabolizers |
| **Excretion** | Urine, feces; clearance decreased in geriatric, renal/hepatic disease |
| **Half-life** | Plasma 1-2 hr, 4-5 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Ampicillin, calcium carbonate, delavirdine, iron, itraconazole, ketoconazole: decreased absorption of each specific product

### Drug classifications

CYP2C19, CYP3A4 (fluvoxamine, voriconazole): increased dexlansoprazole effect

Sucralfate: delayed absorption of dexlansoprazole

### Drug/herb

Decrease: dexlansoprazole effect, St. John's wort

### Drug/lab test

Increased: LFTs, bilirubin, creatinine, glucose, lipids

Decreased: platelets, magnesium

## NURSING CONSIDERATIONS

### Assessment

- **Pseudomembranous colitis:** diarrhea, abdominal cramps, fever, report to prescriber promptly (rare)
- Anaphylaxis, serious skin disorders requiring emergency intervention (rare)
- **Hepatotoxicity:** Hepatitis, jaundice, monitor liver enzymes (AST, ALT, alkaline phosphatase) during treatment if hepatic adverse reactions occur (rare)
- **Hypomagnesemia:** Usually 3 months to 1 yr after beginning therapy; monitor magnesium level, assess for irregular heart beats, muscle spasms; in children fatigue, upset stomach, dizziness; magnesium supplement may be used
- **Pregnancy/breastfeeding:** use only if clearly needed, no well-controlled studies, discontinue breastfeeding or product, excretion unknown
- **Beers:** Avoid scheduled use >8 wk in older adults who are at high risk for erosive esophagitis, pathological hypersecretory conditions

### Patient/family education

- **Pseudomembranous colitis:** report to prescriber at once abdominal cramps, bloody diarrhea, fever
- Inform diabetic patient that hypoglycemia may occur
- Encourage patient to avoid hazardous activities; dizziness may occur
- Tell patient to avoid alcohol, salicylates, ibuprofen; may cause GI irritation
- Teach patient to report allergic reactions, symptoms of low magnesium levels
- Teach patient to notify prescriber if pregnancy is planned or suspected, not to breastfeed
- Advise patient to swallow cap whole, not to chew, crush, to report all products being used to prescriber

### Evaluation

#### Positive therapeutic outcome

- Absence of gastric pain, swelling, fullness; healing of erosive esophagitis

## dextromethorphan (OTC)

(dex-troe-meth-or'fan)

**Balminil, Buckley's Mixture, Delsym 12-Hour, ElixSure Cough, Koffex, Robafen Cough Gels, Robitussin, Robitussin Cough with Honey, Robitussin Long-Acting Cough, Scot-Tussin Diabetes CF, Triaminic Long-Acting Cough, Vicks Formula 44 Cough Relief, Wal-Tussin**

*Func. class.:* Antitussive, nonopioid

*Chem. class.:* Levorphanol derivative

**ACTION:** Depresses cough center in medulla by direct effect related to levorphanol

**Therapeutic outcome:** Absence of cough

**USES:** Nonproductive cough carried by minor respiratory tract infections or irritants that might be inhaled

## CONTRAINDICATIONS

Hypersensitivity, MAOIs, SSRIs

**Precautions:** Pregnancy, fever, hepatic disease, asthma/emphysema, chronic cough, child <4 yr, breastfeeding

## DOSAGE AND ROUTES

**Adult and child ≥12 yr:** PO 10-20 mg q4hr, or 30 mg q6-8hr, max 120 mg/day; SUS REL LIQUID 60 mg q12hr, max 120 mg/day

**Child 6-11 yr:** PO 5-10 mg q4hr; SUS REL LIQUID 30 mg bid, max 60 mg/day; LOZENGE 5-10 mg q1-4hr, max 60 mg/day

**Available forms:** Liquid 7.5, 15 mg/5 ml; syr 15 mg/15 ml, 10 mg/5 ml; 15 mg/5 ml, 30 mg/15 ml; caps 15 mg; gel caps 15 mg; EXT REL SUSP 30 mg/5 ml

### Implementation

- Give **chew tabs:** chew well; **syrup:** use calibrated measuring device; **ext rel susp:** shake well, use calibrated measuring device
- Administer decreased dosage to geriatric patients; their metabolism may be slowed; do not provide water within 30 min of administration because it dilutes product
- Shake susp before administration

## ADVERSE EFFECTS

**CNS:** *Dizziness,* sedation, confusion, ataxia, fatigue
**GI:** *Nausea*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid (PO); slow (SUS REL) |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Terminal 11 hr |

### Pharmacodynamics

| | PO | PO-sus |
|---|---|---|
| **Onset** | 15-30 min | Unknown |
| **Peak** | Unknown | Unknown |
| **Duration** | 3-6 hr | 12 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Amiodarone, quiNIDine, sibutramine: increased adverse reactions
Furazolidone, linezolid, procarbazine: increased hypotension, hyperpyrexia; do not give within 2 wk (MAOI activity)

### Drug classifications

Antihistamines, antidepressants, opiates, sedative-hypnotics: increased CNS depression
MAOIs: increased hypotension, hyperpyrexia, do not give within 2 wk of MAOIs
Serotonin receptor agonists, SSRIs: increased serotonin syndrome

## NURSING CONSIDERATIONS

### Assessment

- **Serotonin syndrome:** Assess for confusion, restlessness, nausea, vomiting, slurred speech, notify prescriber, immediately stop product
- Assess **cough**: type, frequency, character, lung sounds including sputum; provide adequate hydration to 2 L/day to decrease viscosity of secretions unless contraindicated
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, avoid use in breastfeeding

### Patient/family education

- Caution patient to avoid driving or other hazardous activities until stabilized on this medication; may cause drowsiness, dizziness in some individuals
- Advise patient to avoid smoking, smoke-filled rooms, perfumes, dust, environmental pollutants, cleaners, which increase cough; may use gum, hard candy to prevent dry mouth
- Advise patient to avoid alcohol or other CNS depressants while taking this medication; drowsiness will be increased
- Caution patient that any cough lasting over a few days should be assessed by prescriber
- Teach patient not to use if breastfeeding, or in child <4 yr

### Evaluation

**Positive therapeutic outcome**

- Absence of dry, irritating cough

**⚠ HIGH ALERT**

## diazePAM (Rx)

(dye-az'e-pam)
**Diastat, Diazemuls ✱, Valium**
*Func. class.:* Antianxiety, anticonvulsant, skeletal muscle relaxant, central acting
*Chem. class.:* Benzodiazepine, long-acting
**Controlled substance schedule IV**

**Do not confuse:** diazePAM/Ditropan/LORazepam

**ACTION:** Potentiates the actions of GABA, especially in limbic system, reticular formation; enhances presympathetic inhibition, inhibits spinal polysynaptic afferent paths

**Therapeutic outcome:** Decreased anxiety, restlessness, insomnia

**USES:** Anxiety, acute alcohol withdrawal, adjunct in seizure disorders; preoperative skeletal muscle relaxation; rectally for acute repetitive seizures

## CONTRAINDICATIONS

Pregnancy, hypersensitivity to benzodiazepines, closed angle glaucoma, coma, myasthenia gravis, ethanol intoxication, hepatic disease, sleep apnea

**Precautions:** Breastfeeding, geriatric, debilitated, addiction, child <6 mo, asthma, renal disease, bipolar disorder, COPD, CNS depression, labor, Parkinson's disease, neutropenia, psychosis, seizures, substance abuse, smoking

**BLACK BOX WARNING:** Coadministration with other CNS depressants, respiratory depression

## DOSAGE AND ROUTES

### Anxiety/convulsive disorders

**Adult:** PO 2-10 mg bid-qid; IM/**IV** 2-10 mg q3-4hr
**Geriatric:** PO 2-2.5 mg daily-bid, increase slowly as needed
**Child >6 mo:** IM/**IV** 0.04-0.3 mg/kg/dose q2-4hr, max 0.6 mg/kg in an 8-hr period

### Precardioversion

**Adult:** **IV** 5-15 mg 5-10 min precardioversion

### Preendoscopy

**Adult:** **IV** 2.5-20 mg, IM 5-10 mg ½ hr preendoscopy

### Muscle relaxation

**Adult:** PO 2-10 mg tid-qid or EXT REL 15-30 mg daily; IM/**IV** 5-10 mg repeat in 2-4 hr

### Tetanic muscle spasms

**Child >5 yr:** IM/**IV** 5-10 mg q3-4hr prn
**Infant >30 days:** IM/**IV** 1-2 mg q3-4hr prn

### Status epilepticus

**Adult:** IM/**IV** 5-10 mg, 2 mg/min, may repeat q10-15min; max 30 mg; may repeat in 2-4 hr if seizures reappear
**Child >5 yr:** **IV** 1 mg slowly; IM 1 mg q2-5min
**Child 1 mo-5 yr:** **IV** 0.2-0.5 mg slowly; IM 0.2-0.5 mg slowly q2-5min up to 5 mg; may repeat in 2-4 hr prn

### Seizures other than status epilepticus

**Adult:** RECT 0.2 mg/kg, may repeat 4-12 hr later
**Child 6-11 yr:** RECT 0.3 mg/kg, may repeat 4-12 hr later
**Child 2-5 yr:** RECT 0.5 mg/kg, may repeat 4-12 hr later

### Alcohol withdrawal

**Adult:** **IV** 10 mg initially, then 5-10 mg q3-4hr prn

**Available forms:** Tabs 2, 5, 10 mg; inj 5 mg/ml; oral sol 5 mg/5 ml; rectal 2.5 (pediatric), 10, 20 mg, twin packs; ext rel cap 15 mg; rectal gel

### Implementation

**PO route**

- Give with food or milk for GI symptoms
- Crush tab if patient is unable to swallow medication whole
- Reduce opioid dosage by one third if given concomitantly with diazePAM
- Check to see if PO medication has been swallowed
- **Oral solution:** Use calibrated dropper only; mix with water, juice, pudding, applesauce; consume immediately

**Rectal route**

- Do not use more than 5 ×/mo or for an episode q5day (Diastat)

**Direct IV route**

- Administer **IV** into large vein; do not dilute or mix with any other product; give **IV** 5 mg or less/min or total dose over 3 min or more (children, infants); cont inf is not recommended; inject closest vein insertion as possible; do not dilute or mix with other products
- Check **IV** site for thrombosis or phlebitis, which may occur rapidly
- Observe for several hours after IV, if used in combination with opioids, decrease opioid dose

**Sterile emulsion for injection route**

- Use **IV** only, within 6 hr, flush line after use and after 6 hr

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, fatigue, depression, insomnia, hallucinations, ataxia, fatigue
**CV:** *Orthostatic hypotension,* ECG changes, tachycardia, hypotension
**EENT:** *Blurred vision,* tinnitus, mydriasis, nystagmus
**GI:** Constipation, dry mouth, nausea, vomiting, anorexia, diarrhea
**HEMA:** Neutropenia
**INTEG:** Rash, dermatitis, itching
**RESP:** Respiratory depression

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid (PO); erratic (IM) |
| **Distribution** | Widely distributed; crosses blood-brain barrier, placenta; protein binding 99% |
| **Metabolism** | Liver, extensively, CYP2C19, CYP3A4 15%-20% of Asian patients and up to 5% of Caucasians and Black patients are poor metabolizers |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 1-12 days |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | ½ hr | 15 min | Immediate |
| **Peak** | Peak 2 hr | ½-1½ hr | 15 min |
| **Duration** | Up to 24 hr | 1-1½ hr | 15 min-1 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression

Amiodarone, cimetidine, clarithromycin, dalfopristin, delavirdine, dilTIAZem, disulfiram, efavirenz, erythromycin, fluconazole, fluvoxaMINE, imatinib, itraconazole, ketoconazole, IV miconazole, nefazodone, niCARdipine, quinupristin, ranolazine, troleandomycin, valproic acid, verapamil, voriconazole, zafirlukast, zileuton: increased diazePAM effect

Cimetidine, valproic acid: increased toxicity

CYP3A4 inducers (carBAMazepine, ethotoin, fosphenytoin, phenytoins, rifAMPin), smoking: decreased diazePAM effect, monitor for increased sedation

Disulfiram, isoniazid, propranolol, valproic acid: decreased metabolism of diazePAM

### Drug classifications

Barbiturates, CNS depressants, CYP3A4 inhibitors, SSRIs: increased toxicity

CNS depressants: increased CNS depression

CYP3A4 inducers (barbiturates): decreased diazePAM effect

Oral contraceptives: decreased metabolism of diazePAM

### Drug/herb

Increase: CNS depression, kava, chamomile, valerian

### Drug/lab test

Increased: AST/ALT, alk phos

## NURSING CONSIDERATIONS

### Assessment

- **Assess degree of anxiety;** what precipitates anxiety and whether product controls symptoms; other signs of anxiety: dilated pupils, inability to sleep, restlessness, inability to focus
- **Assess for alcohol withdrawal symptoms,** including hallucinations (visual, auditory), delirium, irritability, agitation, fine to coarse tremors
- Monitor B/P (with patient lying, standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
- Monitor blood studies: CBC during long-term therapy; blood dyscrasias have occurred (rarely); hepatic studies: ALT, AST

**BLACK BOX WARNING:** Avoid coadministration with other CNS depressants, do not use with opioids

- **Respiratory depression: Monitor for respiratory depression, respirations q5-15 min if given IV**
- **Monitor for seizure control:** type, duration, and intensity of seizures; what precipitates seizures
- Monitor hepatic studies: AST, ALT, bilirubin, creatinine, LDH, alkaline phosphatase
- **Assess mental status:** mood, sensorium, affect, sleeping pattern, drowsiness, dizziness, suicidal tendencies, and ability of product to control these symptoms; check for tolerance, withdrawal symptoms: headache, nausea, vomiting, muscle pain, weakness after long-term use, high dose
- Assess for muscle spasms, pain relief
- **Pregnancy/breastfeeding:** Use in pregnancy not recommended, do not breastfeed, excreted in breast milk
- **Beers:** Avoid use in older adults, may be appropriate for seizures, sleep disorders, benzodiazepine/ethanol withdrawal, severe anxiety disorders

### Patient/family education

- Advise patient that product may be taken with food; that product is not to be used for everyday stress or used longer than 4 mo unless directed by prescriber; take no more than prescribed amount; may be habit forming
- Caution patient to avoid OTC preparations unless approved by a prescriber; to avoid alcohol, other psychotropic medications unless prescribed; that smoking may decrease diazePAM effect by increasing diazePAM metabolism; not to discontinue medication abruptly after long-term use, gradually taper
- Inform patient to avoid driving, activities that require alertness; drowsiness may occur; to rise slowly or fainting may occur, especially in geriatric
- Advise patient not to become pregnant while using this product
- Inform patient that drowsiness may worsen at beginning of treatment
- Teach patient to notify prescriber if pregnancy is planned or suspected, avoid breastfeeding

### Evaluation

#### Positive therapeutic outcome

- Decreased anxiety, restlessness, insomnia

## TREATMENT OF OVERDOSE:
Lavage, VS, supportive care, flumazenil

### dibucaine topical
*See Appendix B*

### diclofenac ophthalmic
*See Appendix B*

### diclofenac epolamine (Rx)
(dye-kloe′fen-ak)
**Flector**

### diclofenac potassium (Rx)
**Cambia, Cataflam, Voltaren Rapide, Zipsor**

### diclofenac potassium (Rx)
**Apo-Diclo, Novo-Difenac, Nu-Diclo, Pennsaid, Sandoz Diclofenac, Solaraze Topical Gel, Voltram Topical Gel, Voltaren, Voltaren XR**

### diclofenac
**Zorvorex**

*Func. class.:* Nonsteroidal antiinflammatory drug (NSAID), nonopioid analgesic
*Chem. class.:* Phenylacetic acid

**Do not confuse:** Cataflam/Catapres

**ACTION:** Inhibits COX-1, COX-2 by blocking arachidonate, resulting in analgesic, antiinflammatory, antipyretic effects

**Therapeutic outcome:** Decreased pain, inflammation

**USES:** Acute, chronic rheumatoid arthritis, osteoarthritis, ankylosing spondylitis, analgesia, primary dysmenorrhea; patch: mild to moderate pain

## CONTRAINDICATIONS
Hypersensitivity to aspirin, iodides, other NSAIDs, bovine protein; asthma, serious CV disease; eczema, exfoliative dermatitis, skin abrasions (gel patch); treatment of perioperative pain in CABG surgery

**Precautions:** Breastfeeding, children, bleeding disorders, GI/cardiac disorders, hypersensitivity to other antiinflammatory agents, CCr <30 ml/min, accidental exposure, acute bronchospasm, hypersensitivity to benzyl alcohol; pregnancy patch, top sol, cap, powder for oral solution (pregnancy <30 wk, D >30 wk)

**BLACK BOX WARNING:** GI bleeding/perforation, MI, stroke

## DOSAGE AND ROUTES
### Osteoarthritis
**Adult:** PO (Cataflam) 50 mg bid-tid, max 150 mg/day; DEL REL (Voltaren) 50 mg bid-tid or 75 mg bid, max 150 mg/day; EXT REL (Voltaren-XR) 100 mg daily, max 150 mg/day; TOP gel 1% (Voltaren gel) 4 g for each lower extremity qid, max 16 g/day; 2 g for each upper extremity qid, max 8 g/day; TOP SOL (Pennsaid) apply 40 drops to each affected knee qid, apply 10 drops at a time, spread over entire knee

### Rheumatoid arthritis
**Adult:** PO (Cataflam) 50 mg tid-qid, max 200 mg/day; DEL REL (Voltaren) 50 mg tid-qid or 75 mg bid, max 200 mg/day; EXT REL (Voltaren-XR) 100 mg qd, may increase to 200 mg/day, max 200 mg/day

### Ankylosing spondylitis
**Adult:** PO DEL REL (Voltaren) 25 mg qid and 25 mg at bedtime, max 125 mg/day

### Acute migraine with/without aura
**Adult:** PO (powder for oral SOL) (Cambia) 50 mg as a single dose; mix contents of packet in 1-2 oz water

### Mild to moderate pain
**Adult:** PO (Zipsor) 25 mg qid

### Dysmenorrhea or nonrheumatic inflammatory conditions
**Adult:** PO (Cataflam) 50 mg tid or 100 mg initially, then 50 mg tid, max 200 mg 1st day, then 150 mg/day, immediate release only

### Pain of strains/sprains
**Adult:** TOP patch (Flector) apply patch to area bid

### Actinic keratosis
**Adult:** TOP gel (Solaraze) apply to area bid

### Hepatic dose
**Adult:** PO use lower dose

### Renal dose
Avoid use of top gel, patch, sol, potassium oral tab in advanced renal disease

**Available forms: Epolamine:** topical patch 1.3%; **potassium:** tabs 50 mg tabs, liquid filled 25 mg; **sodium:** del rel tabs (enteric-coated) 25, 50, 75, 100 mg; oral powder for sol 50 mg; topical gel 1%, 3%

### Implementation
**PO route**
- Do not break, crush, chew, or dissolve enteric-coated or ext rel tabs
- Administer with food or milk to decrease gastric symptoms

• Remain upright for ½ hr
• Store at room temperature

**Powder:**
• Mix powder in 30-60 ml water only, mix solution, have patient drink immediately

**Powder:**
• Powder (Cambia and Zorvolex) may be less effective if taken with food

**Powder:**
• Zorvolex capsules aren't interchangeable with other formulations or oral product

**Topical route (patch) (Flector)**
• Wash hands before handling patch
• Remove and release liner before administering
• Use only on normal, intact skin
• Remove before bath, shower, swimming, do not use heat or occlusive dressings
• Discard removed patch in trash away from children, pets
• Store at room temperature

**Topical route (gel)**
• Apply to intact skin, do not use heat or occlusive dressings
• Use only for osteoarthritis: mild-moderate pain
• Store at room temperature, avoid heat, do not freeze

**Ophthalmic route**
• Administer with patient recumbent or tilting head back; pull down on lower lid; when conjunctival sac is exposed, instill 1 drop; wait a few minutes before instilling other drops

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache,* drowsiness, fatigue, tremors, confusion, insomnia, anxiety, depression, nervousness, paresthesia, muscle weakness

**CV:** HF, tachycardia, peripheral edema, palpitations, dysrhythmias, hypo/hypertension, fluid retention, MI, stroke

**EENT:** Tinnitus, hearing loss, blurred vision, laryngeal edema

**GI:** Nausea, anorexia, vomiting, diarrhea, jaundice, cholestatic hepatitis, constipation, flatulence, cramps, dry mouth, peptic ulcer, GI bleeding, hepatotoxicity, hematemesis

**GU:** Nephrotoxicity: dysuria, hematuria, oliguria, azotemia, cystitis, UTI

**HEMA:** Blood dyscrasias, epistaxis, anemia

**INTEG:** Purpura, rash, pruritus, sweating, erythema, petechiae, photosensitivity, alopecia

**META:** Hyperglycemia, hypoglycemia

**RESP:** Dyspnea, bronchospasm

**SYST:** Anaphylaxis, Stevens-Johnson syndrome, exfoliative dermatitis, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, ophth) |
| **Distribution** | Crosses placenta; 99% bound to plasma proteins |
| **Metabolism** | Liver (50%) |
| **Excretion** | Breast milk |
| **Half-life** | 1-2 hr, patch 12 hr |

### Pharmacodynamics

| | PO | Ophth | TOP (Patch) |
|---|---|---|---|
| **Onset** | Unknown | Unknown | Unknown |
| **Peak** | 2-3 hr | Unknown | 12 hr |
| **Duration** | Unknown | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Aspirin: increased GI side effects
Cidofovir, cycloSPORINE, digoxin, lithium, methotrexate, phenytoin: increased toxicity

### Drug classifications

ACE inhibitors, β-blockers, diuretics: decreased antihypertensive effect
Anticoagulants, NSAIDs, platelet inhibitors, salicylates, SSRIs, thrombolytics: increased risk of bleeding
Antidiabetic agents: increased need for dosage adjustment
Diuretics: decreased effect of these products
Diuretics (potassium-sparing): hyperkalemia
NSAIDs, bisphosphonates, corticosteroids: increased GI side effects

### Drug/herb

Garlic, ginger, ginkgo: monitor for bleeding; increased bleeding risk

## NURSING CONSIDERATIONS

### Assessment

• **CABG:** do not use oral, top, gel, patch in perioperative pain in CABG surgery for 10-14 days

**BLACK BOX WARNING: Stroke/MI:** may increase HF and hypertension, increased CV thrombotic events that may be fatal; those with CV disease may be at greater risk

• **Assess for pain of rheumatoid arthritis, osteoarthritis, ankylosing spondylitis;** check ROM, inflammation of joints, characteristics of pain
• Assess ophthalmic patients for pain, inflammation, redness, swelling
• Assess for asthma, aspirin hypersensitivity, nasal polyps; may develop hypersensitivity
• Monitor liver function tests (may be elevated) and uric acid (may be decreased in serum,

increased in urine) periodically; also BUN, creatinine, electrolytes (may be elevated)
- **Serious skin disorders/anaphylaxis:** Assess for rash, if rash develops discontinue immediately, may be fatal
- **Monitor for blood dyscrasias (thrombocytopenia):** bruising, fatigue, bleeding, poor healing; monitor blood counts during therapy; watch for decreasing platelets; if low, therapy may need to be discontinued, restarted after hematologic recovery; stool guaiac
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risks <30 wk, do not use >30 wk, discontinue breastfeeding or product, excreted in breast milk
- **Stroke/MI:** Teach patient to notify prescriber immediately, seek medical attention if chest pain, slurred speech, weakness, shortness of breath occur

### Patient/family education
- Teach patient that product must be continued for prescribed time to be effective; to avoid aspirin, NSAIDs, acetaminophen, or other OTC medications unless approved by prescriber, alcoholic beverages; to contact prescriber before surgery regarding when to discontinue this product
- Teach patient to notify prescriber immediately, stop product if rash occurs
- Caution patient to report bleeding, bruising, fatigue, malaise, since blood dyscrasias do occur
- **Advise patient to report hepatotoxicity:** flulike symptoms, nausea, vomiting, jaundice, pruritus, lethargy
- Instruct patient to use sunscreen to prevent photosensitivity
- Instruct patient to use caution when driving; drowsiness, dizziness may occur
- Teach patient to take with a full glass of water to enhance absorption; remain upright for ½ hr; if dose is missed, take as soon as remembered within 2 hr if taking 1-2 ×/day; do not double doses
- **Gel:** Use dosing card to measure, do not apply where cosmetics, sunscreen have been applied
- **Transdermal:** Not to use in water (swimming/bathing), only use on intact skin, do not cover with occlusive dressing, if peeling occurs, apply adhesive tape or mesh sleeve
- Advise to notify all providers that product is being used
- Teach patient to notify prescriber if pregnancy is planned or suspected
- **Beers:** Avoid chronic use in older adults unless other alternatives are not effective, increased risk of GI bleeding

### Evaluation
**Positive therapeutic outcome**
- Decreased pain in arthritic conditions
- Decreased inflammation in arthritic conditions
- Decreased ocular irritation

D

## RARELY USED

## dicyclomine
(dye-sye'kloe-meen)
**Bentyl, Bentylol, Formulex, Lomine**
*Func. class.:* Gastrointestinal anticholinergic, antispasmodic

**USES:** IBS

**CONTRAINDICATIONS**
Hypersensitivity to anticholinergics, closed-angle glaucoma, GI obstructions, myasthenia gravis, paralytic ileus, GI atony, toxic megacolon, dementia

**DOSAGE AND ROUTES**
**Adult: PO** 10-20 mg tid-qid; **IM** 10-20 mg q4-6hr, 1-2 days **max 160/day**
**Child >2 yr: PO** 10 mg tid-qid
**Child 6 mo-2 yr: PO** 5 mg tid-qid

## didanosine (Rx)
(dye-dan'oh-seen)
**ddI, Pediatric Videx, Videx EC**
*Func. class.:* Antiretroviral
*Chem. class.:* Synthetic purine nucleoside reverse transcriptase inhibitor (NRTI)

**ACTION:** Nucleoside analog incorporating into cellular DNA by viral reverse transcriptase, thereby terminating the cellular DNA chain and preventing viral replication

**Therapeutic outcome:** Antiviral against the retroviruses, primarily HIV-1

**USES:** HIV-1 infection in combination with at least 2 other antiretrovirals

**CONTRAINDICATIONS**
Hypersensitivity, lactic acidosis, pancreatitis, phenylketonuria

**Precautions:** Pregnancy, breastfeeding, children, renal disease, sodium-restricted diets, elevated amylase, preexistent peripheral neuropathy, hyperuricemia, gout, HF, noncirrhotic portal hypertension

**BLACK BOX WARNING:** Hepatic disease, lactic acidosis, pancreatitis

## DOSAGE AND ROUTES

### Ext rel cap

**Adult/adolescent/child ≥6 yr and ≥60 kg:** PO ext rel cap 400 mg daily; if used with tenofovir, reduce to 250 mg daily

**Adult/adolescent/child ≥6 yr and 25 kg to <60 kg:** PO ext rel cap 250 mg daily; if used with tenofovir, reduce to 200 mg daily

**Adolescent 20 kg to <25 kg:** PO ext rel cap 200 mg daily

### Oral dosage (powder for oral solution)

**Adult ≥60 kg:** PO 200 mg bid or 400 mg daily; if used with tenofovir, reduce to 250 mg daily

**Adult <60 kg:** PO 125 mg bid or 250 mg daily; if used with tenofovir, reduce to 200 mg daily

**Adolescent/child/infant >8 mo:** PO 120 mg/m$^2$ q12hr, max adult dosing

**Infant ≤8 mo/neonate ≥2 wk:** PO 100 mg/m$^2$ q12hr for up to 3 months

### Renal dose

**Adult:** PO CrCl ≥60 ml/min: no change

**Adult/adolescent ≥60 kg:** PO CCr 30-59 ml/min: reduce oral solution to 100 mg q12hr or 200 mg q24hr, reduce ext rel capsules to 200 mg daily; CCr 10-29 ml/min: reduce oral solution to 150 mg q24hr, reduce ext rel capsules to 125 mg q24hr; CCr <10 ml/min: reduce oral solution to 100 mg q24hr, reduce ext rel capsules to 125 mg q24hr

**Adult/adolescent <60 kg:** PO CCr 30-59 ml/min: reduce oral solution to 75 mg q12hr or to 150 mg q24hr, reduce ext rel capsules to 125 mg daily; CCr 10-29 ml/min: reduce oral solution to 100 mg q24hr, reduce ext rel capsules to 125 mg daily; CCr <10 ml/min: reduce oral solution to 75 mg q24hr, ext rel capsules are not recommended

### Intermittent hemodialysis/continuous ambulatory peritoneal dialysis

≥60 kg, give 100 mg oral solution or 125 mg ext rel capsules q24hr; <60 kg, give 75 mg oral solution q24hr, ext rel capsules are not recommended

**Available forms:** Powder for oral sol 10 mg/ml; del rel caps 125, 200, 250, 400 mg

### Implementation

- Give on empty stomach 1 hr before or 2 hr after meals q12hr; food decreases effectiveness of product; adjust dose in renal impairment
- Pediatric powder for oral sol should be prepared in the pharmacy; shake before using
- Packets for oral sol must be mixed with ½ glass of water, not fruit juice; stir until dissolved; drink immediately
- Store caps, tabs in tightly closed bottle at room temperature; store oral sol after dissolving at room temperature ≤4 hr
- Do not take dapsone at same time as ddl

## ADVERSE EFFECTS

**CNS:** Peripheral neuropathy, seizures, confusion, *anxiety,* hypertonia, abnormal thinking, asthenia, *insomnia, CNS depression,* pain, dizziness, chills, fever

**CV:** Hypertension, vasodilatation, dysrhythmia, syncope, HF, palpitations

**EENT:** Ear pain, otitis, photophobia, visual impairment, retinal depigmentation, optic neuritis

**GI:** Pancreatitis, *diarrhea, nausea,* vomiting, *abdominal pain,* constipation, stomatitis, dyspepsia, liver abnormalities, flatulence, taste perversion, dry mouth, oral thrush, melena, increased ALT, AST, alkaline phosphatase, amylase, hepatic failure, noncirrhotic portal hypertension

**GU:** Increased bilirubin, uric acid

**HEMA:** Leukopenia, granulocytopenia, thrombocytopenia, anemia

**INTEG:** *Rash, pruritus,* alopecia, ecchymosis, hemorrhage, petechiae, sweating

**MS:** Myalgia, arthritis, myopathy, muscular atrophy

**RESP:** Cough, pneumonia, dyspnea, asthma, epistaxis, hypoventilation, sinusitis

**SYST:** Lactic acidosis, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed (up to 40%) |
| **Distribution** | Unknown |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys (55%), feces |
| **Half-life** | 48 min, shorter in children |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Up to 1 hr, del rel 2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Allopurinol, tenofovir

**BLACK BOX WARNING:** Increase: fatal lactic acidosis: stavudine, tenofovir, other antiretrovirals, do not use together

Dapsone, ketoconazole: decreased absorption of each specific product

Gatifloxacin, gemifloxacin, grepafloxacin, levofloxacin, lomefloxacin, moxifloxacin, norfloxacin, sparfloxacin, trovafloxacin: Do not use didanosine with these products (PO)
Itraconazole: decreased concentrations
Methadone: decreased didanosine level
Stavudine: increased pancreatitis risk

### Drug classifications

Aluminum, antacids, magnesium: increased side effects
Antiretrovirals, other: decreased concentration
Fluoroquinolones, tetracyclines: decreased concentrations of each specific product

### Drug/food

Do not use with acidic juices
Decreased: absorption 50%, do not use with food

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Pancreatitis:** do not use in those with symptoms of pancreatitis (may be dose-related) or advanced HIV, alcoholism, history of pancreatitis

- **Assess for peripheral neuropathy:** tingling or pain in hands and feet, distal numbness; onset usually occurs 2-6 mo after beginning treatment; if these occur during therapy, product may be decreased or discontinued

**BLACK BOX WARNING: Assess for pancreatitis:** abdominal pain, nausea, vomiting, elevated liver enzymes; product should be discontinued since condition can be fatal

- Assess children by dilated retinal examination q6mo to rule out retinal depigmentation
- Monitor CBC, differential, platelet count monthly, viral load, $CD4^+$ count; notify prescriber of results
- Monitor renal function studies: BUN, serum uric acid, urine CCr before, during therapy; these may be elevated throughout treatment

**BLACK BOX WARNING: Lactic acidosis, severe hepatomegaly, pancreatitis:** assess for abdominal pain, nausea, vomiting, elevated hepatic enzymes; product should be discontinued because condition can be fatal

- Monitor temp; may indicate beginning of infection
- Monitor liver function tests before, during therapy (bilirubin, AST, ALT, amylase, alkaline phosphatase) as needed or monthly
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, product is not recommended in initial treatment due to toxicity, do not breastfeed, enroll in the Antiretroviral Pregnancy Registry 800-258-4263

### Patient/family education

- Advise patient to take on empty stomach, 30 min before or 2 hr after eating; not to mix powder with fruit juice; to drink powder immediately after mixing; to use exactly as prescribed
- Instruct patient to report signs of **infection:** increased temp, sore throat, flulike symptoms; to avoid crowds and those with known infections
- Instruct patient to report signs of **anemia:** fatigue, headache, faintness, shortness of breath, irritability
- Advise patient to report numbness/tingling in extremities
- Instruct patient to report **bleeding;** avoid use of razors and commercial mouthwash
- Advise patient that hair may be lost during therapy; a wig or hairpiece may make patient feel better
- Caution patient to avoid OTC products and other medications without approval of prescriber; to avoid alcohol

**BLACK BOX WARNING: Pancreatitis:** Teach patient to report immediately abdominal pain, diarrhea, nausea, vomiting

- That product does not cure symptoms, only controls them, that infection of others may occur via sex or blood
- Teach patient not to have any sexual contact without use of a condom; needles should not be shared; blood from infected individual should not come in contact with another's mucous membranes
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, product is not recommended in initial treatment due to toxicity, do not breastfeed, enroll if pregnant in the Antiretroviral Pregnancy Registry (800-258-4263)

### Evaluation

#### Positive therapeutic outcome

- Absence of opportunistic infection, symptoms of HIV

## difenoxin with atropine

*See diphenoxylate with atropine*

**⚠ HIGH ALERT**

## digoxin (Rx) NTI

(di-jox′in)

**Digitek, Toloxin**

*Func. class.:* Inotropic antidysrhythmic, cardiac glycoside

*Chem. class.:* Digitalis preparation

**Do not confuse:** Lanoxin/Lasix/Lonox/Lomotil/Xanax/Levoxine

**ACTION:** Inhibits sodium-potassium ATPase, which makes more calcium available for contractile proteins, resulting in increased cardiac output; increases force of contraction (positive inotropic effect); decreases heart rate (negative chronotropic effect); decreases AV conduction speed

**Therapeutic outcome:** Decreased edema, pulse, respiration, crackles

**USES:** Atrial fibrillation

## CONTRAINDICATIONS

Hypersensitivity to digoxin, ventricular fibrillation, ventricular tachycardia, carotid sinus syndrome, 2nd- or 3rd-degree heart block

**Precautions:** Pregnancy, breastfeeding, geriatric, renal disease, acute MI, AV block, severe respiratory disease, hypothyroidism, sinus nodal disease, hypokalemia, electrolyte disturbances, hypertension, cor pulmonale, Wolff-Parkinson-White syndrome

## DOSAGE AND ROUTES

### Loading dose: IV

**Adult: IV** 400-600 mcg as a single dose, effect in 5-30 min, max effect 1-4 hr, give subsequent doses of 100-300 mcg q6-8hr

**Adolescent/child >10 yr: IV** 8-12 mcg/kg, divided into 3 or more doses, with the first dose equaling approximately half of the total, give subsequent doses q4-8hr

**Child 5-10 yr: IV** 15-30 mcg/kg divided into 3 or more doses, with the first dose equaling approximately half of the total, give subsequent doses q4-8hr

**Child 2-4 yr: IV** 25-35 mcg/kg, divided into 3 or more doses, with the first dose equaling approximately half of the total, give subsequent doses q4-8hr

**Child <2 yr/infant: IV** 30-50 mcg/kg, divided into 3 or more doses, with the first dose equaling approximately half of the total, give subsequent doses q4-8hr

**Full-term neonate: IV** 20-30 mcg/kg, divided into 3 or more doses, with the first dose equaling approximately half of the total, give subsequent doses q4-8hr

**Premature neonate: IV** 15-25 mcg/kg, divided into 3 or more doses, with the first dose equaling approximately half of the total, give subsequent doses q4-8hr

### Loading dose: oral dosage (tablets)

Tablets are 60%-80% bioavailable; oral elixir should be used to obtain the appropriate dose in infants, young pediatric patients, or patients with very low body weight

**Adult/adolescent/child >10 yr:** PO Total dose of 10-15 mcg/kg, in 3 divided doses, give half of the total loading dose initially, then one-fourth the loading dose q4-8hr × 2 doses

**Child 5-10 yr:** PO Total dose of 20-45 mcg/kg, in 3 divided doses, give half of the total loading dose initially, then one fourth of the loading dose q4-8hr × 2 doses

### Loading dose: oral dosage (elixir)

Elixir is approximately 70%-85% bioavailable

**Adult/adolescent/child >10 yr:** PO Total dose of 10-15 mcg/kg, give half of the total loading dose initially, then additional fractions of the planned total dose at 4-8 hr

**Child 5-10 yr:** PO Total dose of 20-35 mcg/kg, give half of the total loading dose initially, then additional fractions of the planned total dose at 4-8 hr

**Child 2-4 yr:** PO Total dose of 30-45 mcg/kg, give half of the total loading dose initially, then additional fractions of the planned total dose at 4-8 hr

**Infant/child <2 yr:** PO Total dose of 35-60 mcg/kg, give half of the total loading dose initially then additional fractions of the planned total dose at 4-8 hr

**Full-term neonate:** PO Total dose of 25-35 mcg/kg, give half of the total loading dose initially, then additional fractions of the planned total dose at 4-8 hr

**Premature neonate:** PO Total dose of 20-30 mcg/kg, give half of the total loading dose initially, then additional fractions of the planned total dose at 4-8 hr

### Maintenance dose: IV

**Adult:** IV 125-350 mcg/day, depending on CrCl, daily; usual daily maintenance dose for the HF in adult based on corrected CrCl (ml/min per 70 kg) and lean body weight (LBW) are listed below

- LBW 50-59 kg
  CrCl ≥100 ml/min: 175 mcg IV daily
  CrCl 70-99 ml/min: 150 mcg IV daily
  CrCl 60-69 ml/min: 125 mcg IV daily

- LBW 60-69 kg
  CrCl ≥90 ml/min: 200 mcg IV daily
  CrCl 70-89 ml/min: 175 mcg IV daily
  CrCl 60-69 ml/min: 150 mcg IV daily
- LBW 70-79 kg
  CrCl ≥100 ml/min: 250 mcg IV daily
  CrCl 90-99 ml/min: 225 mcg IV daily
  CrCl 70-89 ml/min: 200 mcg IV daily
  CrCl 60-69 ml/min: 175 mcg IV daily
- LBW 80-89 kg
  CrCl ≥100 ml/min: 275 mcg IV daily
  CrCl 80-99 ml/min: 250 mcg IV daily
  CrCl 70-79 ml/min: 225 mcg IV daily
  CrCl 60-69 ml/min: 200 mcg IV daily
- LBW 90-99 kg
  CrCl ≥90 ml/min: 300 mcg IV daily
  CrCl 80-89 ml/min: 275 mcg IV daily
  CrCl 70-79 ml/min: 250 mcg IV daily
  CrCl 60-69 ml/min: 225 mcg IV daily
- LBW ≥100 kg
  CrCl ≥100 ml/min: 350 mcg IV daily
  CrCl 90-99 ml/min: 325 mcg IV daily
  CrCl 80-89 ml/min: 300 mcg IV daily
  CrCl 70-79 ml/min: 275 mcg IV daily
  CrCl 60-69 ml/min: 250 mcg IV daily

**Full-term neonate to child >10 yr:** 25%-35% of the IV digitalizing dose IV daily

**Preterm neonate:** 20%-30% of the IV digitalizing dose in 2 daily doses

### Maintenance dose: oral dosage (tablets)

**Adult/adolescent/child >10 yr:** PO 3.4-5.1 mcg/kg/day

- LBW 40-49 kg
  CrCl ≥70 ml/min: 187.5 mcg PO daily
  CrCl ≥60-69 ml/min: 125 mcg PO daily
- LBW 50-59 kg
  CrCl ≥90 ml/min: 250 mcg PO daily
  CrCl 60-89 ml/min: 187.5 mcg PO daily
- LBW 60-69 kg
  CrCl ≥100 ml/min: 312.5 mcg PO daily
  CrCl 60-99 ml/min: 250 mcg PO daily
- LBW 70-79 kg
  CrCl ≥80 ml/min: 312.5 mcg PO daily
  CrCl 60-79 ml/min: 250 mcg PO daily
- LBW 80-89 kg
  CrCl ≥90 ml/min: 375 mcg PO daily
  CrCl 60-89 ml/min: 312.5 mcg PO daily
- LBW 90-99 kg
  CrCl ≥90 ml/min: 437.5 mcg PO daily
  CrCl 70-89 ml/min: 375 mcg PO daily
  CrCl 60-69 ml/min: 312.5 mcg PO daily
- LBW ≥100 kg
  CrCl ≥100 ml/min: 500 mcg PO daily
  CrCl 80-99 ml/min: 437.5 mcg PO daily
  CrCl 60-79 ml/min: 375 mcg PO daily

**Child 5-10 yr:** PO 6.4-12.9 mcg/kg/day PO in 2 divided doses is the recommended starting maintenance dose

### Maintenance dose: oral dosage (elixir)

**Adult/adolescent/child >10 yr:** PO 3-4.5 mcg/kg/day daily

- LBW 40-49 kg
  CrCl ≥100 ml/min: 170 mcg PO daily
  CrCl 90-99 ml/min: 160 mcg PO daily
  CrCl 80-89 ml/min: 150 mcg PO daily
  CrCl 70-79 ml/min: 140 mcg PO daily
  CrCl 60-69 ml/min: 130 mcg PO daily
- LBW 50-59 kg
  CrCl ≥100 ml/min: 213 mcg PO daily
  CrCl 90-99 ml/min: 200 mcg PO daily
  CrCl 80-89 ml/min: 188 mcg PO daily
  CrCl 70-79 ml/min: 175 mcg PO daily
  CrCl 60-69 ml/min: 163 mcg PO daily
- LBW 60-69 kg
  CrCl ≥100 ml/min: 255 mcg PO daily
  CrCl 90-99 ml/min: 240 mcg PO daily
  CrCl 80-89 ml/min: 225 mcg PO daily
  CrCl 70-79 ml/min: 210 mcg PO daily
  CrCl 60-69 ml/min: 195 mcg PO daily
- LBW 70-79 kg
  CrCl ≥100 ml/min: 298 mcg PO daily
  CrCl 90-99 ml/min: 280 mcg PO daily
  CrCl 80-89 ml/min: 263 mcg PO daily
  CrCl 70-79 ml/min: 245 mcg PO daily
  CrCl 60-69 ml/min: 228 mcg PO daily
- LBW 80-89 kg
  CrCl ≥100 ml/min: 340 mcg PO daily
  CrCl 90-99 ml/min: 320 mcg PO daily
  CrCl 80-89 ml/min: 300 mcg PO daily
  CrCl 70-79 ml/min: 280 mcg PO daily
  CrCl 60-69 ml/min: 260 mcg PO daily
- LBW 90-99 kg
  CrCl ≥100 ml/min: 383 mcg PO daily
  CrCl 90-99 ml/min: 360 mcg PO daily
  CrCl 80-89 ml/min: 338 mcg PO daily
  CrCl 70-79 ml/min: 315 mcg PO daily
  CrCl 60-69 ml/min: 293 mcg PO daily
- LBW ≥100 kg
  CrCl ≥100 ml/min: 425 mcg PO daily
  CrCl 90-99 ml/min: 400 mcg PO daily
  CrCl 80-89 ml/min: 375 mcg PO daily
  CrCl 70-79 ml/min: 350 mcg PO daily
  CrCl 60-69 ml/min: 325 mcg PO daily

**Child 5-10 yr:** PO 5.6-11.3 mcg/kg/day in 2 divided doses

**Child 2-4 yr:** PO 9.4-13.1 mcg/kg/day in 2 divided doses

**Child <2 yr/infant:** PO 11.3-18.8 mcg/kg/day in 2 divided doses

**Full-term neonate:** PO 7.5-11.3 mcg/kg/day in 2 divided doses

**Preterm neonate:** PO 4.7-7.8 mcg/kg/day in 2 divided doses

## Renal dose

### IV route

- CrCl 50-59 ml/min
  LBW 50-59 kg: 125 mcg IV once daily
  LBW 60-69 kg: 150 mcg IV once daily
  LBW 70-79 kg: 175 mcg IV once daily
  LBW 80-89 kg: 200 mcg IV once daily
  LBW 90-99 kg: 225 mcg IV once daily
  LBW ≥100 kg: 250 mcg IV once daily
- CrCl 40-49 ml/min
  LBW 50-59 kg: 100 mcg IV once daily
  LBW 60-69 kg: 125 mcg IV once daily
  LBW 70-79 kg: 150 mcg IV once daily
  LBW 80-89 kg: 175 mcg IV once daily
  LBW 90-99 kg: 200 mcg IV once daily
  LBW ≥100 kg: 225 mcg IV once daily
- CrCl 30-39 ml/min
  LBW 50-59 kg: 100 mcg IV once daily
  LBW 60-69 kg: 125 mcg IV once daily
  LBW 70-89 kg: 150 mcg IV once daily
  LBW 90-99 kg: 175 mcg IV once daily
  LBW ≥100 kg: 200 mcg IV once daily
- CrCl 20-29 ml/min
  LBW 50-69 kg: 100 mcg IV once daily
  LBW 70-79 kg: 125 mcg IV once daily
  LBW 80-99 kg: 150 mcg IV once daily
  LBW ≥100 kg: 175 mcg IV once daily
- CrCl 10-19 ml/min
  LBW 50-59 kg: 75 mcg IV once daily
  LBW 60-79 kg: 100 mcg IV once daily
  LBW 80-89 kg: 125 mcg IV once daily
  LBW ≥90 kg: 150 mcg IV once daily
- CrCl <10 ml/min
  LBW 50-69 kg: 75 mcg IV once daily
  LBW 70-89 kg: 100 mcg IV once daily
  LBW 90-99 kg: 125 mcg IV once daily
  LBW ≥100 kg: 150 mcg IV once daily

## Oral dosage (tablets)

- CrCl 40-59 ml/min
  LBW 50-69 kg: 187.5 mcg PO once daily
- CrCl 50-59 ml/min
  LBW 70-89 kg: 250 mcg PO once daily
  LBW ≥90 kg: 312.5 mcg PO once daily
- CrCl 30-39 ml/min
  LBW 50-59 kg: 125 mcg PO once daily
  LBW 60-79 kg: 187.5 mcg PO once daily
  LBW 80-99 kg: 250 mcg PO once daily
  LBW ≥100 kg: 312.5 mcg PO once daily
- CrCl 20-29 ml/min
  LBW 50-69 kg: 125 mcg PO once daily
  LBW 70-89 kg: 187.5 mcg PO once daily
  LBW ≥90 kg: 250 mcg PO once daily
- CrCl <20 ml/min
  LBW 50-69 kg: 125 mcg PO once daily
  LBW 70-99 kg: 187.5 mcg PO once daily
  LBW ≥100 kg: 250 mcg PO once daily

## Oral dosage (elixir)

- CrCl 50-59 ml/min
  LBW 50-59 kg: 150 mcg PO once daily
  LBW 60-69 kg: 180 mcg PO once daily
  LBW 70-79 kg: 210 mcg PO once daily
  LBW 80-89 kg: 240 mcg PO once daily
  LBW 90-99 kg: 270 mcg PO once daily
  LBW ≥100 kg: 300 mcg PO once daily
- CrCl 40-49 ml/min
  LBW 50-59 kg: 138 mcg PO once daily
  LBW 60-69 kg: 165 mcg PO once daily
  LBW 70-79 kg: 193 mcg PO once daily
  LBW 80-89 kg: 220 mcg PO once daily
  LBW 90-99 kg: 248 mcg PO once daily
  LBW ≥100 kg: 275 mcg PO once daily
- CrCl 30-39 ml/min
  LBW 50-59 kg: 125 mcg PO once daily
  LBW 60-69 kg: 150 mcg PO once daily
  LBW 70-79 kg: 175 mcg PO once daily
  LBW 80-89 kg: 200 mcg PO once daily
  LBW 90-99 kg: 225 mcg PO once daily
  LBW ≥100 kg: 250 mcg PO once daily
- CrCl 20-29 ml/min
  LBW 50-59 kg: 113 mcg PO once daily
  LBW 60-69 kg: 135 mcg PO once daily
  LBW 70-79 kg: 158 mcg PO once daily
  LBW 80-89 kg: 180 mcg PO once daily
  LBW 90-99 kg: 203 mcg PO once daily
  LBW ≥100 kg: 225 mcg PO once daily
- CrCl <20 ml/min
  LBW 50-59 kg: 100 mcg PO once daily
  LBW 60-69 kg: 120 mcg PO once daily
  LBW 70-79 kg: 140 mcg PO once daily
  LBW 80-89 kg: 160 mcg PO once daily
  LBW 90-99 kg: 180 mcg PO once daily
  LBW ≥100 kg: 200 mcg PO once daily

The daily maintenance dose can also be estimated using the patient's CrCl and loading dose (LD) according to the method of Jelliffe and Brooker daily % loss = 14 + CrCl/5

**Available forms:** Caps 0.05, 0.1, 0.2 mg; elix 0.05 mg/ml; tabs 0.125, 0.25, 0.5, 0.0625, 0.1875 mg; inj 0.5 ✱, 0.25 mg/ml; pediatric inj 0.1 mg/ml

## Implementation

- Do not give at same time as antacids or other products that decrease absorption

**PO route**

- Bioavailability varies between different oral dosage forms of digoxin and between different brands of the same dosage form. Changing from one preparation to another may require dosage adjustments.
- All dosage forms may be administered without regard to meals.

• Tab may be crushed and administered with food or fluids
• Pediatric elixir should be administered using a calibrated measuring device

**Injectable routes**
• When changing from PO to IM/IV use 20%-25% less
• IV is preferred over IM, as it is less painful
• PO should replace parenteral therapy as soon as possible
• Visually inspect parenteral products for particulate matter and discoloration prior to use

**IV route**
• Monitor ECG during and for 6 hr after IV use, watch for dysrhythmias, or bradycardia, notify prescriber
• May be given undiluted or each 1 ml may be diluted in 4 ml of sterile water for injection, NS, $D_5W$, or LR; diluent volumes less than 4 ml will cause precipitation; use diluted solutions immediately
• Inject over at least 5 min via Y-site or 3-way stopcock; in patients with pulmonary edema, administer over 10-15 min to avoid inadvertent overdosage, do not flush the syringe following administration
• Check for potency and site for redness, inflammation, infiltration, tissue sloughing can occur

**IM route**
• Do not administer more than 2 ml at any one IM injection site
• Inject deeply into gluteal muscle, then massage area

**Y-site compatibilities:** Amrinone, ciprofloxacin, cisatracurium, dilTIAZem, famotidine, meperidine, meropenem, midazolam, milrinone, morphine, potassium chloride, propofol, remifentanil, tacrolimus, vit B/C

**Y-site incompatibilities:** Fluconazole, foscarnet

**Additive compatibilities:** Bretylium, cimetidine, furosemide, lidocaine, raNITIdine, verapamil

**Additive incompatibility:** DOBUTamine

## ADVERSE EFFECTS

**CNS:** *Headache,* drowsiness, apathy, confusion, disorientation, fatigue, depression, hallucinations

**CV:** Dysrhythmias, hypotension, bradycardia, AV block

**EENT:** Blurred vision, yellow-green halos, photophobia, diplopia

**GI:** Nausea, vomiting, anorexia, abdominal pain, diarrhea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Widely distributed; 20%-25% protein bound |
| **Metabolism** | Liver, small amount; also intestinal bacteria |
| **Excretion** | Urine |
| **Half-life** | 30-40 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | ½-1½ hr | 5-30 min |
| **Peak** | 2-6 hr | 1-4 hr |
| **Duration** | After steady state | 2-6 days |

## INTERACTIONS

### Individual drugs

AMILoride, cholestyramine, colestipol, metoclopramide, thyroid hormones: decreased digoxin levels
Amiodarone, dilTIAZem, indomethacin, NIFEdipine, propantheline, quiNIDine, verapamil: increased digoxin levels
Amphotericin B, carbenicillin, ticarcillin: increased hypokalemia, increased toxicity
Calcium IV: increased hypercalcemia, hypomagnesemia, digoxin toxicity, monitor electrolytes
Kaolin/pectin: decreased absorption

### Drug classifications

Antacids: decreased digoxin absorption
Anticholinergics: increased digoxin blood levels
Antidysrhythmics, β-adrenergic blockers: increased bradycardia
Azole antifungals, macrolides, tetracyclines: increased toxicity, monitor for toxicity
Diuretics (thiazide) corticosteroids: increased hypokalemia, hypercalcemia, hypomagnesemia, digoxin toxicity
Sympathomimetics: increased cardiac dysrhythmia risk

### Drug/herb

Increase: Cardiac effects: foxglove, golden seal, hawthorn, rue
St. John's wort: decreased product effect

### Drug/food

Flaxseed, psyllium: decreased digoxin effect: food, separate by ≥1 hr absorption

### Drug/lab test

Increased: CPK

## NURSING CONSIDERATIONS

### Assessment

• Assess and document apical pulse for 1 min before giving product; if pulse <60 in adult or <90 in an infant or is significantly different, take again in 1 hr; if <60 in adult, call prescriber; note rate, rhythm, character, monitor I&O, daily weight, check for edema
• **Monitor electrolytes:** potassium, sodium, chloride, magnesium, calcium; renal function studies: BUN, creatinine; other blood studies: ALT, AST, bilirubin, Hct, Hgb, product levels (therapeutic level 0.5-2 ng/ml) before initiating treatment and periodically thereafter, draw ≥ 6-8 hr after last dose, optimally 12-24 hr after a dose, monitor for decreased potassium, or increased potassium
• Monitor resolution of atrial dysrhythmias by ECG; if tachydysrhythmia develops, hold product; delay cardioversion while product levels are determined
• Monitor ECG continuously during parenteral loading doses and for patients with suspected toxicity; provide hemodynamic monitoring for patients with heart failure or administer multiple cardiac products
• **Beers:** Avoid dosage >0.125 mg/dl in atrial fibrillation, heart failure in older adults; decreased renal clearance may lead to toxicity
• **Pregnancy/breastfeeding:** No well-controlled studies, use only if clearly needed, excreted in breast milk (small amounts), may breastfeed

### Patient/family education

• Advise patient not to stop abruptly; teach all aspects of product
• Caution patient to avoid OTC medications including cough, cold, allergy preparations, antacids, since many adverse product interactions may occur; do not take antacid at same time or within 2 hr of this product
• Instruct patient to notify prescriber of any loss of appetite, lower stomach pain, diarrhea, weakness, drowsiness, headache, blurred or yellow-green vision, rash, depression; teach toxic symptoms of this product and when to notify prescriber
• Advise patient to maintain a sodium-restricted diet as ordered; to take potassium supplements as ordered to prevent toxicity
• Instruct patient to report shortness of breath, difficulty breathing, weight gain, edema, persistent cough
• Teach patient purpose of product is to regulate the heart's functioning
• Teach patient as outpatient to check and record pulse for 1 min before taking dose; if there is a change of >15 bpm from usual pulse, prescriber should be notified
• Teach patient to take medication at the same time each day, take missed doses within 12 hr; do not double doses; notify prescriber if doses are missed for 2 days or more; how to monitor heart rate
• Teach patient toxic symptoms and when to notify prescriber
• Advise patient to carry/wear emergency ID describing dosage and reason for digoxin
• Advise patient to use one brand consistently, to keep in original container
• Teach patient how to take pulse, when to notify prescriber
• Teach patient to notify prescriber if pregnancy is planned or suspected
• Teach patient to carry ID stating condition treated, products taken

### Evaluation

**Positive therapeutic outcome**
• Decreased in heart failure, dysrhythmias
• Serum digoxin level 0.5-2 ng/ml

## TREATMENT OF OVERDOSE:

Discontinue product, administer potassium, monitor ECG, administer an adrenergic blocking agent, digoxin immune FAB

## dihydroergotamine

*See ergotamine*

**⚠ HIGH ALERT**

## dilTIAZem (Rx)

(dil-tye'a-zem)
**Apo-Diltiaz, Cardizem, Cardizem CD, Cardizem LA, Cartia XT, Dilacor-XR, Dilt-CD, Diltia XR, Diltia XT, Diltzac, Taztia XT, Tiamate, Tiazac**
*Func. class.:* Calcium channel blocker, antianginal, antiarrhythmic class IV, antihypertensive
*Chem. class.:* Benzothiazepine

**Do not confuse:** Cardizem/Cardene Tiazac/Ziac

**ACTION:** Inhibits calcium ion influx across cell membrane during cardiac depolarization, produces relaxation of coronary vascular smooth muscle, dilates coronary arteries, slows SA/AV node conduction times, dilates peripheral arteries

**Therapeutic outcome:** Decreased angina pectoris, dysrhythmias, B/P

## USES

**Oral:** Angina pectoris due to hypertension, coronary artery spasm, improvement in exercise tolerance (chronic stable angina)

**Parenteral:** Atrial fibrillation, flutter; paroxysmal supraventricular tachycardia

## CONTRAINDICATIONS

Sick sinus syndrome, 2nd- or 3rd-degree heart block, hypotension less than 90 mm Hg systolic, acute MI, pulmonary congestion, cardiogenic shock

**Precautions:** Pregnancy, breastfeeding, children, HF, aortic stenosis, bradycardia, GERD, hepatic disease, hiatal hernia, ventricular dysfunction, elderly

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO 30 mg TID, increase to max 480 mg/day; EXT REL 120-240 mg qday, max 540 mg/day; SUS REL 60 mg bid, max 360 mg/day

### Prinzmetal's or variant angina, chronic stable angina

**Adult:** PO 30 mg qid, increasing dose gradually to 180-360 mg/day in divided doses or EXT REL (LA, CD, XT, XR products) 180-360 mg, max 480-540 mg/day, depending on brand

### Atrial fibrillation, flutter, paroxysmal supraventricular tachycardia

**Adult:** **IV** 0.25 mg/kg as BOL over 2 min initially, then 0.35 mg/kg may be given after 15 min; if no response, may give CONT INF 5-15 mg/hr for up to 24 hr

**Available forms:** Tabs 30, 60, 90, 120 mg; ext rel tab 120, 180, 240, 300, 360, 420 mg; ext rel caps 60, 90, 120, 180, 240, 300, 360, 420 mg; inj 5 mg/ml (5, 10 ml); powder for inj 100 mg

### Implementation

**PO route**

- Not all products are interchangeable
- Store at room temperature
- **Cardiazem LA ext rel tab 24 hr:** give daily, either AM or PM, without regard to meals
- **Dilacor XR/Diltia XT ext rel cap 24 hr** give daily, take on empty stomach, swallow whole, do not cut, crush, chew, open
- **Tiazac, Tiztia XT:** give daily without regard to meals
- **Conventional regular-rel tab:** give before meals and at bedtime
- **Cardizem CD or equivalent (Cartia XT) generic ext rel cap 24 hr:** give daily, without regard to meals
- Give with meals for GI symptoms; may crush and sprinkle (reg tab) on applesauce

**Direct IV route**

- Give direct **IV** undiluted over 2 min

**Continuous IV infusion route**

- **Dilute** 125 mg/100 ml (1.25 mg/ml) or 250 mg/250 ml (1 mg/ml) or 250 mg/500 ml (0.5 mg/ml) of $D_5W$, 0.9% NaCl, $D_5$/0.45% NaCl; give 10 mg/hr; may increase by 5 mg/hr to 15 mg/hr; may continue inf up to 24 hr max

**Y-site compatibilities:** Albumin, amikacin, amphotericin B, aztreonam, bretylium, bumetanide, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, cefTRIAXone, cefuroxime, cimetidine, ciprofloxacin, clindamycin, digoxin, DOBUTamine, DOPamine, doxycycline, EPINEPHrine, erythromycin, esmolol, fentaNYL, fluconazole, gentamicin, hetastarch, HYDROmorphone, imipenem-cilastatin, labetalol, lidocaine, LORazepam, meperidine, metoclopramide, metroNIDAZOLE, midazolam, milrinone, morphine, multivitamins, niCARdipine, nitroglycerin, norepinephrine, oxacillin, penicillin G potassium, pentamidine, piperacillin, potassium chloride, potassium phosphates, raNITIdine, sodium nitroprusside, theophylline, ticarcillin, ticarcillin/clavulanate, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vecuronium

## ADVERSE EFFECTS

**CNS:** *Headache, fatigue, drowsiness,* dizziness, depression, weakness, insomnia, tremor, paresthesia
**CV:** Dysrhythmia, *edema,* HF, bradycardia, hypotension, palpitations, heart block
**GI:** *Nausea,* vomiting, diarrhea, gastric upset, *constipation,* increased LFTs
**GU:** Nocturia, polyuria, acute renal failure
**INTEG:** *Rash,* pruritus at inj site, flushing, photosensitivity, burning, Stevens-Johnson syndrome
**RESP:** Rhinitis, dyspnea, pharyngitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Not known |
| **Metabolism** | Liver, extensively |
| **Excretion** | Metabolites (96%) |
| **Half-life** | 3½-9 hr |

### Pharmacodynamics

| | PO | PO–sus rel | IV |
|---|---|---|---|
| **Onset** | ½ hr | Unknown | Unknown |
| **Peak** | 2-3 hr | Unknown | Unknown |
| **Duration** | 6-8 hr | 11-18 hr | Unknown |

## INTERACTIONS

### Individual drugs

CarBAMazepine, lithium, methylPREDNISolone: increased effects of each specific product, monitor for increased action of each product

Cimetidine: increased AV node slowing
CycloSPORINE: increased cycloSPORINE effect
Digoxin: increased digoxin effect
Theophylline, lithium: increased effect, toxicity

### Drug classifications

Anesthetics: increased effects of anesthetics
β-Adrenergic blockers: increased bradycardia, HF, increased β-blocker effect
NSAIDs, PHENobarbital, phenytoin: decrease: Antihypertensive effect
Benzodiazepines: increased effect of benzodiazepines
HMG-CoA reductase inhibitors: increased effects

### Drug/food

Increase: dilTIAZem effect, grapefruit juice, avoid use

## NURSING CONSIDERATIONS

### Assessment

- **HF:** monitor for dyspnea, weight gain, edema, jugular vein distention, rales; monitor I&O ratios daily, weight
- **Angina:** location, duration, alleviating factors, activity when pain starts
- **Dysrhythmias:** monitor B/P and pulse, respiration, ECG and intervals (PR, QRS, QT); PCWP, CVP often during infusion; if B/P drops 30 mm Hg, stop infusion and call prescriber, monitor B/P, ECG continuously if using IV, report bradycardia, have emergency equipment nearby
- **Beers:** Avoid extended-release capsule in older adults, promotes fluid retention, exacerbates heart failure
- **Pregnancy:** Identify if pregnancy is planned or suspected or if breastfeeding, use only if benefits outweigh fetal risk
- **Stevens-Johnson syndrome:** Assess for rash, fever, fatigue, mouth blistering, discontinue product

### Patient/family education

- Caution patient to avoid hazardous activities until stabilized on product and dizziness is no longer a problem
- Instruct patient to limit caffeine consumption; to avoid grapefruit juice; to avoid alcohol and OTC products unless directed by prescriber
- Tell patient to comply in all areas of medical regimen; diet, exercise, stress reduction, product therapy; to notify prescriber of irregular heartbeat, shortness of breath, swelling of feet and hands, pronounced dizziness, constipation, nausea, hypotension
- Teach patient to use sunscreen, protective clothing to prevent photosensitivity
- Teach patient to use as directed even if feeling better; may be taken with other cardiovascular products (nitrates, β-blockers); how to take pulse, B/P before taking product; to change position slowly
- Teach patient not to discontinue abruptly
- **Pregnancy:** Teach patient to avoid pregnancy and breastfeeding

### Evaluation

#### Positive therapeutic outcome

- Decreased anginal pain
- Decreased B/P
- Increased exercise tolerance
- Absence of dysrhythmias

## TREATMENT OF OVERDOSE:

Atropine for AV block, vasopressor for hypotension

## dimenhyDRINATE (OTC, Rx)

(dye-men-hye′dri-nate)
**Anti-Nauseant, Dirate, Dramamine, Driminate, TripTone, Wal-Dram**
*Func. class.:* Antiemetic, antihistamine, anticholinergic
*Chem. class.:* H1-receptor antagonist, ethanolamine derivative

**Do not confuse:** dimenhyDRINATE/diphenhydrAMINE

**ACTION:** Competes with histamine for H1 receptors in GI tract, blood vessels, respiratory tract; central anticholinergic activity, which results in decreased vestibular stimulation and blockade of chemoreceptor trigger zone

**Therapeutic outcome:** Absence of nausea, vomiting, or vertigo

**USES:** Motion sickness, nausea, vomiting, vertigo

**Unlabeled uses:** Hyperemesis gravidarum, Ménière's syndrome

## CONTRAINDICATIONS

Hypersensitivity, infants, neonates, tartrazine dye hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric patients, cardiac dysrhythmias, asthma, prostatic hypertrophy, bladder-neck obstruction, closed-angle glaucoma, stenosing peptic ulcer, pyloroduodenal obstruction

## DOSAGE AND ROUTES

**Adult:** PO 50-100 mg q4hr; IM/IV 50 mg q4hr as needed (Canada only)
**Child 6-12 yr:** PO 25-50 mg q6-8hr prn, max 150 mg/day
**Child 2-5 yr:** PO 12.5-25 mg q6-8hr, max 75 mg/day

**Available forms:** Tabs 50 mg; inj 50 mg/ml; elixir 15 mg/5 ml; chew tabs 50 mg

### Implementation

- Give IM inj in large muscle mass; aspirate to avoid IV administration (Canada only)
- Tablets may be swallowed whole, chewed, or allowed to dissolve

**IV route (Canada only)**
- After diluting 50 mg/10 ml of NaCl inj, give 50 mg over 2 min

## ADVERSE EFFECTS

**CNS:** Drowsiness, restlessness, headache, dizziness, insomnia, confusion, nervousness, tingling, vertigo
**CV:** Hypertension, hypotension, palpitation
**EENT:** Dry mouth, blurred vision, diplopia, nasal congestion, photosensitivity, xerostomia
**GI:** Nausea, anorexia, vomiting, constipation
**INTEG:** Rash, urticaria, fever, chills, flushing
**MISC:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | May cross placenta, enter breast milk |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | PO 15-30 min |
| **Peak** | PO 2 hr |
| **Duration** | PO 4-6 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased effects

### Drug classifications

Anticholinergics, tricyclics, MAOIs, opiates, sedative/hypnotics, other CNS depressants: increased effects

### Drug/lab test

False negative: allergy skin testing

## NURSING CONSIDERATIONS

### Assessment

- Monitor VS, B/P; check patients with cardiac disease more often
- **Assess for signs of toxicity of other products or masking of symptoms of disease:** brain tumor, intestinal obstruction
- Observe for drowsiness, dizziness
- **Pregnancy/breastfeeding:** Use only if clearly needed, no well-controlled studies, do not breastfeed, excreted in breast milk

### Patient/family education

- Advise patient to avoid hazardous activities, activities requiring alertness because dizziness may occur; to request assistance with ambulation
- Advise to avoid alcohol, other CNS depressants
- **Beers:** Avoid use in older adults, highly anticholinergic

### Evaluation

**Positive therapeutic outcome**
- Absence of nausea, vomiting, or vertigo

## dinoprostone (Rx)

(dye-noe-prost'one)
**Cervidil, Prepidil, Prostin E-Z**
*Func. class.:* Oxytocic, abortifacient
*Chem. class.:* Prostaglandin $E_2$

**Do not confuse:** Prepidil/bepridil

**ACTION:** Stimulates uterine contractions similar to labor by myometrium stimulation, causing abortion; acts within 30 hr for complete abortion

**Therapeutic outcome:** Beginning of labor, fetal expulsion

**USES:** Abortion during 2nd trimester, benign hydatidiform mole, expulsion of uterine contents in fetal deaths to 28 wk, missed abortion, cervical effacement and dilatation in term pregnancy when they have not occurred spontaneously

## CONTRAINDICATIONS

Hypersensitivity, C-section, surgery, fetal distress, multiparity, vaginal bleeding, cephalopelvic disproportion

**Precautions:** Pregnancy, renal/hepatic/ cardiac disease, asthma, anemia, jaundice, diabetes mellitus, seizure disorders, hypertension, glaucoma, uterine fibrosis, cervical stenosis, pelvic surgery, PID, respiratory disease

**BLACK BOX WARNING:** Requires a specialized setting and an experienced clinician

## DOSAGE AND ROUTES

### Abortifacient/2nd trimester/missed abortion/benign hydatidiform mole/intrauterine fetal death

**Adult:** VAG SUPP 20 mg; repeat q3-5hr until abortion occurs; max dose 240 mg

### Cervical ripening

**Adult:** GEL 0.5 mg vag gel placed in cervical canal, may repeat after 6 hr, max 1.5 mg/24 hr; vag insert 10 mg high in vagina, remove at onset of active labor or within 12 hr

**Available forms:** Vag supp 20 mg; gel 0.5 mg/3 g (prefilled syringe); vag insert 10 mg

### Implementation

**Suppository route**

- Warm supp by running warm water over package; insert high in vagina, wear gloves to prevent absorption; have patient recumbent for at least 10 min

**Gel route**

- Do not allow to come in contact with skin; use soap and water to wash after use
- Gel should be at room temperature
- Place patient in dorsal or lithotomy position to insert gel into cervical canal; remove catheter; discard all items after use; keep supine 15-30 min

## ADVERSE EFFECTS

**CNS:** *Headache,* dizziness, chills, fever, flushing
**CV:** Hypotension, dysrhythmias, DIC
**EENT:** Blurred vision
**GI:** *Nausea, vomiting, diarrhea*
**GU:** Vaginitis, vaginal pain, vulvitis, vaginismus
**INTEG:** Rash, skin color changes
**MS:** *Leg cramps, joint swelling,* weakness
**SYST:** Anaphylactoid syndrome of pregnancy
**Insert:** Uterine hyperstimulation, fever, nausea, vomiting, diarrhea, abdominal pain
**Gel:** Uterine contractile abnormality, GI side effects, back pain, fever, amniotic fluid embolism
**Fetal:** Bradycardia (i.e., deceleration)
**Suppository:** Uterine rupture, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Enzymes |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics

| | Gel | Supp |
|---|---|---|
| **Onset** | Rapid | 10 min |
| **Peak** | 30-45 min | Unknown |
| **Duration** | Unknown | 2-3 hr |

## INTERACTIONS

### Individual drugs

### Drug classifications

Other oxytocics: increased effect

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Specialized setting, specialized clinician:** use only with emergency equipment nearby, by a clinician experienced with use in pregnancy termination; complete abortion should result within 17 hr (insert), use only in 12-20 wk or up to 28 wk for removal of remaining material after miscarriage

- **Abortifacient: Monitor contractions for frequency, duration**
- **Anaphylaxis: Monitor for rash, wheezing**
- **Cervical ripening:** assess dilation and effacement of the cervix, uterine contractions, fetal heart tones; watch for contractions lasting over 1 min, hypertonus, fetal distress; product should be slowed or discontinued
- Assess for fever that occurs approximately 30 min after supp insertion (abortion)
- Monitor for nausea, vomiting, diarrhea; these may require medication
- **Assess for hypersensitivity reaction:** dyspnea, rash, chest discomfort
- Assess respiratory rate, rhythm, depth; notify prescriber of abnormalities in pulse, B/P
- **Check amount of vaginal discharge;** itching, irritation indicates vaginal infection

### Patient/family education

- Teach patient all aspects of treatment including purpose of medication and expected results
- Tell patient that gel may produce warmth in her vagina
- Caution patient that if contractions are longer than 1 min to notify nurse or prescriber
- Advise patient to notify prescriber of cramping, pain, increased bleeding, chills, increased temp, or foul-smelling discharge; these symptoms may indicate uterine infection
- Advise patient to remain supine 10-15 min after insertion of suppository, 2 hr after insert, 15-30 min after gel

### Evaluation

**Positive therapeutic outcome**

- Progression of labor
- Abortion

## diphenhydrAMINE (OTC, Rx)

(dye-fen-hye′dra-meen)

**Allerdryl, Allergy formula, AllerMax, Altaryl, Banophen, Benadryl, Benadryl Allergy, Benadryl Allergy Dye Free, Benadryl Children's Allergy, Benylin, Buckley's Bedtime, Diphedryl, Diphenhist, Calmex, Dormex, Dytan, ElixSure Allergy, Equaline Allergy, Equaline Children's Allergy, Nadryl, Nytol, PediaCare Children's Allergy, PediaCare Nighttime Cough, Q-Dryl Allergy, Select Brand Allergy, Siladryl, Silphen, Simply Sleep, Sleepinal, Sleep Tabs, Sominex, Unisom, Valu-Dryl, Wal-dryl Allergy, Wal-dryl Allergy Dye Free, Wal-dryl Children's Allergy, ZzzQuil**

*Func. class.:* Antihistamine (1st generation, nonselective), antitussive

*Chem. class.:* Ethanolamine derivative, $H_1$-receptor antagonist

**Do not confuse:** diphenhydrAMINE/dicyclomine/dimenhyDRINATE

**ACTION:** Acts on blood vessels, GI, respiratory system by competing with histamine for $H_1$-receptor site; decreases allergic response by blocking histamine

**Therapeutic outcome:** Absence of allergy symptoms and rhinitis, decreased dystonic symptoms, absence of motion sickness, absence of cough, ability to sleep

**USES:** Allergy symptoms, rhinitis, motion sickness, antiparkinsonism, nighttime sedation, infant colic, nonproductive cough, insomnia in children

## CONTRAINDICATIONS

Hypersensitivity to $H_1$-receptor antagonist, neonates

**Precautions:** Pregnancy, breastfeeding, children <6 yr, increased intraocular pressure, renal/cardiac disease, hypertension, bronchial asthma, seizure disorder, stenosed peptic ulcers, hyperthyroidism, prostatic hypertrophy, bladder neck obstruction

## DOSAGE AND ROUTES

**Adult and child >12 yr:** PO 25-50 mg q4-6hr, max 300 mg/day; IM/**IV** 10-50 mg, max 300 mg/day

**Child 6-12 yr:** PO/IM/**IV** 5 mg/kg/day in 4 divided doses, max 300 mg/day

### Nighttime sleep aid

**Adult and child ≥12 yr:** PO 25-50 mg at bedtime

### Antitussive (syrup only)

**Adult and child ≥12 yr:** 25 mg q4hr, max 150 mg/24 hr

**Child 6-12 yr:** 12.5 mg q4hr, max 75 mg/24 hr

**Available forms:** Caps 25, 50 mg; tabs 25, 50 mg; chew tabs 12.5, 25 mg; elix 12.5 mg/5 ml; syr 12.5 mg/5 ml; inj 50 mg/ml; orally disintegrating tabs 12.5 mg; orally disintegrating strips 12.5, 25 mg

### Implementation

- Avoid use in children <6 yr, death has occurred; overdose has occurred in topical gel taken orally (adult/child)
- Give 20 min before bedtime if using for sleep aid

**PO route**

- Give with meals if GI symptoms occur; absorption rate may be slightly decreased; cap may be opened and product mixed with food/fluids for patients with swallowing difficulties

**IM route**

- Give IM inj in large muscle mass; aspirate to avoid **IV** administration; rotate sites

**Direct IV route**

- Give **IV** undiluted ≤25 mg/min

**Intermittent IV infusion route**

May be diluted with 0.9% NaCl, $D_5W$, $D_{10}W$, 0.45% NaCl, $D_5$/0.9% NaCl, $D_5$/0.45% NaCl, $D_5$/0.25% NaCl, LR, Ringer's; give 25 mg/min or less

**Y-site compatibilities:** Acetaminophen, aldesleukin, alfentanil hydrochloride, amifostine, amikacin sulfate, aminocaproic acid, amphotericin B lipid complex (Abelcet), amphotericin B liposome (AmBisome), amsacrine, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium besylate, atropine sulfate, azithromycin, benztropine mesylate, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefTAZidime, ceftizoxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, digoxin, dilTIAZem, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ertapenem,

erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, folic acid, gallium, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methadone, methicillin, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, minocycline, mitoXANTRONE, morphine, multiple vitamins injection, mycophenolate, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, raNITIdine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zoledronic acid

**Y-site incompatibilities:** Foscarnet

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* poor coordination, fatigue, anxiety, euphoria, confusion, paresthesia, neuritis, seizures
**CV:** Hypotension, palpitations
**EENT:** Blurred vision, dilated pupils, tinnitus, nasal stuffiness, dry nose, throat, mouth
**GI:** Nausea, anorexia, diarrhea
**GU:** *Retention,* dysuria, frequency
**HEMA:** Thrombocytopenia, agranulocytosis, hemolytic anemia
**INTEG:** Photosensitivity
**MISC:** Anaphylaxis
**RESP:** Increased thick secretions, wheezing, chest tightness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM); completely absorbed (**IV**) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver (95%) |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 2½-7 hr |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | 15-60 min | 30 min | Immediate |
| **Peak** | 2-4 hr | 2-4 hr | Unknown |
| **Duration** | 4-8 hr | 4-8 hr | 4-8 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression

### Drug classifications

Antidepressants (tricyclic), barbiturates, CNS depressants, opiates, sedative/hypnotics: increased CNS depression
MAOIs: increased effect of diphenhydrAMINE

### Drug/lab test

False negative: skin allergy tests (discontinue antihistamines 3 days before testing)

## NURSING CONSIDERATIONS

### Assessment

- Assess respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness; provide fluids to 2 L/day to decrease secretion thickness
- Monitor I&O ratio: be alert for urinary retention, frequency, dysuria, especially geriatric; product should be discontinued if these occur
- Monitor CBC during long-term therapy; blood dyscrasias may occur but are rare
- If giving for dystonic reactions, assess type of involuntary movements and evaluate response to this medication
- Assess cough characteristics including type, frequency, thickness of secretions; evaluate response to this medication if using for cough
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if clearly needed, do not breastfeed, excreted in breast milk
- Teach patient product should be discontinued 4 days prior to skin allergy tests

### Patient/family education

- Tell patient that a false-negative result may occur with skin testing; these procedures should not be scheduled until 3 days after discontinuing use

- Caution patient to avoid hazardous activities and activities requiring alertness, since dizziness may occur; instruct patient to request assistance with ambulation
- Teach patient to use sunscreen to prevent photosensitivity
- Advise patient to avoid alcohol, other depressants; may potentiate effect; CNS depression may occur
- Teach all aspects of product uses; to notify prescriber if confusion, sedation, hypotension occur; to avoid driving and other hazardous activity if drowsiness occurs; to avoid alcohol or other CNS depressants that may potentiate effect
- Advise patient to avoid breastfeeding; not to breastfeed (injectable)
- Teach patient not to use in child <6 yr, deaths have occurred, do not use in any child for sleep

### Evaluation

**Positive therapeutic outcome**
- Absence of motion sickness
- Absence of nausea, vomiting
- Ability to sleep
- Absence of cough
- Decrease in involuntary movements

## TREATMENT OF OVERDOSE:
- Administer lavage, diazePAM, vasopressors, phenytoin **IV**

## divalproex sodium
*See valproate*

**⚠ HIGH ALERT**

## DOBUTamine (Rx)
(doe-byoo'ta-meen)
*Func. class.:* Adrenergic direct-acting $\beta_1$-agonist, inotropic agent, cardiac stimulant
*Chem. class.:* Catecholamine

**Do not confuse:** DOBUTamine/DOPamine

**ACTION:** Causes increased contractility, increased cardiac output without marked increase in heart rate by acting on $\beta_1$-receptors in heart; minor $\alpha/\beta_2$ effects

**Therapeutic outcome:** Cardiac output increased with decreased fatigue and dyspnea

**USES:** Cardiac decompensation due to organic heart disease or cardiac surgery

**Unlabeled uses:** Cardiogenic shock in children, congenital heart disease in children undergoing cardiac catheterization

## CONTRAINDICATIONS
Hypersensitivity, idiopathic hypertrophic subaortic stenosis

**Precautions:** Pregnancy, breastfeeding, children, hypertension, CAD, MI, hypovolemia, dysrhythmias, sulfite hypersensitivity, renal failure, geriatrics

## DOSAGE AND ROUTES
**Adult and child: IV** INF 0.5-1 mcg/kg/min; titrate to 2-20 mcg/kg/min; may increase to 40 mcg/kg/min if needed

**Available forms:** Inj 12.5 mg/ml, 250 mg/20 ml

### Implementation
**Injectable administration**
- Visually inspect parenteral products for particulate matter and discoloration prior to administration whenever solution and container permit

**IV administration**
NOTE: Infusions lasting up to 72 hr have been given without development of tolerance. However, β-receptor desensitization may occur with prolonged infusions of any β-adrenergic agonist, including DOBUTamine, or as a consequence of sympathetic compensatory mechanisms associated with advanced congestive heart failure, resulting in alterations in DOBUTamine pharmacodynamics. Experience with intravenous DOBUTamine in controlled trials does not extend beyond 48 hours of repeated boluses and/or continuous infusions
- Must be diluted before administration
- Infuse into a large vein

**Dilution**
- Concentrate for injection must be diluted with at least 50 ml of a compatible IV solution (strongly alkaline [i.e., sodium bicarbonate] solutions are incompatible). A common dilution is 500 mg (40 ml) in 210 ml $D_5W$ or NS (withdraw 40 ml from a 250 ml bag) to produce a final concentration of 2000 mcg/ml; or 1000 mg (80 ml) in 170 ml $D_5W$ or NS (withdraw 80 ml from a 250 ml bag) to produce a final concentration of 4000 mcg/ml. Max 5000 mcg/ml and should be adjusted according to the fluid requirements of the patient

**Infusion**
- Premixed bags of in $D_5W$ solutions may be a pink color that, if present, will increase with time; this color change is due to slight oxidation of the drug, but there is no significant loss of potency.

- Do not give DOBUTamine simultaneously with solutions containing sodium bicarbonate or strong alkaline solutions (incompatible)
- Infusion of should be started at a low rate and titrated frequently to reach the optimal dosage; dosage titration is guided by the patient's response, including systemic blood pressure, urine flow, frequency of ectopic activity, heart rate, and measurements of cardiac output, central venous pressure, and/or pulmonary capillary wedge pressure

**Y-site compatibilities:** Alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, amiodarone, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clarithromycin, cloNIDine, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, dilTIAZem, diphenhydrAMINE, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, metaraminol, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, netilmicin, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentamidine, pentazocine, phenylephrine, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, raNITIdine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sodium acetate, succinylcholine, SUFentanil, tacrolimus, temocillin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** Acyclovir, alteplase, aminophylline, foscarnet, phytonadione

## ADVERSE EFFECTS

**CNS:** *Anxiety,* headache, dizziness, fatigue
**CV:** Palpitations, tachycardia, hypo/hypertension, PVCs, angina
**ENDO:** Hypokalemia
**GI:** Heartburn, nausea, vomiting
**MS:** Muscle cramps (leg)
**RESP:** Dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 2 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1-5 min |
| **Peak** | 10 min |
| **Duration** | <10 min |

## INTERACTIONS

### Individual drugs

Atomoxetine: increased pressor effect, dysrhythmias
Bretylium, oxytocin: increased dysrhythmias
Guanethidine: increased severe hypertension
Oxytocin: increased pressor effects

### Drug classifications

Anesthetics (general): increased dysrhythmias
Antidepressants (tricyclic), COMT inhibitors, MAOIs, oxytocics: increased pressor response, dysrhythmias
β-Blockers: decreased action of DOBUTamine

## NURSING CONSIDERATIONS

### Assessment

- **Assess for hypovolemia;** if present, correct before beginning treatment with DOBUTamine; avoid use in patients with atrial fibrillation before digitalization
- **Monitor ECG for dysrhythmias, ischemia** during treatment; some patients may not need continuous ECG monitoring; also monitor PCWP, CVP, $CO_2$, urinary output; notify prescriber if <30 ml/hr, may induce ectopic beats

- **Assess for heart failure:** bibasilar crackles, $S_3$ gallop, dyspnea, neck vein distention in patients with cardiomyopathy or HF
- **Assess for oxygenation or perfusion deficit:** decreased B/P, chest pain, dizziness, loss of consciousness
- Monitor serum electrolytes, urine output, correct electrolytes before use
- Monitor B/P and pulse q5min during infusion; if B/P drops 30 mm Hg, stop infusion and call prescriber
- Monitor ALT, AST, bilirubin daily
- Monitor for sulfite sensitivity, which may be life threatening
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Teach patient reason for medication and expected results, reason for all monitoring and procedures
- Advise patient to report dyspnea, headache, **IV** site discomfort, chest pain, numbness of extremities

### Evaluation

**Positive therapeutic outcome**

- Increased cardiac output
- Decreased PCWP, adequate CVP
- Decreased dyspnea, fatigue, edema, ECG
- Increased urine output

## TREATMENT OF OVERDOSE:

Discontinue product, support circulation

**⚠ HIGH ALERT**

# DOCEtaxel (Rx)

(doe-se-tax'el)

**Docefrez, Taxotere**

*Func. class.:* Antineoplastic, miscellaneous

**Do not confuse:** Taxotere/Taxol

**ACTION:** Inhibits the reorganization of the microtubule network needed for interphase and mitotic cellular functions; also causes abnormal bundles of microtubules during cell cycle and multiple esters of microtubules during mitosis

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Locally advanced or metastatic breast cancer, non–small cell lung cancer, androgen-independent metastatic prostate cancer, postsurgery operable node-positive breast cancer, induction treatment of locally advanced squamous cell cancer of the head/neck, adjuvant treatment of breast cancer with CARBOplatin and trastuzumab, gastric adenocarcinoma

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to this product, bilirubin exceeding upper normal limit

**BLACK BOX WARNING:** Hypersensitivity to other products with polysorbate 80, neutropenia (neutrophils $<1500/mm^3$)

**Precautions:** Children, CV disease, pulmonary disorders, bone marrow depression, herpes zoster, pleural effusion

**BLACK BOX WARNING:** Edema, hepatic disease, lung cancer, taxane hypersensitivity

## DOSAGE AND ROUTES

- Other regimens are used

**Locally advanced or metastatic breast cancer after failure of other chemotherapy**

**Adult: IV** 60-100 $mg/m^2$ given over 1 hr q3wk; if neutrophil count is $<500/mm^3$ for >1 wk, reduce dose by 25%

**Operable node-positive breast cancer; adjuvant postsurgery treatment of operable node-positive breast cancer**

**Adult: IV** (TAC regimen) 75 $mg/m^2$ 1 hr after DOXOrubicin 50 $mg/m^2$ and cyclophosphamide 500 $mg/m^2$ q3wk for 6 cycles

**Adjuvant treatment of operable stage I-III invasive breast cancer in combination with cyclophosphamide**

**Adult: IV** (TAC) regimen DOCEtaxel 75 $mg/m^2$ with cyclophosphamide 600 $mg/m^2$ q21day × 4 cycles

**Locally advanced or metastatic non–small cell lung cancer after failure of CISplatin chemotherapy**

**Adult: IV** 75 $mg/m^2$ over 1 hr q3wk; if neutrophil count is $<500/mm^3$ for >1 wk, reduce dose to 55 $mg/m^2$; if patient develops grade 3 peripheral neuropathy, stop product

**Unresectable, locally advanced or metastatic non–small cell lung cancer previously treated with chemotherapy**

**Adult: IV** 75 $mg/m^2$ over 1 hr, then CISplatin 75 $mg/m^2$ **IV** given over 30-60 min q3wk; reduce

dose to 65 mg/m$^2$ in those with hematologic or nonhematologic toxicities

### Androgen-independent metastatic prostate cancer

**Adult: IV** 75 mg/m$^2$ given over 1 hr q3wk, with 5 mg predniSONE PO bid continuously; give dexamethasone 8 mg PO at 12 hr, 3 hr, and 1 hr prior to DOCEtaxel; if neutrophil count is <500 cells/mm$^3$ for more than 1 wk or other toxicities occur, reduce dose to 60 mg/m$^2$

### Squamous cell cancer of head/neck

**Adult: IV** 75 mg/m$^2$ over 1 hr, then CISplatin 100 mg/m$^2$ over 1 hr on day 1, then 5-FU 1000 mg/m$^2$/day CONT INF × 5 days, repeat cycle q3wk

### Gastric adenocarcinoma

**Adult: IV** 75 mg/m$^2$ q3wk, given with CISplatin, fluorouracil

**Available forms:** Inj 10 mg/ml, 20 mg/0.5 ml, 20 mg/ml, 80 mg/2 ml, 80 mg/4 ml; 20, 80 mg powder for injection

### Implementation

- Give top or systemic analgesics for pain to lessen effects of stomatitis
- Give liquid diet: carbonated beverages; gelatin may be added if patient is not nauseated or vomiting
- Confirm that dexamethasone was given 12 hr and 6 hr before inf begins
- Store prepared sol up to 27 hr in refrigerator

**Intermittent IV infusion route**

- Use gloves and cytotoxic handling precautions
- Use non-PVC bag and use non-DEHP tubing
- Double-check all orders and products, errors can be fatal
- Allow vials to warm to room temperature, withdraw all diluent and inject in vial of DOCEtaxel, rotate gently to mix, allow to stand to decrease foaming, then withdraw the required amount (10 mg/ml) and inject in 250 ml of 0.9% NaCl or $D_5W$, mix gently, give over 1 hr

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, diazePAM, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOPamine, doripenem, doxacurium, DOXOrubicin HCl, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methotrexate, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANTRONE, mivacurium, morphine, nafcillin, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, raNITIdine, remifentanil, riTUXimab, rocuronium, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Seizures
**CV:** *Hypotension, fluid retention, peripheral edema,* flushing, MI, sinus tachycardia
**GI:** *Nausea, vomiting, diarrhea,* hepatotoxicity, stomatitis, colitis
**HEMA:** Neutropenia, leukopenia, thrombocytopenia, anemia, bleeding, infections, myelosuppression
**INTEG:** *Alopecia,* nail pain, rash, skin eruptions
**MISC:** Amenorrhea, fever of unknown origin, secondary malignancy, Stevens-Johnson syndrome, epiphora

**MS:** *Arthralgia, myalgia*, back pain, weakness
**NEURO:** *Peripheral neuropathy*
**RESP:** Dyspnea, pulmonary edema, fibrosis, embolism
**SYST:** Hypersensitivity reactions, AML, death

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively |
| **Excretion** | Fecal |
| **Half-life** | 11.1 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Anastrozole (high doses), aprepitant, clarithromycin, conivaptan, delavirdine, efavirenz (induces or inhibits), erythromycin, fluconazole, FLUoxetine, fluvoxaMINE, fosaprepitant, imatinib, itraconazole, ketoconazole, nefazodone, voriconazole, and others: increased CYP3A inhibition

Bosentan, carBAMazepine, nevirapine, phenytoin, fosphenytoin, rifabutin, rifAMPin, rifapentine: increased CYP3A induction

CycloSPORINE, erythromycin, ketoconazole, troleandomycin: altered metabolism of DOCEtaxel

### Drug classifications

Antineoplastics, radiation: increased myelosuppression

Barbiturates: increased CYP3A induction

Live virus vaccines: decreased immune response

## NURSING CONSIDERATIONS

### Assessment

- **Assess CNS changes:** confusion, paresthesias, peripheral neuropathy, dysesthesia, pain, weakness: if severe, product should be discontinued
- Check buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine) to use in mouth

**BLACK BOX WARNING: Taxane: assess symptoms indicating severe allergic reaction, anaphylaxis:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing

**BLACK BOX WARNING: Neutropenia:** Monitor CBC, differential, platelet count weekly; withhold product if WBC is $<1500/mm^3$ or platelet count is $<100{,}000/mm^3$, notify prescriber of results

**BLACK BOX WARNING:** Use of DOCEtaxel, polysorbate 80 are contraindicated, some products may contain polysorbate 80

**BLACK BOX WARNING: Edema:** oral corticosteroids should be given as premedication; assess for fluid retention, may be severe, is usually dose related

**BLACK BOX WARNING: Lung cancer:** increased mortality in those with increased LFTs and a history of platinum-based products

- **Monitor renal function tests:** BUN, creatinine, serum uric acid, urine CCr before, during therapy; check I&O ratio; report fall in urine output to $<30$ ml/hr
- Monitor temp (may indicate beginning of infection)

**BLACK BOX WARNING: Hepatic disease:** Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; check for jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

**BLACK BOX WARNING: Assess for bone marrow depression/bleeding:** hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr; check for inflammation of mucosa, breaks in skin

**BLACK BOX WARNING: Hypersensitive reactions, anaphylaxis,** usually during first or second dose, mild reactions can be treated by slowing infusion, treating symptomatically, do not retreat in those with severe reactions

- Assess effects of alopecia on body image; discuss feelings about body changes

### Patient/family education

- **Pregnancy/breastfeeding:** Inform patient that nonhormonal contraceptive measures are recommended during therapy and >4 mo after; teratogenic effects are possible

• Teach patient to avoid use of products containing aspirin or ibuprofen, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
• Instruct patient to report signs of **anemia** (fatigue, headache, irritability, faintness, shortness of breath) and CNS reactions (confusion, psychosis, nightmares, seizures, severe headaches)
• Instruct patient to report signs of **infection:** fever, sore throat, flulike symptoms
• Inform patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color and texture
• Inform patient that receiving vaccinations during therapy may cause serious reactions
• Instruct patient to rinse mouth tid-qid with water, club soda; brush teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

### Evaluation

**Positive therapeutic outcome**
• Prevention of rapid division of malignant cells

## docosanol topical
*See Appendix B*

## docusate calcium (OTC)
(dok'yoo-sate cal'see-um)
**Kao-Tin, Kaopectate Stool Softener**
## docusate sodium (OTC)
**Colace, Correctol, Diocto, Docu DOK, Doculace, Enemeez, Fleet Pedialax, Fleet Sof-Lax, Phillips Liquid-Gels, Selex, Silace, Soflax**
*Func. class.:* Laxative, emollient
*Chem. class.:* Anionic surfactant

**ACTION:** Increases water, fat penetration in intestine; allows for easier passage of stool

**Therapeutic outcome:** Passage of softened stool, absence of constipation

**USES:** Prevent hard, dry stools, prevent constipation, soften fecal impaction (rectal route)

## CONTRAINDICATIONS
Hypersensitivity, obstruction, fecal impaction, nausea/vomiting

**Precautions:** Pregnancy, breastfeeding

## DOSAGE AND ROUTES
**Adult:** PO 50-300 mg/day (docusate sodium) or 240 mg (docusate calcium); enema 4 ml (docusate sodium)
**Child >12 yr:** Enema 2 ml (docusate sodium)
**Child 6-12 yr:** PO 40-150 mg/day (docusate sodium) in divided doses
**Child 3-6 yr:** PO 20-60 mg/day (docusate sodium) in divided doses
**Child <3 yr:** PO 10-40 mg/day (docusate sodium) in divided doses

**Available forms: Docusate calcium:** caps 240 mg; **docusate sodium:** caps 50, 100, 250 mg; tabs 100 mg; liquid syr 20 mg/5 ml, 50 mg/5 ml, enema 283 mg

### Implementation
**PO route**
• Dilute oral sol in juice or other fluid to disguise taste
• Give tabs or caps with 8 oz of liquid; give on empty stomach for increased absorption, results
• Store in cool environment; do not freeze

## ADVERSE EFFECTS
**EENT:** Bitter taste, throat irritation
**GI:** Nausea, anorexia, cramps, diarrhea
**INTEG:** Rash

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Minimal (PO) |
| **Distribution** | Unknown |
| **Metabolism** | Not metabolized |
| **Excretion** | Bile |
| **Half-life** | Unknown |

### Pharmacodynamics

| | PO | RECT |
|---|---|---|
| **Onset** | 24-72 hr | 4-6 hr |
| **Peak** | Unknown | Unknown |
| **Duration** | Unknown | Unknown |

## INTERACTIONS
### Individual drugs
Mineral oil: toxicity

### Drug/herb
Flax, senna: increased laxative action

## NURSING CONSIDERATIONS
### Assessment
• Assess cramping, rectal bleeding, nausea, vomiting; if these symptoms occur, product should be discontinued; identify cause of constipation; identify fluids, bulk, or exercise is missing from lifestyle
• **Pregnancy/breastfeeding:** low risk of pregnancy, breastfeeding

### Patient/family education

- Discuss with patient that adequate fluid consumption is as necessary as bulk, exercise for adequate bowel function
- Teach patient that normal bowel movements do not always occur daily
- Advise patient not to use in presence of abdominal pain, nausea, vomiting; tell patient to notify prescriber if unrelieved constipation or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness, excessive thirst
- Advise patient that product may take up to 3 days to soften stools
- Instruct patient to take oral preparation with a full glass of water and increase fluid intake unless on fluid restrictions
- Caution patients with heart disease to avoid using the Valsalva maneuver to expedite evacuation

### Evaluation

**Positive therapeutic outcome**

- Decreased constipation within 3 days

**⚠ HIGH ALERT REMS**

## dofetilide

(doff-ee-till′-lide)

**Tikosyn**

*Func. class.:* Antidysrhythmic (Class III)

**ACTION:** Blocks cardiac ion channel carrying the rapid component of delayed potassium current, no effect on sodium channels

**Therapeutic outcome:** Absence of atrial fibrillation

**USES:** Atrial fibrillation, flutter, maintenance of normal sinus rhythm

## CONTRAINDICATIONS

Hypersensitivity, digoxin toxicity, aortic stenosis, pulmonary hypertension, children, severe renal disease, QT prolongation, torsades de pointes, renal failure

**Precautions:** Pregnancy, breastfeeding, AV block, bradycardia, electrolyte imbalance, renal disease

**BLACK BOX WARNING:** arrhythmias, ventricular **arrhythmias**/tachycardia, requires an experienced clinician, in a specialized care setting

## DOSAGE AND ROUTES

### Conversion of atrial fibrillation/atrial flutter to normal sinus rhythm; or, maintenance therapy with highly symptomatic atrial fibrillation/atrial flutter of ≥1 wk duration

**Adult:** PO Individualize dosage based on renal function and QTc in a monitored facility. Refer to the step-by-step procedure for determining the initial dose of dofetilide

### Maintenance therapy of atrial fibrillation/atrial flutter after hospital discharge

**Adult:** PO continue dosage at discharge as from initial dosage titration. Individualize dosage based on renal function and QTc, which should be re-evaluated q3mo or as medically warranted; if the QTc >500 milliseconds (550 msec in patients with ventricular conduction abnormalities) at any time, discontinue; carefully monitor until QTc returns to baseline; if renal function deteriorates, adjust the dose as described in the dosage guidelines for patients with renal impairment

### Discontinuation of dofetilide before use of interacting drugs

**Adult:** PO discontinue dofetilide for ≥2 days before starting a potentially interacting drug

### Renal dose

**Adult:** PO initial dose for CCr >60 mg/ml 500 mcg bid; CCr 40-60 mg/min 250 mcg bid; CCr 20-39 mg/min 125 mcg bid; CCr <20 mg/min do not use

**Available forms:** Caps 125, 250, 500 mcg

### Implementation

- Physician and pharmacy must be registered to use product
- With patient hospitalized for ≥ 3 days

**BLACK BOX WARNING: Step 1: Assess cardiac conduction:** Before first dose, the QTc interval must be determined using an average of 5-10 beats; if the QTc interval is >440 msec (or >500 msec in ventricular conduction abnormalities), do not use. If baseline heart rate is <60 bpm, then the QT interval should be used
**Step 2: Assess renal function:** Before first dose, determine renal function using the Cockroft-Gault equation, use actual body weight to calculate creatinine clearance
**Step 3: Adjust starting dose according to renal function:** Refer to the Renal dose section (above) to determine the appropriate initial dose
**Step 4: ECG monitoring:** Begin continuous ECG monitoring starting with the first dose
**Step 5: Dose adjustments:** Approximately 2-3 hr after the first dose, determine the QTc interval. If the QTc interval has increased by >15% (compared with baseline), or, if the QTc interval is >500 msec (>550 msec in patients with ventricular conduction abnormalities), the initial dosage should be reduced by half as follows:
- Decrease an initial dose of 500 mcg bid to 250 mcg bid
- Decrease an initial dose of 250 mcg bid to 125 mcg bid
- Decrease an initial dose of 125 mcg bid to 125 mcg daily

**Step 6: Reassess QTc interval:** Reassess the QTc interval 2-3 hr after each subsequent dose; if, the QTc interval lengthens to >500 msec (or >550 msec in patients with ventricular conduction abnormalities), **discontinue**
**Step 7: ECG Monitoring:** Monitor continuous ECG for a minimum of 3 days or for 12 hr after conversion to normal sinus rhythm, whichever is greater

## ADVERSE EFFECTS

**CNS:** *Syncope, dizziness,* headache, stroke
**CV:** *Hypotension, postural hypotension, bradycardia,* angina, PVCs, substernal pressure, precipitation of angina, transient hypertension, QT prolongation, torsades de pointes, ventricular dysrhythmias, chest pain
**GI:** *Nausea, vomiting,* severe diarrhea, anorexia
**MISC:** Angioedema
**RESP:** Dyspnea, respiratory infections

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | >90% |
| **Distribution** | Steady state 2-3 days |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys 80% |
| **Half-life** | 10 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

AMILoride, entecavir, lamiVUDine, memantine, metFORMIN, procainamide, triamterene, trospium: increased toxicity
Arsenic trioxide, chloroquine, ciprofloxacin, clarithromycin, droperidol, erythromycin, halofantrine, haloperidol, levomethadyl, methadone, pentamidine, ziprasidone: increased QT prolongation, torsades de pointes
Cimetidine, hydroCHLOROthiazide, ketoconazole, megestrol, metFORMIN, prochlorperazine, triamterene, trimethoprim/sulfamethoxazole, verapamil: do not use together

### Drug classifications

Antiretroviral protease inhibitors: increased dofetilide levels
Class IA/III antidysrhythmics, some phenothiazines: increased QT prolongation, torsades de pointes
Diuretics, potassium depletion: increased hypokalemia
CYP3A4 inhibitors, SSRIs, macrolides, azoles, protease inhibitors, amiodarone, doltizem, quinine: Increase: dysrhythmias

### Drug/food

- Do not use with grapefruit juice

## NURSING CONSIDERATIONS

### Assessment

- **Severe renal impairment:** CCr <20 ml/min: do not use for mild to moderate renal disease, monitor BUN/creatinine; adjust dose based on creatinine clearance
- AF patients should receive anticoagulation prior to cardioversion
- Nausea, vomiting, before and after use
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, avoid breastfeeding, excretion unknown

### Patient/family education
- Instruct patient to notify prescriber if fast heartbeats with fainting or dizziness occur
- Instruct patient to notify all prescribers of all medications and supplements taken
- Teach patient that if a dose is missed, do not double, take next dose at usual time

### Evaluation

**Positive therapeutic outcome**
- Increased control in atrial fibrillation

## dolasetron (Rx)
(do-la′se-tron)
**Anzemet**
*Func. class.:* Antiemetic
*Chem. class.:* 5-HT receptor antagonist

**ACTION:** Prevents nausea, vomiting by blocking serotonin peripherally, centrally, and in the small intestine

**Therapeutic outcome:** Control of nausea, vomiting

**USES:** Prevention of postoperative nausea, vomiting

**Unlabeled uses:** Radiotherapy-induced nausea/vomiting

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breast-feeding, children, geriatric, hypokalemia, electrolyte imbalances, granisetron, ondansetron, palonosetron hypersensitivity, QT prolongation

## DOSAGE AND ROUTES
### Prevention of postoperative nausea/vomiting
**Adult: IV** 12.5 mg as a single dose 15 min before cessation of anesthesia; PO 100 mg 2 hr before surgery (prevention only)
**Child 2-16 yr: IV** 0.35 mg/kg as a single dose 15 min before cessation of anesthesia; PO 1.2 mg/kg within 2 hr before surgery (prevention only)

### Prevention of cancer chemotherapy nausea/vomiting (PO only)
**Adult:** PO 100 mg 1 hr before chemotherapy
**Child 2-16 yr:** PO 1-8 mg/kg, 1 hr before chemotherapy

**Available forms:** Tabs 50, 100 mg; inj 20 mg/ml, 12.5 mg/0.625 ml

### Implementation
**PO route**
- Do not mix product for oral administration in juice until immediately before administration; apple or apple-grape diluted can be kept for 2 hr at room temperature
- Store at room temp 48 hr after dilution

**Intermittent IV infusion route**
- Administer by inj 100 mg/30 sec or less or diluted in 50 ml of compatible sol; give over 15 sec
- Store at room temperature for 24 hr after dilution
- Do not admix

## ADVERSE EFFECTS
**CNS:** *Headache,* dizziness, fatigue, drowsiness, serotonin syndrome
**CV:** Dysrhythmias, ECG changes, hypo/hypertension, tachycardia, bradycardia, QT prolongation, torsades de pointes, ventricular tachycardia/fibrillation, cardiac arrest (IV)
**GI:** *Diarrhea,* constipation, increased AST, ALT, abdominal pain, anorexia
**GU:** Urinary retention, oliguria
**MISC:** Rash, bronchospasm

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual drugs
Arsenic trioxide, chloroquine, clarithromycin, droperidol, erythromycin, halofantrine, haloperidol, levomethadyl, methadone, pentamidine, ziprasidone: increased QT prolongation; occurs at higher dose of dolasetron
Cimetidine: increased dolasetron levels
RifAMPin: decreased dolasetron levels

### Drug classifications
Antidysrhythmics: increased dysrhythmias
Class IA/III antidysrhythmics, some phenothiazines, loop diuretics, thiazide: increased QT prolongation

## NURSING CONSIDERATIONS
### Assessment
- **QT prolongation and QRS, PR prolongation:** do not use in those with congenital long QT syndrome, hypokalemia, hypomagnesemia, complete heart block (unless a pacemaker is in place); correct electrolytes before use; monitor ECG in the elderly, renal cardiac disease

- **Assess for hypersensitivity reaction:** rash, bronchospasm
- Assess for cardiac conduction conditions; electrolyte imbalances or dysrhythmias
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if clearly needed, cautious use in breastfeeding, excretion unknown
- **Serotonin syndrome:** Usually when combined with SSRIs, SNRIs, MAOIs

### Patient/family education

- Instruct patient to report diarrhea, constipation, rash, or changes in respirations; may cause headache; use analgesic
- Teach patient reason for medication and expected results

### Evaluation

**Positive therapeutic outcome**

- Absence of nausea, vomiting during cancer chemotherapy

## dolutegravir

(dole-oo-teg'ra-vir)

**Tivicay**

*Func. class.:* Antiretroviral

*Chem. class.:* HIV integrase strand transfer inhibitor (ISTIs)

## ACTION:

Inhibits catalytic activity of HIV integrase, which is an HIV-encoded enzyme needed for replication

**Therapeutic outcome:** Improvement in cell counts, T-cell counts

## USES:

HIV in combination with other antiretrovirals

## CONTRAINDICATIONS

Breastfeeding, hypersensitivity

**Precautions:** Pregnancy, children, geriatric patients, hepatic disease, immune reconstitution syndrome, hepatitis, antimicrobial resistance, lactase deficiency

## DOSAGE AND ROUTES

**Adult and child >12 yr and ≥40 kg (treatment-naïve or treatment-experienced but integrase strand transfer inhibitor–naïve): PO** 50 mg/day; if given with efavirenz, fosamprenavir/ritonavir, tipranavir/ritonavir or RifAMPin give 50 mg bid

**Available forms:** Tabs 50 mg

### Implementation

- May give without regard to meals, with 8 oz of water
- Store at room temperature
- Give 2 hr before or 6 hr after cation-containing antacids or laxatives, sucralfate, oral iron, oral calcium, or buffered products

## ADVERSE EFFECTS

**CNS:** Fatigue, fever, dizziness, headache, asthenia, suicidal ideation
**CV:** MI
**GI:** Nausea, vomiting, diarrhea, abdominal pain, asthenia, gastritis, hepatitis
**INTEG:** Rash, pruritus, urticaria
**META:** Hyperglycemia
**SYST:** Immune reconstitution syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Steady state 5 days, 98% protein binding |
| **Metabolism** | Liver; some patients are poor metabolizers |
| **Excretion** | Feces 53%, urine 31% |
| **Half-life** | Terminal 14 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Peak 2-3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Efavirenz, RifAMPin tenofovir, tipranavir/ritonavir: decreased levels of each product

### Drug classifications

Antacids, buffered products, laxatives/sucralfate, oral iron products, oral calcium products, buffered products: decreased effect of dolutegravir

### Drug/herb

St. John's wort: avoid concurrent use

## NURSING CONSIDERATIONS

### Assessment

- **HIV infection:** monitor CD4, T-cell count, plasma HIV RNA, viral load; resistance testing before treatment, at treatment failure
- Perform drug resistance testing prior to use in treatment-naïve patients
- Immune reconstitution syndrome, usually during initial phase of treatment, may be antiinfective before starting
- Monitor total/HDL/LDL cholesterol baseline and periodically, all may be elected
- **Pregnancy/breastfeeding:** All HIV-positive women should receive antiretroviral therapy, report pregnancy to the Antiretroviral

Pregnancy Registry (800-258-4263), glucose screening should be performed at 24-28 wk gestation, confirm gestation age in each trimester by ultrasound, avoid breastfeeding

### Patient/family education

- Teach patient to take as prescribed; if dose missed to take as soon as remembered up to 1 hr before next dose; not to double dose; not to share with others
- Teach patient that sexual partners need to be told that patient has HIV; that product does not cure infection, just controls symptoms, does not prevent infecting others
- Teach patient to report sore throat, fever, fatigue (may indicate superinfection)
- Teach patient to notify prescriber if pregnancy is planned or suspected; to avoid breastfeeding and to continue follow-up exams and work

### Evaluation

**Positive therapeutic outcome**

- Improvement in cell counts, T-cell counts

## donepezil (Rx)

(don-ep-ee′zill)

**Aricept**

*Func. class.:* Anti-Alzheimer's agent

*Chem. class.:* Reversible cholinesterase inhibitor

**Do not confuse:** Aricept/Aciphex/Azitect

**ACTION:** Elevates acetylcholine concentrations (cerebral cortex) by slowing degradation of acetylcholine released in cholinergic neurons; does not alter underlying dementia

**Therapeutic outcome:** Decreased symptoms of Alzheimer's disease

**USES:** Treatment of mild to severe dementia in Alzheimer's disease

**Unlabeled uses:** Subcortical vascular dementia, dementia with Lewy bodies

## CONTRAINDICATIONS

Hypersensitivity to this product or piperidine derivatives

**Precautions:** Pregnancy, breastfeeding, children, sick sinus syndrome, history of ulcers, GI bleeding, hepatic disease, bladder obstruction, asthma, seizures, COPD, abrupt discontinuation, AV block, GI obstruction, Parkinson's disease, surgery

## DOSAGE AND ROUTES

**Adult:** PO 5 mg/day at bedtime; may increase to 10 mg/day after 4-6 wk, may increase to 23 mg/day after 3 mo of 10 mg/day (moderate to severe)

**Available forms:** Tabs 5, 10, 23 mg; oral sol 1 mg/ml

### Implementation

**PO route**

- Give between meals; may be given with meals for GI symptoms
- Administer dosage adjusted to response no more than q4-6wk, oral dosage forms are interchangeable
- Provide assistance with ambulation during beginning therapy; dizziness, ataxia may occur
- Oral sol: measure with calibrated oral syringe or other calibrated device

## ADVERSE EFFECTS

**CNS:** Dizziness, insomnia, somnolence, headache, fatigue, abnormal dreams, syncope, seizures, drowsiness, agitation, depression, confusion, fever, hallucinations

**CV:** Atrial fibrillation, hypo/hypertension, sinus bradycardia, AV block

**GI:** *Nausea, vomiting,* anorexia, *diarrhea,* abdominal pain, weight loss, GI bleeding

**GU:** Frequency, UTI, incontinence

**INTEG:** Rash, flushing, diaphoresis, bruising

**META:** Hyperlipidemia

**MS:** Cramps, arthritis, arthralgia, back pain

**RESP:** Rhinitis, URI, cough, pharyngitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well |
| **Distribution** | Unknown |
| **Metabolism** | Liver to metabolites |
| **Excretion** | Unknown |
| **Half-life** | 10 hr (single dose) |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

CarBAMazepine, dexamethasone, PHENobarbital, phenytoin, RifAMPin: decreased donepezil effect

Succinylcholine: synergistic effects

### Drug classification

Anticholinergics: decreased activity

Cholinergic agonists, cholinesterase inhibitors: synergistic effects

Increase: QT prolongation: astemizole, cisapride, dofetilide, dronedarone, grepafloxacin, mesoridazine, pimozide, probucol,

sparfloxacin, terfenadine, ziprasidone, do not use concurrently
NSAIDs: increased GI intolerance
CYP2D6, CYP3A4 inducers: decreased donepezil effects
CYP2D6, CYP3A4 inhibitors: increased donepezil effects

### Drug/herb
St. John's wort: decreased donepezil effect

### Drug/lab test
Increase: CK

## NURSING CONSIDERATIONS

### Assessment
- Monitor B/P, heart rate: hypo/hypertension
- Assess mental status: affect, mood, behavioral changes, depression, complete suicide assessment
- Assess GI status: nausea, vomiting, anorexia, diarrhea, active/occult GI bleeding
- Assess GU status: urinary frequency, incontinence
- **Beers:** Avoid use in older adults, increases risk of hyper/hypotension/bradycardia
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if use justifies fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education
- Advise patient to report side effects: twitching, nausea, vomiting, sweating, dizziness; indicates overdose
- Advise patient to use product exactly as prescribed, not to use with other products, unless approved by prescriber
- Advise patient to notify prescriber of nausea, vomiting, diarrhea (dose increase or beginning treatment), or rash
- Advise patient not to increase or abruptly decrease dosage, serious consequences may result
- Instruct patient that product is not a cure
- Teach patient to report if pregnancy is planned or suspected, avoid breastfeeding

### Evaluation

#### Positive therapeutic outcome
- Decrease in confusion; improved mood

**⚠ HIGH ALERT**

## DOPamine (Rx)
(doe'pa-meen)
*Func. class.:* Agonist, vasopressor, inotropic agent
*Chem. class.:* Catecholamine

**Do not confuse:** DOPamine/DOBUTamine

**ACTION:** Causes increased cardiac output; acts on $\beta_1$- and $\alpha$-receptors, causing vasoconstriction in blood vessels; when low doses are administered, causes renal and mesenteric vasodilatation; $\beta_1$ stimulation produces inotropic effects with increased cardiac output

**Therapeutic outcome:** Increased B/P, cardiac output

**USES:** Shock; to increase perfusion; hypotension, cardiogenic/septic shock

## CONTRAINDICATIONS
Hypersensitivity, ventricular fibrillation, tachydysrhythmias, pheochromocytoma, hypovolemia

**Precautions:** Pregnancy, breastfeeding, geriatric, arterial embolism, peripheral vascular disease, sulfite hypersensitivity, acute MI

**BLACK BOX WARNING:** Extravasation

## DOSAGE AND ROUTES
**Adult: IV** INF 2-5 mcg/kg/min, titrate upward 5-10 mcg/kg/min, max 50 mcg/kg/min; titrate to patient's response
**Child: IV** 1-5 mcg/kg/min initially; usual dosage range 2-20 mcg/kg/min

### HF
**Adult: IV** 3-10 mcg/kg/min

**Available forms:** Inj 40, 80, 160 mg/ml; conc for **IV** inf 0.8, 1.6, 3.2 mg/ml in 250, 500 ml $D_5W$

### Implementation
- Store reconstituted sol for up to 24 hr if refrigerated
- Do not use discolored sol; protect from light

**Continuous infusion route**
- Dilute 200-400 mg/250-500 ml of $D_5W$, 0.9% NaCl, $D_5$/LR, $D_5$/0.45% NaCl, $D_5$/0.9% NaCl, LR; do not use discolored sol; sol is stable for 24 hr; give 0.5-5 mcg/kg/min; may increase by 1-4 mcg/kg/min q15-30min until desired patient response; use infusion pump

**BLACK BOX WARNING: Extravasation:** if extravasation occurs, stop infusion, may inject area with phentolamine 10 mg/15 ml NS

**Y-site compatibilities:** Alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate,

CARBOplatin, caspofungin, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clarithromycin, clindamycin, cloNIDine, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, methicillin, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, miconazole, midazolam, milrinone, minocycline, mitoXANTRONE, morphine, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, raNITIdine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanil, tacrolimus, temocillin, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, warfarin, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** *Headache,* anxiety
**CV:** *Palpitations,* tachycardia, *hypertension,* ectopic beats, *angina,* wide QRS complex, peripheral vasoconstriction, hypotension
**GI:** *Nausea, vomiting, diarrhea*
**INTEG:** Necrosis, tissue sloughing with extravasation, gangrene
**RESP:** Dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Widely |
| **Metabolism** | Liver |
| **Excretion** | Kidney, plasma |
| **Half-life** | 2 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 2-5 min |
| **Peak** | Unknown |
| **Duration** | <10 min |

## INTERACTIONS

### Individual drugs

Phenytoin: bradycardia, hypotension

### Drug classifications

α-Adrenergic blockers, β-adrenergic blockers: decreased action of DOPamine
Anesthetics (general): increased dysrhythmias
Antidepressants (tricyclic): increased pressor response
Ergots: severe hypertension
MAOIs: increased hypertension (severe), do not use within 2 wk; increased pressor effect; hypertensive crisis may result
Oxytocics: increased B/P

### Drug/lab test

Increased: urinary catecholamine, serum glucose

## NURSING CONSIDERATIONS

### Assessment

- Monitor ECG for dysrhythmias, ischemia during treatment; some patients may not need continuous ECG monitoring; also monitor PCWP, CVP, $CO_2$, urinary output; notify prescriber if <30 ml/hr
- **Assess for heart failure:** bibasilar crackles, $S_3$ gallop, dyspnea, neck vein distention in patients with cardiomyopathy or HF
- **Assess for oxygenation or perfusion deficit:** decreased B/P, chest pain, dizziness, loss of consciousness
- Monitor B/P and pulse q5min during inf; if B/P drops 30 mm Hg, stop inf and call prescriber

**BLACK BOX WARNING:** Check for extravasation: if this occurs, administer phentolamine mixed with 0.9% NaCl

- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh

fetal risk, may cause toxicity, avoid use in breastfeeding, excretion unknown

### Patient/family education

- Teach patient reason for medication, expected results, reason for all monitoring and procedures
- Advise patient to report all side effects
- Teach patient to report immediately chest pain, SOB, numbness/tingling of extremities
- Teach patient to report immediately pain, burning, redness at IV site

### Evaluation

#### Positive therapeutic outcome

- Increased cardiac output

### TREATMENT OF OVERDOSE:

Discontinue product, support circulation; give a short-acting α-blocker

## doripenem (Rx)

(dore-i-pen'em)

**Doribax**

*Func. class.:* Antiinfective, miscellaneous

*Chem. class.:* Carbapenem

**Do not confuse:** Doribax/Zovirax

### ACTION:

Bactericidal, interferes with cell wall replication of susceptible organisms; osmotically unstable cell wall swells, bursts from osmotic pressure

**Therapeutic outcome:** Negative C&S; decreasing symptoms and signs of infection

### USES:

Serious infections caused by *Acinetobacter baumannii, Bacteroides caccae, Bacteroides fragilis, Bacteroides thetaiotaomicron, Bacteroides uniformis, Bacteroides vulgatus, Citrobacter freundii, Escherichia coli, Klebsiella pneumoniae, Peptostreptococcus micros, Proteus mirabilis, Pseudomonas aeruginosa, Serratia marcescens, Staphylococcus aureus, Streptococcus contellatus, Streptococcus intermedius;* complicated UTIs, pyelonephritis, complicated intraabdominal infections

### CONTRAINDICATIONS

Hypersensitivity to carbapenems (meropenem, doripenem, imipenem), penicillin, β-lactam; viral infection

**Precautions:** Pregnancy, breastfeeding, geriatric, renal disease, seizure disorder, pseudomembranous colitis, nebulizer or inhalation use, hypersensitivity to cephalosporins, children/adolescents

### DOSAGE AND ROUTES

**Adult: IV** 500 mg every 8 hr × 5-14 days; if improvement occurs after 3 days, switch to an appropriate oral product

#### Renal dose

**Adult:** IV CCr 30-50 ml/min 250 mg over 1 hr q8hr; CCr >10 to <30 ml/min 250 mg over 1 hr q12hr; CCr ≤10 ml/min no data

**Available forms:** Powder for inj 500 mg

### Implementation

#### IV route

- Visually inspect parenteral products for particulate matter and discoloration before use, diluted range in color from clear, colorless solutions to solutions that are clear and slightly yellow
- **Reconstitution:** No bacteriostatic preservative is present; observe aseptic technique while preparing the infusion
- **500-mg dose using the 500 mg vial:** Reconstitute the vial with 10 ml of sterile water for injection or sodium chloride 0.9% (normal saline). Gently shake (50 mg/ml); THE RECONSTITUTED SUSPENSION IS NOT FOR DIRECT INJECTION; FURTHER DILUTION IS REQUIRED. Using a syringe with a 21-G needle, withdraw the suspension and add it to an infusion bag containing 100 ml of NS or $D_5W$; gently shake until clear: final (4.5 mg/ml)
- **250-mg dose using the 500 mg vial:** Reconstitute the vial with 10 ml of sterile water for injection or sodium chloride 0.9% (normal saline). Gently shake (50 mg/ml); THE RECONSTITUTED SUSPENSION IS NOT FOR DIRECT INJECTION; FURTHER DILUTION IS REQUIRED. Using a syringe with a 21-G needle, withdraw the 5 ml (250 mg) and add it to an infusion bag containing 100 ml of normal saline or $D_5W$; gently shake until clear; remove 55 ml of this solution and discard. The remaining infusion solution contains 250 mg (4.5 mg/ml)
- **250-mg dose using the 250 mg vial:** Reconstitute the vial with 10 ml of sterile water for injection or sodium chloride 0.9% (normal saline). Gently shake (25 mg/ml); THE RECONSTITUTED SUSPENSION IS NOT FOR DIRECT INJECTION; FURTHER DILUTION IS REQUIRED. Using a syringe with a 21-G needle, withdraw the contents of the vial and add it to an infusion bag containing 50 or 100 ml of normal saline or $D_5W$; gently shake until clear; final concentration 4.2 mg/ml (50 ml infusion bag) or 2.3 mg/ml (100 ml infusion bag)
- **Storage:** Reconstituted suspensions may be held in vial for up to 1 hr prior to transfer and dilution in the infusion bag. Including storage and infusion time, diluted infusion solutions are stable for up to 12 hr (NS) or 4 hr ($D_5W$) at controlled

room temperature; diluted infusion solutions are stable for up to 72 hr (NS) or 24 hr ($D_5W$) refrigerated, do not freeze reconstituted solutions.
• If Baxter Minibag Plus infusion bags are to be used, consult the instructions provided by the infusion bag manufacturer

**Intermittent IV infusion route**
• Do not mix with or physically add to solutions containing other drugs, infuse over 1 hr

**Solution compatibilities:** $D_5W$, 0.9% NaCl, sterile water for inj

**Y-site compatibilities:** Acyclovir, amikacin, aminophylline, amiodarone, anidulafungin, atropine, azithromycin, bumetanide, calcium gluconate, CARBOplatin, caspofungin, ceftaroline, ceftobiprole, cimetidine, ciprofloxacin, CISplatin, cyclophosphamide, cycloSPORINE, DAPTOmycin, dexamethasone, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin, enalaprilat, esmolol, esomeprazole, etoposide, famotidine, fentaNYL, fluconazole, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, insulin (regular), labetalol, levofloxacin, linezolid, LORazepam, magnesium sulfate, mannitol, meperidine, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, micafungin, midazolam, milrinone, morphine, moxifloxacin, norepinephrine, ondansetron, PACLitaxel, pantoprazole, PHENobarbital, phenylephrine, potassium chloride, raNITIdine, sodium bicarbonate/phosphates, tacrolimus, telavancin, tigecycline, tobramycin, vancomycin, voriconazole, zidovudine

## ADVERSE EFFECTS

**CNS:** Seizures, headache
**GI:** *Diarrhea, nausea,* vomiting, pseudomembranous colitis, hepatitis
**GU:** Renal impairments/failure
**HEMA:** Neutropenia, leukopenia, anemia
**INTEG:** *Rash,* urticaria, phlebitis, erythema at inj site, Stevens-Johnson syndrome, toxic epidermal necrolysis, pruritus
**RESP:** Pneumonitis (inhalation)
**SYST:** Anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | To most body fluids/tissue |
| **Metabolism** | Unknown |
| **Excretion** | Mainly unchanged in urine, 70% recovered in 48 hr |
| **Half-life** | 1 hr, extended in renal disease |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Probenecid: increased doripenem plasma levels
Divalproex sodium, valproic acid: decreased effects

### Drug/lab test

Increased: AST, ALT, LDH, BUN, alkaline phosphatase, bilirubin, creatinine
False positive: direct Coombs' test

## NURSING CONSIDERATIONS

### Assessment

• Assess sensitivity to carbapenem antibiotics, penicillins, cephalosporins, other beta lactams
• Monitor renal disease: lower dose may be required
• **Pseudomembranous colitis:** Monitor bowel pattern daily, diarrhea, abdominal cramps, fever; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis
• **Monitor for infection:** temp, sputum, characteristics of wound, before, during, and after treatment
• **Monitor for allergic reactions, anaphylaxis:** rash, urticaria, pruritus; may occur few days after therapy begins, discontinue, notify prescriber, have emergency equipment nearby
• **Monitor overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
• **Pregnancy/breastfeeding:** Use only if clearly needed, likely safe in breastfeeding

### Patient/family education

• Instruct patient to report severe diarrhea with abdominal cramping, fever; may indicate pseudomembranous colitis
• Instruct patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
• Instruct patient to report overgrowth of infection: black, furry tongue; vaginal itching; foul-smelling stools
• Advise patient to avoid breastfeeding; product is excreted in breast milk

### Evaluation

**Positive therapeutic outcome**
• Negative C&S
• Absence of symptoms and signs of infection

**TREATMENT OF HYPERSENSITIVITY:** EPINEPHrine, antihistamines; resuscitate if needed (anaphylaxis)

## dorzolamide ophthalmic

*See Appendix B*

## doxazosin (Rx)

(dox-ay′zoe-sin)
**Cardura, Cardura XL**
*Func. class.:* Peripheral α-adrenergic blocker, antihypertensive
*Chem. class.:* Quinazoline

**Do not confuse:** Cardura/Coumadin/Cardene/Ridaura

**ACTION:** Peripheral blood vessels are dilated, peripheral resistance lowered; reduction in B/P results from peripheral α-adrenergic receptors being blocked

**Therapeutic outcome:** Decreased B/P, decreased symptoms of benign prostatic hypertrophy (BPH)

**USES:** Hypertension, urinary outflow obstruction, symptoms of benign prostatic hyperplasia

## CONTRAINDICATIONS

Hypersensitivity to quinazolines

**Precautions:** Pregnancy, breastfeeding, children, hepatic disease, geriatrics

## DOSAGE AND ROUTES

### BPH

**Adult:** PO 1 mg/day at bedtime, increase in stepwise manner to 2, 4, 8 mg/day as needed at 1-2 wk intervals, max 8 mg; ext rel tab (Cardura XL) 4 mg/day with breakfast, adjust dose q3-4wk up to 8 mg/day

### Hypertension

**Adult:** PO 1 mg/day at bedtime, increasing up to 16 mg daily if required; usual range 4-16 mg/day
**Geriatric:** PO 0.5 mg nightly, gradually increase

**Available forms:** Tabs 1, 2, 4, 8 mg; ext rel tabs 4, 8 mg

### Implementation

**PO route**

- **Tabs** broken, crushed, or chewed; chewed tabs taste bitter; do not break, crush, chew **XL tabs**
- **Immediate release tab:** give without regard to meals; **EXT REL tabs:** give with breakfast; when switching from immediate release to EXT REL, the final evening dose of immediate release should be taken
- Store in tight container at room temperature (86° F [30° C] or less)
- May be used in combination with other antihypertensives
- May be given with food to prevent GI symptoms

## ADVERSE EFFECTS

**CNS:** *Dizziness,* headache, drowsiness, anxiety, depression, vertigo, weakness, fatigue, asthenia, syncope
**CV:** Palpitations, *orthostatic hypotension,* tachycardia, *edema,* dysrhythmias, chest pain
**EENT:** Epistaxis, tinnitus, dry mouth, red sclera, pharyngitis, rhinitis
**GI:** *Nausea,* vomiting, diarrhea, constipation, abdominal pain, hepatitis
**GU:** Incontinence, polyuria, priapism, impotence, decreased libido

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Not known; 98% plasma protein bound |
| **Metabolism** | Liver, extensively (<63%) |
| **Excretion** | Kidneys |
| **Half-life** | 22 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 2 hr |
| **Peak** | 2-3 hr |
| **Duration** | up to 24 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased hypotensive effects

### Drug classifications

NSAIDs, estrogens, sympathomimetics: decrease: hypotensive effects
Other antihypertensives, nitrates, PDE-5 inhibitors, dose may need adjustment: increased hypotensive effects

## NURSING CONSIDERATIONS

### Assessment

- **Hypertension:** monitor B/P (lying, standing) and pulse, syncope; check for edema in feet, legs daily; I&O; monitor for weight daily; notify prescriber of changes
- **BPH:** urinary pattern changes (hesitancy, dribbling, incomplete bladder emptying, dysuria, urgency, nocturia, urgency incontinence, intermittency before and during treatment)
- Assess for orthostatic hypotension; tell patient to rise slowly from sitting or lying position; assess pulse, jugular venous distention q4hr, crackles, dyspnea, orthopnea with B/P

• **Pregnancy/breastfeeding:** No well-controlled studies, use only if clearly needed, use cautiously in breastfeeding

### Patient/family education

• Teach patient not to discontinue product abruptly; emphasize the importance of complying with dosage schedule, even if feeling better; if dose is missed take as soon as remembered; take at same time each day
• Teach patient not to use OTC products (cough, cold, allergy) unless directed by prescriber; also to avoid large amounts of caffeine
• Emphasize the need to rise slowly to sitting or standing position to minimize orthostatic hypotension
• Teach patient to notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain
• Caution patient to report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P
• Caution patient that product may cause dizziness, fainting, light-headedness; may occur during 1st few days of therapy; to avoid hazardous activities
• Teach patient how to take B/P, and normal readings for age-group; to take B/P q7days
• Inform patient that fainting occasionally occurs after 1st dose; do not drive or operate machinery for 4 hr after 1st dose or after dosage increase or take 1st dose at bedtime; may take 1-2 wk in BPH
• Teach patient to comply with hypertension regimen, low-sodium diet, exercise, weight reduction, stress management, not to smoke
• Teach patient how to take B/P to check at least once/wk
• Teach patient to notify all health care providers of all RX, OTC, and herbal supplements; not to add any products unless approved by prescriber
• Teach patient to avoid hazardous activities until response is known, dizziness or drowsiness may occur
• Teach patient to continue to take product even if feeling better, take at same time each day, do not take double doses

### Evaluation

**Positive therapeutic outcome**

• Decreased B/P in hypertension
• Decreased symptoms of BPH

## TREATMENT OF OVERDOSE:

Administer volume expanders or vasopressors; discontinue product; place in supine position

**⚠ HIGH ALERT**

## doxepin (Rx)

(dox′e-pin)
**Prudoxin Cream, Silenor 🍁, SINEquan 🍁, Zonolon Topical Cream**
*Func. class.:* Antidepressant, tricyclic; antianxiety
*Chem. class.:* Dibenzoxepin, tertiary amine

D

**ACTION:** Blocks reuptake of norepinephrine, serotonin into nerve endings, increasing action of norepinephrine, serotonin in nerve cells; has anticholinergic effects

**Therapeutic outcome:** Decreased symptoms of depression after 2-3 wk

**USES:** Major depression, anxiety, topical: lichen simplex, atopic dermatitis, eczema, insomnia

**Unlabeled uses:** Migraine prophylaxis; topical: pruritus

## CONTRAINDICATIONS

Hypersensitivity to tricyclics, urinary retention, closed-angle glaucoma, prostatic hypertrophy, acute recovery from MI

**Precautions:** Pregnancy, breastfeeding, geriatric, seizures

**BLACK BOX WARNING:** Suicidal patients, children

## DOSAGE AND ROUTES

### Depression/anxiety

**Adult:** PO 50-75 mg/day, may increase to 300 mg/day for severely ill, give in divided doses if >150 mg/day
**Geriatric:** PO 25-50 mg at bedtime, increase qwk by 25-50 mg to desired dose, max 150 mg/day

### Pruritus

**Adult:** PO 10 mg at bedtime, may increase to 25 mg at bedtime; TOP apply a thin film qid ≥3 hr apart

### Insomnia (Silenor)

**Adult:** PO 6 mg, 30 min before bedtime, 3 mg may be sufficient, max 6 mg/night

**Available forms:** Caps 10, 25, 50, 75, 100, 150 mg; oral conc 10 mg/ml; cream 5%; tabs (Silenor) 3, 6 mg

### Implementation

• **Oral conc** should be diluted with 120 ml of water, milk, or orange, grapefruit, tomato, prune, pineapple juice; do not mix with grape juice

• Give with food or milk for GI symptoms; do not give with carbonated beverages
• Give dose at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric may not tolerate once/day dosing
• Store at room temperature; do not freeze
• Provide safety measures, primarily for geriatric
• Store in tight container protected from direct sunlight
• **Topical:** apply to affected area; rub slightly, do not use occlusive dressing

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric), increased psychiatric symptoms, paresthesia, suicidal ideation
**CV:** *Orthostatic hypotension, ECG changes,* tachycardia, *hypertension,* palpitations, dysrhythmias
**EENT:** *Blurred vision,* tinnitus, mydriasis, ophthalmoplegia, glossitis
**GI:** *Diarrhea, dry mouth,* nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis, constipation
**GU:** *Retention,* acute renal failure
**HEMA:** Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia, pancytopenia, purpuric disorder
**INTEG:** Rash, urticaria, sweating, pruritus, photosensitivity

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver, extensively by CYP2C19/CYP2D6 7% of patients are poor metabolizers |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 8-24 hr |

### Pharmacodynamics

**PO:** Peak 2 hr

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Cimetidine, FLUoxetine, fluvoxaMINE, PARoxetine, sertraline: increased doxepin effect
CloNIDine: increased hypertensive crisis; do not use together
EPINEPHrine, norepinephrine: increased hypertensive action

### Drug classifications

Antiarrhythmics, 1C (propafenone, flecainide), class III, quinolones: increased QT interval
Anticholinergics: increased anticholinergic effect
Barbiturates, benzodiazepines, CNS depressants, sedative/hypnotics: increased CNS depression
MAOIs: hypertensive crisis, seizures, hyperpyretic crisis
SSRIs, SNRIs, serotonin receptor agonists, triptans: increased toxicity

### Drug/herb

St. John's wort: increased serotonin syndrome, avoid using together

### Drug/lab test

Increased: serum bilirubin, blood glucose, alkaline phosphatase, LFTs

## NURSING CONSIDERATIONS

### Assessment

• **Assess chronic pain:** location, severity, type, alleviating/aggravating factors before and during treatment
• **Sexual dysfunction: Assess for decreased libido, erectile dysfunction may occur**
• Monitor B/P (with patient lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with CV disease
• Monitor blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy
• Monitor liver function tests: AST, ALT, bilirubin
• Check weight weekly; appetite may increase with product
• Assess ECG for flattening of T wave, bundle branch block, AV block, dysrhythmias in cardiac patients; product should be discontinued gradually several days before surgery
• Assess for EPS primarily in geriatric: rigidity, dystonia, akathisia
• **Assess depression:** mood, sensorium, affect, suicidal tendencies; increase in psychiatric symptoms, assess often during initial treatment, restrict the amount of the product given to the patient
• Monitor urinary retention, constipation; constipation is more likely to occur in children or geriatric
• **Assess for withdrawal symptoms:** headache, nausea, diarrhea, agitation, hallucination, hyperthermia, incoordination, vomiting, muscle pain, weakness; do not usually occur unless product was discontinued abruptly
• Identify alcohol consumption; if alcohol is consumed, hold dose until AM

• **Beers:** Avoid use in older adults, highly anticholinergic, sedating, causes orthostatic hypotension, may cause delirium
• **Serotonin syndrome:** May occur when used with other products known to cause serotonin syndrome
• **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh risks, cautious use in breastfeeding, excreted in breast milk

### Patient/family education

• Tell patient that therapeutic effects of decreased depression may take 2-3 wk, antianxiety effects sooner; to use caution in driving and other activities requiring alertness because of drowsiness, dizziness, blurred vision
• Advise patient to avoid rising quickly from sitting to standing, especially geriatric
• Teach patient to avoid alcohol ingestion, other CNS depressants: may potentiate effects; not to discontinue medication quickly after long-term use: may cause nausea, headache, malaise
• Teach patient to wear sunscreen or large hat, since photosensitivity occurs
• Teach patient that clinical worsening and suicidal ideation may occur
• Teach patient to increase fluids, bulk in diet if constipation occurs, especially geriatric; to take gum, hard sugarless candy, or frequent sips of water for dry mouth
• Teach patient to report urinary retention immediately

### Evaluation

**Positive therapeutic outcome**

• Decrease in depression
• Absence of suicidal thoughts

**TREATMENT OF OVERDOSE:** ECG monitoring, induce emesis, lavage, administer anticonvulsant

## doxercalciferol

*See Vitamin D*

⚠ **HIGH ALERT**

## DOXOrubicin

(dox-oh-roo'bi-sin)

**Adriamycin**

*Func. class.:* Antineoplastic, antibiotic
*Chem. class.:* Anthracycline glycoside

**Do not confuse:** DOXOrubicin/DOXOrubicin liposomal/DAUNOrubicin

**ACTION:** Inhibits DNA synthesis primarily; replication is decreased by binding to DNA, which causes strand splitting; active throughout entire cell cycle; a vesicant

**USES:** Wilms' tumor; bladder, breast, lung, ovarian, stomach, thyroid cancer; Hodgkin's/non-Hodgkin's disease; acute lymphoblastic leukemia; myeloblastic leukemia; neuroblastomas; soft tissue/bone sarcomas

**CONTRAINDICATIONS:** Pregnancy 1st trimester, breastfeeding, hypersensitivity, systemic infections, cardiac disorders, severe myelosuppression, lifetime dose of 550 mg/m$^2$

**BLACK BOX WARNING:** Hepatic disease

**Precautions:** Accidental exposure, cardiac disease, dental work, electrolyte imbalance, infection, hyperuricemia

**BLACK BOX WARNING:** Bone marrow suppression, extravasation, heart failure, secondary malignancy; requires an experienced clinician, IM/SUBCUT use

## DOSAGE AND ROUTES

**Adult: IV** 60-75 mg/m$^2$ q3wk, or may be used in combination with other antineoplastics with 40-75 mg/m$^2$ q21-28d, max cumulative dose 550 mg/m$^2$ or 450 mg/m$^2$ if prior DAUNOrubicin, cyclophosphamide, mediastinal XRT

### Hepatic dose

**Adult:** IV Bilirubin 1.2-3 mg/dl, give 50% of dose; bilirubin 3.1-5 mg/dl, give 25% of dose

### Renal dose

**Adult:** IV CCr <10 ml/min give 75% of dose

**Available forms:** Powder for inj 10, 20, 50 mg; inj 2 mg/ml

### Implementation

**IV route**

• Give antiemetic 30-60 min before product to prevent vomiting
• Give allopurinol or sodium bicarbonate to maintain uric acid levels, alkalization of urine
• **Use cytotoxic handling procedures:** inspect for particulate and discoloration before use

**BLACK BOX WARNING:** Do not give IM, subcut

**BLACK BOX WARNING:** If extravasation occurs, stop inf and complete via another vein, preferably in another limb, use dexrazoxane topically

- Aluminum needles may be used during administration; avoid aluminum during storage
- Rapid injection can cause facial flushing or erythema along the vein

**Reconstitution:**

- To avoid risks with reconstitution, the commercially available injection may be used; there are still risks involved in handling the injection
- Do not use diluents containing preservatives to reconstitute powder for injection
- Reconstitute 10, 20, 50, 100 mg of DOXOrubicin with 5, 10, 25, 50 ml, respectively, of nonbacteriostatic NS injection (2 mg/ml), shake until completely dissolved; use reconstituted solution within 24 hr; do not expose to sunlight
- **IV injection:** Inject reconstituted solution over 0.3-5 min via Y-site or 3-way stopcock into a free-flowing IV inf of NS or $D_5W$; a butterfly needle inserted into a large vein is preferred

**BLACK BOX WARNING:** Care should be taken to avoid extravasation because the drug is extremely irritating to extravascular tissue

- Increased fluid intake to 2-3 L/day to prevent urate, calculi formation
- Store at room temperature for 24 hr after reconstituting

**Y-site compatibilities:** Alemtuzumab, alfentanil, amifostine, amikacin, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceftizoxime, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, cladribine, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, HYDROmorphone, ifosfamide, imipenem cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, leucovorin, levorphanol, lidocaine, linezolid, LORazepam, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, morphine, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pancuronium, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin-dalfopristin, raNITIdine, sargramostim, sodium acetate, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CV:** Increased B/P, sinus tachycardia, PVCs, chest pain, bradycardia, extrasystoles, irreversible cardiomyopathy, acute left ventricular failure

**GI:** *Nausea, vomiting,* anorexia, *mucositis,* hepatotoxicity

**GU:** Impotence, sterility, amenorrhea, gynecomastia, hyperuricemia, urine discoloration

**HEMA:** Thrombocytopenia, leukopenia, anemia

**INTEG:** *Rash,* necrosis at inj site, radiation recall, dermatitis, reversible *alopecia,* cellulitis, thrombophlebitis at inj site

**SYST:** Anaphylaxis, secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Urine, bile, breast milk |
| **Half-life** | 30 min, terminal 16.5 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CycloSPORINE, mercaptopurine: increased toxicity

Fluconazole, posaconazole: increased life-threatening dysrhythmias: do not use together

Fosphenytoin, phenytoin: increased effect of these drugs

Hematopoietic progenitor cell: decreased antineoplastic effect; do not use 24 hr before or after treatment

PACLitaxel: decreased clearance of DOXOrubicin

PHENobarbital: decreased DOXOrubicin effect
Progesterone: increased neutropenia, thrombocytopenia
Streptozocin: increased DOXOrubicin effect

### Drug classifications

Antineoplastics, radiation: increased toxicity
Calcium channel blockers: increased cardiomyopathy
Drugs that increase QT prolongation: increased effect
Live virus vaccine: decreased antibody response

### Drug/lab test

Increased: uric acid

## NURSING CONSIDERATIONS

### Assessment:

**BLACK BOX WARNING: Bone marrow depression:** CBC, differential, platelet count weekly; withhold or reduce dose of product if WBC is $<1500/mm^3$ or platelet count is $<50,000/mm^3$; notify prescriber of these results

- Renal studies: BUN, serum uric acid, urine CCr, electrolytes before, during therapy
- I&O ratio: Report fall in urine output to <30 ml/hr
- Monitor temperature: Fever might indicate beginning infection
- **Hepatotoxicity:** hepatic studies before, during therapy: bilirubin, AST, ALT, alk phos as needed or monthly; check for jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

**BLACK BOX WARNING: Dysrhythmias:** ECG; watch for ST-T wave changes, low QRS and T, possible dysrhythmias (sinus tachycardia, heart block, PVCs), ejection fraction before treatment, signs of irreversible cardiomyopathy, can occur up to 6 mo after treatment begins

- **Bleeding:** hematuria, guaiac, bruising, petechiae of mucosa or orifices every 8 hr
- Effects of alopecia on body image; discuss feelings about body changes; almost total alopecia is expected

**BLACK BOX WARNING: Secondary malignancy:** Assess for acute myelogenous leukemia (AML) and myelodysplastic syndrome (MDS)

- Buccal cavity every 8 hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia
- Alkalosis if severe vomiting is present

**BLACK BOX WARNING: Extravasation:** local irritation, pain, burning at inj site; a vesicant; if extravasation occurs, stop drug, restart at another site, apply ice, elevate extremity to reduce swelling; if resolution does not occur, surgical debridement may be required

- GI symptoms: frequency of stools, cramping
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

### Patient/family education

- Instruct patient to add 2-3 L of fluids unless contraindicated before and for 24-48 hr after to decrease possible hemorrhagic cystitis
- Instruct patient to report any complaints, side effects to nurse or prescriber
- Advise patient that hair may be lost during treatment; that wig or hairpiece might make patient feel better; that new hair might be different in color, texture
- Instruct patient to avoid foods with citric acid, hot or rough texture
- Instruct patient to report any bleeding, white spots, ulcerations in mouth to prescriber; to examine mouth daily
- Advise patient that urine, other body fluids may be red-orange for 48 hr
- Instruct patient to avoid crowds and persons with infections when granulocyte count is low
- **Pregnancy/breastfeeding:** Advise patient that barrier contraceptive measures are recommended during therapy and for 4 mo after to avoid breastfeeding
- Instruct patient to avoid vaccinations

### Evaluation

#### Positive therapeutic outcome

- Decreased tumor size, decreased spread of malignancy

**⚠ HIGH ALERT**

## DOXOrubicin liposomal

(dox-oh-roo'bi-sin)
**Doxil, Lipodex**
*Func. class.:* Antineoplastic, antibiotic
*Chem. class.:* Anthracycline glycoside

**Do not confuse:** DOXOrubicin liposomal/ DOXOrubicin/DAUNOrubicin

**ACTION:** Inhibits DNA synthesis primarily; replication is decreased by binding to DNA, which causes strand splitting; active throughout entire cell cycle; a vesicant

**USES:** AIDS-related Kaposi's sarcoma, multiple myeloma, metastatic ovarian carcinoma

## CONTRAINDICATIONS:

Pregnancy, breastfeeding, hypersensitivity

**Precautions:** Children, infection, leukopenia, stomatitis, thrombocytopenia, cardiotoxicity, inf reactions, myelosuppression, hepatic disease, systemic infections, cardiac disorders

## DOSAGE AND ROUTES

Max lifetime cumulative dose 550 mg/m$^2$; 400 mg/m$^2$ for those who have received other cardiotoxics or mediastinal radiation

### Kaposi's sarcoma

**Adult: IV** 20 mg/m$^2$ q3wk

### Multiple myeloma

**Adult: IV** 30 mg/m$^2$ IV inf on day 4 every 3 wk plus bortezomib 1.3 mg/m$^2$/dose IV bolus on days 1, 4, 8, 11 of each cycle; give DOXOrubicin liposomal after bortezomib receipt on day 4; administer up to 8 treatment cycles or until disease progression or unacceptable toxicity occurs

### Breast cancer, metastatic (unlabeled)

**Adult: IV** 50 mg/m$^2$ day 1, q4wk

**Available forms:** Liposomal dispersion for inj: 2 mg/ml

### Implementation

- Prepared liposomal DOXOrubicin is a translucent, red liposomal dispersion; visually inspect for particulate matter and discoloration before use
- Pegylated liposomal DOXOrubicin (Doxil) is for IV INF use only and should not be given IM/subcut, give under the supervision of a physician who is experienced in cancer chemotherapy

**BLACK BOX WARNING:** Care should be taken to avoid extravasation because the drug is irritating to extravascular tissue

- Premedication with antiemetics is recommended

**IV route**

- **Reconstitution (Doxil):** dilute the appropriate dose, not to exceed 90 mg/250 ml $D_5W$; do not mix with any other diluent, drugs, or bacteriostatic agent, use aseptic technique; product contains no preservative or bacteriostatic agent; diluted solution must be refrigerated and used within 24 hr
- **IV INF (Doxil):** do not administer as a bolus injection or an undiluted solution; rapid injection can increase the risk of an inf-related reaction
- An acute inf reaction can occur during the first inf and is usually resolved by slowing the rate of inf; most patients can tolerate subsequent inf
- **Rate:** infuse at an initial rate of 1 mg/min; if no inf-related action, the rate can be increased to complete the inf over 1 hr; do not filter
- For hematologic toxicity in patients with ovarian cancer or HIV-related Kaposi's sarcoma: Grade 1 (ANC of 1500-1900/mm$^3$, platelets ≥75,000/mm$^3$): No dose reduction; Grade 2 (ANC of 1000-1499/mm$^3$, platelets ≥50,000/mm$^3$ and <75,000/mm$^3$: Wait until ANC ≥1500 cells/mm$^3$ and platelets ≥75,000 cells/mm$^3$; redose with no dose reduction; Grade 3 (ANC of 500-999/mm$^3$, platelets ≥25,000/ mm$^3$ and <50,000/mm$^3$): Wait until ANC ≥1500 cells/mm$^3$ and platelets ≥75,000 cells/mm$^3$; redose with no dose reduction; Grade 4 (ANC <500/mm$^3$, platelets <25,000/mm$^3$): Wait until ANC ≥1500 cells/mm$^3$ and platelets ≥75,000 cells/mm$^3$; reduce dose by 25% or continue with full dose with colony-stimulating factor
- Give antiemetic 30-60 min before product to prevent vomiting
- Use allopurinol or sodium bicarbonate to maintain uric acid levels, alkalinization of urine
- Avoid mixing with other products
- Increase fluid intake to 2-3 L/day to prevent urate, calculi formation
- Store refrigerated for 24 hr after reconstituting

## ADVERSE EFFECTS

**CNS:** Paresthesias, headache, depression, insomnia, fatigue, fever

**CV:** Chest pain, decreased B/P, cardiomyopathy, heart failure, dysrhythmias, tachycardia

**EENT:** Optic neuritis, rhinitis, pharyngitis, stomatitis

**GI:** *Nausea, vomiting,* anorexia, *mucositis,* hepatotoxicity, constipation, oral candidiasis, abdominal pain

**HEMA:** Thrombocytopenia, leukopenia, anemia, neutropenia, secondary malignancy

**INTEG:** *Rash,* necrosis at inj site, dermatitis, reversible *alopecia,* exfoliative dermatitis, palmar-plantar erythrodysesthesia, thrombophlebitis at inj site

**RESP:** Dyspnea, cough, respiratory infections

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Urine, bile, breast milk |
| **Half-life** | 55 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CycloSPORINE, mercaptopurine: increased toxicity
Fluconazole, posaconazole: increased life-threatening dysrhythmias: do not use together
Fosphenytoin, phenytoin: increased effect of these drugs
Hematopoietic progenitor cell: decreased antineoplastic effect; do not use 24 hr before or after treatment
PACLitaxel: decreased clearance of DOXOrubicin
PHENobarbital: decreased DOXOrubicin effect
Progesterone: increased neutropenia, thrombocytopenia
Streptozocin: increased DOXOrubicin effect

### Drug classifications

Antineoplastics, radiation: increased toxicity
Calcium channel blockers: increased cardiomyopathy
Drugs that increase QT prolongation: increased effect
Live virus vaccine: decreased antibody response

### Drug/lab test

Increased: uric acid

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Bone marrow depression:** CBC, differential, platelet count weekly; withhold or reduce dose of product if WBC is $<1500/mm^3$ or platelet count is $<50,000/mm^3$; notify prescriber of these results

- Renal studies: BUN, serum uric acid, urine CCr, electrolytes before, during therapy
- I&O ratio: Report fall in urine output to <30 ml/hr
- Monitor temperature: Fever might indicate beginning infection
- **Hepatotoxicity:** hepatic studies before, during therapy: bilirubin, AST, ALT, alk phos as needed or monthly; check for jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

**BLACK BOX WARNING: Dysrhythmias:** ECG; watch for ST-T wave changes, low QRS and T, possible dysrhythmias (sinus tachycardia, heart block, PVCs), ejection fraction before treatment, signs of irreversible cardiomyopathy, can occur up to 6 mo after treatment begins

- Bleeding: hematuria, guaiac, bruising, petechiae of mucosa or orifices every 8 hr
- Effects of alopecia on body image; discuss feelings about body changes; almost total alopecia is expected
- Inflammation of mucosa, breaks in skin
- Buccal cavity every 8 hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia
- Alkalosis if severe vomiting is present

**BLACK BOX WARNING: Extravasation:** local irritation, pain, burning at inj site; a vesicant; if extravasation occurs, stop drug, restart at another site, apply ice, elevate extremity to reduce swelling; if resolution does not occur, surgical debridement may be required

- **Secondary malignancy:** Assess for acute myelogenous leukemia and oral cancer
- GI symptoms: frequency of stools, cramping
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

### Patient/family education

- Instruct patient to add 2-3 L of fluids unless contraindicated before and for 24-48 hr after to decrease possible hemorrhagic cystitis
- Instruct patient to report any complaints, side effects to nurse or prescriber
- Advise patient that hair may be lost during treatment; that wig or hairpiece might make patient feel better; that new hair might be different in color, texture
- Instruct patient to avoid foods with citric acid, hot or rough texture
- Instruct patient to report any bleeding, white spots, ulcerations in mouth to prescriber; to examine mouth daily
- Advise patient that urine, other body fluids may be red-orange for 48 hr
- Instruct patient to avoid crowds and persons with infections when granulocyte count is low
- **Pregnancy/breastfeeding:** Advise patient that barrier contraceptive measures are recommended during therapy and for 4 mo after to avoid breastfeeding
- Instruct patient to avoid vaccinations because reactions can occur; to avoid alcohol

## Evaluation

**Positive therapeutic outcome**

• Decreased tumor size, decreased spread of malignancy

### doxycycline (Rx)

(dox-i-sye'kleen)

**Adoxa, Alsoxa, Apo-Doxy, Doryx, Doxy, Doxycaps, Doxycin, doxycycline calcium, doxycycline hyclate, doxycycline monohydrate, Monodox, Monohydrate, Oracea, Periostat, Vibramycin, Vibra-Tabs**

*Func. class.:* Antiinfective

*Chem. class.:* Tetracycline

**Do not confuse:** doxycycline/doxepin/dicyclomine

**ACTION:** Inhibits protein synthesis, phosphorylation in microorganisms by binding to 30S ribosomal subunits, reversibly binding to 30S ribosomal subunits; bacteriostatic

**Therapeutic outcome:** Bactericidal action against the following: gram-positive pathogens: *Bacillus anthracis, Clostridium perfringens, Clostridium tetani, Listeria monocytogenes, Nocardia, Propionibacterium acnes, Actinomyces israelii;* gram-negative pathogens *Haemophilus influenzae, Legionella pneumophila, Yersinia enterocolitica, Yersinia pestis, Neisseria gonorrhoeae, Neisseria meningitidis, Mycoplasma, Chlamydia*

**USES:** Syphilis, gonorrhea, lymphogranuloma venereum, uncommon gram-negative or gram-positive organisms, malaria prophylaxis, *Acinetobacter, Actinomyces israelii, Bacillus anthracis, Bacteroides, Balantidium coli, Bartonella bacilliformis, Borrelia recurrentis, Brucella, Campylobacter fetus, Chlamydia psittaci, Chlamydia trachomatis, Clostridium, Entamoeba histolytica, Enterobacter aerogenes, Enterococcus, Escherichia coli, Francisella tularensis, Fusobacterium fusiforme, Haemophilus ducreyi, Haemophilus influenzae* (beta-lactamase negative), *Haemophilus influenzae* (beta-lactamase positive), *Klebsiella granulomatis, Klebsiella, Leptospira, Listeria monocytogenes, Mycoplasma pneumoniae, Neisseria gonorrhoeae, Neisseria meningitidis, Orientia tsutsugamushi, Plasmodium falciparum, Propionibacterium acnes, Rickettsia akari, Rickettsia prowazekii, Rickettsia rickettsii, Shigella, Staphylococcus aureus* (MSSA), *Streptococcus pneumoniae, Streptococcus pyogenes* (group A beta-hemolytic streptococci), *Treponema pallidum, Treponema pertenue, Ureaplasma urealyticum, Vibrio cholerae,* viridans streptococci, *Yersinia pestis*

**Unlabeled uses:** Enterocolitis, biliary tract, intraabdominal infections; epididymitis *(Chlamydia trachomatis);* chronic prostatitis *(Ureaplasma urealyticum);* traveler's diarrhea (enterotoxigenic *Escherichia coli*); Legionnaire's disease *(Legionella pneumophila);* Lyme disease *(Borrelia burgdorferi),* Lyme disease (erythema migrans); Lyme arthritis; Lyme carditis; pleural effusion; malaria (chloroquine-resistant *Plasmodium falciparum*); pelvic inflammatory disease (PID), tubo-ovarian abscess in combination; acute dental infection, dentoalveolar infection, endodontic infection; aggressive juvenile periodontitis, plague prophylaxis *(Yersinia pestis);* tularemia prophylaxis *(Francisella tularensis);* Bancroft's filariasis (elephantiasis) *(Wuchereria bancrofti);* melioidosis due to *Burkholderia pseudomallei;* leptospirosis *(Leptospira);* infection prophylaxis for gynecologic procedures/surgical infection prophylaxis for hysterosalpingogram or chromotubation/induced abortion/dilation and evacuation; methicillin-resistant *Staphylococcus aureus* (MRSA)-associated bone and joint infections

## CONTRAINDICATIONS

Pregnancy, children <8 yr, esophageal ulceration, hypersensitivity to tetracyclines

**Precautions:** Hepatic disease, breastfeeding, pseudomembranous colitis, ulcerative colitis, sulfite hypersensitivity, excessive sunlight

## DOSAGE AND ROUTES

### Most infections

**Adult:** PO/**IV** 100 mg q12hr on day 1, then 100 mg/day; **IV** 200 mg in 1-2 INF on day 1, then 100-200 mg/day

**Child >8 yr (≥45 kg):** PO/**IV** 100 mg q12hr on day 1, then 100 mg/day; severe infections 100 mg q12hr; **IV** 200 mg on day 1, then 100-200 mg/day, give 200 mg dose as 1 or 2 infusions

**Child ≥8 yr, <45 kg:** PO 2.2 mg/kg q12hr on day 1, then 2.2 mg/kg/day, severe infections 2.2 mg/kg q12hr; **IV** 4.4 mg/kg divided on day 1, then 2.2-4.4 mg/kg/day in 1-2 divided doses

### Gonorrhea (uncomplicated) (patients allergic to penicillin)

**Adult:** PO 100 mg q12hr × 7 days, or 300 mg followed 1 hr later by another 300 mg

### Malaria prophylaxis

**Adult:** 100 mg/day 1-2 days before travel, daily during travel, and 4 wk after return

**Adolescent/child ≥8 yr <45 kg:** PO 2 mg/kg/day (up to 100 mg/day) begin 1-2 days before travel, continue for 4 wk after return

### Chlamydia trachomatis
**Adult:** PO 100 mg bid × 7 days

### Syphilis
**Adult:** PO 100 mg bid × 14 days

### Anthrax
**Adult and child >8 yr and ≥45 kg: IV** 100 mg q12hr, change to PO when able × 60 days
**Adolescent/child ≥8 yr and <45 kg:** PO 2.2 mg/kg q12hr × 60 days; **IV** 100 mg q12hr, change to PO when able × 60 days

### Lyme disease
**Adult:** PO 100 mg bid × 14-21 days

### Periodontitis
**Adult:** 20 mg bid after sealing and root planing for ≤9 mo; give close to meal AM or PM

**Available forms: Doxycycline:** cap 40 mg; **doxycycline calcium:** susp 50 mg/5 ml; **doxycycline hyclate:** cap 20, 50, 100 mg; del rel tab 75, 100, 150 mg; del rel cap 75, 100 mg; inj 100 mg; tabs 20, 100, mg; **doxycycline monohydrate:** caps 50, 100, 150 mg; tabs 50, 75, 100 mg; oral susp 25 mg/5 ml

### Implementation
**PO route**
- Do not break, crush, or chew caps
- Give around the clock to maintain proper blood levels; give with food to increase absorption of product; do not give within 3 hr of other agents; product reactions may occur
- Give with 8 oz of water 1 hr before bedtime to prevent ulceration
- Shake liquid preparation well before giving; use calibrated device for proper dosing
- Do not give with iron, calcium, magnesium products or antacids, which decrease absorption and form insoluble chelate
- **Del rel cap:** swallow whole or open and sprinkle on applesauce
- **Susp:** shake well, use calibrated device, may give with food/milk for GI irritation, store at room temperature, discard after 14 days

**Intermittent IV infusion route**
- Check for irritation, extravasation, phlebitis daily
- Dilute each 100 mg/10 ml or 200 mg/20 ml of 0.9% NaCl, sterile water for inj; each 100 mg must be further dilute in at least 100 ml of 0.9% NaCl, $D_5W$, Ringer's, LR, $D_5W$/LR; give over 1-4 hr
- Avoid rapid use, extravasation
- Store in tight, light-resistant container at room temperature; **IV** sol stable for 12 hr at room temperature, 72 hr if refrigerated; discard if precipitate forms

**Y-site compatibilities:** Acyclovir, alemtuzumab, alfentanil, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, CARBOplatin, caspofungin, cefonicid, cefotaxime, cefTRIAXone, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, enalapril, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eftifibitide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANTRONE, morphine, multivitamins, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, pancuronium, pantoprazole, papaverine, pentamidine, pentazocine, perphenazine, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, raNITIdine, remifentanil, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, SUFentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tirofiban, tobramycin, tolazoline, TPN (2 in 1), trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zoledronic acid

**Y-site incompatibilities:** Allopurinol, amphotericin B colloidal, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azaTHIOprine, ceFAZolin, cefoperazone, cefoTEtan, cefOXitin, ceftizoxime, cefuroxime, chloramphenicol, dantrolene, dexamethasone, diazePAM, diazoxide, erythromycin, fluorouracil, folic acid, furosemide, ganciclovir, heparin, hydrocortisone, inamrinone, indomethacin, ketorolac, methotrexate, methylPREDNISolone, mezlocillin, moxalactam, nafcillin, oxacillin, palonosetron, PEMEtrexed, penicillin G, PENTobarbital, PHENobarbital, phenytoin, piperacillin/tazobactam,

potassium acetate, sodium bicarbonate, trimethoprim/sulfamethoxazole

## ADVERSE EFFECTS

**CNS:** Fever, headache
**CV:** Pericarditis
**EENT:** Dysphagia, glossitis, decreased calcification of deciduous teeth, oral candidiasis, tooth discoloration
**GI:** *Nausea, abdominal pain, vomiting, diarrhea,* anorexia, enterocolitis, hepatotoxicity, flatulence, abdominal cramps, gastric burning, stomatitis
**GU:** *Increased BUN*
**HEMA:** Eosinophilia, neutropenia, thrombocytopenia, hemolytic anemia
**INTEG:** Rash, urticaria, photosensitivity, increased pigmentation, exfoliative dermatitis, pruritus, phlebitis, injection site reaction
**MS:** Bone growth retardation (child <8 yr), muscle, joint pain
**RESP:** Cough
**SYST:** Stevens-Johnson syndrome, angioedema, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Some hepatic recycling, 90% protein binding |
| **Excretion** | Bile, feces; kidneys unchanged (20%-40%), enters breast milk |
| **Half-life** | 1 day; increased in severe renal disease |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | 1½-4 hr | Immediate |
| **Peak** | 1½-4 hr | Infusion's end |

## INTERACTIONS

### Individual drugs

Bismuth, calcium, carBAMazepine, cimetidine, cholestyramine, colestipol, kaolin/pectin, magnesium, $NaHCO_3$, phenytoin, RifAMPin, sucralfate, zinc: decreased effect of doxycycline
Digoxin: increased or decreased effect of digoxin, sevelamer
Iron: forms chelates, decreased absorption
Penicillins: decreased effects of penicillins
Warfarin: increased effect of warfarin

### Drug classifications

Alkali products, antacids, barbiturates: decreased effect of doxycycline
Anticoagulants (oral): increased effect of anticoagulants, methotrexate

### Drug/food

Decreased: absorption with dairy products

### Drug/lab test

Increased: BUN, alkaline phosphatase, bilirubin, amylase, ALT, AST, eosinophils, WBC
False increase: urinary catecholamines

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction
- **Assess patient for signs and symptoms of infection** including characteristics of wounds, sputum, urine, stool, WBC >10,000/$mm^3$, fever; obtain baseline information before, during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for allergic reactions:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema may occur a few days after therapy begins
- Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy; blood dyscrasias may occur
- **Assess for overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- **Pregnancy/breastfeeding:** No well-controlled studies, may affect skeletal development, do not use in the second half of pregnancy unless benefits outweigh fetal risk, discontinue breastfeeding or product, excreted in small amounts in breast milk

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection; report itching, rash, pruritus, urticaria
- Instruct patient to take all medication prescribed for the length of time ordered; product must be taken around the clock to maintain blood levels; do not give medication to others
- Advise patient to notify prescriber of diarrhea with blood or pus
- Teach patient not to use with antacids, iron products, $H_2$ blockers, sevelamer, calcium (milk), magnesium, zinc

• Advise patient to take with full glass of water, if nausea occurs take with food

### Evaluation

**Positive therapeutic outcome**

• Absence of signs/symptoms of infection (WBC $<10,000/mm^3$, temp WNL, absence of red draining wounds)
• Reported improvement in symptoms of infection

**⚠ HIGH ALERT REMS**

## dronedarone (Rx)

(drone-da-rone)
**Multaq**
*Func. class.:* Antidysrhythmic (Class III)
*Chem. class.:* Iodinated benzofuran derivative

**ACTION:** Prolongs action potential duration and effective refractory period, noncompetitive α- and β-adrenergic inhibition; increases PR and QT intervals, decreases sinus rate, decreases peripheral vascular resistance

**Therapeutic outcome:** Decreased amount and severity of ventricular dysrhythmias

**USES:** Atrial fibrillation, atrial flutter

## CONTRAINDICATIONS:

Pregnancy, breastfeeding, severe sinus node dysfunction, 2nd- or 3rd-degree AV block; bradycardia, hypersensitivity, heart failure, hepatic disease, QT prolongation

**BLACK BOX WARNING:** NYHA class IV heart failure or class II-III with recent decompensation requiring hospitalization, permanent atrial fibrillation (cannot restore sinus rhythm)

**Precautions:** Children, electrolyte imbalances, elderly, Asian patients, females, atrial fibrillation/flutter

## DOSAGE AND ROUTES

**Adult: PO** 400 mg bid; discontinue class I, III antidysrhythmias or strong CYP3A4 inhibitors prior to beginning treatment; max 800 mg/day
**Available forms:** Tabs 400 mg

### Implementation

• Start with patient hospitalized and monitored
**PO route**
• Give reduced dosage slowly with ECG monitoring only
• Give loading dose with food to decrease nausea

## ADVERSE EFFECTS

**CNS:** Weakness
**CV:** *Bradycardia,* heart failure, QT prolongation, torsades de pointes, atrial flutter
**ENDO:** Hypo/hyperthyroidism
**GI:** Nausea, vomiting, diarrhea, abdominal pain, severe hepatic injury, hepatic failure
**INTEG:** Rash, photosensitivity, angioedema
**RESP:** Interstitial pneumonitis, pulmonary fibrosis

D

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Slow, variable (PO) up to 65% |
| **Distribution** | Body tissues; crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Bile, kidney (minimal) |
| **Half-life** | 15-100 day |

### Pharmacodynamics

| | PO |
|---|---|
| **Onset** | 1-3 wk |
| **Peak** | Unknown |
| **Duration** | Up to months |

## INTERACTIONS

### Individual drugs

CycloSPORINE, dextromethorphan, digoxin, disopyramide, flecainide, methotrexate, phenytoin, procainamide, quiNIDine, theophylline: increased blood levels, increased toxicity
Dabigatran, warfarin: increased anticoagulant effect

### Drug classifications

β-Adrenergic blockers, calcium channel blockers: increased bradycardia
CYP3A4 inhibitors, CYP2D6 inhibitors: increased dronedarone levels
CYP3A, CYP2D6 inducers: decreased dronedarone levels

### Drug/herb

St. John's wort: decreased effect
Yohimbine: increased anticoagulant effect

### Drug/food

Grapefruit juice: increased dronedarone effect, avoid use

### Drug/lab test

Increased: T4, LFTs, bilirubin, creatinine
Decreased: potassium, magnesium

## NURSING CONSIDERATIONS

### Assessment

• Monitor I&O ratio; monitor electrolytes: potassium, creatinine, magnesium
• Monitor liver function studies: AST, ALT, bilirubin, alkaline phosphatase

**BLACK BOX WARNING:** NYHA Class IV heart failure or symptomatic heart failure with recent decomposition requiring hospitalization doubles risk of death

- Monitor **ECG** to determine product effectiveness; measure PR, QRS, QT intervals; check for PVCs, other dysrhythmias; monitor B/P continuously for hypo/hypertension; check for rebound hypertension after 1-2 hr
- Monitor serum creatine, potassium, magnesium
- Monitor for dehydration or hypovolemia
- **Assess for hypothyroidism:** lethargy, dizziness, constipation, enlarged thyroid gland, edema of extremities, cool, pale skin
- Monitor cardiac rate, respiration: rate, rhythm, character, chest pain, ventricular tachycardia, supraventricular tachycardia or fibrillation
- Assess sight and vision before treatment and throughout therapy; microdeposits on the cornea may cause blurred vision, halos, and photophobia

### Patient/family education

- Instruct patient to report weight gain, edema, difficulty breathing, fatigue, peripheral edema immediately to prescriber
- Instruct patient to use sunscreen and protective clothing to prevent burning associated with photosensitivity
- Instruct patient to take medication as prescribed, in AM, PM with meals not to double doses, avoid use with all other products without approval of prescriber, do not use grapefruit juice
- Instruct patient to complete follow-up appointment with health care provider, including pulmonary function studies, chest x-ray
- Teach patient to take consistently with or without food
- Teach patient not to take double doses
- **Pregnancy/breastfeeding:** Teach patient to use effective contraception during treatment, do not breastfeed

### Evaluation

**Positive therapeutic outcome**

- Decreased dysrhythmias

## TREATMENT OF OVERDOSE:

Administer $O_2$, artificial ventilation, ECG, DOPamine for circulatory depression

**⚠ HIGH ALERT**

# dulaglutide (Rx)

(doo-la-gloo′-tide)

**Trulicity**

*Func. class.:* Antidiabetic

*Chem. class.:* Incretin mimetic

## ACTION:

Binds and activates known human glucagon-like peptide-1 (GLP-1) receptor agonist, mimics natural physiology for self-regulating glycemic control

**Therapeutic outcome:** Decreased polyuria, polydipsia, polyphagia; improved Hgb A1C

## USES:

Type 2 diabetes mellitus, once-weekly dosing

## CONTRAINDICATIONS

Hypersensitivity

**BLACK BOX WARNING:** Medullary thyroid carcinoma, multiple endocrine neoplasia syndrome type 2 (men-2), thyroid cancer

**Precautions:** Pregnancy, breastfeeding, children, geriatric patients, severe renal/hepatic/GI disease, pancreatitis, vit D deficiency, burns, colitis, diarrhea, fever, GI bleeding/perforation/obstruction, ileus, infection, pseudomembranous colitis, thyroid disease, trauma, surgery, type 1 diabetes mellitus, tobacco smoking, vomiting

## DOSAGE AND ROUTES

**Adult: SUBCUT** 0.75 mg qwk, may increase to 1.5 mg qwk

**Available forms:** Inj 0.75 mg/0.5 ml, 1.5 mg/0.5ml

### Implementation

**SUBCUT route**

- Do not use as first-line therapy for those who have inadequate glycemic control on diet and exercise
- Administer the dose at any time of day, with or without meals
- If a dose is missed, take as soon as remembered, as long as the next dose is due at least 3 days later, If it is more than 3 days after the missed dose, wait until the next regularly scheduled dose
- Give by **SUBCUT** only; do not give **IV** or **IM**; inject into the thigh, abdomen, or upper arm; rotate sites with each inj to prevent lipodystrophy
- Properly dispose of the pen or syringe

• Store in refrigerator for unopened pen; may store at room temperature after opening for up to 30 days, do not freeze
• When using concomitantly with insulin, give as separate injections. Never mix them together. The two injections may be injected in the same body region, but not adjacent to each other
• **Pre-filled pen administration:** Part of pen is glass; if dropped on a hard surface, do not use; uncap the pen after checking that it is locked; place base flat and firmly; unlock by turning the lock ring, press and hold green button, click will be heard; continue holding until another click is heard; inj is complete when the gray plunger is visible, remove the pen, dispose of used pen

## ADVERSE EFFECTS

**CNS:** Fatigue
**ENDO:** Hypoglycemia
**GI:** Nausea, vomiting, diarrhea, anorexia, gastroesophageal reflux, pancreatitis, flatulence, abdominal pain, constipation
**SYST:** Secondary malignancy
**INTEG:** Injection-site reactions, rash, urticaria

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 5 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 24-72 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol, disopyramide: increased hypoglycemia
Dextrothyroxine, niacin, triamterene: decreased hypoglycemia efficacy

### Drug classifications

ACE inhibitors, anabolic steroids, androgens, fibric acid derivatives, sulfonylureas: increased hypoglycemia
Corticosteroids, phenothiazines: increased hyperglycemia
Estrogens, MAOIs, oral contraceptives, progestins, thiazide diuretics: decreased hypoglycemia

## NURSING CONSIDERATIONS

### Assessment

• Monitor fasting blood glucose, A1C levels, postprandial glucose during treatment to determine diabetes control
• **Pancreatitis:** severe abdominal pain, with/without vomiting; product should be discontinued
• Assess for hypo/hyperglycemic reaction that can occur soon after meals; for severe hypoglycemia give **IV** $D_5W$, then **IV** dextrose solution
• Assess for nausea, diarrhea, vomiting, ability to tolerate product, may cause dehydration

### Patient/family education

• Teach patient symptoms of hypo/hyperglycemia, what to do about each; to have glucagon emergency kit available; to carry a glucose source (candy, sugar cube) to treat hypoglycemia
• Advise patient that product must be continued on a weekly basis explain consequences of discontinuing product abruptly
• Teach patient that diabetes is a lifelong illness; product will not cure disease
• Advise patient to carry emergency ID
• Advise patient to continue weight control, dietary restrictions, exercise, hygiene
• Inform patient that regular blood glucose monitoring and A1C testing is needed
• Advise patient to notify prescriber if pregnant or intend to become pregnant
• **Pancreatitis:** if severe abdominal pain with or without vomiting occurs, seek medical attention immediately

### Evaluation

**Positive therapeutic outcome**

• Decreased polyuria, polydipsia, polyphagia; improved Hgb A1C

## DULoxetine (Rx)

(du-lox′uh-teen)
**Cymbalta**
*Func. class.:* Antidepressant, miscellaneous
*Chem. class:* Serotonin, norepinephrine reuptake inhibitor (SNRI)

**Do not confuse:** Cymbalta/Symbyax, DULoxetine/FLUoxetine

**ACTION:** Unknown, may potentiate serotoninergic, noradrenergic activity in the CNS. In studies DULoxetine is a potent inhibitor of neuronal serotonin and norepinephrine reuptake

**Therapeutic outcome:** Decreased depression, decreased neuropathic pain

**USES:** Major depressive disorder (MDD), neuropathic pain associated with diabetic neuropathy, generalized anxiety disorder, fibromyalgia, chronic low back pain, osteoarthritis pain

## CONTRAINDICATIONS:

Hypersensitivity, closed-angle glaucoma, alcohol intoxication, alcoholism, hepatic disease, hepatitis, jaundice

**Precautions:** Pregnancy, breastfeeding, geriatric, mania, hypertension, cardiac/renal/hepatic disease, seizures, increased intraocular pressure, anorexia nervosa, bleeding, dehydration, diabetes, hyponatremia, hypotension, hypovolemia, orthostatic hypotension, abrupt drug withdrawal

**BLACK BOX WARNING:** Children, suicidal ideation

## DOSAGE AND ROUTES NTI

### Depression

**Adult:** PO 40-60 mg/day as a single dose or 2 divided doses

### Diabetic neuropathy

**Adult:** PO 60 mg qday

### Generalized anxiety disorder

**Adult:** PO 60 mg/day, may start with 30 mg/day × 1 wk, then increase to 60 mg/day, maintenance 60-120 mg/day

### Fibromyalgia

**Adult:** PO 30 mg/day × 1 wk, then 60 mg/day

### Musculoskeletal pain

**Adult:** PO 60 mg/day or 30 mg/day × 1 wk, then 60 mg/day

### Renal dose

**Adult:** PO Start with 20 mg, gradually increase; avoid use in severe renal disease

**Available forms:** Caps 20, 30, 60 mg

### Implementation

- Swallow caps whole; do not break, crush, or chew; do not sprinkle on food or mix with liquid
- Give without regard to food
- Store in tight container at room temperature; do not freeze
- Provide assistance with ambulation during beginning therapy, since drowsiness, dizziness occur
- Check to see if PO medication was swallowed

## ADVERSE EFFECTS

**CNS:** Insomnia, anxiety, dizziness, tremor, somnolence, fatigue, decreased appetite, decreased weight, agitation, diaphoresis, hallucinations, neuroleptic malignant syndrome–like reaction, aggression, seizures, headache, abnormal dreams, flushing, hot flashes, chills
**CV:** Thrombophlebitis, peripheral edema, palpitations, hypertension, supraventricular dysrhythmia, orthostatic hypotension
**EENT:** *Abnormal vision*
**ENDO:** Hypoglycemia, SIADH
**GI:** Constipation, diarrhea, dysphagia, *nausea,* vomiting, anorexia, dry mouth, colitis, gastritis, abdominal pain, hepatic failure
**GU:** Abnormal ejaculation, urinary hesitation, ejaculation delayed, erectile dysfunction, urinary frequency/retention, gyn bleeding
**INTEG:** Photosensitivity, bruising, sweating, Stevens-Johnson syndrome
**MS:** Gait disturbances, muscle spasm, restless legs syndrome, myalgia
**SYST:** Anaphylaxis, angioedema, serotonin syndrome, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | 90% protein binding |
| **Metabolism** | Extensively metabolized (CYP2D6, CYP1A2) in the liver to an active metabolite |
| **Excretion** | 70% of product recovered in urine, 20% in feces |
| **Half-life** | 12 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol: increased ALT, bilirubin

### Drug classifications

- **MAOIs:** coadministration (or within 14 days of MAOIs use) is contraindicated: hyperthermia, rigidity, rapid fluctuations of VS, mental status changes, neuroleptic malignant syndrome

Anticoagulants, antiplatelets, salicylates, NSAIDs: increased bleeding risk
Opioids, antihistamines, sedative/hypnotics: increased CNS depression
CYP1A2 inhibitors (fluvoxaMINE, quinolone antiinfectives); CYP2D6 inhibitors (FLUoxetine, quiNIDine, PARoxetine): increased action of DULoxetine
CYP2D6 extensively metabolized products (flecainide, phenothiazines, propafenone, tricyclics, thioridazine): narrow therapeutic index
SSRIs serotonin receptor agonists: increased serotonin syndrome, neuroleptic malignant syndrome

### Drug/herb

Kava: increased CNS depression
St. John's wort: Increase: serotonin syndrome

### Drug/lab test
Increased: blood glucose

## NURSING CONSIDERATIONS
### Assessment

**BLACK BOX WARNING: Depression:** Assess mental status: mood, sensorium, affect, **suicidal tendencies,** increase in psychiatric symptoms; depression, panic; monitor children weekly face to face during first 4 wk or dosage change, then every other wk for next 4 wk, then at 12 wk

- **Hypo/hyperglycemia:** Assess for each during treatment and before dosing
- Assess B/P lying, standing; pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with CV disease
- Monitor hepatic studies: AST, ALT, bilirubin
- Monitor weight qwk; weight loss or gain; appetite may increase; peripheral edema may occur
- Offer sugarless gum, hard candy, frequent sips of water for dry mouth
- Assess for withdrawal symptoms: headache, nausea, vomiting, muscle pain, weakness; not usual unless product is discontinued abruptly
- Assess for neuroleptic malignant syndrome–like reaction
- **Serotonin syndrome:** assess for nausea, vomiting, dizziness, facial flushing, shivering, sweating
- **Sexual dysfunction:** ejaculation dysfunction, erectile dysfunction, decreased libido, orgasm dysfunction
- **Beers:** Use with caution in older adults, may exacerbate or cause SIADH
- **Pregnancy/breastfeeding:** No well-controlled studies, use only if benefits outweigh fetal risk, complications in late third trimester have occurred, pregnancy should be registered with the Cymbalta **Pregnancy Registry 866-814-6975**

### Patient/family education
- Advise that product is dispensed in small amounts because of suicide potential, especially in the beginning of therapy
- Teach patient/family to use caution when driving or other activities requiring alertness because of drowsiness, dizziness, blurred vision
- Advise patient to avoid alcohol ingestion, other CNS depressants, MAOIs
- Teach patient to notify prescriber of nausea, vomiting, dizziness, facial flushing, shivering, sweating, confusion, hallucinations, incoordination; may indicate serotonin syndrome
- **Abrupt discontinuation:** Advise patient not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise
- Advise patient to wear sunscreen or large hat, since photosensitivity may occur
- Advise patient to notify prescriber if pregnancy is planned or suspected or if breastfeeding
- Tell patient that improvement may occur in 4-8 wk; up to 12 wk (geriatric patients)

**BLACK BOX WARNING:** Advise that clinical worsening and suicide risk may occur

### Evaluation
**Positive therapeutic outcome**
- Decreased depression

## dutasteride (Rx)
(doo-tass'ter-ide)
**Avodart**
*Func. class.:* Sex hormone, 5α-reductase inhibitor
*Chem. class.:* Synthetic 4-azasteroid compound

**ACTION:** Inhibits both types 1 and 2 forms of a steroid enzyme that converts testosterone to 5 μ-dihydrotestosterone (DHT), which is responsible for the initial growth of prostatic tissue

**Therapeutic outcome:** Decreased symptoms of benign prostatic hyperplasia (BPH)

**USES:** Treatment of symptomatic BPH in men with an enlarged prostate gland, or may be used in combination with tamsulosis

**Unlabeled uses:** Alopecia

## CONTRAINDICATIONS
Pregnancy, breastfeeding, children, women, hypersensitivity

**Precautions:** Hepatic disease

## DOSAGE AND ROUTES
### Benign prostatic hyperplasia (BPH)
**Adult:** PO 0.5 mg/day

### Alopecia (unlabeled)
**Adult:** PO 0.5-2.5 mg/day

**Available forms:** Caps 0.5 mg

### Implementation
- Swallow caps whole: do not break, crush, chew, or open
- May be given without regard to meals

## ADVERSE EFFECTS

**GU:** Decreased libido, impotence, gynecomastia, ejaculation disorders (rare), mastalgia, teratogenesis
**INTEG:** Serious skin infections

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Absolute bioavailability ~60% |
| **Distribution** | Protein binding 99% |
| **Metabolism** | Liver (CYP3A4) |
| **Excretion** | Feces |
| **Half-life** | 5 wk at steady state |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | 2-3 hr |
| **Duration** | Levels detectable 4-6 mo post-treatment |

## INTERACTIONS

### Individual drugs

Cimetidine, ciprofloxacin, dilTIAZem, ketoconazole, ritonavir, verapamil: increased dutasteride concentrations

### Drug classifications

Antiretroviral protease inhibitors or other CYP3A4-metabolized products: increased dutasteride concentrations

### Drug/lab test

Decreased: PSA

## NURSING CONSIDERATIONS

### Assessment

- **Assess for decreasing symptoms in BPH:** decreasing urinary retention, frequency, urgency, nocturia
- Assess PSA levels, digital rectal exam, urinary obstruction; determine the absence of urinary cancer before starting treatment
- **Assess liver function tests:** ALT, AST, bilirubin; blood studies: CBC with differential, serum creatinine, serum electrolytes

### Patient/family education

- Advise patient to notify prescriber if therapeutic response decreases, if edema occurs
- Caution patient not to discontinue product abruptly
- Inform patient about changes in sex characteristics, gynecomastia, breast tenderness, decreased libido after 6 mo
- Caution patient not to donate blood for at least 6 mo after last dose to prevent possible blood administration to pregnant woman
- **Pregnancy/breastfeeding:** Advise patient and family that caps should not be handled by pregnant women or those who may become pregnant since this product can be absorbed through the skin
- Inform patient that ejaculate volume may decrease during treatment, that product rarely interferes with sexual function
- Advise patient to read patient information leaflet before starting therapy and reread it upon prescription renewal
- Teach patient product should not be used or handled by breastfeeding women
- Advise patient to swallow whole; do not crush, chew, or open caps
- Teach patient that drug may increase risk for developing high-grade prostate cancer

### Evaluation

#### Positive therapeutic outcome

- Decreased levels of DHT (5 α-dihydrotestosterone)
- Decreased urinary frequency
- Decreased urinary retention
- Decreased urinary urgency
- Decreased nocturia

dabigatran (Rx)
daclatasvir
dalfampridine (Rx)
dapagliflozin
darifenacin
delavirdine (Rx)
desmopressin (Rx)
desoxyribonuclease
dexamethasone sodium phosphate (Rx)

## econazole topical

*See Appendix B*

## efavirenz (Rx)

(ef-ah-veer′enz)
**Sustiva**
*Func. class.:* Antiretroviral
*Chem. class.:* Nonnucleoside reverse transcriptase inhibitor (NNRTI)

**ACTION:** Binds directly to reverse transcriptase and blocks RNA polymerase and DNA polymerase, causing a disruption of the enzyme's site

**Therapeutic outcome:** Improvement of HIV-1 infection

**USES:** HIV-1 in combination with other antiretrovirals

### CONTRAINDICATIONS

Pregnancy, hypersensitivity, moderate/severe hepatic disease

**Precautions:** Liver disease, breastfeeding, children <3 yr, renal disease, myelosuppression, depression, seizures

### DOSAGE AND ROUTES

Given in combination with protease inhibitor or nucleoside analog reverse transcriptase inhibitors (NRTIs)
**Adult and child >40 kg:** PO 600 mg/day at bedtime
**Child ≥3 mo:**
7-14.9 kg: PO 200 mg/day at bedtime
15-19.9 kg: PO 250 mg/day at bedtime
20-24.9 kg: PO 300 mg/day at bedtime
25-32.4 kg: PO 350 mg/day at bedtime
32.5-39.9 kg: PO 400 mg/day at bedtime
**Child ≥3 mo, 5-<7.5 kg:** PO 150 mg/day at bedtime
**Child 3.5 ≤5 kg:** PO 100 mg/day at bedtime

**Available forms:** Caps 50, 100, 200 mg; tabs 600 mg

#### Implementation

• Give at bedtime to decrease CNS side effects, give on empty stomach, or sprinkled on food, do not cut/break caps

### ADVERSE EFFECTS

**CNS:** Headache, dizziness, fatigue, impaired cognition, insomnia, abnormal dreams, depression, anxiety, drowsiness, odd feeling, depersonalization
**GI:** *Diarrhea,* abdominal pain, *nausea,* hyperlipidemia, constipation, increased liver function tests, vomiting, hepatotoxicity
**GU:** Hematuria, kidney stones
**INTEG:** *Rash,* erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed, ☙ concentrations higher in females, Africans, Asians, Hispanics |
| **Distribution** | Highly protein bound (99%) |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, feces |
| **Half-life** | Terminal 40-76 hr |

#### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3-5 hr |
| **Duration** | Unknown |

### INTERACTIONS

#### Individual drugs

Alcohol: increased CNS depression
Amprenavir, indinavir, itraconazole, ketoconazole, lopinavir, posaconazole, saquinavir, voriconazole, cycloSPORINE, tacrolimus, sirolimus, buPROPion, sertraline: decreased level of each specific product
CarBAMazepine: decreased efavirenz levels
Cisapride, midazolam, triazolam, pimozide: do not give together
Ritonavir: increased levels of both products

#### Drug classifications

Anticonvulsants, ergots, statins (except pravastatin, fluvastatin): increased levels of each specific product
Antidepressants, antihistamines, opioids: increased CNS depression
Benzodiazepines, ergots: do not give together
CYP3A4 inhibitors (conivaptan, ambrisentan, sorafenib): decreased efavirenz metabolism
CYP2B6 inhibitors, CYP2C19 substrates, CYP3A4 substrates: Decreased metabolism
CYP3A4 inducers (carBAMazepine, rifamycins): decreased efavirenz effect
Estrogens: increased level of both products
Oral contraceptives: decreased level of these products
Rifamycins: decreased efavirenz action

#### Drug/herb

St. John's wort: decreased efavirenz level; do not use together

#### Drug/food

Increased: absorption of high-fat foods

#### Drug/lab test

Increased: ALT
False positive: cannabinoids

## NURSING CONSIDERATIONS

### Assessment

- **Pregnancy:** Rule out pregnancy before starting treatment; a type of contraception is needed, oral/non-oral contraceptives are decreased, use barrier methods also
- **HIV:** Assess CBC, with differential, plasma HIV RNA, absolute $CD4^+$/$CD8^+$/cell counts/%, serum $\beta_2$ microglobulin, serum ICD+24 antigen levels, cholesterol, hepatic enzymes, blood glucose, pregnancy test, bilirubin, urinalysis
- **Serious skin reactions:** Stevens-Johnson syndrome, toxic epidermal necrolysis, usually occurs during first 2 wk, mild rash may resolve within 30 days; severe skin reactions including blistering, fever, product should be discontinued immediately and corticosteroids started
- Assess bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- **Assess for signs of toxicity:** severe nausea/vomiting, maculopapular rash
- **Hepatotoxicity:** Monitor LFTs in those with liver disease, hold if LFTs are moderately elevated; if severe or if LFTs increase after product is restarted, discontinue permanently

### Patient/family education

- Advise patient to take as prescribed; if dose is missed, take as soon as remembered; do not double dose; take on empty stomach with water/juice, teach patient to take at same time of day, not to break tabs, to use with other antiretrovirals
- Instruct patient to make sure health care provider knows of all the medications being taken, supplements, herbs, OTC products
- Advise patient that if severe rash occurs, stop taking and notify health care provider
- Advise patient not to breastfeed or become pregnant if taking this product, use barrier method for ≥ 3 months after last dose
- Avoid use of this product during the first trimester (particular caution during first 8 weeks of pregnancy) and in females of child-bearing potential), consider another product. Register pregnant women with the Antiretroviral Pregnancy Registry at 800-258-4263. Obtain pregnancy testing and confirm the patient is not pregnant before starting treatment. Use after the second trimester of pregnancy can be considered if other alternatives are not available and if adequate contraception can be assured postpartum. Barrier contraception should always be used. If a woman becomes pregnant while taking this drug and the fetus is thus exposed during the first trimester, thoroughly counsel the woman regarding the potential harm to the fetus. To reduce the risk of postnatal transmission, HIV-infected mothers are advised to avoid breastfeeding. This recommendation applies to both untreated women and women who are receiving antiretroviral therapy. This product has been shown to pass into human breast milk.
- Advise patient that adverse reactions (rash, dizziness, abnormal dreams, insomnia) lessen after a month
- Teach patient to avoid hazardous activities if dizziness, drowsiness occurs
- Teach patient that product does not cure disease but controls symptoms; HIV can be transmitted to others even while taking this product
- Advise patient to continue safer-sex practices, that opportunistic infections can occur
- Teach patient to report all adverse reactions, insomnia, poor concentration, but usually are less in 2-4 wk
- Tell patient that CNS side effects of feeling "drunk" or "stoned" usually abate in several months

### Evaluation

**Positive therapeutic outcome**

- Increased CD4, cell counts
- Decreased viral load
- Improvement in symptoms and progression of HIV-1 infection

## efinaconazole topical

*See Appendix B*

## eletriptan (Rx)

(el-ee-trip'tan)

**Relpax**

*Func. class.:* Antimigraine agent

**ACTION:** Binds selectively to the vascular 5-$HT_1$-receptor subtype, exerts antimigraine effect; causes vasoconstriction in cranial arteries

**Therapeutic outcome:** Decreased severity of migraine

**USES:** Acute treatment of migraine with or without aura

## CONTRAINDICATIONS

Uncontrolled hypertension, hypersensitivity, basilar or hemiplegic migraine, ischemic bowel disease, severe renal/hepatic disease, coronary artery vasospasm, peripheral vascular disease, heart disease, acute MI, stroke, angina, postmenopausal women, men >40 yr, risk factors of CAD, MI, or other cardiac disease, hypercholesterolemia, obesity, diabetes

**Precautions:** Pregnancy, breastfeeding, children, geriatric, impaired renal/hepatic function

## DOSAGE AND ROUTES

**Adult: PO** 20 or 40 mg, may increase if needed, max 40 mg (single dose); may repeat in 2 hr if headache improves but returns, max 80 mg/24 hr

**Available forms:** Tabs 20, 40 mg

### Implementation

- Swallow tabs whole; do not break, crush, or chew, take with 8 oz of water, without regard to food
- Provide quiet, calm environment with decreased stimulation from noise, bright light, excessive talking

## ADVERSE EFFECTS

**CNS:** *Dizziness,* headache, anxiety, paresthesia, asthenia, somnolence, flushing, fatigue, hot/cold sensation, chills, vertigo, hypertonia, seizures, serotonin syndrome
**CV:** Chest pain, palpitations, hypertension, MI, sinus tachycardia, stroke, ventricular fibrillation/tachycardia, atrial fibrillation, AV block, bradycardia, chest pressure syndrome, coronary vasospasm
**GI:** Nausea, dry mouth, vomiting
**MS:** *Weakness,* back pain
**RESP:** Chest tightness, pressure

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Urine, feces |
| **Half-life** | 4 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Of pain relief 1/2, peak 1 1/2-2 hr |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Clarithromycin, erythromycin, itraconazole, ketoconazole, nelfinavir, propanolol, ritonavir: increased eletriptan effect

### Drug classifications

CYP3A4 inhibitors: increased concentration of ergots, eletriptan, avoid use within 72 hr of these products
SSRIs, SNRIs, serotonin-receptor agonists, linezolid, MAOIs: increased serotonin syndrome
Ergots, ergot similar products: Increase: vasospastic reactions, avoid use within 24 hr of these products

## NURSING CONSIDERATIONS

### Assessment

- **Migraine:** pain location, character, intensity, nausea, vomiting, aura
- Monitor B/P; signs/symptoms of coronary vasospasms; geriatrics may be at higher risk
- Assess for tingling, hot sensation, burning, feeling of pressure, numbness, flushing
- Assess stress level, activity, recreation, coping mechanisms
- Assess neurologic status: LOC, blurring vision, nausea, vomiting, tingling in extremities preceding headache
- Identify ingestion of tyramine foods (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches
- Determine if CYP3A4 inhibitors or other ergot type products have been given
- There have been no adequate and well-controlled studies in pregnant women; therefore the use of this product during pregnancy is not recommended unless the benefits outweigh the risks. Product is excreted into human breast milk, and caution is advisable when administering the drug during breastfeeding.

### Patient/family education

- Teach patient to avoid driving or hazardous activity if dizziness occurs
- Teach patient to report chest pain, neck or jaw pain
- Teach patient to take with whole glass of water
- Teach patient to use contraception while taking product
- Teach patient to have dark, quiet environment
- Teach patient that product does not prevent or reduce number of migraine attacks
- Teach patient to take when migraine is starting, a second dose may be used if headache returns

### Evaluation

**Positive therapeutic outcome**

- Decreased severity of migraine

## eltrombopag

**Promacta**

*See Appendix A, Selected New Drugs*

**Do not confuse:** elvitegravir/cobicistat/emtricitabine/tenofovir/clostuzumab

## emedastine ophthalmic

*See Appendix B*

## empagliflozin

(em-pa-gli-floe′zin)
**Jardiance**
*Func. class.:* Antidiabetic
*Chem. class.:* Sodium-glucose cotransporter 2 (SGLT2) inhibitors

**ACTION:** An inhibitor of sodium-glucose cotransporter 2 (SGLT2), the transporter responsible for reabsorbing the majority of glucose filtered by the tubular lumen in the kidney

**Therapeutic outcome:** Decreased blood glucose, A1c

**USES:** Type 2 diabetes mellitus with diet and exercise

**CONTRAINDICATIONS:** Hypersensitivity, dialysis, renal failure

**Precautions:** Adrenal insufficiency, breastfeeding, children, dehydration, diabetic ketoacidosis, fever, geriatric patients, hypercholesterolemia, hypercortisolism, hyperglycemia, hyperthyroidism, hypoglycemia, hypotension, hypothyroidism, hypovolemia, malnutrition, pituitary insufficiency, pregnancy, renal impairment, type 1 diabetes mellitus, vaginitis

### DOSAGE AND ROUTES

**Adult: PO** 10 mg daily, may increase to 25 mg daily

**Available forms:** Tabs 10, 25 mg

#### Implementation

- Give every day without regard to food in the AM

### ADVERSE EFFECTS

**CNS:** Syncope
**CV:** Hypotension, orthostatic hypotension
**ENDO:** Hypercholesterolemia, hyperlipidemia, hypoglycemia
**GU:** Increased urinary frequency, nocturia, polyuria, cystitis, dehydration, diuresis
**GI:** Nausea
**MISC:** Infection
**MS:** Arthralgia

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 82.6% |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Terminal elimination half-life 12.4 hr |

#### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1.5 hr |
| **Duration** | Unknown |

### INTERACTIONS

#### Individual drugs

Alcohol, bortezomib, cloNIDine, lithium: increased/decreased hypoglycemic effect
Baclofen, cycloSPORINE, dexfenfluramine, dextrothyroxine, ethotoin, fenfluramine, fosphenytoin, glucagon, phenytoin, tacrolimus, tobacco: decreased hypoglycemic effect
FLUoxetine, octreotide, OLANZapine: increased hypoglycemic effect
Gatifloxacin: do not use concurrently

#### Drug classifications

Androgens, sulfonamides: increase/decreased hypoglycemic effect
Angiotensin II receptor antagonists, angiotensin-converting enzyme (ACE) inhibitors, β-blockers, fibric acid derivatives, loop diuretics, MAOIs type A, thiazide diuretics: increased hypoglycemic effect
Atypical antipsychotics, carbonic anhydrase inhibitors, corticosteroids, estrogens, oral contraceptives, phenothiazines, progestins, salicylates: decreased hypoglycemic effect
Thyroid hormones: do not use concurrently

#### Drug/herb

Chromium, horse chestnut: increased hypoglycemia
Green tea: decreased hypoglycemia
Niacin: increased/decreased hypoglycemia

#### Drug/lab test

**Hct, creatinine:** Increase
**GFR:** Increase

### NURSING CONSIDERATIONS

#### Assessment

- **Diabetes:** Monitor blood glucose, glycosylated hemoglobin A1c (HbA1c), serum cholesterol profile, serum creatinine/BUN, assess for polydipsia, other products taken by patient
- **Fractures:** Assess fracture risk before use, do not use in patients with risk of fractures
- **Pregnancy/breastfeeding:** Use if benefits outweigh risk to fetus, no well-controlled studies, do not breastfeed

#### Patient/family education

- Teach patient how to check blood glucose, to continue with diet and exercise changes, to avoid smoking, alcohol
- Instruct patient to avoid other products unless approved by prescriber

• To take in the am, without regard to food; if dose is missed, take when remembered; do not take double dose, to read "medication guide" provided, that product controls symptoms but does not cure diabetes
• To follow medical regimen, including diet, exercise, and weight loss
• To teach how to take blood glucose, urine ketones readings, and how often
• **Pregnancy/breastfeeding:** To report if pregnancy is planned or suspected, to avoid breastfeeding
• **Hypoglycemia:** To report rapid heartbeat, dizziness, weakness, that lab testing will be needed including blood glucose monitoring, a dosage change may be needed, to carry a sugar source at all times, review signs and symptoms of hypoglycemia and hyperglycemia and what to do about each
• **Hypotension:** To report vision changes, dizziness, fatigue, B/P should be checked regularly
• **Ketoacidosis:** To report nausea, vomiting, abdominal pain, confusion, sleepiness
• **Infections:** Usually urinary tract infections, patient should report burning, cloudy, foul-smelling urine; fever; back pain, antibiotics will be needed, or mycotic infections including foul-smelling vaginal discharge or penis discharge and redness

### Evaluation

**Positive therapeutic outcome**
• Decreased blood glucose, A1c

## emtricitabine (Rx)

(em-tri-sit'uh-bean)
**Emtriva**
*Func. class.:* Antiretroviral
*Chem. class.:* Nucleoside reverse transcriptase inhibitor (NRTI)

**ACTION:** Synthetic nucleoside analog of cytosine; inhibits replication of HIV virus by competing with the natural substrate and then becoming incorporated into cellular DNA by viral reverse transcriptase, thereby terminating cellular DNA chain

**Therapeutic outcome:** Decreasing symptoms of HIV

**USES:** HIV-1 infection with other antiretrovirals

**Unlabeled uses:** HBV (hepatitis B virus) infection

## CONTRAINDICATIONS

Hypersensitivity, lactic acidosis

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal disease

**BLACK BOX WARNING:** Hepatic insufficiency, chronic hepatitis B virus (HBV) infection, more common in females or those that are overweight; monitor lactic acid levels, LFTs

## DOSAGE AND ROUTES

**Oral cap and sol are not interchangeable**

**Adult:** PO (caps) 200 mg/day; oral SOL 240 mg (24 ml) daily
**Adolescent/child >33 kg:** PO (caps) 200 mg/day
**Child 3 mo-17 yr:** oral SOL 6 mg/kg/day, max 240 mg (24 ml)
**Infant <3 mo:** PO oral SOL 3 mg/kg daily, do not use caps

### Renal dose

**Adult:** PO CCr 30-49 ml/min 200 mg q48hr, SOL 120 mg q24hr; caps CCr 15-29 ml/min 200 mg q72hr, SOL 80 mg q24hr; caps CCr ,15 ml/min 200 mg q96hr, SOL 60 mg q24hr

**Available forms:** Caps 200 mg; oral sol 10 mg/ml; oral cap and sol are not interchangeable

### Implementation

• Give without regard to meals
• Store at 25° C (77° F)
• Take at same time every day
• Oral cap and sol are not interchangeable

## ADVERSE EFFECTS

**CNS:** Headache, abnormal dreams, depression, dizziness, insomnia, neuropathy, paresthesia, *asthenia*
**GI:** *Nausea, vomiting, diarrhea, anorexia, abdominal pain, dyspepsia,* hepatomegaly with stenosis (may be fatal)
**INTEG:** Rash, skin discoloration
**MS:** Arthralgia, myalgia
**RESP:** Cough
**SYST:** Change in body fat distribution, lactic acidosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly, extensively absorbed |
| **Distribution** | Protein binding <4% |
| **Metabolism** | Unknown |
| **Excretion** | Excreted unchanged in urine (86%), feces (14%) |
| **Half-life** | 10 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr |
| **Duration** | Unknown |

## INTERACTIONS

Ribavirin: Complex interactions

### Drug classifications

**Interferons:** Decreased emtricitabine level

### Drug/Lab

Increase: AST/ALT, glucose, amylase, bilirubin, CK, lipase
Decrease: neutrophils

## NURSING CONSIDERATIONS

### Assessment

- **HIV:** Monitor for infections and improvement in symptoms of HIV
- Monitor liver, renal function tests: AST, ALT, bilirubin, amylase, lipase, triglycerides periodically during treatment
- Use if clearly needed, register pregnant woman at the Antiretroviral Pregnancy Registry at 800-258-4263. To reduce the risk of postnatal transmission, HIV-infected mothers are advised to avoid breastfeeding
- **Assess for lactic acidosis, severe hepatomegaly with steatosis;** if lab reports confirm these conditions, discontinue treatment; more common in females, obese; monitor serum lactate levels, liver function tests

**BLACK BOX WARNING:** Confirm that patient is free of HBV (hepatitis B virus) before starting treatment

**BLACK BOX WARNING: Hepatotoxicity:** Do not use in those with risk factors such as alcoholism; discontinue if hepatotoxicity occurs

- **Hepatitis B and HIV coinfection (unlabeled):** Perform HBV screening in any patient who has HIV to ensure appropriate treatment; avoid single-drug treatments in HBV

### Patient/family education

- Teach that GI complaints resolve after 3-4 wk of treatment
- Advise patient to report planned or suspected pregnancy, not to breastfeed while taking this product
- Instruct that product must be taken at same time of day to maintain blood level, solution and cap are not interchangeable
- Advise that product will control symptoms, but is not a cure for HIV; patient is still infectious, may pass HIV virus on to others
- Instruct that other products may be necessary to prevent other infections
- Advise that changes in body fat distribution may occur
- **Lactic acidosis:** Teach patient to notify prescriber immediately of fatigue, muscle aches/pains, abdominal pain, difficulty breathing, nausea, vomiting, change in heart rate

**BLACK BOX WARNING:** Hepatotoxicity: Teach patient to notify prescriber of dark urine, yellowing of skin/eyes, clay-colored stools, anorexia, nausea, vomiting

- Instruct patient to avoid breastfeeeding to reduce postnatal HIV transmission

### Evaluation

**Positive therapeutic outcome**

- Decrease in signs/symptoms of HIV
- Decrease viral load, increase CD4 counts

## emtricitabine/rilpivirine/tenofovir

(em-tri-situh-bean/ril-pi-vireen/ten-oh-fohveer)

**Complera**

*Func. class.:* Antiretroviral
*Chem. class.:* Nucleoside reverse transcriptase inhibitor (NRTI)

## ACTION:

- Emtricitabine: Inhibits viral reverse transcriptase and is active both on HIV-1 and HBV
- Tenofovir: Inhibits viral reverse transcriptase and acts as a DNA chain terminator
- Rilpivirine: Inhibits HIV-1 reverse transcriptase; it does not compete for binding, nor does it require phosphorylation to be active

**Therapeutic outcome:** Improvement in CD4, HIV RNC counts, decreasing signs and symptoms of HIV

**USES:** HIV in treatment-naive patients with HIV RNA ≤100,000 copies/ml at initiation and certain virologically stable (HIV RNA >50 copies/ml) treatment-experienced patients

## CONTRAINDICATIONS

Hypersensitivity

**PRECAUTIONS:** Alcoholism, autoimmune disease, bone fractures, breastfeeding, children, depression, females, Graves' disease, Guillain-Barré syndrome, hepatic disease, hepatitis, hepatitis B and HIV coinfection, hepatitis C and HIV coinfection, hepatomegaly, HIV resistance, hypercholesterolemia, hyperlipidemia, hypertriglyceridemia, hypophosphatemia, immune reconstitution syndrome, obesity, osteomalacia, osteoporosis, pregnancy, QT prolongation, renal failure, renal impairment, serious rash, suicidal ideation, torsades de pointes

**BLACK BOX WARNING:** Hepatitis B exacerbation, hepatotoxicity, lactic acidosis

## DOSAGE AND ROUTES

Treatment of HIV infection in antiretroviral treatmentnaive patients with HIV RNA concentrations 100,000 copies/ml or less at treatment initiation and certain virologically stable (HIV RNA <50 copies/ml) treatment-experienced patients

**Adult/adolescent/child 12 years and older weighing 35 kg or more:** PO 1 tablet (200 mg emtricitabine; 25 mg rilpivirine; 300 mg tenofovir) qday. During coadministration with rifabutin, the rilpivirine dose needs to be increased to 50 mg qday; give an additional 25 mg/day of rilpivirine with a meal

### HIV prophylaxis after occupational exposure to HIV (unlabeled)

**Adult: PO** 1 tablet (200 mg emtricitabine; 25 mg rilpivirine; 300 mg tenofovir disoproxil fumarate) qday × 28 days

### Renal dose

**Adult:** PO CCr <50 ml/min: Not recommended

**Available forms:** Tablet 200-25-300 mg

### Implementation:

- Antiretroviral drug resistance testing (preferably genotypic testing) is recommended before use in treatment-naive patients and before changing therapy for treatment failure
- For adults, treatment is recommended in all patients to reduce the risk of disease progression and to prevent the transmission of HIV, including perinatal transmission and transmission to sexual partners. Conditions increasing the urgency for therapy include pregnancy, AIDS-defining conditions (including HIV-associated dementia), acute or early HIV infection, acute opportunistic infections, HIV-associated nephropathy, hepatitis B (HBV) or hepatitis C (HCV) coinfection, lower CD4 counts (<200 cells/mm$^3$), rapidly declining CD4 counts (>100 cells/mm$^3$ decrease per year), or higher viral loads (>100,000 copies/ml)
- For pregnant women, therapy should begin immediately after HIV diagnosis, as early maternal viral suppression is associated with lower risk of perinatal infection
- Before initiating therapy consider the following: virologic failures occurred more frequently in those with baseline HIV RNA concentrations >100,000 copies; CD4 counts <200 cells/mm$^3$
- Avoid use of tenofovir-containing regimens in those with renal disease and osteoporosis

## ADVERSE EFFECTS

**CNS:** *Headache,* abnormal dreams, *depression,* dizziness, *insomnia,* neuropathy, paresthesia, asthenia, suicide, fatigue, drowsiness
**GI:** *Nausea, vomiting, anorexia, diarrhea, abdominal pain, dyspepsia,* hepatomegaly with stenosis (may be fatal), hyperbilirubinemia, hypercholesterolemia, pancreatitis
**GU:** Glomerulonephritis membranous/mesangial proliferative
**Integ:** *Rash,* skin discoloration
**MS:** Arthralgia, myalgia, rhabdomyolysis
**Resp:** *Cough*
**Syst:** Change in body fat distribution, lactic acidosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Tenofovir: bioavailability is increased with a high-fat meal |
| **Distribution** | Rilpivirine: Protein binding 99.7% to albumin; tenofovir <0.7% ; emtricitabine <4% |
| **Metabolism** | **Emtricitabine:** metabolized via oxidation to 3'-sulfoxide diastereomer (approximately 9% of dose) and via conjugation with glucuronic acid to 2'-O-glucuronide (approximately 4% of dose); **Tenofovir:** undergoes phosphorylation to its active metabolite; **Rilpivirine:** Via oxidation by CYP3A system |
| **Excretion** | Emtricitabine: excreted renally (86%) and via feces (14%); tenofovir: eliminated by a combination of glomerular filtration and active renal tubular secretion, 70%-80% excreted unchanged in urine by 72 hr; **rilpivirine:** 85% feces, 6.1% urine |
| **Half-life** | **Emtricitabine:** half-life 10 hr: **Tenofovir:** terminal elimination half-life 17 hr; **Rilpivirine:** terminal elimination half-life 50 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Emtricitabine: Peak 1-2 hr postdose; Rilpivirine: Peak 4-5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Arsenic trioxide, chloroquine, droperidol, haloperidol, levomethadyl, pentamidine: increased QT prolongation

Efavirenz, lamivudine: Do not use with, treatment duplication will occur

Fluconazole, voriconazole: increased rilpivirine adverse reactions, fungal infections

### Drug classifications

Arsenic trioxide, beta agonists, class IA/III antidysrhythmics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, levomethadyl, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, quetiapine, quinidine, risperidone, ziprasidone), local anesthetics, some phenothiazines, tricyclics: increased QT prolongation

CYP3A4 inducers (barbiturates, bexarotene, bosentan, carbamazepine, dexamethasone, efavirenz, enzalutamide, etravirine, griseofulvin, modafinil, nafcillin, nevirapine, phenobarbital, phenytoin, primidone, rifabutin, rifampin, rifapentine), proton pump inhibitors: decreased rilpivirine effect, treatment failure

CYP3A4 inhibitors (aldesleukin IL-2, amiodarone, aprepitant, atazanavir, basiliximab, boceprevir, bromocriptine, chloramphenicol, clarithromycin, conivaptan, danazol, dalfopristin, darunavir, dasatinib, delavirdine, diltiazem, dronedarone, efavirenz, erythromycin, ethinyl estradiol, fluconazole, fluoxetine, fluvoxamine, fosamprenavir, fosaprepitant, imatinib, indinavir, isoniazid, itraconazole, ketoconazole, lanreotide, lapatinib, miconazole, nefazodone, nelfinavir, nicardipine, octreotide, posaconazole, quinine, ranolazine, rifaximin, tamoxifen, telaprevir, telithromycin, tipranavir, troleandomycin, verapamil, voriconazole, zafirlukast): increased rilpivirine level

Interferons: decreased emtricitabine level

### Drug/food

Increased: Adverse reactions: grapefruit juice

### Drug/lab test

Increased: AST/ALT, amylase, bilirubin, CK, glucose, lipase

Decreased: Neutrophils

## NURSING CONSIDERATIONS

### Assessment

• **HIV infection:** Assess symptoms of HIV, including opportunistic infections, before and during treatment, some may be life threatening; monitor plasma CD4+, CD8 cell counts, serum beta-2 microglobulin, serum ICD+24 antigen levels, treatment failures occur more often in those with baseline HIV-1 RNA concentrations >100,000 copies/ml than in those <100,000 copies/ml; monitor blood glucose, CBC with differential, serum cholesterol, lipid panel

**BLACK BOX WARNING:** Hepatotoxicity/lactic acidosis: Monitor hepatitis B serology, LFTs, plasma hepatitis C RNA, lactic acidosis levels. If lab reports confirm these conditions, discontinue product. More common in females or those who are overweight. Avoid use in alcoholism

• **Pregnancy:** Obtain pregnancy testing before use Hepatitis B exacerbation: Those with coexisting HBV and HIV infections who discontinue emtricitabine or tenofovir may experience severe acute hepatitis B exacerbation with some cases resulting in hepatic decompensation and hepatic failure. Patients coinfected with HBV and HIV who discontinue this product should have transaminase concentrations monitored q6wk for the first 3 mo, and q3-6 mo thereafter. Resumption of anti–hepatitis B treatment may be required. For patients who refuse a fully suppressive antiretroviral regimen but still require treatment for HBV, consider 48 wk of peginterferon alfa; do not administer HIV-active medications in the absence of a fully suppressive ARV regimen

• Periodically monitor serum bilirubin (total and direct), serum creatinine, urinalysis, LFTs, amylase, lipase

### Evaluate

### Teach patient/family:

• That hepatitis and HIV coinfected patients should avoid consuming alcohol; offer vaccinations against hepatitis A/hepatitis B as appropriate

• That GI complaints resolve after 2-3 wk of treatment

• To report suspected or planned pregnancy, not to breastfeed

• To take at the same time of day to maintain blood level, not to crush, break, or chew

• That product controls the symptoms of HIV but does not cure, that patient is still able to infect others, that other products may be necessary to prevent other infections

**BLACK BOX WARNING: Lactic acidosis:** To notify prescriber of fatigue, muscle aches/pains, abdominal pain, difficulty breathing, nausea, vomiting, change in heart rhythm

**BLACK BOX WARNING: Hepatotoxicity:** To notify prescriber of dark urine, yellowing skin or eyes, clay-colored stools, anorexia, nausea, vomiting

- **Suicide:** To report severe depression, suicidal ideation to prescriber immediately

**Evaluation:** Improvement in CD4, HIV RNC counts, decreasing signs and symptoms of HIV

## enalapril/enalaprilat (Rx)

(e-nal'a-pril/e-nal'a-pril-at)

**Vasotec**

*Func. class.:* Antihypertensive

*Chem. class.:* Angiotensin-converting enzyme (ACE) inhibitor

**Do not confuse:** enalapril/Eldepryl/ramipril/Anafranil

**ACTION:** Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE; prevents conversion of angiotensin I to angiotensin II, resulting in dilatation of arterial and venous vessels

**Therapeutic outcome:** Decreased B/P in hypertension; decreased preload, afterload in HF

**USES:** Hypertension, HF, left ventricular dysfunction

## CONTRAINDICATIONS

Hypersensitivity, history of angioedema

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Breastfeeding, renal disease, hyperkalemia, hepatic failure, dehydration, bilateral renal artery/aortic stenosis

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO 2.5-5 mg/day, may increase or decrease to desired response, range 10-40 mg/day; **IV** 0.625-1.25 mg q6hr over 5 min

**Child:** PO 0.08 mg/kg/day in 1-2 divided doses, max 0.58 mg/kg/day in 1-2 divided doses; **IV** 5-10 mcg/kg/dose q8-24hr

### HF

**Adult:** PO 2.5-20 mg/day in 2 divided doses, max 40 mg/day in divided doses

### Renal dose

**Adult:** PO CCr <30 ml/min 2.5 mg/day, increase gradually; IV CCr >30 ml/min 1.25 mg q6hr; CCr <30 ml/min 0.625 mg as one-time dose, increase as per B/P

**Available forms:** Enalapril: tabs 2.5, 5, 10, 20 mg; enalaprilat: inj 1.25 mg/ml

### Implementation

**PO route**

- Store in airtight container at 86° F (30° C) or less
- Severe hypotension may occur after 1st dose of this medication; hypotension may be prevented by reducing or discontinuing diuretic therapy 3 days before beginning benazepril therapy
- Give by **IV** inf of 0.9% NaCl (as ordered) to expand fluid volume if severe hypotension occurs

**Direct IV route/ intermittent IV infusion**

- Give undiluted over ≥5 min; use diluent provided or 50 ml $D_5W$, 0.9% NaCl, 0.9% NaCl in $D_5W$, or LR, give over ≥5 min, sol is stable for 24 hr

**Y-site compatibilities:** Acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B liposome, anidulafungin, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, ceFAZolin, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, cimetidine, cisatracurium, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dextran 40, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposome, doxycycline, ePHEDrine, EPINEPHrine, epirubicin, epoetin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamin infusion, nafcillin, nalbuphine, naloxone, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, papaverine, PEMEtrexed, penicillin G potassium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine,

phytonadione, piperacillin/tazobactam, potassium chloride/phosphate, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanil, ritodrine, riTUXimab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, tetracycline, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole

**Y-site incompatibilities:** Amphotericin B cholesteryl sulfate, caspofungin, cefepime, dantrolene, diazepam, diazoxide, gemtuzumab, lansoprazole, phenytoin

## ADVERSE EFFECTS

**CNS:** *Insomnia, dizziness,* paresthesias, headache, fatigue, anxiety
**CV:** *Hypotension,* chest pain, tachycardia, dysrhythmias, syncope, angina, MI, orthostatic hypotension
**EENT:** *Tinnitus,* visual changes, sore throat, double vision, dry burning eyes
**GI:** Nausea, vomiting, colitis, cramps, diarrhea, constipation, flatulence, dry mouth, loss of taste, hepatotoxicity
**GU:** Proteinuria, renal failure, increased frequency of polyuria or oliguria
**HEMA:** Agranulocytosis, neutropenia
**INTEG:** Rash, purpura, alopecia, hyperhidrosis, photosensitivity
**META:** Hyperkalemia
**RESP:** Dyspnea, dry cough, crackles
**SYST:** Toxic epidermal necrolysis, Stevens-Johnson syndrome, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO), complete (**IV**) |
| **Distribution** | Unknown |
| **Metabolism** | Liver (active metabolite—enalaprilat) |
| **Excretion** | Kidneys (60%—enalaprilat, 20%—enalapril) |
| **Half-life** | Enalaprilat 35 hr, increased in renal disease |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | 1 hr | 5-15 min |
| **Peak** | 4-6 hr | 1-4 hr |
| **Duration** | 24 hr | 4-6 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased hypotension (large amounts)
Allopurinol: increased hypersensitivity
CycloSPORINE, NSAIDs: increased potassium levels
Digoxin, lithium: increased serum levels
Rifampin: decreased effects of enalapril

### Drug classifications

Antacids: decreased effects of enalapril
Diuretics, general anesthesia, nitrates, other antihypertensives, phenothiazines: increased hypotension
Diuretics (potassium-sparing), potassium supplements, salt substitutes: increased potassium levels

### Drug/lab test

Increased: ALT, AST, bilirubin, alkaline phosphatase, glucose, uric acid, BUN, creatinine
False positive: ANA titer

## NURSING CONSIDERATIONS

### Assessment

- **Bone marrow depression (rare):** monitor blood studies: neutrophils, decreased platelets with differential baseline and q3mo; if neutrophils $<1000/mm^3$, discontinue treatment
- **Hypertension:** monitor B/P, orthostatic hypotension, syncope; if changes occur, dosage change may be required; obtain peak/trough levels, maintain adequate hydration

> **BLACK BOX WARNING: Pregnancy:** Identify if pregnancy is planned or suspected or if breastfeeding; in pregnancy, breastfeeding, fetal harm may occur

- **HF:** monitor for increased weight, rales, jugular vein distention, edema, difficulty breathing
- Monitor electrolytes: K, Na, Cl during 1st 2 wk of therapy
- **Monitor renal studies:** protein, BUN, creatinine; increased levels may indicate nephrotic syndrome and renal failure; monitor renal symptoms: polyuria, oliguria, frequency, dysuria
- Establish baselines in renal, liver function tests before therapy begins and 1 wk into therapy, avoid activities requiring coordination, those with impaired renal function should be monitored for hyperkalemia
- Check potassium levels throughout treatment, although hyperkalemia rarely occurs
- Check for edema in feet, legs daily
- **Serious skin disorders, angioedema:** Black patients are more likely to develop angioedema; also, product is less effective;

if rash occurs, stop product and notify prescriber

### Patient/family education

- Advise patient not to discontinue product abruptly; advise patient to tell all persons associated with health care that product is being taken
- Teach patient not to use OTC products (cough, cold, allergy medications) unless directed by physician, to avoid potassium, salt substitutes; serious side effects can occur; xanthines, such as coffee, tea, chocolate, cola, can prevent action of product
- Instruct patient on the importance of complying with dosage schedule, even if feeling better; to continue with medical regimen to decrease B/P: exercise, cessation of smoking, decreasing stress, diet modifications
- Emphasize the need to rise slowly to sitting or standing position to minimize orthostatic hypotension; not to exercise in hot weather, which can cause increased hypotension
- Advise patient to notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, coughing, shortness of breath, trouble breathing
- Caution patient to report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P
- Caution patient that product may cause skin rash or impaired perspiration; that angioedema may occur and to discontinue if it occurs
- Caution patient that product may cause dizziness, fainting, light-headedness; may occur during 1st few days of therapy; to avoid activities that may be hazardous
- Teach patient how to take B/P, normal readings for age-group

**BLACK BOX WARNING:** Teach patient to use contraception during treatment, **pregnancy,** to notify prescriber if pregnancy is planned or suspected, not to breastfeed

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P in hypertension

## TREATMENT OF OVERDOSE:

Lavage, **IV** atropine for bradycardia; **IV** theophylline for bronchospasm, digoxin, $O_2$; diuretic for cardiac failure, hemodialysis

## enfuvirtide (Rx)

(en-fyoo′vir-tide)

**Fuzeon**

*Func. class.:* Antiretroviral

*Chem. class.:* Fusion inhibitor

E

## ACTION:

Inhibitor of the fusion of HIV-1 with CD4+ cells

**Therapeutic outcome:** Decreasing symptoms of HIV

## USES:

Treatment of HIV-1 infection in combination with other antiretrovirals in those who are treatment experienced only

## CONTRAINDICATIONS

Breastfeeding, hypersensitivity

**Precautions:** Pregnancy, (must be enrolled in the Antiretroviral Pregnancy Registry: 800-258-4263), children <6 yr, liver disease, myelosuppression, infections

## DOSAGE AND ROUTES

**Adult:** SUBCUT 90 mg (1 ml) bid

**Child 6-16 yr and <42.6 kg:** SUBCUT 2 mg/kg bid, max 90 mg bid; **11-15.5 kg** 27 mg/0.3 ml bid; **15.6-20 kg** 36 ml/0.4 ml bid; **20.1-24.5 kg** 45 mg/0.5 ml bid; **24.6-29 kg** 54 mg/0.6 ml bid; **29.1-33.5** kg 63 mg/0.7 ml bid; **33.6-38 kg** 72 mg/0.8 ml bid; **38.1-42.5 kg** 81 mg/0.9 ml bid

**Available forms:** Powder for inj, lyophilized 108 mg (90 mg/ml when reconstituted)

### Implementation

- Give SUBCUT, bid; rotate sites; preferred sites are upper arm, anterior thigh, abdomen

## ADVERSE EFFECTS

**CNS:** Anxiety, peripheral neuropathy, taste disturbance, Guillain-Barré syndrome, insomnia, depression, fatigue, peripheral neuropathy
**GI:** Nausea, abdominal pain, anorexia, constipation, pancreatitis, dry mouth, weight loss
**GU:** Glomerulonephritis, renal failure
**HEMA:** Thrombocytopenia, neutropenia
**INTEG:** *Inj site reactions, skin papilloma*
**MISC:** Influenza, cough, conjunctivitis, lymphadenopathy, myalgias, hyperglycemia, bacterial hypersensitivity, pneumonia, rhinitis, fatigue

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | 92% protein binding |
| **Metabolism** | Undergoes catabolism |
| **Excretion** | Unknown |
| **Half-life** | Terminal 3.8 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 8 hrs |
| **Duration** | Unknown |

## INTERACTIONS

### Drug/drug

Protease inhibitors: Increase effect of either product

### Drug/lab

Increased: LFTs, lipase, CK triglycerides
Decreased: Hgb

## NURSING CONSIDERATIONS

### Assessment

- Assess for signs of infection, inj site reactions, use analgesics; bacterial pneumonia may occur if blood counts are low or viral load is high or low CD4 counts, IV drug user, lung disease
- **Monitor renal studies:** BUN, creatinine, renal failure may occur
- Monitor bowel pattern before, during treatment; if severe abdominal pain or constipation occurs, notify prescriber; monitor hydration
- Assess skin eruptions, rash, urticaria, itching
- Identify allergies before treatment, reaction to each medication, may occur quickly or later
- CBC, blood chemistry, plasma HIV RNA, absolute CD4/CD8 cell counts/%, serum $\beta_2$ microglobulin, serum ICD+24 antigen levels, cholesterol
- **Immune reconstitution syndrome:** Occurs with combination therapy
- **Peripheral neuropathy:** May occur and last for several months

### Patient/family education

- Instruct to notify prescriber if pregnancy is suspected, avoid breastfeeding, if pregnant register with the antiretroviral pregnancy registry 800-258-4263
- Advise that pneumonia may occur, to contact prescriber if cough, fever occur
- Teach that hypersensitive reactions may occur: rash, pruritus; stop product, contact prescriber
- Teach that this product is not a cure for HIV-1 infection but controls symptoms; HIV-1 can still be transmitted to others
- Teach that this product is to be used in combination only with other antiretrovirals
- Teach patient how to prepare and give using subcut injection, watch for site reactions, rotate sites
- Teach patient that pneumonia may occur; to contact prescriber if cough, fever occur
- **Pregnancy:** Identify if pregnancy is planned or suspected, if breastfeeding; if more information is needed call 877-438-9366

### Evaluation

**Positive therapeutic outcome**

- Increased CD4 cell counts; decreased viral load; slowing progression of HIV-1 infection

**⚠ HIGH ALERT**

## enoxaparin (Rx)

(ee-nox'a-par-in)
**Lovenox**
*Func. class.:* Anticoagulant, antithrombotic
*Chem. class.:* Unfractionated porcine heparin (low-molecular-weight heparin)

**Do not confuse:** enoxaparin/enoxacin, Lovenox/Lotronex

**ACTION:** Binds to antithrombin III inactivating factors Xa/IIa resulting in higher ratio of anti-factor Xa to anti-factor IIa

**Therapeutic outcome:** Prevention of deep vein thrombosis

**USES:** Prevention of DVT (inpatient or outpatient), pulmonary emboli (inpatient) in hip and knee replacement, abdominal surgery at risk for thrombosis; unstable angina/non–Q-wave MI, acute MI, coronary artery thrombosis

## CONTRAINDICATIONS

Hypersensitivity to this product, heparin, or pork; hemophilia; leukemia with bleeding; thrombocytopenic purpura, heparin-induced thrombocytopenia, active major bleeding

**Precautions:** Pregnancy, breastfeeding, children, geriatric, severe renal/hepatic disease, blood dyscrasias, severe hypertension, subacute bacterial endocarditis, acute nephritis, recent burn, spinal surgery, indwelling catheters, low weight (men <57 kg, women <45 kg), hypersensitivity to benzyl alcohol

**BLACK BOX WARNING:** Lumbar puncture, epidural/spinal anesthesia, aneurysm, coagulopathy

## DOSAGE AND ROUTES

### DVT/PE prophylaxis

**Adult (moderate risk—general surgery, nonsurgery 40-60 yr, major surgery <40 yr with no risk factors):** SUBCUT 20 mg/day
**Adult (higher risk—abdominal surgery, elderly-general surgery, major surgery <40 yr with no risk factors):** SUBCUT 30 mg q12hr or 40 mg/day

### DVT prevention before hip/knee surgery

**Adult:** SUBCUT 30 mg bid given 12-24 hr postoperatively for 7-10 days until DVT risk is diminished

### DVT prevention before hip replacement
**Adult:** SUBCUT 40 mg/day started 9-15 hr preop or 30 mg q12hr started 12-24 hr postop, continued until DVT risk is diminished or patient is adequately on anticoagulant

### DVT prophylaxis before abdominal surgery
**Adult:** SUBCUT 40 mg/day × 7-10 days to prevent thromboembolic complications, start 24 hr before surgery

### Treatment of DVT/PE
**Adult:** SUBCUT (outpatient without PE) 1 mg/kg q12hr or 1.5 mg/kg/day (outpatient/inpatient); warfarin should be started within 72 hr and continued ≥5 days until INR is 2-3 (at least 3)

### Prevention of ischemic complications in unstable angina/non–Q-wave/non-ST MI with aspirin
**Adult:** SUBCUT/**IV** 1 mg/kg q12hr until stable with aspirin 100-325 mg/day × ≥2 days

### Renal dose
**Adult:** SUBCUT CCr <30 ml/min: 30 mg q day (thrombosis prophylaxis in abdominal surgery, hip or knee replacement surgery, during acute illness); 1 mg/kg q day (concurrently with aspirin to treat unstable angina or non-Q-wave myocardial infarction); 1 mg/kg q day (STEMI in those ≥75 yrs, 30 mg IV bolus plus 1 mg/kg SC then 1 mg/kg q day (STEMI in those <75 yrs, or 1 mg/kg q day (concurrently with warfarin for inpatient or outpatient treatment of acute deep vein thrombosis (with or without pulmonary embolism)

**Available forms:** Prefilled syringes/inj 30 mg/0.3 ml, 40 mg/0.4 ml, 60 mg/0.6 ml, 80 mg/0.8 ml, 100 mg/1 ml, 120 mg/0.8 ml, 150 mg/ml; multidose vials 100 mg/ml (3 ml)

### Implementation
- Give at same time each day to maintain steady blood levels

**SUBCUT route**
- Administer SUBCUT deeply; do not give IM, begin 1 hr before surgery, do not aspirate, do not expel bubble from syringe before administration; sol is clear to yellow; do not use sol with precipitate; apply gentle pressure for 1 min, do not use products with benzyl alcohol in pregnant women
- Give to recumbent patient, rotate sites (left/right anterolateral, left/right posterolateral abdominal wall)
- Leave vascular access sheath in place for 6 hr after dose, then give next dose 6 hr after sheath removed

**Direct IV route**
- Use multidose vial for **IV** administration; use TB syringe or other graduated syringe to measure dose; give **IV** BOL through **IV** line; flush after
- If withdrawing from multidose vial, use TB syringe for proper measurement
- Prefilled syringes (30, 40 mg) are not graduated; do not use for partial doses
- Do not mix with other products or infusion fluids
- Give only this product when ordered; not interchangeable with heparin or LMWHs

## ADVERSE EFFECTS
**CNS:** Fever, confusion
**GI:** Nausea
**HEMA:** Hemorrhage from any site, hypochromic anemia, thrombocytopenia, bleeding
**INTEG:** Ecchymosis, inj site hematoma
**META:** Hyperkalemia in renal failure
**MS:** Osteoporosis
**SYST:** Edema, peripheral edema, angioedema, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (90%) |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys; IV unknown |
| **Half-life** | 4½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3-5 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Drug classifications
Anticoagulants, antiplatelets, NSAIDs, RU-486, SSRIs, monitor INR/PT salicylates, thrombolytics: increased bleeding

### Drug/herb
Feverfew, garlic, ginger, ginkgo, horse chestnut: increased bleeding risk

### Drug/lab test
Increased: AST/ALT
Decreased: platelets

## NURSING CONSIDERATIONS
### Assessment
- Monitor antifactor Xa activity in chronic therapy (renal disease)
- **Pregnancy/breastfeeding:** Do not use multidose vials, benzyl alcohol is present, do not breastfeed
- Monitor blood studies (Hct, CBC, coagulation studies, occult blood in stools), anti-Xa levels

q3mo; platelet count q2-3day; thrombocytopenia may occur, PT, PTT, is not needed in those with adequate coagulation; discontinue and notify prescriber if platelets <100
• Assess patient for bleeding gums, petechiae, ecchymosis, black tarry stools, hematuria, epistaxis, decrease in B/P; indicate bleeding and possible hemorrhage; notify prescriber immediately

**BLACK BOX WARNING:** Assess for **neuroleptic symptoms** in patients who have received spinal anesthesia, may develop spinal hematoma, those who have had trauma, spinal surgery are at greater risk

• **Anaphylaxis, angioedema:** Assess for rash, fever, chills, swelling of face, lips, or tongue, dyspnea; stop product, initiate emergency procedures
• **Neurologic status:** those with epidural catheters are at greater chance for impairments
• **Injection site reactions:** Assess for inflammation, redness, hematomas

### Patient/family education
• **Spinal anesthesia:** Teach patient to report numbness, weakness in lower extremities
• Warn patient to avoid OTC preparations unless directed by prescriber because they could cause serious product interactions, not to start any Rx, OTC, supplements, or herbal products unless approved by prescriber
• Instruct patient to use soft-bristled toothbrush to avoid bleeding gums; to avoid contact sports; to use electric razor; to avoid IM inj
• **Advise patient to report any signs of bleeding, bruising:** gums, under skin, urine, stools, dizziness, rash, breathing changes, do not rub injection site
• **Beers:** Reduce dose in older adults, increased bleeding risk, or if CCr ≤30 ml/min

### Evaluation
**Positive therapeutic outcome**
• Absence of DVT/PE

**RARELY USED**

## entacapone (Rx)
(en-ta′ka-pone)
**Comtan**
*Func. class.:* Antiparkinsonian agent
*Chem. class.:* COMT (Catechol-O- methyltransferase inhibitor)

**ACTION:** Inhibits COMT (catechol *O*-methyltransferase) and alters the plasma pharmacokinetics of levodopa; given with levodopa/carbidopa

**Therapeutic outcome:** Decreased symptoms of Parkinson's disease (involuntary movements)

## USES:
Parkinsonism in those experiencing end of dose, decreased effect as an adjunct to levodopa/carbidopa

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, renal/hepatic disease, affective disorders, psychosis

## DOSAGE AND ROUTES
**Adult:** PO 200 mg given with carbidopa/levodopa, max 1600 mg/day; may allow 25% dosage reduction in levodopa therapy

**Available forms:** Tabs 200 mg film coated

### Implementation
• Adjust dosage to patient response
• Give with meals to decrease GI upset; limit protein taken with product
• Give only after MAOIs have been discontinued for 2 wk

## ADVERSE EFFECTS
**CNS:** *Involuntary choreiform movements, dyskinesia, hypokinesia, hyperkinesia, hand tremors, fatigue, headache, anxiety, twitching, numbness, weakness, confusion, agitation, nightmares,* psychosis, hallucinations, hypomania, severe depression, dizziness, neuroleptic malignant syndrome
**CV:** *Orthostatic hypotension*
**GI:** *Nausea, vomiting, anorexia, abdominal distress, dry mouth, flatulence,* gastritis, GI disorder, *diarrhea, constipation,* bitter taste
**INTEG:** Rash, sweating, alopecia
**MISC:** Dark urine and other body fluids, back pain, dyspnea, purpura, fatigue, asthenia, infection-bacterial, rhabdomyolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Protein binding 98% |
| **Metabolism** | Liver extensively |
| **Excretion** | Kidneys, feces; breast milk |
| **Half-life** | 0.5 hr initial, 2.5 hr second |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | ≤8 hr |

## INTERACTIONS

### Individual drugs

Ampicillin, chloramphenicol, erythromycin, probenecid, rifampin: decreased excretion of entacapone

Bitolterol, DOBUTamine, DOPamine, EPHINEPHrine, isoetharine, methyldopa, norepinephrine: increased CV reactions; avoid use

### Drug classifications

MAOIs: prevent catecholamine metabolism; do not use together

### Drug/herb

Kava: decreased effect

Ma huang: increased B/P

## NURSING CONSIDERATIONS

### Assessment

- **Assess for neuroleptic malignant syndrome:** high temp, increased CPK, rigidity, change in consciousness, usually during rapid withdrawal, do not combine with SSRIs or MAOIs
- **Diarrhea:** Occurs between 4 and 12 wk of treatment
- Monitor B/P, respiration during initial treatment; hypotension should be reported
- Assess mental status: affect, mood, behavioral changes, depression; complete suicide assessment
- Monitor liver function enzymes: AST, ALT, alkaline phosphatase; also check LDH, bilirubin, CBC
- **Assess for involuntary movements in parkinsonism:** akinesia, tremors, staggering gait, muscle rigidity, drooling; these symptoms should improve with therapy when given with levodopa/carbidopa
- **Rhabdomyolysis:** Assess for muscle pain, tenderness, weakness, swelling of affected muscles, may lead to decreased B/P, shock

### Patient/family education

- Advise patient that hallucinations, mental changes, nausea, dyskinesia can occur
- Caution patient to change positions slowly to prevent orthostatic hypotension; not to drive or operate machinery until stabilized on medication and mental performance is not affected
- Instruct patient to use product exactly as prescribed; if dose is missed, take as soon as remembered, up to 2 hr before next dose, not to discontinue abruptly, withdraw gradually
- Inform patient that urine, sweat may darken
- Instruct patient to notify prescriber if pregnancy is suspected; if breastfeeding, product is excreted in breast milk

### Evaluation

#### Positive therapeutic outcome

- Decreased akathisia, other involuntary movements when used with levodopa/carbidopa
- Increased mood when used with levodopa/carbidopa

## entecavir (Rx)

(en-te'ka-veer)

**Baraclude**

*Func. class.:* Antiretroviral nucleoside reverse transcriptase inhibitors (NRTIs)

*Chem. class.:* Guanosine nucleoside analog

E

**ACTION:** Inhibits hepatitis B virus DNA polymerase by competing with natural substrates and by causing DNA termination after its incorporation into viral DNA; causes viral DNA death

**Therapeutic outcome:** Improved liver function tests in chronic hepatitis B (HBV)

**USES:** Chronic hepatitis B (HBV)

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, child, geriatric, severe renal disease, liver transplant

**BLACK BOX WARNING:** Hepatic disease, hepatitis, lactic acidosis, HIV

## DOSAGE AND ROUTES

### Chronic hepatitis B (nucleoside treatment–naive)

**Adult and adolescent ≥16 yr:** PO tab 0.5 mg/day

**Adult:** PO (solution) 0.5 mg qday

**Child/adolescent ≥2 yr, >30 kg:** 0.5 mg (10 mL) qday

**Child ≥2 yr, 27 to 30 kg:** 0.45 mg (9 mL) qday

**Child ≥2 yr, 24 to 26 kg:** 0.4 mg (8 mL) qday

**Child ≥2 yr, 21 to 23 kg:** 0.35 mg (7 mL) qday

**Child ≥2 yr, 18 to 20 kg:** 0.3 mg (6 mL) qday

**Child ≥2 yr, 15 to 17 kg:** 0.25 mg (5 mL) qday

**Child ≥2 yr, 12 to 14 kg:** 0.2 mg (4 mL) qday

**Child ≥2 yr:** 0.15 mg (3 mL) qday

### Chronic hepatitis B with compensated liver disease

**Adult and adolescent ≥16 yr:** PO tab 1 mg/day

**Adult:** PO (solution) 1 mg qday

**Child/adolescent ≥2 yr, >30 kg:** 1 mg (20 mL) qday

**Child ≥2 yr, 27 to 30 kg:** 0.9 mg (18 mL) qday

**Child ≥2 yr, 24 to 26 kg:** 0.8 mg (16 mL) qday

**Child ≥2 yr, 21 to 23 kg:** 0.7 mg (14 mL)

**Child ≥2 yr, 18 to 20 kg:** 0.6 mg (12 mL) qday

**Child ≥2 yr, 15 to 17 kg:** 0.5 mg (10 mL) qday

**Child ≥2 yr, 12 to 14 kg:** 0.4 mg (8 mL) qday

**Child ≥2 yr, 10 to 11 kg:** 0.3 mg (6 mL) qday

### Renal dose

**Adult and child >16 yr:** PO CCr ≥50 ml/min 0.5 mg/day; CCr 30-49 ml/min 0.25 mg daily, 0.5 mg/day or 1 mg q48hr for lamiVUDine refractory patient; CCr 10-29 ml/min 0.15/day, 0.3 for lamiVUDine refractory patient; CCr <10 ml/min 0.05 mg PO/day, 0.1 mg/day or 1 mg q7days for lamiVUDine refractory patient

**Available forms:** Tabs, film coated 0.5, 1 mg; oral sol 0.05 mg/ml

### Implementation

- After hemodialysis give by mouth on empty stomach 2 hr before or after food
- Tabs: Store at room temperature
- **Oral liquid:** Use calibrated oral dosing spoon provided, may be used interchangeably with tabs, do not dilute
- Store in cool environment; protect from light

## ADVERSE EFFECTS

**CNS:** *Headache*, fatigue, dizziness, insomnia
**ENDO:** Hyperglycemia
**GI:** *Dyspepsia*, nausea, vomiting, diarrhea, elevated liver function enzymes, hepatotoxicity with steatosis
**INTEG:** Alopecia, rash
**SYST:** Lactic acidosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 100% |
| **Distribution** | Extensively to tissues, protein binding 13% |
| **Metabolism** | Unknown |
| **Excretion** | Unchanged 62%-73% via kidneys |
| **Half-life** | Terminal 128-149 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 0.5-1.5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug/food

High-fat meal: decreased absorption

### Drug/lab test

Increased: ALT, AST, total bilirubin, amylase, lipase, creatinine, blood glucose, urine glucose
Decreased: platelets, albumin

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess **for HIV** before beginning treatment because HIV resistance may occur in patients with chronic hepatitis B infection; monitor HIV RNA, do not use in those with HIV and HBV unless receiving antiretroviral treatment for both

**BLACK BOX WARNING:** Assess for **lactic acidosis and severe hepatomegaly with stenosis:** increased serum lactate, increased hepatic enzymes, palpate liver; discontinue product if these occur, may be fatal

- Monitor geriatric patients more carefully; may develop renal, cardiac symptoms more rapidly

**BLACK BOX WARNING:** Assess **for exacerbations of hepatitis** (jaundice, pruritus, fatigue, anorexia) after discontinuing treatment; and for several months monitor liver function tests

- Use if clearly needed, register pregnant woman at the Antiretroviral Pregnancy Registry at 800-258-4263. To reduce the risk of postnatal transmission, HIV-infected mothers are advised to avoid breastfeeding

### Patient/family education

- Teach patient not to take with food
- Teach patient to take exactly as prescribed, read the "Patient Information," take missed dose when remembered unless close to time of next dose, that compliance with dosage schedule is required, do not share product
- Advise patient not to stop medication without approval of prescriber
- Advise that optimal duration of treatment is unknown
- Teach patient to avoid use with other medications, supplements unless approved by prescriber
- Teach patient to notify prescriber of decreased urinary output, blood in urine

**BLACK BOX WARNING: Teach patient symptoms of lactic acidosis:** muscle pain, severe tiredness, weakness, trouble breathing, stomach pain with nausea/vomiting, coldness in arms/legs, fast/irregular heartbeat, dizziness

**BLACK BOX WARNING: Teach patient symptoms of hepatotoxicity:** eyes/skin turns yellow, dark urine, light bowel movements, no appetite for days, nausea, stomach pain, may be worsened after discontinuing treatment

• Advise patient that product does not cure, but lowers the amount of HBV in body
• Teach patient that product does not stop the spreading of HBV to others by sex, sharing needles, or being exposed to blood
• Teach patient to notify prescriber if pregnancy is planned or suspected, not to breastfeed
• Teach patient not to operate machinery until effect is known, dizziness may occur
• Inform patient that regular follow-up and lab tests will be needed

### Evaluation

**Positive therapeutic outcome**

• Decreased symptoms of chronic hepatitis B, improving liver function tests

**RARELY USED**

## enzalutamide

(en-zal-u'ta-mide)

**Xtandi**

*Func. class.:* Antineoplastic hormone

*Chem. class.:* Nonsteroidal antiandrogen

**Therapeutic outcome:** Decreased tumor size, decreased spread of malignancy

**USES:** Metastatic castration-resistant prostate cancer in those who have received DOCEtaxel

### CONTRAINDICATIONS

Pregnancy, women, hypersensitivity

### DOSAGE AND ROUTES

**Adult: PO** 160 mg (4 × 40-mg caps) daily

If a patient experiences a grade 3 or higher toxicity or an intolerable adverse effect, withhold dosing for 1 wk or until symptoms improve to grade 2 or less, then resume at the same or a reduced dosage (120 or 80 mg), if warranted

The concomitant use of strong cytochrome P450 (CYP-450) 2C8 inhibitors should be avoided if possible; if a strong CYP2C8 inhibitor must be coadministered, reduce the enzalutamide dosage to 80 mg once daily

**Available forms:** TABs 40 mg

## epinastine ophthalmic

*See Appendix B*

**⚠ HIGH ALERT**

## EPINEPHrine (Rx, OTC)

(ep-i-nef'rin)

**Adrenaclick, Primatene Mist, Twinject, Walgreens Bronchial Mist**

## EPINEPHrine HCl

**Adrenalin, EpiPen, EpiPen Jr.**

*Func. class.:* Bronchodilator, nonselective adrenergic agonist, cardiac stimulant, vasopressor

*Chem. class.:* Catecholamine

**Do not confuse:** EPINEPHrine/ePHEDrine

**ACTION:** $\beta_1$- and $\beta_2$-agonist causing increased levels of cyclic AMP producing bronchodilatation, cardiac and CNS stimulation; large doses cause vasoconstriction via $\alpha$-receptors; small doses can cause vasodilation via $\beta_2$-vascular receptors

**Therapeutic outcome:** Vasoconstrictor, cardiac stimulator, bronchodilator, decreased aqueous humor

**USES:** Acute asthmatic attacks, hemostasis, bronchospasm, anaphylaxis, allergic reactions, cardiac arrest, adjunct in anesthesia, shock

### CONTRAINDICATIONS

Hypersensitivity to sympathomimetics, sulfites, closed-angle glaucoma, nonanaphylactic shock during general anesthesia

**Precautions:** Pregnancy, breastfeeding, cardiac disorders, hyperthyroidism, diabetes mellitus, prostatic hypertrophy, hypertension, organic brain syndrome, local anesthesia of certain areas, labor, cardiac dilatation, coronary insufficiency, cerebral arteriosclerosis, organic heart disease

### DOSAGE AND ROUTES

**Anaphylaxis/severe asthma exacerbation**

**Adult: IM/SUBCUT** 0.3-0.5 mg, may repeat q10-15 min (anaphylaxis) or q20min-4 hr (asthma)

**Severe allergic reactions type 1**

**Adult/child ≥30 kg: IM** 0.3 mg (EpiPen/EpiPen 2-Pak, 1:1000)

**Child <30 kg: IM** 0.15 mg (EpiPen Jr/EpiPen Jr 2-Pak 1:2000)

**Adult/child ≥66 lb:** IM/SUBCUT 0.3 mg (0.3 ml) initially (Twinject 1.1 ml 1:1000, 1 mg/ml, containing 2 doses of 0.3 mg)

**Adult/child 33-66 lb:** IM/SUBCUT 0.15 mg (0.15 ml) initially, may give another 0.15 mg after 10 min (Twinject 1.1 ml 1:1000 [1 mg/ml] containing 2 doses of 0.15 mg)

### Status asthmaticus

**Adult/adolescent:** SUBCUT 0.3-0.5 mg q20min ×3 doses

**Child/infant:** SUBCUT 0.01-0.5 mg/kg q20min ×3 doses

**Available forms:** Nasal spray (sol) 1 mg/ml; sol for inj 1 mg/ml; inh vapor (sol) 0.22 mg/actuation; pressurized inh (sol) 0.22 mg/actuation; sol for inj 0.15 mg/0.15 ml autoinjector, 0.3 mg/0.3 ml autoinjector, 0.15 mg/0.3 ml

### Implementation

- Give subcut, IM, intraosseously, IV; suspensions are for subcut use only; do not give IV
- Visually inspect parenteral products for particulate matter and discoloration prior to use; do not use solutions that are pinkish to brownish in color or contain a precipitate
- Avoid extravasation during parenteral administration; if extravasation occurs, infiltrate the affected area with phentolamine diluted in NS
- Death has occurred from drug errors; make sure the right concentration is used
- Store reconstituted sol refrigerated 24 hr

**Direct IV injection route**

- Inject EPINEPHrine directly into a vein over 5-10 min for adults or 1-3 min for children; may be given IV push in cardiac arrest
- In neonates, may administer via the umbilical vein
- During adult cardiopulmonary resuscitation (CPR): resuscitation drugs may be given IV by bolus injection into a peripheral vein, followed by an injection of 20 ml IV fluid; elevate the extremity for 10-20 sec to facilitate drug delivery to the central circulation

**Continuous IV infusion route**

- Dilute 1 mg EPINEPHrine in 250 or 500 ml of a compatible IV infusion solution to provide a concentration of 4 or 2 mcg/ml, respectively; give into a large vein, if possible
- More concentrated solutions (16-32 mcg/ml) may be used in fluid-restricted patients when administered through a central line

**IM route**

- EPINEPHrine injection should preferably be into the deltoid or anterior thigh (vastus lateralis); do not administer into the gluteal muscle
- Twinject is light-sensitive and should be stored in the carrying case provided; do not refrigerate; protect from freezing; replace if solution is discolored or contains a precipitate

**Subcut route**

- Inject taking care not to inject intradermally
- Massage injection site well after use to enhance absorption and to decrease local vasoconstriction; injection can cause tissue irritation

**Intraosseous infusion route (unlabeled)**

- During CPR, the same EPINEPHrine dosage may be given via the intraosseous route when IV access is not available

**Intracardiac route**

- Should be reserved for extreme emergencies. Intracardiac injection should only be performed by properly trained medical personnel

**Inhalation route**

- Use 2.25% sol diluted in nebulizer/respirator
- Rinse mouth after inh
- 10 drops of a 1% sol should be placed in nebulizer
- Dilute racepinephrine 2.25% sol

**Endotracheal route**

- Per the ACLS or PALS guidelines, the EPINEPHrine parenteral product is administered via this route
- Endotracheal (ET) administration should only be used if access to IV or intraosseous routes is not possible
- **Adult:** Dilute dose in 5-10 ml NS or sterile distilled water; administer via ET tube; endotracheal absorption of EPINEPHrine may be improved by diluting with water instead of NS
- **Child:** After dose administration, flush the ET tube with a minimum of 5 ml NS

**Y-site compatibilities:** Alfentanil, amikacin, amiodarone, amphotericin B liposome, anidulafungin, ascorbic acid, atracurium, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin, doxycycline, enalaprilat, epirubicin, epoetin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, folic acid, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopa, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins, nafcillin, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, norepinephrine,

octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin-tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanil, ritodrine, rocuronium, sodium acetate, streptomycin, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex with C, voriconazole, warfarin, zoledronic acid

**Y-site incompatibilities:** Acyclovir, aminophylline, azaTHIOprine, carmustine, cephapirin, dantrolene, diazepam, diazoxide, fluorouracil, ganciclovir, gemtuzumab, indomethacin, micafungin, PENTobarbital, PHENobarbital, phenytoin, sodium bicarbonate, thiopental, sulfamethoxazole/trimethoprim

## ADVERSE EFFECTS

**CNS:** *Tremors, anxiety,* insomnia, headache, dizziness, weakness, drowsiness, confusion, hallucinations, cerebral hemorrhage
**CV:** *Palpitations, tachycardia,* hypertension, *dysrhythmias,* increased T wave
**GI:** *Anorexia, nausea, vomiting*
**MISC:** Sweating, dry eyes
**RESP:** *Dyspnea,* paradoxical bronchospasm (inhalation)
**META:** Hypoglycemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO), complete (**IV**) |
| **Distribution** | Unknown, crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

| | SUBCUT | IM | IV | INH |
|---|---|---|---|---|
| **Onset** | 3-5 min | Variable | Immediate | 1 min |
| **Peak** | Unknown | Unknown | Unknown | Unknown |
| **Duration** | 1-4 hr | 1-4 hr | Unknown | 1-4 hr |

## INTERACTIONS

### Drug classifications

β-Adrenergic blockers: decreased hypertensive effects, stop β blocker 3 days before starting product
Antidepressants (tricyclics): increased chance of hypertensive crisis; do not use together
MAOIs: increased chance of hypertensive crisis, do not use together
Other sympathomimetics: toxicity
α blockers: Increase: hypotension-antihistamines, thyroid replacement hormones: Increased: cardiac effects
Cardiac glycosides: Increase: dysrhythmias

## NURSING CONSIDERATIONS

### Assessment

- **Asthma:** Monitor respiratory function: vital capacity, forced expiratory volume, ABGs, lung sounds, heart rate, rhythm (baseline); amount, color of sputum
- Epinephrine crosses the placenta. There are no adequate and well-controlled studies in pregnant women. Epinephrine should be used with extreme caution during active labor and obstetric delivery. Although it can improve maternal hypotension associated with anaphylaxis, it may result in uterine vasoconstriction, decreased uterine blood flow, and fetal anoxia. Avoid use of epinephrine during the second stage of labor; epinephrine may cause a prolonged period of uterine atony with hemorrhage at dosages sufficient to reduce uterine contractions. Avoid use if the maternal blood pressure exceeds 130/80 mm Hg; it is not known whether epinephrine is excreted in human milk. Epinephrine is rapidly inactivated in the body, suggesting that any excreted in breast milk would not likely affect the infant. Caution should be exercised when administering epinephrine to a breastfeeding woman; consider the route of administration and dosage when assessing the risk to the nursing infant
- **Vasopressor:** Monitor during administration continuously; if B/P increases, product should be decreased; check B/P, pulse q5min after parenteral route; CVP, PCWP, SVR; inadvertent high arterial B/P can result in angina, aortic rupture, cerebral hemorrhage
- Check inj site for tissue sloughing; if this occurs, administer phentolamine mixed with 0.9% NaCl
- **Monitor for evidence of allergic reactions, paradoxical bronchospasm:** (swelling of face/lips/eyelids, rash, difficulty breathing) withhold dose, notify prescriber; sulfite sensitivity, which may be life threatening

### Patient/family education

- Identify if pregnancy is planned or suspected, if breastfeeding
- Tell patient not to use OTC medications; extra stimulation may occur; to use this medication before other medications and allow at least 5 min between each, to prevent overstimulation
- Teach patient that paradoxical bronchospasm may occur and to stop product immediately and notify prescriber; to limit caffeine products such as chocolate, coffee, tea, and colas
- **Inhalation:** Patient should rinse mouth after inh
- Patient should report blurred vision, irritation with ophth preparations
- **Autoinjector:** Teach patient how to use for anaphylaxis, remove cap, place black tip on thigh at 45-degree angle, hold 10 sec, remove

### Evaluation

**Positive therapeutic outcome**

- Absence of dyspnea, wheezing, relief of bronchospasm
- Improved airway exchange, improved ABGs
- Decreased aqueous humor
- Stabilization of heart rate and cardiac output

## TREATMENT OF OVERDOSE:

Administer a $\beta_2$-adrenergic blocker, vasodilators, $\alpha$-blocker

## EPINEPHrine nasal agent

*See Appendix B*

**⚠ HIGH ALERT**

## epirubicin (Rx)

(ep-i-roo'bi-sin)

**Ellence, Pharmorubicin**

*Func. class.:* Antineoplastic, antibiotic

*Chem. class.:* Anthracycline

**Do not confuse:** epirubicin/DOXOrubicin/DAUNOrubicin/eribulin/IDArubicin

**ACTION:** Inhibits DNA synthesis primarily; replication is decreased by binding to DNA, which causes strand splitting; maximum cytotoxic effects at S and $G_2$ phases; a vesicant

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Breast cancer as an adjuvant therapy, with axillary node involvement, after resection

**Unlabeled uses:** Used in combination for treatment of advanced forms of cancer

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to this product, anthracyclines, anthracenediones, baseline neutrophil count $<1500$ cell/mm$^3$, severe myocardial insufficiency, recent MI, heart failure, cardiomyopathy

**BLACK BOX WARNING:** Severe hepatic disease, IM/subcut

**Precautions:** Children, geriatric, renal/hepatic/cardiac disease, previous anthracycline use, accidental exposure, angina, dental disease, herpes, hyperkalemia, hyperphosphatemia, hypertension, hyperuricemia, hypocalcemia, infection, infertility, tumor lysis syndrome, ventricular dysfunction

**BLACK BOX WARNING:** Bone marrow suppression (severe), heart failure, extravasation, secondary malignancy, requires an experienced clinician

## DOSAGE AND ROUTES

### Breast cancer with axillary node involvement following resection of the primary tumor in combination with cyclophosphamide and fluorouracil

**Adult: IV** 100 mg/m$^2$ on day 1 with fluorouracil and cyclophosphamide (FEC regimen) q21 days $\times$ 6 cycles or 60 mg/m$^2$ on days 1 and 8 with oral cyclophosphamide and fluorouracil q28 days $\times$ 6 cycles

### Breast cancer in combination with cyclophosphamide

**Adult: IV** 60 mg/m$^2$ day 1 with cyclophosphamide (500 mg/m$^2$ IV day 1), repeated q21 days $\times$ 8 cycles, or a higher-dose regimen of epirubicin 100 mg/m$^2$ IV day 1 with cyclophosphamide (830 mg/m$^2$ IV day 1), q21 days $\times$ 8 cycles

**Dosage adjustments based upon hematologic and non-hematologic toxicities:** Nadir platelet counts $<50{,}000$/mm$^3$ absolute neutrophil counts (ANC) $<250$/mm$^3$, neutropenic fever, or Grades 3/4 non-hematologic toxicities: Day 1 dose in subsequent cycles should be reduced by 25% of the previous dose

**For patients receiving divided-dose epirubicin (i.e., day 1 and 8):** Day 8 dose should be reduced by 25% of the day 1 dose if the platelet counts are 75,000-100,000/mm$^3$ and the ANC is 1000-1499/mm$^3$; if day 8 platelet counts are $<75{,}000$/mm$^3$, ANC $<1000$/mm$^3$, or Grade 3/4 nonhematologic toxicity has occurred, omit the day 8 dose

### Hepatic dose

**Adult: IV** Bilirubin 1.2-3 mg/dl or AST 2-4 $\times$ normal upper limit, 50% of starting dose; bilirubin $>3$ mg/dl or AST $>4$ $\times$ normal upper limit, 25% of starting dose

**Available forms:** Inj (2 mg/ml) 10 mg/5 ml, 50 mg/25 ml, 150 mg/75 ml, 200 mg/100 ml

## Implementation

- Avoid contact with skin; very irritating; wash completely to remove; give fluids **IV** or PO before chemotherapy to hydrate patient
- Give antiemetic 30-60 min before giving product to prevent vomiting and prn
- Administer prophylactic antibiotic with a fluoroquinolone or trimethoprim/sulfamethoxazole if dose of epirubicin is 120 mg/m$^2$
- Provide liquid diet: carbonated beverages; gelatin may be added if patient is not nauseated or vomiting; monitor electrolytes

**BLACK BOX WARNING:** To be used by a clinician experienced in giving cytotoxic products

**BLACK BOX WARNING:** Do not use IM/subcut due to severe tissue necrosis

**BLACK BOX WARNING:** Give IV, only, subcut; a vesicant: if extravasation occurs, stop and complete via another vein, preferably in another limb; avoid infusion into veins over joints or in extremities with compromised venous or lymphatic drainage

- Rapid injection may cause facial flushing or erythema along the vein; avoid administration time of less than 3 min
- Product should be given to those with neutrophils ≥1500/mm$^3$, platelet count ≥100,000/mm$^3$, and non-hematologic toxicities recovered to ≤Grade 1
- When refrigerated, the preservative-free, ready-to-use solution may form a gelled product; and will return to solution after 2-4 hr at room temperature
- Visually inspect for particulate matter and discoloration prior to use
- Double-check dose and product, fatalities have occurred with wrong dose or product
- Give antiinfectives before using this product

### IV route

- Product should be prepared by experienced personnel using proper precautions; pregnant women must not handle product
- Reconstitute 50 mg and 200 mg powder for injection vials with 25 ml and 100 ml, respectively, of sterile water for injection (2 mg/ml), shake vigorously for up to 4 min; reconstituted solutions are stable for 24 hr when stored refrigerated and protected from light or at room temperature in normal light
- Solution can be further diluted with sterile water for injection

### IV injection route

- Give doses of 100-120 mg/m$^2$ into tubing of a freely flowing 0.9% sodium chloride (NS) or $D_5W$ IV infusion over 15-20 min; the infusion time may be decreased, proportionally, in those who require lower doses; infusion times <3 min are not recommended
- Direct injection into the vein is not recommended due to the risk of extravasation; avoid use with any solution of alkaline pH as hydrolysis will occur

### IV infusion route

- Dilute dose in 0.9% sodium chloride (NS) or $D_5W$; infuse over 30-60 min
- Avoid use with any solution of alkaline pH as hydrolysis will occur

**Y-site compatibilities:** Alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, anidulafungin, argatroban, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefotaxime, ceftizoxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, DAPTOmycin, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, ertapenem, erythromycin, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), isoproterenol, labetalol, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, mannitol, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mivacurium, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pentamidine, pentazocine, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin-dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** Acyclovir, allopurinol, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azithromycin, cefepime, cefoperazone, cefoTEtan, cefOXitin, cefTAZidime, cefTRIAXone, cefuroxime, dexamethasone, diazepam, ertapenem, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemtuzumab, heparin, hydrocortisone, ketorolac, leucovorin, magnesium sulfate, meropenem, methohexital, methylPREDNISolone, nafcillin, pantoprazole, PEMEtrexed, PENTobarbital, PHENobarbital, phenytoin, piperacillin/tazobactam, potassium phosphates, sodium bicarbonate, sodium phosphates, thiopental, ticarcillin/clavulanate, tigecycline, sulfamethoxazole/trimethoprim

## ADVERSE EFFECTS

**CV:** Increased B/P, sinus tachycardia, PVCs, chest pain, bradycardia, extrasystole, cardiomyopathy

**GI:** Nausea, vomiting, diarrhea, anorexia, mucositis

**GU:** *Hot flashes, amenorrhea, hyperuricemia,* red urine

**HEMA:** Thrombocytopenia, leukopenia, anemia, neutropenia, secondary AML

**INTEG:** *Rash, necrosis, pain at inj site, reversible alopecia*

**MISC:** Infection, febrile neutropenia, lethargy, fever, conjunctivitis, tumor lysis syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Bile (60%) |
| **Half-life** | 3 min; 1hr; 30 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Cimetidine, radiation: increased toxicity

PACLitaxel: give epirubicin before PACLitaxel if given concurrently

Trastuzumab: increased ventricular dysfunction, HF

### Drug classifications

Antineoplastics: increased toxicity

Calcium channel blockers: increased heart failure

Live virus vaccines: decreased antibody response

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Heart failure:** monitor left ventricular ejection fraction, multigated acquisition scan or echocardiogram, ECG; watch for ST-T wave changes, low QRS and T; possible dysrhythmias (sinus tachycardia, heart block, PVCs) may occur; assess tachypnea, ECG changes, dyspnea, edema, fatigue; cardiac status: B/P, pulse, character, rhythm, rate, ABGs; identify cumulative amount of anthracycline received (lifetime); reactions that follow may be delayed; assess for dyspnea, tachycardia, peripheral edema, rales/crackles, ascites

- **Assess symptoms indicating severe allergic reaction:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing; product should be discontinued

**BLACK BOX WARNING: Bone marrow depression (severe):** monitor CBC, differential, platelet count weekly; withhold product if baseline neutrophil count is $<1500/mm^3$; notify prescriber of results if WBC $<20,000/mm^3$, platelets $<150,000/mm^3$; leukocyte nadir occurs 10-14 days after administration; recovery by 21st day; assess for bleeding: Hemanaturia, guaiac, bruising or petechiae in mucosa or orifices

- **Infection:** treat before receiving this product in regimens $>120$ mg/m$^2$; prophylactic antibiotics should be given (trimethoprim-sulfamethoxazole or a quinolone)
- Assess for increased uric acid levels, swelling, joint pain, primarily extremities; patient should be well hydrated to prevent urate deposits
- Monitor renal function studies: BUN, creatinine, serum uric acid, urine CCr before, during therapy; I&O ratio; report fall in urine output to $<30$ ml/hr; dosage adjustment is needed for serum creatinine $>5$ mg/dl

**BLACK BOX WARNING: Severe hepatic disease:** monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; note jaundice of skin or sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

- Fetal harm may occur if given to a pregnant woman, based on animal studies. Women of reproductive potential should avoid becoming pregnant during therapy and should be advised to utilize effective contraceptive methods. If a woman becomes pregnant during therapy, she should be advised of the potential risks to the fetus. Because this

product may induce chromosomal damage in sperm, there is potential for male-mediated teratogenicity. Men with sexual partners of reproductive potential should use effective contraceptive methods during and after therapy. Men or women who receive this product may have a risk of infertility. Women treated may develop irreversible amenorrhea or premature menopause; discontinue breastfeeding or discontinue product

- Assess for bleeding: hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr; inflammation of mucosa, breaks in skin
- Identify effects of alopecia on body image; discuss feelings about body changes

**BLACK BOX WARNING: Extravasation (vesicant):** Assess for local irritation, pain, burning, necrosis at injection site; discontinue and start at another site

- **Stomatitis:** Assess oral mucosa for ulceration, burning, bleeding, may lead to inability to eat and swallow

### Patient/family education

- Advise patient to avoid use of products containing aspirin or NSAIDs, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
- Instruct patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath)
- Inform patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture, new hair growth occurs in ≤3 mo after treatment
- Caution patient not to have any vaccinations without the advice of the prescriber; serious reactions can occur

**BLACK BOX WARNING:** Teach patient that irreversible myocardial damage, leukopenia, menopause may occur

- **Pregnancy/breastfeeding:** Advise patient to use contraception during treatment and 4 mo afterward; not to breastfeed
- Advise patient that urine may appear red for 2 days
- Instruct patient to avoid crowds, persons with known infection
- Caution patient to avoid OTC medications, supplements unless approved by prescriber
- Teach patient to report rapid heartbeat, trouble breathing, fever, nausea, vomiting, oral sores
- To report pain at site immediately

### Evaluation

**Positive therapeutic outcome**

- Prevention of rapid division of malignant cells

## eplerenone (Rx)

(ep-ler-ee′known)

**Inspra**

*Func. class.:* Antihypertensive

E

**Do not confuse:** Inspra/Spiriva

**ACTION:** Binds to mineralocorticoid receptor and blocks the binding of aldosterone, a component of the renin-angiotensin-aldosterone system (RAAS)

**Therapeutic outcome:** Absence of hypertension

**USES:** Hypertension, alone or in combination with thiazide diuretics, HF, post-MI

## CONTRAINDICATIONS

Hypersensitivity, increased serum creatinine >2 mg/dl (male) or >1.8 mg/dl (female), potassium >5.5 mEq/L, type 2 diabetes with microalbuminuria, hepatic disease, CCr <30 ml/min, CCr <50 ml/min in hypertension

**Precautions:** Pregnancy, breastfeeding, children, geriatric, impaired renal/hepatic function, hyperkalemia

## DOSAGE AND ROUTES

### Hypertension

**Adult: PO** 50 mg/day initially, may increase to 50 mg bid after 4 wk, max 100 mg/day; start dose at 25 mg/day if patient is taking CYP3A4 inhibitors

### HF/post-MI

**Adult:** PO 25 mg/day initially, may increase to 50 mg/day max

**Available forms:** Tabs 25, 50 mg

### Implementation

- Store in tight container at 86° F (30° C) or less
- **Dosage adjustments for those receiving moderate CYP3A4 inhibitors:** Potassium level 5 mEq/L, increase from 25 mg every other day to 25 mg/qday, or increase from 25 mg/qday to 50 mg qday.
- If potassium level is 5-5.4 mEq/L no adjustment; if potassium level is 5.5 to 5.9 mEq/L, decrease dose from 50 mg qday to 25 mg/qday to 25 mg every other day; withhold dose; If potassium level is >6 mEq/L withhold; may restart drug at 25 mg every other day when potassium level is <5.5 mEq/L

## ADVERSE EFFECTS

**CNS:** Headache, *dizziness, fatigue*
**CV:** Angina, MI
**GI:** Increased GGT *diarrhea,* abdominal pain, increased ALT
**GU:** Gynecomastia, mastodynia (males), abnormal vaginal bleeding
**META:** *Hyperkalemia,* hyponatremia, hypercholesteremia, hypertriglyceridemia, increased uric acid
**RESP:** *Cough*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 50% |
| **Metabolism** | Liver (CYP3A4) |
| **Excretion** | Urine, feces |
| **Half-life** | 4-6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1½ hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Clarithromycin, imatinib, nelfinavir, nefazodone, ritonavir, troleandomycin: do not use concurrently
Erythromycin, fluconazole, verapamil: reduce dose of eplerenone; increased eplerenone levels
Itraconazole, ketoconazole, saquinavir, verapamil: increased levels of eplerenone; reduce dose of eplerenone
Lithium: increased serum lithium levels, monitor lithium level

### Drug classifications

ACE inhibitors, angiotensin II antagonists, diuretics (potassium-sparing), do not use together, NSAIDs, potassium supplements: increased hyperkalemia
CYP3A4 inhibitors: increased levels of eplerenone; reduce dose of eplerenone
NSAIDs: decreased antihypertensive effect

### Drug/herb

Decreased antihypertensive effect: ephedra, St. John's wort

### Drug/food

Grapefruit, grapefruit juice: increased product level by 25%
• Do not use salt substitutes with potassium

### Drug/lab test

Increased: BUN, creatinine, potassium, cholesterol, lipids, uric acid
Decreased: sodium

## NURSING CONSIDERATIONS

### Assessment

• **Hypertension:** monitor B/P at peak/trough level of product, orthostatic hypotension, syncope when used with diuretic; those on moderate CYP3A4 inhibitors should monitor potassium at baseline, within first wk, and at 1 month and more often in diabetes, renal disease
• Monitor renal studies: protein, BUN, creatinine; increased liver function tests; uric acid may be increased, contraindicated in CCr <30 ml/min
• **Pregnancy/breastfeeding:** Use in pregnancy only if clearly needed, may be excreted in breast milk, discontinue breastfeeding or discontinue product
• Monitor potassium levels, hyperkalemia may occur

### Patient/family education

• Advise patient not to discontinue product abruptly
• Advise patient not to use OTC products (cough, cold, allergy) unless directed by prescriber; do not use salt substitutes containing potassium without consulting prescriber
• Teach patient the importance of complying with dosage schedule, even if feeling better
• Teach patient that product may cause dizziness, fainting, light-headedness; may occur during first few days of therapy
• Teach patient how to take B/P, normal readings for age group

### Evaluation

**Positive therapeutic outcome**

• Decrease in B/P

**⚠ HIGH ALERT**

## epoetin (Rx)

(ee-poe'e-tin)
**Epogen, Eprex, Procrit**
*Func. class.:* Antianemic, biologic modifier, hormone
*Chem. class.:* Amino acid polypeptide

**ACTION:** Erythropoietin is a factor controlling rate of red cell production; product is developed by recombinant DNA technology

**Therapeutic outcome:** Decreased anemia with increased RBCs

**USES:** Anemia caused by reduced endogenous erythropoietin production, primarily end-stage renal disease; to correct hemostatic defect in uremia; anemia caused by AZT (zidovudine) treatment in HIV-positive patients; anemia caused by chemotherapy; reduction of allogeneic blood transfusion in surgery patients

**Unlabeled uses:** Anemia in premature preterm infants

## CONTRAINDICATIONS

Hypersensitivity to mammalian cell–derived products or human albumin; uncontrolled hypertension

**Precautions:** Pregnancy, breastfeeding, children <1 mo, seizure disorder, porphyria, CV disease, hemodialysis, latex allergy, hypertension, history of CABG; multidose preserved formulation contains benzyl alcohol and should not be used in premature infants

**BLACK BOX WARNING:** Hgb >11 g/dl, surgery, neoplastic disease

## DOSAGE AND ROUTES

### Anemia due to chronic kidney disease including dialysis-dependent and dialysis-independent patients to decrease the need for red blood cell transfusion

**Adult/adolescent ≥17 yr:** SUBCUT/IV, initially, 50-100 units/kg 3×/wk; for patients on dialysis, administer IV and initiate treatment when hemoglobin (Hgb) is <10 g/dl. If Hgb approaches or exceeds 11 g/dl, reduce or interrupt the dose. For patients not on dialysis, consider initiating treatment only when Hgb is <10 g/dl and the rate of Hgb decline indicates the likelihood of requiring a RBC transfusion and reducing the risk of alloimmunization and/or other RBC transfusion-related risks is a goal. If Hgb is >10 g/dl, reduce or interrupt the dose, and use the lowest dose sufficient to reduce the need for RBC transfusions. If the Hgb rises >1 g/dl in any 2-wk period, reduce dose by 25% or more as needed to reduce rapid responses. In contrast, if Hgb has not increased >1 g/dl after 4 wk of therapy, increase the dose by 25%. For patients who do not respond adequately over a 12-wk escalation period, increasing the dose further is unlikely to improve response and may increase risks. Use the lowest dose that will maintain a Hgb concentration sufficient to reduce the need for RBC transfusions. Evaluate other causes of anemia, and discontinue if responsiveness does not improve

**Adolescent ≤16 yr/child/infant:** SUBCUT/IV 50 units/kg 3×/wk initially; for dosage adjustments, see adult dosage

### Zidovudine-induced anemia in HIV-infected patients with circulating endogenous erythropoietin concentrations ≤500 mUnits/ml who are receiving a dose of zidovudine ≤4200 mg/wk

**Adult:** SUBCUT/IV initially, 100 units/kg 3×/wk. If Hgb does not increase after 8 wk, increase by 50-100 units/kg at 4 to 8 wk intervals until Hgb is at a concentration to avoid RBC transfusions or a dose of 300 units/kg is reached. If the Hgb >12 g/dl, withhold, once Hgb <11 g/dl resume at a dose 25% below the previous dose

### Anemia in patients with nonmyeloid malignancies where the anemia is due to the effect of concomitantly administered chemotherapy and at least 2 additional months of chemotherapy is planned

**Adult:** SUBCUT 150 units/kg three times weekly or 40,000 units once weekly only when the hemoglobin is <10 g/dl and only until the chemotherapy course is completed. Adjust the dose to maintain the lowest Hgb concentration sufficient to avoid RBC transfusions. If no rise in Hgb ≥1 g/dl after 4 wk of therapy and Hgb is <10 g/dl, the dosage may be increased to 300 units/kg subcut 3 times weekly or 60,000 units once wkly. Discontinue if after 8 wk of therapy there is no response as measured by Hgb rise of <1-2 g/dl concentrations or if transfusions are still required. Reduce the dose by approximately 25% if Hgb increases by more than 1 g/dl in any 2-week period or if Hgb reaches a concentration needed to avoid RBC infusion. If Hgb is increasing and exceeds a concentration necessary to avoid blood transfusions, hold therapy and reinstitute at a dose that is 25% lower when the Hgb reaches a concentration where transfusions may be needed

**Adolescent/child ≥5 yr:** IV 600 units/kg qwk only when the hemoglobin is <10 g/dl and only until the chemotherapy course is completed. Adjust the dose to maintain the lowest Hgb concentration sufficient to avoid RBC transfusions. If no rise in Hgb ≤1 g/dl after 4 wk of therapy and Hgb is <10 g/dl, the dosage may be increased to 900 units/kg (up to 60,000 units) IV weekly. Discontinue if after 8 wk there is no response as measured by Hgb concentrations or if transfusions are still required. Reduce the dose by approximately 25% if Hgb increases by more than 1 g/dl in any 2-wk period or if Hgb reaches a

concentration needed to avoid RBC infusion. If the Hgb is increasing and exceeds a concentration necessary to avoid blood transfusions, hold therapy and reinstitute at a dose that is 25% lower when the Hgb reaches a concentration where transfusions may be needed

**To reduce the need for allogenic blood transfusions in anemic patients (hemoglobin >10 and ≤13 g/dl) scheduled to undergo elective, noncardiac, nonvascular surgery**

**Adult:** Subcut 300 units/kg/day × 10 days before surgery, on the day of surgery, and for 4 days after surgery (15 days total) or 600 units/kg once weekly, 21, 14, and 7 days before surgery plus one dose on the day of surgery

**Available forms:** Inj 2000, 3000, 4000, 10,000, 20,000, 40,000 units/ml

### Implementation

- Do not use if discolored or particulates are present

**SUBCUT route**

- Before injecting, preservative-free, single-dose formulation may be admixed by using 0.9% NaCl, USP, with benzyl alcohol 0.9% at a 1:1 ratio to reduce injection site discomfort, store solution in refrigerator, protect from light

**Direct IV route**

- Administer by direct route at end of dialysis by venous line, do not shake vial
- If Hgb increases by 1 g/dl in 2 wk, decrease dose by 25%; increase dose if Hgb does not increase by 5-6 points after 8 wk of therapy; suggested target Hgb range 30%-36%
- Give additional heparin to lower chance of clots

**Solution compatibilities:** Do not dilute or administer with other solutions

## ADVERSE EFFECTS

**CNS:** Seizures, coldness, sweating, headache, fatigue, dizziness
**CV:** *Hypertension,* hypertensive encephalopathy, HF, edema, DVT, MI, stroke
**INTEG:** Pruritus, rash, inj site reaction
**MISC:** Iron deficiency
**MS:** Bone pain, arthralgia, myalgia
**RESP:** Cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (SUBCUT), completely absorbed (IV) |
| **Distribution** | Increased RBC count 2-6 wk |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 5-14 hr |

### Pharmacodynamics

| | SUBCUT/IV |
|---|---|
| **Onset** | Unknown |
| **Peak** | Immediate; SUBCUT: Peak 5-24 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Anticoagulants: need for increased heparin during hemodialysis

## NURSING CONSIDERATIONS

### Assessment

- Monitor renal studies: urinalysis, protein, blood, BUN, creatinine; I&O; report drop in output to <50 ml/hr

**BLACK BOX WARNING:** Monitor blood studies: ferritin, transferrin monthly, transferrin sat ≥20%; ferritin ≥100 ng/ml; Hct 2 ×/wk until stabilized in target range (30%-36%), then at regular intervals; those with endogenous erythropoietin levels of <500 units/L respond to this agent; check for symptoms of anemia: fatigue, pallor, dyspnea; monitor Hct 2 ×/wk in chronic renal failure; cancer patients and those being treated with zidovudine should be monitored weekly, then periodically after stabilization; death may occur in Hgb >12 g/dl

- Assess for CNS symptoms: coldness, sweating, pain in long bones
- Assess CV status: B/P before, during treatment; hypertension may occur rapidly, leading to hypertension encephalopathy; antihypertensives may be needed
- Assess patient during hemodialysis for bruits, thrills, or shunts; product prevents severe anemia in chronic renal failure; clotting may need to be treated with increased anticoagulant
- **Seizures:** place on seizure precautions; assess for seizures if Hct is increased within 2 wk by 4 points, increased B/P, more common in chronic renal failure in the first 90 days of treatment
- Monitor serum iron, ferritin, transferrin levels; iron therapy may be needed to prevent recurring anemia
- Monitor B/P, check for rising B/P as Hct rises
- Monitor blood studies: BUN, creatinine, uric acid, platelets, WBC, phosphorus, potassium, bleeding time; Hct, Hgb, RBCs, reticulocytes should be checked in chronic renal failure
- For hypersensitivity reactions: Skin rashes, urticaria (rare), antibody development does not occur

• For pure cell aplasia (PRCA) in absence of other causes, evaluate by testing serum for recombinant erythropoietin antibodies; any loss of response to epoetin should be evaluated
• Product should be used during pregnancy only when the benefits outweigh the risks of treatment. Multidose vials of epoetin are contraindicated due to the use of benzyl alcohol as a preservative; it is not known whether epoetin alfa is distributed into breast milk. Multidose vials of epoetin alfa are contraindicated in breastfeeding due to the use of benzyl alcohol as preservative Consider the benefits of breastfeeding, the risk of potential infant drug exposure, and the risk of an untreated or inadequately treated condition

### Patient/family education
• Teach patient how to take B/P
• Teach patient to report immediately chest pain, pain in calves, confusion, inability to speak, numbness in face, arms, legs
• Advise patients to take iron supplements, vit $B_{12}$, folic acid as directed
• Teach patient to avoid driving or hazardous activity during treatment
• Teach patients with renal disease to include high-iron and low-potassium foods in their diets (meat, dark green leafy vegetables, eggs, enriched breads)
• Teach patient the reason for treatment, expected results
• Advise patient to use contraception
• Chronic renal failure (anemia): Teach patient that product does not cure condition, to maintain prescribed diet, medications, dialysis follow-up appointments

### Evaluation
**Positive therapeutic outcome**
• Increased appetite
• Enhanced sense of well-being
• Increase in reticulocyte count in 2-6 wk, Hgb, Hct

**RARELY USED**

## eprosartan (Rx)
(ep-roh-sar'tan)
**Teveten**
*Func. class.:* Antihypertensive
*Chem. class.:* Angiotensin II receptor antagonist (Subtype $AT_1$)

**ACTION:** Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the $AT_1$ receptor found in tissues

**Therapeutic outcome:** Decreased B/P

**USES:** Hypertension, alone or in combination with other antihypertensives

## CONTRAINDICATIONS
Hypersensitivity

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Breastfeeding, children, geriatric, hypersensitivity to ACE inhibitors, renal/hepatic disease, angioedema, hyperkalemia

E

## DOSAGE AND ROUTES
**Adult:** PO 600 mg/day; dose may be divided and given bid, with total daily doses ranging from 400-800 mg, max 900 mg/day

### Renal dose
**Adult:** PO CCr ≤30 ml/min, max 600 mg/day

**Available forms:** Tabs 400, 600 mg

### Implementation
• May be given without regard to meals

## ADVERSE EFFECTS
**CNS:** *Dizziness*, depression, *fatigue,* headache
**CV:** Chest pain, palpitations
**EENT:** Sinusitis
**GI:** *Diarrhea, dyspepsia, abdominal pain*
**GU:** UTI
**HEMA:** Neutropenia
**INTEG:** Pruritus, angioedema
**META:** Hypertriglyceridemia
**MS:** *Myalgia,* arthralgia, rhabdomyolysis
**RESP:** *Cough, upper respiratory infection,* rhinitis, pharyngitis, viral infection
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Absolute bioavailability ~13%; food delays absorption |
| **Distribution** | Protein binding 98% |
| **Metabolism** | Moderate renal impairment increases product levels by 30%, hepatic impairment increases levels by 40% |
| **Excretion** | Urine, feces |
| **Half-life** | 5-9 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Drug classifications
Antidiabetics: Increase: hyperglycemia
ACE inhibitors, angiotensin II receptor antagonists, potassium sparing diuretics, potassium supplements: increased hyperkalemia

NSAIDs, salicylates: decreased antihypertensive effect
Other antihypertensives: increased antihypertensive effect

### Drug/lab test

Increased: ALT, AST, alkaline phosphatase, potassium
Decreased: Hgb

## NURSING CONSIDERATIONS

### Assessment

- Assess B/P with position changes, pulse periodically; note rate, rhythm, quality
- Assess electrolytes: K, Na, Cl
- Assess baselines in renal, liver function tests before therapy begins
- **Heart failure:** Assess for edema, daily weight, rales/crackles, jugular vein distension, report significant findings
- Assess skin turgor, dryness of mucous membranes for hydration status
- **Hypersensitivity/anaphylaxis/angioedema:** Monitor for rash, dyspnea, throat tightness, if these occur, stop product, give antihistamine first, notify prescriber immediately
- **Pregnancy:** Identify if pregnancy is planned or suspected, if breastfeeding

### Patient/family education

- Advise patient to comply with dosage schedule, even if feeling better
- Advise patient to notify prescriber of fever, swelling of hands or feet, chest pain
- Inform patient that excessive perspiration, dehydration, diarrhea may lead to fall in blood pressure; consult prescriber if these occur, maintain adequate hydration
- Inform patient that product may cause dizziness; advise to avoid hazardous activities until effect is known, to rise slowly from sitting position
- Teach patient/family how to take B/P, report changes if significant

**BLACK BOX WARNING:** Advise patient not to take this medication if pregnant or breastfeeding, or if allergic reaction to this product has occurred

- Advise patient to take missed dose as soon as possible, unless within 1 hr of next dose

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P

**⚠ HIGH ALERT**

## eptifibatide (Rx)

(ep-tih-fib'ah-tide)
**Integrilin**
*Func. class.:* Antiplatelet agent
*Chem. class.:* Glycoprotein IIb/IIIa inhibitor

**ACTION:** Platelet glycoprotein antagonist; reversibly prevents fibrinogen, von Willebrand factor from binding to the glycoprotein IIb/IIIa receptor, inhibiting platelet aggregation

**Therapeutic outcome:** Decreased platelets

**USES:** Acute coronary syndrome, including those undergoing percutaneous coronary intervention (PCI)

## CONTRAINDICATIONS

Hypersensitivity, active internal bleeding, recent history of bleeding, stroke within 30 days or any hemorrhagic stroke, major surgery with severe trauma, severe hypertension, history of intracranial bleeding, current or planned use of another parenteral GPIIb/IIIa inhibitor, dependence on renal dialysis, coagulopathy, AV malformation, aneurysm

**Precautions:** Pregnancy, breastfeeding, children, geriatric, bleeding, renal function impairment

## DOSAGE AND ROUTES

### Acute coronary syndrome

**Adult: IV** BOL 180 mcg/kg as soon as diagnosed, max 22.6 mg; then **IV** CONT INF 2 mcg/kg/min × 72 hr or coronary artery bypass graft (CABG) discontinue ≥ 2-4 hr before procedure

### PCI in patients without acute coronary syndrome

**Adult: IV** BOL 180 mcg/kg given immediately before PCI; then 2 mcg/kg/min × 18 hr by CONT IV INF and a 2nd 180 mcg/kg BOL, 10 min after 1st BOL; continue INF for up to 18-24 hr at a rate of 1 mcg/kg/min

### Renal dose

**Adult:** IV BOL CCr <50 ml/min 2-4 mg/dl same loading dose, then ½ usual INF dose; CCr <10 ml/min contraindicated

**Available forms:** Sol for inj 2 mg/ml (10 ml), 0.75 mg/ml (100 ml)

### Implementation

- Aspirin may be given with this product; check for bleeding
- Discontinue heparin before removing femoral artery sheath after PCI

• Do not give discolored solutions, those with particulates; discard unused amount, protect from light
• Discontinue product prior to CABG

**Direct IV route**
• After withdrawing the BOL dose from 10-ml vial, give **IV** push over 1-2 min
• Do not use discolored sol or sol with particulate

**Continuous IV infusion route**
• Follow BOL dose with cont inf using infusion pump, give product undiluted directly from the 100-ml vial, spike the 100-ml vial with a vented infusion set; use caution when centering the spike on the circle of the stopper top, refrigerate vials, store vials ≤2 months at room temperature

**Y-site compatibilities:** Alfentanil, alteplase, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, atenolol, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cycloSPORINE, DAPTOmycin, dexamethasone, $D_5$/NaCl 0.9%, diazepam, diltiazem, diphenhydrAMINE, DOBUTamine, dolasetron, DOPamine, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, ertapenem, erythromycin, esmolol, famotidine, fentaNYL, fluconazole, fosphenytoin, ganciclovir, gatifloxacin, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, imipenem-cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, meperidine, meropenem, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mivacurium, morphine, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, NS, octreotide, ofloxacin, ondansetron, oxytocin, palonosetron, pancuronium, PEMEtrexed, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, ranitidine, remifentanil, rocuronium, sodium bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, teniposide, theophylline, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, trimethobenzamide, vancomycin, vecuronium, verapamil, zidovudine, zoledronic acid

**Solution compatibilities:** 0.9% NaCl, $D_5$/0.9% NaCl
• Discontinue product before CABG
• Give all medications PO if possible, avoid IM inj and catheters

## ADVERSE EFFECTS

**CV:** Stroke, hypotension
**GU:** Hematuria
**HEMA:** Thrombocytopenia, platelet dysfunction
**SYST:** Major/minor bleeding from any site, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 25% |
| **Metabolism** | Limited |
| **Excretion** | Kidneys |
| **Half-life** | 1.5-2 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Within 1 hr |

## INTERACTIONS

### Individual drugs

Abciximab, aspirin, clopidogrel, dipyridamole, heparin, ticlopidine, valproate: increased bleeding

### Drug classifications

Anticoagulants, NSAIDs, SSRIs, SNRIs, thrombolytics: increased bleeding
Platelet receptor inhibitors IIb, IIIa: do not give together

### Drug/herb

Feverfew, garlic, ginger, ginkgo, ginseng

## NURSING CONSIDERATIONS

### Assessment

• **Thrombocytopenia:** Monitor platelets, Hgb, Hct, creatinine, APTT baseline, INR, within 6 hr of loading dose and daily thereafter; patients undergoing PCI should have ACT monitored; maintain APTT 50-70 sec unless PCI is to be performed; during PCI, ACT should be 200-300 sec; if platelets drop <100,000/mm³, obtain additional platelet counts; if thrombocytopenia is confirmed, discontinue product; also draw Hct, Hgb, serum creatinine
• **Pregnancy/breastfeeding:** Use in pregnancy only if clearly needed, it is not known if product is excreted in breast milk, consider risks and benefits

• **Assess for bleeding:** gums, bruising, ecchymosis, petechiae; from GI, GU tract, cardiac catheter sites, IM inj sites

### Patient/family education

• Teach patient to report bruising, bleeding, chest pain immediately
• Teach patient not to use other Rx, OTC, supplements without prescriber approval
• Inform patient of reason for medication and expected results

### Evaluation

**Positive therapeutic outcome**
• Decreased platelets

## ergocalciferol

*See vitamin D*

**⚠ HIGH ALERT**

## eribulin (Rx)

(er'i-bue'lin)
**Halaven**
*Func. class.:* Antineoplastics
*Chem class.:* Microtubule inhibitor

**Do not confuse:** eribulin/epirubicin/erlotinib

**ACTION:** Potent antimitotic agent, different from taxes, vinca alkaloids, epothilones; blocks cell progression in $G_2$-M phase, inhibits the growth phase of microtubules and sequesters tubules, leading to disruption of mitotic spindles and apoptotic cell death

**Therapeutic outcome:** Decreased spread and size of tumor

**USES:** Metastatic breast cancer patients who have received at least 2 chemotherapy regimens

### CONTRAINDICATIONS

Hypersensitivity, pregnancy

**Precautions:** Bradycardia, breastfeeding, children, electrolyte imbalances, heart failure, hepatic disease, hypokalemia, hypomagnesemia, infants, infertility, neonates, neutropenia, peripheral neuropathy, QT prolongation, renal disease

### DOSAGE AND ROUTES

**Adult: IV** 1.4 mg/m² over 2-5 min on days 1 and 8, repeat q21days

### Recommendations for dose delay

• **For ANC< 1000/mm³, platelets< 75,000/mm³, or grade 3 or 4 nonhematologic toxicities:** Do not administer; the day 8 dose may be delayed a maximum of 1 wk
• **For the day 8 dose, if toxicities do not resolve to ≤grade 2 by day 15:** Omit the dose
• **For the day 8 dose, if toxicities resolve or improve to ≤grade 2 by day 15:** Administer eribulin at a reduced dose (see below) and initiate the next cycle no sooner than 2 wk later

### Dosage adjustments for hematologic toxicity

• **ANC <500/mm³ for >7 days or ANC <1000/mm³ with fever or infection:** Permanently reduce dosage to 1.1 mg/m²
• **Platelets <25,000/mm³ or <50,000/mm³ requiring transfusion:** Permanently reduce dosage to 1.1 mg/m²
• **If day 8 of previous cycle omitted or delayed:** Permanently reduce dosage to 1.1 mg/m²
• **While receiving 1.1 mg/m², if recurrence of hematologic event occurs, or if day 8 of previous cycle omitted or delayed:** Permanently reduce dosage to 0.7 mg/m²
• **While receiving 0.7 mg/m², if recurrence of hematologic event occurs, or if day 8 of previous cycle omitted or delayed:** Discontinue

### Dose adjustments of eribulin for nonhematologic toxicity during treatment

• **Any grade 3 or 4 nonhematologic toxicity:** Permanently reduce dosage to 1.1 mg/m²
• **If day 8 of previous cycle omitted or delayed:** Permanently reduce dosage to 1.1 mg/m²
• **While receiving 1.1 mg/m², if recurrence of grade 3 or 4 nonhematologic toxicity occurs, or if day 8 of previous cycle omitted or delayed:** Permanently reduce dosage to 0.7 mg/m²
• **While receiving 0.7 mg/m², if recurrence of grade 3 or 4 nonhematologic toxicity occurs, or if day 8 of previous cycle omitted or delayed:** Discontinue

**Available forms:** Solution for injection 1 mg/2 ml

### Implementation

**IV direct, intermittent route**
• Visually inspect for particulate matter or discoloration as solution and container permit; withdraw required amount (0.5 mg/ml) from single-use vial, give undiluted over 2-5 min or diluted in 100 ml 0.9% NaCl and give as intermittent infusion, do not give through line with dextrose or any other product
• Store at room temperature for 4 hr or 24 hr refrigerated

## ADVERSE EFFECTS

**CNS:** Depression, dizziness, *fatigue,* fever, headache, insomnia, *peripheral neuropathy*
**CV:** QT prolongation, peripheral edema
**GI:** Abdominal pain, anorexia, constipation, diarrhea, dyspepsia, nausea, vomiting, weight loss
**HEMA:** Anemia, neutropenia, thrombocytopenia
**INTEG:** *Alopecia,* rash, stomatitis, infusion-related reactions
**META:** Hypokalemia
**MS:** Arthralgia, myalgia, bone/back pain
**RESP:** Cough, dyspnea
**SYST:** Infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Protein binding, 49%-65% |
| **Distribution** | Unknown |
| **Metabolism** | Inhibits CYP3A4 |
| **Excretion** | Feces 82%, urine 9% |
| **Half-life** | 40 hr, increased levels in renal/hepatic disease |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Arsenic trioxide, bepridil, chloroquine, clarithromycin, dextromethorphan, dronedarone, droperidol, erythromycin, halofantrine, haloperidol, levomethadyl, methadone, pentamidine, pimozide, posaconazole, probucol, propafenone, quiNIDine, saquinavir, sparfloxacin, troleandomycin, and ziprasidone; also to a lesser degree abarelix, alfuzosin, amoxapine, apomorphine, artemether; lumefantrine, asenapine, ofloxacin, cloZAPine, cyclobenzaprine, dasatinib, dolasetron, flecainide, gatifloxacin, gemifloxacin, iloperidone, lapatinib, levofloxacin, lopinavir; ritonavir, magnesium sulfate; potassium sulfate; sodium sulfate, maprotiline, mefloquine, moxifloxacin, nilotinib, norfloxacin, octreotide, ciprofloxacin, OLANZapine, ondansetron, paliperidone, palonosetron, QUEtiapine, ranolazine, risperiDONE, sertindole, SUNItinib, tacrolimus, telavancin, telithromycin, tetrabenazine, venlafaxine, vardenafil, vorinostat: increased QT prolongation

Live virus vaccines, do not use together
Increase: Adverse reactions

### Drug classifications

Certain phenothiazines (chlorproMAZINE, mesoridazine, thioridazine), class IA antiarrhythmics (disopyramide, procainamide, quiNIDine), class III antiarrhythmics (amiodarone, bretylium, dofetilide, ibutilide, sotalol), also to a lesser degree, beta-agonists, halogenated anesthetics, local anesthetics, some phenothiazines (fluPHENAZine, perphenazine, prochlorperazine, trifluoperazine), tricyclic antidepressants: increased QT prolongation

## NURSING CONSIDERATIONS

### Assessment

- Peripheral neuropathy: assess for pain, numbness in extremities
- Infection: assess for increased temperature, sore throat, flulike symptoms
- **QT prolongation:** assess for drug interactions that may occur; monitor ECG, heart rate
- **Bone marrow depression:** CBC and differential, serum creatinine/bun/electrolytes, liver function tests, baseline and periodically, increased AST/ALT $>3 \times$ ULN or total bilirubin $>1.5 \times$ ULN are at a greater chance of grade 4 or febrile neutropenia

### Dosage adjustments for treatment-related toxicities

- **Dermatologic: Severe rash, not responsive to medical management: Hold;** when rash resolves to baseline or grade 0 or 1 (generally less than 10% BSA), resume therapy at a reduced dose (by 50-mg decrements); **Severe bullous, blistering, or exfoliating skin condition:** Discontinue
- **Gastrointestinal: Persistent severe diarrhea not responsive to medical management (e.g., loperamide):** Hold; when diarrhea resolves to baseline or grade 0 or 1 (fewer than four stools/day over baseline; mild increase in ostomy output compared with baseline), resume therapy at a reduced dose (by 50-mg decrements); **GI perforation:** Permanently discontinue
- **Ocular; grade 3 or 4 keratitis (decline in vision, worse than 20/40; limiting self-care ADL; perforation or blindness) or grade 2 keratitis (symptomatic; topical agents indicated; limiting instrumental ADL) lasting more than 2 wk:** Hold; when keratitis resolves to baseline or grade 0 or 1

(asymptomatic; not limiting ADL), resume at a reduced dose (by 50-mg decrements); **acute/worsening ocular disorders (e.g., eye pain):** Hold and consider discontinuation or, when ocular disorder resolves to baseline or grade 0 or 1, resume at a reduced dose (by 50-mg decrements); **corneal perforation or severe ulceration:** Discontinue
• **Pneumonitis/interstitial lung disease (ILD); Acute onset of new or progressive pulmonary symptoms (e.g., dyspnea, cough, or fever):** Hold until diagnostic evaluation; permanently discontinue and institute appropriate treatment if ILD is confirmed

### Patient/family education

• **Infection:** teach patient to notify prescriber of increased temperature, sore throat, fatigue, flu-like symptoms
• **QT prolongation:** teach patient to report extra heartbeats
• Peripheral neuropathy: teach patient to report tingling, pain in extremities
• Teach patient reason for product and expected results
• Advise patient to report side effects to health care provider
• Advise patient to avoid other medications, supplements unless approved by provider, serious drug interactions may occur
• Discuss hair loss and use of wig or hairpiece
• Advise patient to notify prescriber if pregnancy is planned or suspected to use contraception during treatment, avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**
• Decreasing tumor spread and size

**⚠ HIGH ALERT**

## erlotinib (Rx)

(er-loe'tye-nib)
**Tarceva**
*Func. class.:* Misc. antineoplastic
*Chem. class.:* Epidermal growth factor receptor inhibitor

**ACTION:** Not fully understood. Inhibits intracellular phosphorylation of cell surface receptors associated with epidermal growth factor receptors.

**Therapeutic outcome:** Decrease in tumor size

**USES:** Non–small cell lung cancer (NSCLC), maintenance, after failure of at least one chemotherapy regimen including EGFR exon 19 deletions or exon 21 substitution mutations, pancreatic cancer

## CONTRAINDICATIONS

Pregnancy, breastfeeding

**Precautions:** Renal, hepatic; ocular, pulmonary disorders; children; geriatric, diverticulitis

## DOSAGE AND ROUTES

### Non–small cell lung cancer (NSCLC)

**Adult:** PO 150 mg/day

### Pancreatic cancer

**Adult:** PO 100 mg/day in combination with gemcitabine 1000 mg/m$^2$ cycle 1, days 1, 8, 15, 22, 29, 36, 43 of an 8-wk cycle; cycle 2 and subsequent cycles, days 1, 8, 15 of a 4-wk cycle, used with gemcitabine

### CYP3A4 inducers concurrently (such as rifampin or phenytoin)

Dosage increase is advised

### CYP3A4 inhibitors (atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, telithromycin, ritonavir, saquinavir, troleandomycin, nelfinavir)

Dosage reduction may be needed

### Hepatic dose

**Baseline hepatic impairment: Adult PO** ***Child-Pugh A, B, and C; total bilirubin above upper limit of normal (ULN):*** Closely monitor for adverse events, as erlotinib undergoes significant liver metabolism; use increased monitoring in those with total bilirubin more than 3 times ULN

**Treatment-related hepatotoxicity:** ***Total bilirubin more than 3 times ULN or AST/ALT more than 5 times ULN in patients without baseline hepatic impairment:*** Hold; resume at a reduced dose (by 50-mg decrements) when liver function tests resolve to baseline or grade 0 or 1 (bilirubin less than or equal to 1.5 times ULN or AST/ALT less than or equal to 3 times ULN). Discontinue if resolution or significant improvement does not occur within 3 wk. ***Total bilirubin 2 times baseline or AST/ALT 3 times baseline in patients with preexisting hepatic impairment or biliary obstruction:*** Hold, resume at a reduced dose (by 50-mg decrements) when liver function tests resolve to baseline or grade 0 or 1 (bilirubin ≤ 1.5 X ULN, or AST/ALT ≤ 3 times ULN). Discontinue if resolution or significant improvement does not occur within 3 wk

### Renal dose

**Adult: PO treatment-induced nephrotoxicity:** ***Grade 3 or 4 renal impairment (serum creatinine (CCr) >3 times baseline or >3 to***

***6 times ULN:*** Hold, when resolved to grade 0 or 1 (CCr ≤ 1.5 times either baseline or ULN), resume at a reduced dose (by 50-mg decrements) or discontinue

**Available forms:** Tabs 25, 100, 150 mg

### Implementation
- Administer 1 hr before or 2 hr after food

## ADVERSE EFFECTS
**CNS:** CVA, anxiety, depression, headache, rigors, insomnia
**CV:** MI/ischemia
**EENT:** Ocular changes, *conjunctivitis, eye pain,* hypertrichosis
**GI:** *Nausea, diarrhea, vomiting, anorexia, mouth ulceration,* hepatic failure, GI perforation
**GU:** Renal impairment/failure
**HEMA:** DVT, bleeding
**INTEG:** *Rash,* Stevens-Johnson–like skin reactions, toxic epidermal necrolysis
**MISC:** *Fatigue, infection*
**RESP:** Interstitial lung disease, *cough, dyspnea,* ARDS, pulmonary fibrosis
**SYST:** Hepatorenal syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Slowly absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Metabolized by CYP3A4 (Gen), inhibits tyrosine kinase, which is a factor in epidermal growth factor receptor (EGFR) |
| **Excretion** | Feces (86%), urine (<4%) |
| **Half-life** | 36 hr elimination |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3-7 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Metoprolol, warfarin: increased plasma concentrations
Smoking: decreased erlotinib level, dose may need to be increased

### Drug classifications
CYP3A4 inducers (phenytoin, rifampin, carBAMazepine, phenobarbital), proton-pump inhibitors: decreased erlotinib levels
CYP3A4 inhibitors (clarithromycin, erythromycin, itraconazole, ketoconazole, telithromycin): increased erlotinib concentrations
HMG-CoA reductase inhibitors: increased myopathy
NSAIDs: GI bleeding may be fatal

### Drug/herb
St. John's wort: decreased erlotinib levels

### Drug/food
Grapefruit juice: increased effect of erlotinib

### Drug/labs
Increase: INR, PT, AST, ALT, bilirubin

## NURSING CONSIDERATIONS
### Assessment
- **Serious skin toxicities:** toxic epidermal necrolysis, Stevens-Johnson syndrome, check for rash, blistering, discontinue treatment, may need corticosteroid
- **Pregnancy/breastfeeding:** Patient should not become pregnant during treatment or for 1 mo after last dose, do not breastfeed during or for 2 wk after final dose
- Assess for MI/ischemia, CVA in pancreatic cancer
- **Assess for pulmonary changes:** lung sounds, cough, dyspnea; interstitial lung disease may occur, may be fatal; discontinue therapy if confirmed
- **Assess for ocular changes:** eye irritation, corneal erosion/ulcer, aberrant eyelash growth
- Assess for GI symptoms: frequency of stools; if diarrhea is poorly tolerated, therapy may be discontinued for up to 14 days; monitor for dehydration, fluid status during period of vomiting and diarrhea
- Monitor blood studies: INR, LFTs, PT
- **Hepatic failure:** interrupt dosing if severe changes to liver function occur (total bilirubin >3× ULN and/or transaminases >5× ULN for normal pretreatment LFTs)
- **GI perforation/bleeding:** some cases have been fatal, usually occurs in those using NSAIDs, taxanes, or those with diverticulitis or peptic ulcer disease, discontinue if these occur

### Patient/family education
- **Teach patient to report adverse reactions immediately:** SOB, severe abdominal pain, persistent diarrhea or vomiting, ocular changes, skin eruptions (face, upper chest, back pain)
- Explain reason for treatment, expected results, to take on empty stomach 1 hr before or 2 hr after meals
- Advise patient to use contraception during treatment; pregnancy, avoid breastfeeding

• Instruct patient to avoid use with other products, herbs, or supplements unless approved by provider
• Instruct patient to avoid smoking; decreases effect of this product

### Evaluation

**Positive therapeutic outcome**
• Decrease non–small cell lung cancer cells

## ertapenem (Rx)

(er-tah-pen′em)
**INVanz**
*Func. class.:* Antiinfective, miscellaneous
*Chem. class.:* Carbapenem

**Do not confuse:** INVanz/Aninza

**ACTION:** Interferes with cell wall replication of susceptible organisms

**Therapeutic outcome:** Bactericidal action against the following organisms: *Bacteroides fragilis, Bacteroides distasonis, Bacteroides ovatus, Bacteroides thetaiotaomicron, Bacteroides uniformis; Clostridium clostridioforme, Escherichia coli, Eubacterium lentum, Haemophilus influenzae* (β lactamase–negative), *Klebsiella pneumoniae, Moraxella catarrhalis, Peptostreptococcus* sp., *Porphyromonas asaccharolytica, Prevotella bivia, Staphylococcus aureus* (methicillin-susceptible); *Streptococcus agalactiae, Streptococcus pneumoniae* (penicillin-susceptible), *Streptococcus pyogenes*

**USES:** Bacteremia, *Bacteroides distasonis, Bacteroides fragilis, Bacteroides ovatus, Bacteroides thetaiotaomicron, Bacteroides uniformis, Bacteroides vulgatus, Citrobacter freundii, Citrobacter koseri, Clostridium clostridioforme, Clostridium perfringens,* community-acquired pneumonia, diabetic foot ulcer, endomyometritis, *Enterobacter aerogenes, Enterobacter cloacae, Escherichia coli, Eubacterium lentum, Fusobacterium, Haemophilus influenzae* (beta-lactamase negative), *Haemophilus influenzae* (beta-lactamase positive), *Haemophilus parainfluenzae, intraabdominal infections, Klebsiella oxytoca, Klebsiella pneumoniae, Moraxella catarrhalis, Morganella morganii, Peptostreptococcus, Porphyromonas asaccharolytica, Prevotella bivia, Proteus mirabilis, Proteus vulgaris, Providencia rettgeri, Providencia stuartii, Serratia marcescens,* skin infections, *Staphylococcus aureus* (MSSA), *Staphylococcus epidermidis, Streptococcus agalactiae* (group B streptococci), *Streptococcus pneumoniae, Streptococcus pyogenes* (group A beta-hemolytic streptococci), surgical infection prophylaxis, urinary tract infections

## CONTRAINDICATIONS

Hypersensitivity to this product or its components, to amide-type local anesthetics (IM only); anaphylactic reactions to β-lactams, other carbapenems

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal/hepatic/GI disease, seizures

## DOSAGE AND ROUTES

### Complicated intraabdominal infections

**Adult:** IM/**IV** 1 g/day × 5-14 days
**Child 3 mo-12 yr:** IM/**IV** 15 mg/kg bid (max 1 g/day) × 5-14 days

### Complicated skin/skin structure infections

**Adult/adolescent:** IM/**IV** 1 g/day × 7-14 days
**Child 3 mo-12 yr:** IM/**IV** 15 mg/kg bid × 7-14 days

### Community-acquired pneumonia

**Adult/adolescent:** IM/**IV** 1 g/day × 10-14 days
**Child 3 mo-12 yr:** IM/**IV** 15 mg/kg bid × 10-14 days, max 1 g/day

### Complicated UTI

**Adult/adolescent:** IM/**IV** 1 g/day × 10-14 days
**Child 3 mo-12 yr:** IM/**IV** 15 mg/kg bid × 10-14 days

### Acute pelvic infections

**Adult/adolescent:** IM/**IV** 1 g/day × 3-10 days
**Child 3 mo-12 yr:** IM/**IV** 15 mg/kg bid × 3-10 days

### Surgical infection prophylaxis

**Adult:** **IV** 1 g as a single dose 1 hr prior to surgical incision

### Renal dose

**Adult:** IM/IV CCr ≤30 ml/min, 500 mg/day

**Available forms:** Powder, lyophilized, 1 g

### Implementation

**IV route**
• Visually inspect for particulate matter and discoloration before use: may be colorless to pale yellow; do not mix with other products; dextrose solutions are not compatible
• 1 g vial: For each gram reconstitute with 10 ml of either NS injection, sterile water for injection, or bacteriostatic water for injection to 100 mg/ml, shake
• 1 g dose: immediately transfer contents of the reconstituted vial to 50 ml of NS injection; for a dose <1 g (pediatric patients 3 mo to

12 yr): from the reconstituted vial, immediately withdraw a volume equal to 15 mg/kg of body weight (max 1 g/day) and dilute in NS injection to a concentration of 20 mg/ml or less

**IV infusion route**

- Complete the infusion within 6 hr of reconstitution, infuse over 30 min; do not co-infuse with other medications
- The reconstituted IV solution may be stored at room temperature if used within 6 hr, or stored under refrigeration for 24 hr and used within 4 hr after removal from refrigeration; do not freeze

**IM route**

- Reconstitute the 1 g vial of ertapenem with 3.2 ml of 1% lidocaine HCl injection (without EPINEPHrine) (280 mg/ml), agitate well to form a solution; the IM reconstituted formulation is not for IV use
- IM administration may be used as an alternative to IV administration in the treatment of infections where IM therapy is appropriate; only given via IM injection × 7 days
- For a 1 g dose: immediately withdraw the contents of the vial and inject deeply into a large muscle, aspirate prior to injection to avoid injection into a blood vessel
- For a dose <1 g (i.e., for pediatric patients 3 mo to 12 yr): immediately withdraw a volume equal to 15 mg/kg (max 1 g/day) and inject deeply into a large muscle, aspirate prior to injection to avoid injection into a blood vessel; use the reconstituted IM solution within 1 hour after preparation

**Y-site compatibilities:** Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, argatroban, arsenic trioxide, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, dolasetron, DOPamine, doxacurium, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, ifosfamide, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lepirudin, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metaraminol, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, milrinone, mitoMYcin, mivacurium, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, PACLitaxel, pamidronate, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, polymixin B, potassium acetate/chloride/phosphates, procainamide, propranolol, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, telavancin, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethobenzamide, vancomycin, vasopressin, vecuronium, vinBLASTine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Insomnia, seizures, dizziness, *headache,* agitation, confusion, somnolence, disorientation, edema, hypotension

**CV:** Tachycardia, seizures

**GI:** *Diarrhea, nausea, vomiting,* pseudomembranous colitis, cholelithiasis, jaundice, abdominal pain

**GU:** *Vaginitis,* dysuria

**INTEG:** *Rash,* urticaria, *pruritus,* pain at inj site, *infused vein complication, phlebitis/thrombophlebitis*, erythema at inj site, dermatitis

**RESP:** Dyspnea, cough, pharyngitis, crackles, respiratory distress

**SYST:** Anaphylaxis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Almost completely absorbed (IM); completely absorbed (**IV**) |
| **Distribution** | 85%-95% plasma protein bound |
| **Metabolism** | Liver (IM, **IV**) |
| **Excretion** | Urine (80%), feces (10%), breast milk (IM, **IV**) |
| **Half-life** | 4 hr (**IV**) |

### Pharmacodynamics

| | IM | IV |
|---|---|---|
| **Onset** | Unknown | Immediate |
| **Peak** | 2.3 hr | Dose-dependent |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Probenecid: increased ertapenem plasma levels; do not coadminister
Valproic acid: decreased effect of valproic acid, monitor valproic levels, seizure control
Warfarin: Increase: INR

### Drug/lab test

Increased: hepatic enzymes, albumin, alkaline phosphatase, bilirubin, creatinine, PT
Decrease: Hct, WBC

## NURSING CONSIDERATIONS

### Assessment

- Assess for renal disease: lower dose may be required
- **Pseudomembranous colitis:** Assess bowel pattern daily: if severe diarrhea occurs, product should be discontinued
- **Assess for infection:** temp, sputum, characteristics of wound before, during, after treatment
- **Pregnancy/breastfeeding:** Use only when clearly needed, use caution in breastfeeding
- **Assess for allergic reactions, anaphylaxis:** rash, urticaria, pruritus may occur a few days after therapy begins; assess for sensitivity to carbapenem antibiotics, other β-lactam antibiotics, penicillins, have emergency equipment, epinephrine close by
- **Assess for overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough or sputum

### Patient/family education

- Advise patient to report severe diarrhea; may indicate pseudomembranous colitis
- **Advise patient to report overgrowth of infection:** black, furry tongue, vaginal itching, foul-smelling stools
- Caution patient to avoid breastfeeding; product is excreted in breast milk

### Evaluation

**Positive therapeutic outcome**

- Negative C&S, absence of signs and symptoms of infection

## TREATMENT OF OVERDOSE:

Administer EPINEPHrine, antihistamines; resuscitate if needed (anaphylaxis)

**ERYTHROMYCIN**

**erythromycin base (Rx)**
(eh-rith-roh-my′sin)
**Apo Erythro, Ery-Tab, Novo-Rythro Encap, PCE**
**erythromycin ethylsuccinate (Rx)**
**Apo-Erythro-ES, EES, Erythro-ES, Ery Ped, Novo-Rythro**
**erythromycin lactobionate (Rx)**
**Erythrocin**
**erythromycin stearate (Rx)**
**Apo-Erythro-S, Erythrocin, My-E, Novo-Rythro**
*Func. class.:* Antiinfective
*Chem. class.:* Macrolide

**Do not confuse:** erythromycin/azithromycin

**ACTION:** Binds to 50S ribosomal subunits of susceptible bacteria and suppresses protein synthesis

**Therapeutic outcome:** Bactericidal action against the following organisms: *Neisseria gonorrhoeae, Streptococcus pneumoniae, Mycoplasma pneumoniae, Corynebacterium diphtheriae, Bordetella pertussis, Borrelia burgdorferi, Listeria monocytogenes, Treponema pallidum;* streptococci, staphylococi; gram-negative pathogens: *Neisseria, Haemophilus influenzae* (when used with sulfonamides), *Legionella pneumophila, Chlamydia trachomatis*

**USES:** Mild to moderate respiratory tract, skin, soft tissue infections, Legionnaire's disease, syphilis

## CONTRAINDICATIONS

Hypersensitivity, preexisting liver disease (estolate)

**Precautions:** Pregnancy, breastfeeding, geriatric, hepatic/GI disease, QT prolongation, seizure disorder, myasthenia gravis

## DOSAGE AND ROUTES

### Acne vulgaris

**Adult:** PO 250 mg qid

**Mild to moderately severe upper respiratory tract infections (otitis media, sinusitis) or lower respiratory tract infections (pneumonia,**

### bronchitis) caused by susceptible organisms

**Adult:** PO 250-500 mg (of base, estolate or stearate) q6hr or 400-800 mg (ethylsuccinate) q6hr; IV 15-20 mg/kg/day in divided doses q4-6 hr, max 4 g/day

**Adolescent/child/infant:** PO 20-50 mg/kg/day divided q6hr, max adult doses; IV 15-20 mg/kg/day in divided doses q4-6hr, or as a continuous infusion, max dose 4 g/day

**Neonate >7 days, weighing ≥1200 g:** PO 30 mg/kg/day in divided doses q8hr

**Neonate >7 days, weighing <1200 g:** PO 20 mg/kg/day in divided doses q12hr

**Neonate ≤7 days:** PO 20 mg/kg/day PO in divided doses q12hr

### Pneumonia caused by *Chlamydia trachomatis* in infants and neonates

**Infant/neonate:** PO; the CDC recommends 50 mg/kg/day in four divided doses × 14 days (erythromycin base or ethylsuccinate)

### *Mycoplasma* infection such as *Mycoplasma pneumoniae* pneumonia

**Adult:** PO 250-500 mg tid

**Adult/adolescent/child/infant:** IV 15-20 mg/kg/day, given in divided doses q4-6hr, or as a continuous infusion, maximum dose 4 g/day; replace by oral dosage as soon as possible

### Legionnaire's disease (caused by *Legionella pneumophila*)

**Adult:** PO/IV 0.5-1 g q6hr × 21 days

### Treatment of group A beta-hemolytic streptococcal (GAS) pharyngitis (primary rheumatic fever prophylaxis)

**Adult:** PO 250-500 mg (base, estolate, or stearate) q6hr or 400-800 mg (ethylsuccinate) q6hr × 10 days

**Adolescent/child/infant:** PO 20-50 mg/kg/day, divided q6hr × 10 days, max adult dose

### Secondary prevention of rheumatic fever (prevention of recurrent attacks of rheumatic fever)

**Adult/adolescent/child:** PO 250 mg bid in patients allergic to penicillin and sulfADIAZINE for 10 yr or age 40 yr, whichever is longer, secondary prophylaxis (American Heart Association)

### Listeriosis

**Adult:** PO 250-500 mg (base, estolate or stearate) q6hr or 400-800 mg (ethylsuccinate) q6hr

**Adolescent/child/infant:** PO 20-50 mg/kg/day PO, divided q6hr, max adult doses

### Cervicitis caused by *Chlamydia trachomatis*

**Adult/adolescent:** PO; the CDC recommends erythromycin base 500 mg qid or erythromycin ethylsuccinate 800 mg qid × 7 days as alternatives to first-line agents doxycycline or azithromycin

**Pregnant female:** As alternatives to first-line agents azithromycin or amoxicillin, the CDC recommends PO base 500 mg qid × 7 days, base 250 mg qid × 14 days, ethylsuccinate 800 mg qid × 7 days, ethylsuccinate PO 400 mg qid × 14 days

**Child ≤45 kg:** The CDC recommends base or ethylsuccinate PO 50 mg/kg/day in 4 doses × 14 days

### Proctitis caused by *Chlamydia trachomatis*

**Adult/adolescent:** PO base 500 mg qid

### Chlamydial conjunctivitis caused by *Chlamydia trachomatis* including trachoma and inclusion conjunctivitis

**Pregnant and lactating woman/child <8 yr:** PO 250-500 mg qid × 10-14 days

### Infant pneumonia caused by *Chlamydia trachomatis*

**Infant/neonate:** PO (base or ethylsuccinate); the CDC recommends 50 mg/kg/day 4 divided doses × 14 days

### Nongonococcal urethritis (NGU) caused by *Chlamydia trachomatis* or *Ureaplasma urealyticum*

**Adult/adolescent:** PO; the CDC recommends 500 mg (base) qid or 800 mg (ethylsuccinate) qid × 7 days as alternatives to first-line agents doxycycline or azithromycin

**Pregnant female:** PO; the CDC recommends base 500 mg qid × 7 days

**Child <45 kg:** PO; the CDC recommends base 50 mg/kg/day in 4 divided doses × 10-14 days, second course of therapy may be required

### Ophthalmia neonatorum caused by *Chlamydia trachomatis*

**Neonate:** PO (erythromycin base or ethylsuccinate); the CDC recommends 50 mg/kg/day in qid × 14 days, may be repeated if condition returns

### Lymphogranuloma venereum caused by *Chlamydia trachomatis*

**Adult:** PO (base); the CDC recommends 500 mg qid × 21 days as an alternative to doxycycline

### Adjunctive treatment of diphtheria to prevent establishment of carrier state and to eradicate *Corynebacterium diphtheriae* in carriers

**Adult:** PO 500 mg q6hr × 10 days

### Intestinal amebiasis (unable to take metroNIDAZOLE)

**Adult:** PO 250 mg q6hr × 10-14 days
**Adolescent/child:** PO 30-50 mg/kg/day, divided q6hr × 10-14 days, max adult dose

### Pertussis (whooping cough) caused by *Bordetella pertussis* or for postexposure pertussis prophylaxis

**Adult:** PO 500 mg PO qid (2 g total) × 14 days
**Adolescent/child/infant:** PO 40-50 mg/kg/day (max 2 g/day) in 4 divided doses × 14 days

### Primary or secondary syphilis (caused by *Treponema pallidum*) in penicillin-allergic, nonpregnant patients

**Adult:** PO (CDC) 500 mg qid × 14 days as an alternative therapy

### Surgical infection prophylaxis as a bowel preparation in combination with neomycin

**Adult:** It is generally recommended that if surgery is scheduled for 8 AM, 1 g erythromycin PO with neomycin sulfate PO should be given at 1 PM, 2 PM, and 11 PM on the day before surgery

### Impetigo/burn wound infection (unlabeled)

**Adult:** PO 250-500 mg q6hr (base, estolate, stearate) or 400-800 mg (ethylsuccinate) q6hr
**Adolescent/child/infant:** PO 20-50 mg/kg/day divided q6hr

**Available forms:** Base: enteric-coated tab 250, 333, 500 mg; film-coated tab 250, 500 mg; enteric-coated caps, 250, 333 mg; stearate: film-coated tabs, 250 mg, granules for oral susp: 200, 400 mg/5 ml powder for inj 500 mg, 1 g (lactobionate); 1 g (as gluceptate)

### Implementation

- Store at room temp; store susp in refrigerator
- Adequate intake of fluids (2 L) during diarrhea episodes

**PO route**

- Give around the clock on an empty stomach, at least 1 hr before or 2 hr after meals; may be taken with food if GI upset occurs; do not take with juices; take dose with a full glass of water: use calibrated measuring device for drops or susp; shake well
- Store susp in refrigerator
- Do not crush or chew enteric-coated tab

**IV route**

- Add 10 ml of sterile water for inj without preservatives to 250- or 500-mg vials and 20 ml to 1-g vial; sol is stable for 1 wk after reconstitution if refrigerated

**Intermittent IV infusion route**

- Dilute further in 100-250 ml of 0.9% NaCl or $D_5W$
- Give over 20-60 min to avoid phlebitis; assess for pain along vein; slow inf if pain occurs; apply ice to site and notify prescriber if unable to relieve pain

**Continuous infusion route**

- May also be administered as an inf in a dilution of 1 g/L of 0.9% NaCl, $D_5W$, over 4 hr

### Erythromycin lactobionate

**Y-site compatibilities:** Acyclovir, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, atenolol, atosiban, atracurium, atropine, azaTHIOprine, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefotaxime, cefTAZidime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, CISplatin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, doxapram, DOXOrubicin, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin, eptifibatide, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, insulin (regular), irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, LORazepam, LR, mannitol, mechlorethamine, meperidine, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentamidine, pentazocine, perphenazine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, Ringer's, ritodrine, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, temocillin,

teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Seizures
**CV:** Dysrhythmias, QT prolongation
**EENT:** Hearing loss, tinnitus
**GI:** *Nausea, vomiting, diarrhea,* abdominal pain, stomatitis, heartburn, anorexia, pruritus ani, pseudomembranous colitis, esophagitis, hepatotoxicity
**GU:** *Vaginitis, moniliasis*
**INTEG:** Rash, urticaria, pruritus, thrombophlebitis, injection-site reactions (**IV** site)
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO) |
| **Distribution** | Widely distributed; minimally distributed (CSF); crosses placenta |
| **Metabolism** | Liver, partially |
| **Excretion** | Bile, unchanged; kidneys (minimal), unchanged |
| **Half-life** | 1-3 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | 1 hr | Rapid |
| **Peak** | 1-4 hr | Infusion's end |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Alfentanil, ALPRAZolam, bromocriptine, busPIRone, carBAMazepine, cilostazol, clindamycin, cloZAPine, cycloSPORINE, diazepam, digoxin, disopyramide, felodipine, ibrutinib, methylPREDNISolone, midazolam, quiNIDine, rifabutin, sildenafil, tacrolimus, tadalafil, theophylline, triazolam, vardenafil, vinBLAStine, warfarin: increased toxicity, increased action

Diltiazem, itraconazole, ketoconazole, nefazodone, pimozide, verapamil: increased serious dysrhythmias, do not use together

### Drug classifications

Ergots: increased action, toxicity
HMG-CoA reductase inhibitors: increased action, toxicity
Products that increase QT prolongation: increased QT
Protease inhibitors: serious dysrhythmias rifamycins (rifabutin, rifAMPin, rifapentine)
Decrease: erythromycin effect

### Drug/food

Grapefruit juice, avoid using together
Decrease: Erythromycin metabolism

### Drug/lab test

Increased: AST/ALT
Decreased: folate assay
False increase: 17-OHCS/17-KS

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction
- **Assess patient for signs and symptoms of infection** including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, earache, fever; obtain baseline information before, during treatment
- Obtain C&S test results before beginning product therapy to identify if correct treatment has been initiated
- Assess for allergic reactions: rash, urticaria may occur a few days after therapy begins
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also monitor increases in BUN, creatinine
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- **Assess for overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- **Pregnancy/breastfeeding:** Use only if clearly needed, use other form of erythromycin, avoid estolate salt, use caution in breastfeeding, appears in breast milk
- **Pseudomembranous colitis:** assess for diarrhea with blood, mucus, abdominal pain, fever, product should be discontinued immediately
- **Anaphylaxis:** assess for generalized hives, itching, flushing, swelling of lips/tongue/throat, wheezing; have emergency equipment nearby
- **QT prolongation:** may occur (IV >15 mg/min), those with electrolyte imbalances, congenital QT prolongation, and the elderly are at greater risk; correct electrolyte imbalances prior to treatment; monitor ECG

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)

• Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection
• Instruct patient to take all medication prescribed for the length of time ordered
• Teach patient to avoid use with other products unless approved by prescriber

### Evaluation

**Positive therapeutic outcome**

• Absence of signs/symptoms of infection (WBC $<10{,}000/mm^3$, temp WNL, absence of red, draining wounds, earache)
• Reported improvement in symptoms of infection

## TREATMENT OF OVERDOSE:

Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, $O_2$, **IV** corticosteroids

## erythromycin ophthalmic

*See Appendix B*

## erythromycin topical

*See Appendix B*

## escitalopram (Rx)

(es-sit-tal′oh-pram)

**Cipralex ✱, Cipralex Meltz ✱, Lexapro**

Func. class.: Antidepressant, selective serotonin reuptake inhibitor

**ACTION:** Inhibits CNS neuron uptake of serotonin but not of norepinephrine

**Therapeutic outcome:** Decreased symptoms of depression

**USES:** General anxiety disorder; major depressive disorder in adults/adolescents

**Unlabeled uses:** Panic disorder, social phobia, autism, hot flashes related to menopause

### CONTRAINDICATIONS

Hypersensitivity to this product or citalopram, MAOIs

**Precautions:** Pregnancy, breastfeeding, geriatric, renal/hepatic disease, history of seizures, abrupt discontinuation, bleeding, anticoagulants

**BLACK BOX WARNING:** Children ≤12 yr/adolescents, suicidal ideation

### DOSAGE AND ROUTES

**Adult/adolescent:** PO 10 mg/day in AM or PM; after 1 wk if no clinical improvement is noted, dosage may be increased to 20 mg/day PM; maintenance 10-20 mg/day; reassess to determine need for treatment

**Child ≥12 yr:** PO 10 mg qday, may increase to 20 mg qday after 21 days

Geriatric/hepatic dose: PO 10 mg/day

Hot flashes (menopause, unlabeled) Adult PO 10-20 mg qday × 8 wk

**Available forms:** Tabs 5, 10, 20 mg; oral sol 5 mg (as base)/5 ml (contains sorbitol)

### Implementation

• Give with food or milk for GI symptoms; give with full glass of water, one a day in the AM
• Give crushed if patient is unable to swallow medication whole, scored tabs can be cut
• Give dose at bedtime if oversedation occurs during the day
• Give gum, hard candy, frequent sips of water for dry mouth
• Oral sol: measure with calibrated device
• Store at room temperature; do not freeze
• Provide assistance with ambulation during therapy, because drowsiness, dizziness occur
• Provide safety measures primarily in geriatric
• Check to see if PO medication swallowed

### ADVERSE EFFECTS

**CNS:** *Headache, nervousness, insomnia,* suicidal ideation, *drowsiness, anxiety, tremor, dizziness, fatigue, sedation, poor concentration, abnormal dreams, agitation,* seizures, apathy, euphoria, hallucinations, delusions, psychosis, neuroleptic malignant syndrome–like reactions, ataxia, worsening depression
**CV:** *Hot flashes, palpitations,* angina pectoris, hemorrhage, hypertension, tachycardia, 1st-degree AV block, bradycardia, MI, thrombophlebitis, postural hypotension
**EENT:** Visual changes, ear/eye pain, photophobia, tinnitus, pupil dilation, dental pain
**GI:** *Nausea, diarrhea, dry mouth, anorexia, dyspepsia, constipation, cramps, vomiting, taste changes, flatulence, decreased appetite,* hepatitis
**GU:** *Dysmenorrhea, decreased libido, urinary frequency, UTI,* amenorrhea, cystitis, impotence, urine retention, ejaculation disorder
**HEMA:** Impaired platelet aggregation
**INTEG:** *Sweating, rash, pruritus,* acne, alopecia, urticaria, photosensitivity, bruising
**MS:** *Pain,* arthritis, twitching, osteopenia
**RESP:** *Infection, pharyngitis, nasal congestion, sinus headache, sinusitis, cough, dyspnea, bronchitis,* asthma, hyperventilation, pneumonia
**SYST:** *Asthenia, viral infection, fever, allergy, chills,* serotonin syndrome, neonatal abstinence syndrome, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Urine |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Amantadine, bromocriptine, busPIRone, lithium, traMADol, tryptophan: increased serotonin syndrome
BusPIRone: increased symptoms of OCD
CarBAMazepine, lithium, phenytoin, warfarin: increased levels or toxicity of each specific product
Cyproheptadine: decreased escitalopram effect
Diazepam: increased half-life of diazepam
Haloperidol: increased effect of haloperidol

### Drug classifications

Antidepressants, opioids, sedatives: increased CNS depression
Antidysrhythmics, antipsychotics: increased levels, toxicity
Highly protein-bound products: increased side effects of escitalopram
MAOIs: do not use with or 14 days before escitalopram
NSAIDs, salicylates, anticoagulants, SSRIs, platelet inhibitors: increased bleeding risk
Phenothiazines: increased levels of phenothiazines
SSRIs, SNRIs, serotonin-receptor agonists, amphetamines: increased serotonin syndrome
Tricyclics: increased levels of tricyclics

### Drug/herb

Kava: increased CNS effect
St. John's wort: do not use together, serotonin syndrome may occur

### Drug/food

Grapefruit juice: increased escitalopram effect

### Drug/lab test

Increased: serum bilirubin, blood glucose, alkaline phosphatase
Decreased: VMA, 5-HIAA
False increase: urinary catecholamines

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess mental status: mood, sensorium, affect, **suicidal tendencies,** increase in psychiatric symptoms, depression, panic, not approved for use in children <12 yr

- Assess appetite in bulimia nervosa, weight daily, increase nutritious foods in diet, watch for bingeing and vomiting
- **Assess allergic reactions:** itching, rash, urticaria; product should be discontinued; may need to give antihistamine
- Monitor B/P (lying/standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with cardiovascular disease
- Monitor blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy; check platelets; bleeding can occur
- **Serotonin syndrome:** Assess for nausea, vomiting, sedation, dizziness, sweating, facial flushing, mental changes, shivering, increased B/P: discontinue, notify prescriber
- Monitor liver function tests: AST, ALT, bilirubin, creatinine; thyroid function studies
- Monitor weight qwk; appetite may decrease with product
- Monitor ECG for flattening of T wave, bundle branch, AV block, dysrhythmias in cardiac patients
- Monitor alcohol consumption; if alcohol is consumed, hold dose until AM
- **Pregnancy/breastfeeding:** Use only if benefit outweighs risk to fetus, if used during pregnancy, taper third trimester, use cautiously in breastfeeding, excreted in breast milk

### Patient/family education

- Teach patient that therapeutic effect may take 1-4 wk, may have increased anxiety for first 5-7 days, do not abruptly discontinue
- **Serotonin syndrome:** To report immediately nausea, vomiting, sedation, dizziness, sweating, facial flushing, mental changes, shivering
- Advise patient to use caution in driving, other activities requiring alertness because of drowsiness, dizziness, blurred vision
- Advise patient to use sunscreen to prevent photosensitivity
- Advise patient to avoid alcohol ingestion, other CNS depressants
- Advise patient to notify prescriber if pregnant or plan to become pregnant or breastfeed, discuss sexual dysfunction
- Advise patient to change positions slowly; orthostatic hypotension may occur

- Teach patient to avoid all OTC products unless approved by prescriber, to take without regard to meals
- Teach patient to report immediately signs of urinary retention

**BLACK BOX WARNING:** Teach patient that clinical worsening and suicide risk may occur, especially in adolescents and young adults, worsening of depression

- Teach patient using MedGuide provided
- Teach patient about drug interactions

### Evaluation

**Positive therapeutic outcome**

- Decreased depression

**⚠ HIGH ALERT**

## eslicarbazepine

(es'lye-kar-bay'ze-peen)

**Aptiom**

*Func. class.:* Anticonvulsant, misc

*Chem. class.:* Voltage-gated sodium channel (VGSC) blocker, carboxamide derivative

## ACTION

Exact mechanism unknown; a voltage-gated sodium-channel blocker inhibits repetitive neuronal firing

## USES

Partial seizures, adjunctive treatment

## CONTRAINDICATIONS

Hypersensitivity to this product or OXcarbazepine

**Precautions:** Breastfeeding, abrupt discontinuation, depression, driving/operating machinery, ethanol intoxication, hepatic disease, renal disease, hyponatremia, suicidal ideation, pregnancy

## DOSAGE AND ROUTES

**Adult: PO** 400 mg/day, after 1 wk increase to 800 mg/day, max 1600 mg/day

### Renal dose

**Adult:** PO CCr <50 ml/min, 200 mg/day, after 2 wk increase to 400 mg/day, max 800 mg/day

**Available forms:** Tab 200, 400, 600, 800 mg

### Implementation

- May be taken without regard to food
- May be crushed or swallowed whole
- Store at room temperature

## ADVERSE EFFECTS

**CNS:** Drowsiness, dizziness, amnesia, depression, insomnia, lethargy, memory impairment, confusion, fatigue, headache, speech disturbance, suicidal thoughts/behaviors, tremor

**CV:** Hypertension, peripheral edema

**EENT:** Blurred vision, nystagmus, diplopia

**GI:** Nausea, constipation, diarrhea, hypercholesterolemia/hypertriglyceride, vomiting, hepatotoxicity

**GU:** Cystitis

**INTEG:** Rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, anaphylaxis, angioedema

**META:** Hyponatremia

**RESP:** Cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Urine, feces |
| **Half-life** | Terminal 13-20 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Bedaquiline, boceprevir, bosutinib, carbozantinib, cobicistat, elvitegravir, emtricitabine, crizotinib, cycloSPORINE, dronederone, erlotinib, fosamprenavir, galantamine, gefitinib, HYDROcodone, maraviroc, oxyCODONE, paliperidone, perampanel, pimozide, praziquantel, QUEtiapine, ranolazine, rilpivirine: decreased effects of these agents

CYP1A2, CYP2C19 substrates: decreased eslicarbamazepine effect

### Drug classifications

CYP3A inducers: decreased effect of these agents

## NURSING CONSIDERATIONS

### Assessment

- **Seizures:** character, location, duration, intensity, frequency, aura
- Hepatic studies: ALT, AST, bilirubin; sodium
- **Pregnancy/breastfeeding: Pregnancy:** Only use during pregnancy if the benefits of treatment clearly outweigh the risks to the fetus. Enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 888-233-2334. Information on the registry can also be found at http://www.aedpregnancyregistry.org; the product is present in breast milk. Consider the benefits of breastfeeding, the risk of potential infant drug exposure, and the risk of an untreated or inadequately treated condition

• **Mental status:** mood, sensorium, affect, behavioral changes, suicidal thoughts/behaviors; if mental status changes, notify prescriber
• Eye problems: need for ophthalmic examinations before, during, after treatment (slit lamp, funduscopy, tonometry)
• **Allergic reaction:** purpura, red, raised rash; if these occur; product should be discontinued
• **Beers:** Avoid in older adults unless safer alternative is not available, may cause ataxia, impaired psychomotor function

### Patient/family education

• Instruct patient to carry emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
• Instruct patient to avoid driving, other activities that require alertness, usually for the first 3 days of treatment
• Instruct patient not to discontinue medication quickly after long-term use
• **Pregnancy:** Instruct patient to notify prescriber if pregnancy is planned or suspected, avoid breastfeeding
• Instruct patient to report signs of decreased renal function, dizziness, increased cholesterol, ocular toxicity, suicidal ideation, skin rashes
• Teach patient to take with or without food; tablet can be crushed

### Evaluation

**Positive therapeutic outcome**

• Decreased seizure activity; document on patient's chart

**⚠ HIGH ALERT**

## esmolol (Rx)

(ez′moe-lole)
**Brevibloc**
*Func. class.:* β-Adrenergic blocker (antidysrhythmic II)

**Do not confuse:** esmolol/Osmitrol, Brevibloc/Brevital

**ACTION:** Competitively blocks stimulation of $\beta_1$-adrenergic receptors in the myocardium; produces negative chronotropic, inotropic activity (decreases rate of SA node discharge, increases recovery time), slows conduction of AV node, decreases heart rate, decreases $O_2$ consumption in myocardium; also decreases renin-aldosterone-angiotensin system at high doses; inhibits $\beta_2$-receptors in bronchial system at higher doses

**Therapeutic outcome:** Decreased supraventricular tachycardia

**USES:** Supraventricular tachycardias, noncompensatory sinus tachycardia, hypertensive crisis, intraoperative and postoperative tachycardia and hypertension, atrial fibrillation/flutter

**Unlabeled uses:** Hypertensive crisis/urgency, unstable angina

## CONTRAINDICATIONS

Heart block (2nd- or 3rd-degree), cardiogenic shock, HF, cardiac failure, hypersensitivity, severe bradycardia

**Precautions:** Pregnancy, breastfeeding, geriatric patients, hypotension, peripheral vascular disease, diabetes, hypoglycemia, thyrotoxicosis, renal disease, atrial fibrillation, bronchospasms, hyperthyroidism, myasthenia gravis, asthma, COPD, CV disease, pheochromocytoma, abrupt discontinuation

## DOSAGE AND ROUTES

### Atrial fibrillation/flutter

**Adult: IV** Loading dose 500 mcg/kg/min over 1 min; maintenance 50 mcg/kg/min for 4 min; if no response in 5 min, give 2nd loading dose; then increase INF to 100 mcg/kg/min for 4 min; if no response, repeat loading dose, then increase maintenance INF by 50 mcg/kg/min (max of 200 mcg/kg/min); titrate to patient response
**Child: IV** A total loading dose of 600 mcg/kg over 2 min, maintenance **IV** INF 200 mcg/kg/min, titrate upward by 50-100 mcg/kg/min q5-10 min until B/P, heart rate reduced by >10%

### Perioperative hypertension/tachycardia

**Adult:** IV immediate control 80 mg (bolus) over 30 seconds, then 150 mcg/kg/min, adjust to response, max 300 mcg/kg/min

### Hypertensive emergency (unlabeled)

**Adult:** IV 250-500 mcg/kg over 1 min, then IV INF 50-100 mcg/kg/min × 4 min

**Available forms:** Inj 10 mg, 250 mg/ml

### Implementation

**IV route**

• Check that correct concentration is being given
• The 10 mg/ml inj solution needs no dilution and may be used as an **IV** loading dose using handheld syringe

**Continuous IV infusion route**

• Ready-to-use bags premixed isotonic sol of 10 mg/ml and 20 mg/ml are available in 100, 250 ml bags; use controlled device, a central line is preferred, rate is based on patient's weight
• Store at room temperature for 24 hr; sol should be clear

**Y-site compatibilities:** Amikacin, aminophylline, ampicillin, amiodarone, atracurium, butorphanol, calcium chloride, ceFAZolin, cefmetazole, cefoperazone, cefTAZidime, ceftizoxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, diltiazem, DOPamine, enalaprilat, erythromycin, famotidine, fentaNYL, gentamicin, heparin, hydrocortisone, regular insulin, labetalol, magnesium sulfate, methyldopate, metroNIDAZOLE, midazolam, morphine, nafcillin, nitroglycerin, norepinephrine, nitroprusside, pancuronium, penicillin G potassium, phenytoin, piperacillin, polymyxin B, potassium chloride, potassium phosphate, propofol, ranitidine, remifentanil, streptomycin, tacrolimus, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, voriconazole, zoledronic acid

**Y-site incompatibilities:** Furosemide

## ADVERSE EFFECTS

**CNS:** Confusion, light-headedness, paresthesia, somnolence, fever, dizziness, fatigue, headache, depression, anxiety, seizures

**CV:** Hypotension, bradycardia, chest pain, peripheral ischemia, shortness of breath, HF, conduction disturbances 1st-, 2nd-, 3rd-degree heart block

**GI:** *Nausea,* vomiting, anorexia, gastric pain, flatulence, constipation, heartburn, bloating

**GU:** Urinary retention, impotence, dysuria

**INTEG:** *Induration, inflammation at inj site,* discoloration, edema, erythema, burning, pallor, flushing, rash, pruritus, dry skin, alopecia

**RESP:** Bronchospasm, dyspnea, cough, wheezing, nasal stuffiness, pulmonary edema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 9 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | Unknown |
| **Duration** | 1-2 min |

## INTERACTIONS

### Individual drugs

Amphetamine, ePHEDrine, EPINEPHrine, norepinephrine, phenylephrine, pseudoephedrine: increased α-adrenergic stimulation

Clonidine: possibly fatal increased B/P

Digoxin: increased digoxin levels

DilTIAZem, verapamil: Increase: potentiate suppressive effects of these products

Thyroid hormones: decreased effect of salicylates, esmolol, decreased action of thyroid hormone

### Drug classifications

Antidiabetics: Increased: effect of antidiabetic

MAOIs, solatol: avoid use

General anesthetics: increased antihypertensive effect

### Drug/herb

Ephedra, hawthorn: decreased antihypertensive effect

### Drug/lab test

Interference: glucose/insulin tolerance test

## NURSING CONSIDERATIONS

### Assessment

- **Pregnancy/breastfeeding:** Use only if potential benefit justifies risk to fetus, use in last trimester of pregnancy or labor and obstetric delivery has resulted in fetal bradycardia, not known if excreted in breast milk
- **Dysrhythmias:** Monitor B/P during beginning treatment, periodically thereafter; pulse q4hr; note rate, rhythm, quality; apical/radial pulse before administration; notify prescriber of any significant changes (pulse <50 bpm); if severe, slow or stop infusion
- Check for baselines in renal, liver function tests before therapy begins
- **HF:** Assess for edema in feet, legs daily; monitor I&O, daily weight; check for jugular vein distention, crackles bilaterally, dyspnea
- **Bronchospasm:** Assess breath sounds and respiratory patterns
- **Infusion site:** Monitor infusion site during infusion, do not use butterfly if irritation occurs, stop and start at another site

### Patient/family education

- Teach patient not to drive or perform other hazardous activities if drowsiness occurs
- Teach patient to change positions slowly to prevent orthostatic hypotension
- Teach patient need for medication and expected results
- Caution patient to rise slowly to prevent orthostatic hypotension
- Advise patient to notify if pain, swelling occurs at **IV** site
- Teach patient to notify prescriber if chest pain, shortness of breath, wheezing, low B/P occur

### Evaluation

**Positive therapeutic outcome**

- Absence of dysrhythmias

## TREATMENT OF OVERDOSE:
Defibrillation, vasopressor for hypotension, IV glucagon if needed

## esomeprazole (Rx)
(es′oh-mep′rah-zohl)
**NexIUM, 24 hr**
*Func. class.:* Antiulcer, proton pump inhibitor
*Chem. class.:* Benzimidazole

**Do not confuse:** NexIUM/NexAVAR

## ACTION:
Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in the gastric parietal cell; characterized as gastric acid pump inhibitor, since it blocks final step of acid production

**Therapeutic outcome:** Absence of duodenal ulcers; decreased gastroesophageal reflux

## USES:
Gastroesophageal reflux disease (GERD), adult/child/infant; severe erosive esophagitis; treatment of active duodenal ulcers in combination with antiinfectives for *Helicobacter pylori* infection; long-term use in hypersecretory conditions

## CONTRAINDICATIONS
Hypersensitivity to proton-pump inhibitors (PPIs)

**Precautions:** Pregnancy, breastfeeding, children, geriatric, hypomagnesemia, osteoporosis

## DOSAGE AND ROUTES
### Active duodenal ulcers associated with *H. pylori*
**Adult:** PO 40 mg/day × 10-14 days in combination with clarithromycin 500 mg bid × 10 days and amoxicillin 1000 mg bid × 10 days

### GERD/erosive esophagitis
**Adult:** PO 20 or 40 mg/day × 4-8 wk; no adjustment needed in renal, liver failure, geriatric; **IV** 20 or 40 mg/day up to 10 days
**Child and adolescent 12-17 yr:** PO 20 or 40 mg/day 1 hr before meals up to 8 wk
**Child 1-11 yr and ≥20 kg:** PO 10 mg/day 1 hr before meals for up to 8 wk
**Infant ≥1 mo:** **IV** 0.5 mg/kg over 10-30 min
**Infant 1-11 mo (>7.5-12 kg):** PO 10 mg daily up to 6 wk
**Infant 1-11 mo (5-7.5 kg):** PO 5 mg daily up to 6 wk
**Infant 1-11 mo (3-5 kg):** PO 2.5 mg daily up to 6 wk

### Hepatic dose
**Adult:** PO/IV max 20 mg/day (severe hepatic disease)

**Available forms:** Del rel caps 20, 40 mg; powder for **IV** inj 20, 40 mg/vial; del rel powder for oral susp 2.5, 5, 20, 40 mg

### Implementation
**PO route**
- Swallow caps whole; do not crush or chew; cap may be opened and sprinkled over Tbsp of applesauce
- Same time daily, 1 hr before meal
- **Oral susp (del rel):** empty contents of packet into container with 1 Tbsp of water, let stand 2-3 min to thicken, restir, give within 30 min of mixing; any residual product should be flushed with more water, taken immediately
- **NG tube (del rel oral susp):** add 15 ml water to contents of packet in syringe, shake, leave 2-3 min to thicken, shake, inject through NG tube within 30 min

**IV, direct route**
- Reconstitute each vial with 5 ml 0.9% NaCl, $D_5W$, LR; give over 3 min

**Intermittent IV INF route**
- Dilute reconstituted sol to 50 ml, give over 30 min, do not admix, flush line with $D_5W$, 0.9% NaCl, LR after inf

**Solution compatibilities:** $D_5W$, LR, 0.9% NaCl

## ADVERSE EFFECTS
**CNS:** *Headache, dizziness*
**GI:** *Diarrhea, flatulence,* abdominal pain, constipation, dry mouth, hepatic failure, hepatitis, microscopic colitis, *Clostridium difficile–associated diarrhea (CDAD)*
**INTEG:** *Rash,* dry skin
**MISC:** Heart failure
**RESP:** *Cough,* pneumonia
**SYST:** Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 97% plasma protein bound |
| **Metabolism** | Liver (metabolites), by CYP2C19, CYP3A4 Asian, Black and some Caucasians may be poor metabolizers |
| **Excretion** | Urine (metabolites), feces (metabolites); in geriatric, elimination rate decreased, bioavailability increased |
| **Half-life** | 1-1½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1½ hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Calcium carbonate, clopidogrel, dapsone, indinavir, iron, itraconazole, ketoconazole, mycophenolate, vitamin $B_{12}$: decreased effect

Increase: effect of methotrexate, tacrolimus, warfarin

Cilostazol, clozapine, those drugs metabolized by CYP2C19, diazepam, digoxin, penicillins, saquinavir: increased effect, toxicity

### Drug/lab test

Interference: sodium, Hgb, WBC, platelets, magnesium

## NURSING CONSIDERATIONS

### Assessment

- **Assess GI system:** bowel sounds, abdomen for pain, swelling, anorexia, bloody stools; pseudomembranous colitis may occur
- **Hepatic failure, hepatitis:** monitor AST, ALT, alkaline phosphatase during treatment
- **Serious skin disorders:** Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis
- **Pregnancy/breastfeeding:** Use only if benefits clearly outweigh risk, avoid use, do not breastfeed

### Patient/family education

- Instruct patient to report severe diarrhea; product may have to be discontinued, rash
- Advise diabetic patients that hypoglycemia may occur
- Advise patient to avoid hazardous activities; dizziness may occur
- Teach patient to notify provider if pregnancy is planned or suspected, or if breastfeeding
- Advise patient to avoid alcohol, salicylates, ibuprofen; may cause GI irritation
- Teach patient to take ≥1 hr prior to meal; not to crush, chew delayed-release product, if missed, take as soon as remembered if not almost time for next dose, take full course prescribed "Patient Information"
- Teach patient if cap cannot be swallowed whole contents may be mixed with a tablespoon of applesauce
- Teach patient to notify all providers of all OTC/Rx or herbal products taken
- **Hypomagnesemia:** Teach patient if dizziness, fast heartbeat, tremors, weakness, spasm, cramps, notify prescriber

### Evaluation

**Positive therapeutic outcome**

- Absence of epigastric pain, swelling, fullness, decreased GERD

## estradiol (Rx)

(ess-tra-dye'ole)

**Estrace**

## estradiol cypionate (Rx)

**Depo-Estradiol**

## estradiol topical emulsion (Rx)

**Estrasorb**

## estradiol valerate (Rx)

**Delestrogen**

## estradiol transdermal system (Rx)

**Alora, Climara, Estraderm, Minivelle, Vivelle**

## estradiol transdermal spray (Rx)

**Evamist**

## estradiol vaginal tablet (Rx)

**Vagifem Dot**

## estradiol vaginal ring (Rx)

**Estring, Femring**

## estradiol gel (Rx)

**Divigel, Elestrin, Estrogel**

*Func. class.:* Estrogen, progestin

*Chem. class.:* Nonsteroidal synthetic estrogen

**ACTION:** Needed for adequate functioning of female reproductive system; affects release of pituitary gonadotropins, inhibits ovulation, promotes adequate calcium use in bone structure

**Therapeutic outcome:** Decreased tumor size in prostatic cancer; increased estrogen levels in menopause, female hypogonadism

**USES:** Vasomotor symptoms associated with menopause, inoperable breast cancer (selected cases), prostatic cancer, atrophic vaginitis, kraurosis vulvae, hypogonadism, primary ovarian failure, prevention of osteoporosis, castration

## CONTRAINDICATIONS

Pregnancy, breastfeeding, reproductive cancer, genital bleeding (abnormal, undiagnosed), protein S or C deficiency, antithrombin deficiency, angioedema, MI, stroke

**BLACK BOX WARNING:** Breast/endometrial cancer, thromboembolic disorders, MI, stroke

**Precautions:** Hypertension, asthma, blood dyscrasias, gallbladder disease, HF, diabetes mellitus, bone disease, depression, migraine headache, seizure disorders, renal/hepatic disease, family history of cancer of breast or reproductive tract, history of smoking, uterine fibroids, vaginal irritation/infection, history of angioedema, cardiac disease

**BLACK BOX WARNING:** Dementia, accidental exposure pets/children (topical)

## DOSAGE AND ROUTES

### Hormone replacement/menopause symptoms

**Adult:** TD 1 patch delivering 0.025, 0.0375, 0.05, 0.075, or 0.1 mg/day 2×/wk (Alora, Estraderm, Vivelle-Dot); 1 patch delivering 0.025, 0.0375, 0.05, 0.06, 0.075, or 0.1 mg/day replace q7 days (Climara); **GEL** apply entire unit dose packet to 5- × 7-inch area of upper thigh/day, alternate thighs; **SPRAY** (Evamist) 1 spray to inner surface of forearm/day in AM

### Menopause/hypogonadism/castration/ovarian failure

**Adult:** PO 0.5-2 mg/day 3 wk on, 1 wk off or continuously; IM 1-5 mg q3-4wk (cypionate), 1-5 mg q3-4wk; 10-20 mg q4wk (valerate); TOP Estraderm 0.05 mg/24 hr applied 2 ×/wk, Climara 0.05 mg/hr applied 1 ×/wk in a cyclic regimen; women with hysterectomy may use continuously

### Prostatic cancer

**Adult:** IM 30 mg q1-2wk (valerate); PO 1-2 mg tid (oral estradiol)

### Breast cancer (palliative treatment)

**Adult:** PO 10 mg tid × 3 mo or longer

### Atropic vaginitis/kraurosis vulvae

**Adult:** VAG cream 2-4 g/day × 1-2 wk, then 1 g 1-3 ×/wk cycled; VAG tab 1/day × 2 wk, maintenance 1 tab 2 ×/wk; VAG ring inserted and left in place continuously for 3 mo

### Vasomotor symptoms

**Adult:** TOP after cleaning and drying skin on left thigh, calf, rub in contents of pouch using both hands until completely absorbed; wash hands

**Available forms: Estradiol:** tabs 0.5, 1, 2 mg; **valerate:** inj 10, 20, 40 mg/ml; **transdermal** 0.014, 0.025, 0.0375, 0.05, 0.075, 0.1 mg/24-hr release rate; **vag cream** 100 mcg/g; **vag ring** 2 mg/90 days; **vag tab** 10 mcg; **topical emulsion:** 2.5 mg; **gel** 0.1%, 0.06%, (Divigel); **spray** (Evamist) 1.53 mg/actuation

### Implementation

**PO route**

- Give titrated dose, use lowest effective dose
- Give with food or milk to decrease GI symptoms

**IM route**

- Administer deeply in large muscle mass; product is painful
- Rotate syringe to mix oil and medication

**Transdermal route**

- May contain aluminum or other metals in backing of patch, can overheat in MRI scan and burn patients
- Apply to area free of hair to ensure adhesion on trunk of body 2 ×/wk; press firmly and hold in place for 10 sec to ensure good contact; do not apply to breasts
- Start transdermal dose 7 days before last PO dose if routes are to be changed

**Topical route spray (Evamist)**

- Use daily; spray to inner upper arm; may increase to 2-3 ×/day based on response; let dry for 2 min, avoid secondary exposure to children, pets, caregivers

**Vaginal route**

- Place cream in applicator by attaching tube to applicator; squeeze cream into tube to mark; insert with patient reclining
- Use a new applicator daily

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, migraine, depression, seizures

**CV:** Hypertension, thrombophlebitis, edema, thromboembolism, stroke, pulmonary embolism, MI, chest pain

**EENT:** Contact lens intolerance, increased myopia, astigmatism, throat swelling, eyelid edema

**GI:** *Nausea,* vomiting, diarrhea, anorexia, pancreatitis, cramps, constipation, increased appetite, increased weight, cholestatic jaundice, hepatic adenoma

**GU:** Amenorrhea, cervical erosion, breakthrough bleeding, dysmenorrhea, vaginal candidiasis, breast changes, *gynecomastia, testicular atrophy, impotence;* increased risk of breast, endometrial cancer, changes in libido; toxic shock, vaginal wall ulceration/erosion (vag ring)

**INTEG:** Rash, urticaria, acne, hirsutism, alopecia, oily skin, seborrhea, purpura, erythema, pruritus, melasma; site irritation (transdermal)

**META:** Folic acid deficiency, hypercalcemia, hyperglycemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| **Onset** | Rapid | Slow | Rapid |
| **Peak** | Unknown | Unknown | Unknown |
| **Duration** | Unknown | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Calcium, phenylbutazone, rifampin: decreased estradiol action
CycloSPORINE, dantrolene: increased toxicity
Tamoxifen: decreased tamoxifen action

### Drug classifications

Anticoagulants: decreased action of anticoagulants
Anticonvulsants, barbiturates: decreased estradiol action
Corticosteroids: increased action of corticosteroids, tricyclics
Hypoglycemics (oral): decreased action of hypoglycemics

### Drug/herb

Black cohosh, DHEA: altered estrogen effect
Saw palmetto, St. John's wort: decreased estrogen effect

### Drug/food

Grapefruit juice: increased estrogen level

### Drug/lab test

Increased: BSP retention test; PBI; $T_4$; serum sodium; platelet aggregation; thyroxine-binding globulin (TBS); prothrombin; factors VII, VIII, IX, X; triglycerides
Decreased: serum folate, serum triglyceride, $T_3$ resin uptake test, glucose tolerance test, antithrombin III, pregnanediol, metyrapone test
False positive: LE prep, ANA titer

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess for previous breast/endometrial cancer, thromboembolic disorders, MI, stroke, dementia, use adequate screening for these conditions, estrogen increases the risk

- Monitor blood glucose in patient with diabetes; hyperglycemia may occur
- Monitor B/P q4hr; watch for increase caused by water and sodium retention
- Monitor I&O ratio; be alert for decreasing urinary output and increasing edema; monitor weight daily; notify prescriber if weekly weight gain is >5 lb; if increased, diuretic may be ordered
- Obtain liver function tests baseline, periodically, including AST, ALT, bilirubin, alkaline phosphatase, periodic folic acid level
- Assess edema, hypertension, cardiac symptoms, jaundice
- Assess mental status: affect, mood, behavioral changes, aggression; depression may occur, product may need to be discontinued
- Assess female patient for intact uterus; if so, progesterone should be added to estrogen therapy to decrease risk of endometrial cancer
- **Pregnancy/breastfeeding:** Do not use in pregnancy; estrogens decrease milk production, use only if clearly needed
- **Beers:** Avoid oral and topical patch in older adults, evidence of carcinogenic potential (breast, endometrial)

### Patient/family education

- Tell patient to take exactly as prescribed; do not double doses
- **Advise patient that increased weight gain and symptoms of fluid retention should be reported to prescriber:** edema of feet, ankles, sacral area; abnormal vaginal bleeding; breast lumps; hepatic disease (dark urine, clay-colored stools, jaundice of skin, sclera, pruritus); to report dermal rash with transdermal patch
- **Caution patient that thromboembolic symptoms should be reported:** tenderness in legs, chest pain, dyspnea, headaches, blurred vision
- Inform patient to use sunscreen and protective clothing because sunburns may occur
- Advise patient to stop smoking; smokers have a greater chance of thromboembolic disorder
- Teach patient to avoid grapefruit or grapefruit juice (PO)
- Teach patient that smoking increases CV conditions, encourage to stop
- Advise patient to notify prescriber if pregnancy is planned or suspected, and not to become pregnant when using estrogen
- Inform patient to report changes in blood glucose, if diabetic

### Evaluation

**Positive therapeutic outcome**

- Reversal of menopausal symptoms
- Decrease in tumor size in prostatic or breast cancer
- Decrease in itching, inflammation of vagina
- Absence of symptoms of osteoporosis

**⚠ HIGH ALERT**

**estrogens, conjugated, equine**
**(C.E.S 🍁, Congest 🍁, Premarin)**
**estrogens, conjugated (Rx) (synthetic A)**
**Cenestin, Premarin**
**estrogens, conjugated (synthetic B) (Rx)**
**Enjuvia**

**Do not confuse:** Premarin/Provera, Enjuvia/Januvia

**ACTION:** Needed for adequate functioning of female reproductive system; affects release of pituitary gonadotropins; inhibits ovulation; promotes adequate calcium use in bone structures

**Therapeutic outcome:** Decreased tumor size in prostatic cancer; increased estrogen levels in menopause, female hypogonadism

**USES:** Symptoms associated with menopause, inoperable breast cancer, prostatic cancer, abnormal uterine bleeding, hypogonadism, primary ovarian failure, prevention of osteoporosis, castration, atrophic vaginitis

## CONTRAINDICATIONS

Pregnancy, breastfeeding, thromboembolic disorders, reproductive cancer, genital bleeding (abnormal, undiagnosed), hypersensitivity, MI, stroke, phlebitis

**BLACK BOX WARNING:** Endometrial breast cancer, thromboembolic diseases

**Precautions:** Hypertension, asthma, blood dyscrasias, gallbladder disease, HF, diabetes mellitus, bone disease, depression, migraine headache, seizure disorders, renal/hepatic disease, family history of cancer of breast or reproductive tract, history of smoking, hypothyroidism, obesity, SLE

**BLACK BOX WARNING:** Dementia

## DOSAGE AND ROUTES

### >> Estrogens, conjugated

**Menopause**
**Adult:** PO 0.3-1.25 mg/day 3 wk on, 1 wk off

**Prevention of osteoporosis**
**Adult:** PO 0.3 mg/day or in a cycle

**Atrophic vaginitis**
**Adult:** VAG cream 0.5 g/day × 21 days, off 7 days, repeat

**Prostatic cancer**
**Adult:** PO 1.25-2.5 mg tid

**Advanced inoperable breast cancer**
**Adult:** PO 10 mg tid × 3 mo or longer

**Abnormal uterine bleeding**
**Adult:** **IV**/IM 25 mg, repeat in 6-12 hr

**Castration/primary ovarian failure**
**Adult:** PO 1.25 mg/day 3 wk on, 1 wk off

**Hypogonadism**
**Adult:** PO 0.3 or 0.625 mg q day/3 wk on, 1 wk off; adjust to response

### >> Estrogens, conjugated synthetic B

**Menopause**
**Adult:** PO 0.625 mg/day initially, may increase based on response

**Available forms:** Tabs 0.3, 0.45, 0.625, 0.9, 1.25, 2.5 mg; inj 25 mg/vial; vag cream 0.625 mg/g; synthetic B: tabs 0.625, 1.25 mg

### Implementation

**PO route**

- Give titrated dose, use lowest effective dose
- Give in 1 dose in AM for prostatic cancer, vaginitis, hypogonadism
- Give with food or milk to decrease GI symptoms

**IM route**

- Reconstitute after withdrawing at least 5 ml of air from container and inject sterile diluent on vial side, rotate to dissolve
- Give IM inj deeply in large muscle

**Vaginal route**

- Place cream in applicator by attaching tube to applicator, squeeze cream into tube to mark, insert with patient recumbent
- Applicator should be washed after each use

**IV, direct route**

- Reconstitute as for IM, inject into distal port of running **IV** line of $D_5W$, 0.9% NaCl, LR, at a rate of 5 mg/min or less

**Y-site compatibilities:** Heparin/hydrocortisone, potassium chloride, vit B/C

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, migraine, depression, seizures, mood disturbances

**CV:** Hypertension, thrombophlebitis, edema, thromboembolism, stroke, pulmonary embolism, MI, chest pain
**EENT:** Contact lens intolerance, increased myopia, astigmatism
**GI:** *Nausea,* vomiting, diarrhea, anorexia, pancreatitis, cramps, constipation, increased appetite, cholestatic jaundice, hepatic adenoma, weight gain/loss
**GU:** Amenorrhea, cervical erosion, breakthrough bleeding, dysmenorrhea, vaginal candidiasis, breast changes, *gynecomastia, testicular atrophy, impotence,* increased risk of breast, endometrial cancer, libido changes
**INTEG:** Rash, urticaria, acne, hirsutism, alopecia, oily skin, seborrhea, purpura, melasma
**META:** Folic acid deficiency, hypercalcemia, hyperglycemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO), completely absorbed **(IV)** |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Liver, exclusively; hepatic recirculation |
| **Excretion** | Kidney |
| **Half-life** | Unknown |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | Rapid | Slow | Immediate |
| **Peak** | Unknown | Unknown | Unknown |
| **Duration** | Unknown | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Bosentan, cycloSPORINE, dantrolene: increased toxicity
Phenylbutazone, rifampin: decreased action of estrogens
Tamoxifen, thyroid: decreased tamoxifen action

### Drug classifications

Anticoagulants: decreased action of anticoagulants
Anticonvulsants, barbiturates: decreased action of estrogens
Corticosteroids: increased action of corticosteroids
Oral hypoglycemics: decreased action of hypoglycemics
Tricyclic antidepressants: decreased effect of the antidepressant

### Drug/food

Grapefruit juice: increased estrogen level

### Drug/lab test

Increased: PBI, $T_4$; serum sodium; platelet aggregation; thyroxine-binding globulin (TBG); prothrombin; factors VII, VIII, IX, X; triglycerides
Decreased: serum folate, serum triglyceride, $T_3$ resin uptake test, glucose tolerance test, antithrombin III, metyrapone test
False positive: LE prep, ANA titer

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Breast, endometrial cancer: estrogens should not be used in known, suspected, or history of these disorders

**BLACK BOX WARNING:** Stroke, thromboembolic disease of MI: should not be used in these conditions or known protein C deficiency, protein S deficiency or antithrombin in deficiency

- Monitor blood glucose in patient with diabetes; hyperglycemia may occur
- Monitor B/P q4hr; watch for increase caused by water and sodium retention
- Monitor I&O ratio; be alert for decreasing urinary output and increasing edema; monitor weight daily; notify prescriber if weekly weight gain is >5 lb; if increased, diuretic may be ordered
- Obtain liver function tests, including AST, ALT, bilirubin, alkaline phosphatase
- Assess edema, hypertension, cardiac symptoms, jaundice
- Assess mental status: affect, mood, behavioral changes, aggression; depression may occur; product may need to be discontinued
- Assess female patient for intact uterus; if so, progesterone should be added to estrogen therapy to decrease risk of endometrial cancer; abnormal uterine bleeding, breast exam
- Pregnancy, estrogens decrease milk production, use only if clearly needed
- **Beers:** Avoid oral and topical patch in older adults, evidence of carcinogenic potential (breast, endometrial)

### Patient/family education

- Caution patient to take exactly as prescribed and not to double doses

**BLACK BOX WARNING:** Advise patient that increased weight gain and symptoms of fluid retention should be reported to prescriber: edema of feet, ankles, sacral area; abnormal vaginal bleeding; breast lumps; hepatic disease (dark urine, clay-colored stools, jaundice of skin, sclera, pruritus)

- **Caution patient that thromboembolic symptoms should be reported:** pain, redness, tenderness in legs; chest pain, dyspnea, headaches, blurred vision
- Inform patient that sunburns may occur and to use sunscreen and protective clothing
- Advise patient to stop smoking; smokers have a greater chance of thromboembolic disorder
- Tell patient to use nonhormonal birth control and to notify prescriber if pregnancy is suspected
- Tell patient that vasomotor symptoms improve in 2 wk, max relief 8 wk

### Evaluation

**Positive therapeutic outcome**

- Reversal of menopause symptoms
- Decrease in tumor size in prostatic, breast cancer
- Decrease in itching, inflammation of vagina
- Absence of symptoms of osteoporosis

**⚠ HIGH ALERT**

## eszopiclone (Rx)

(es-zop'i-klone)

**Lunesta**

*Func. class.:* Sedative-hypnotic, non-benzodiazepine

*Chem. class.:* Cyclopyrrolone

**Controlled substance schedule IV**

**ACTION:** Interacts with GABA receptors

**Therapeutic outcome:** Ability to sleep and stay asleep throughout the night

**USES:** Insomnia

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric, severe hepatic disease, abrupt discontinuation, COPD, depression, labor, sleep apnea, substance abuse, suicidal ideation, ethanol intoxication

## DOSAGE AND ROUTES

**Adult:** PO 1 mg immediately before bed, may increase to 2-3 mg if needed, max 3 mg nightly

### Hepatic dose/CYP3A4 inhibitors

**Adult:** PO 1 mg immediately before bed in severe hepatic disease, max 2 mg/day

**Available forms:** Tabs 1, 2, 3 mg

### Implementation

- Do not break, crush, or chew tab
- For short-term use only
- Give immediately before bedtime
- Avoid use with a high-fat meal
- Provide assistance with ambulation, nightlight, call bell within reach
- Check to see product is swallowed

## ADVERSE EFFECTS

**CNS:** Worsening depression, hallucinations, headache, daytime drowsiness, suicidal thoughts/actions, migraine, restlessness, anxiety, sleep driving, sleep walking

**CV:** Peripheral edema, chest pain

**GI:** Dry mouth, bitter taste (dysgeusia)

**GU:** Gynecomastia, dysmenorrhea

**INTEG:** Rash, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Extensively in the liver by CYP3A4, CYP2E1; protein binding 52%-59% |
| **Excretion** | Via kidneys |
| **Half-life** | 6 hr, geriatric 9 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | 1 hr |
| **Duration** | 6 hr |

## INTERACTIONS

### Drug classifications

CNS depressants: increased CNS depression

CYP3A4 inducers (dexamethasone, barbiturates, carBAMazepine, OXcarbazepine, phenytoin, fosphenytoin, ethotoin): Decrease: eszopiclone effect

CYP3A4 inhibitors (clarithromycin, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, troleandomycin): increased toxicity due to decreased eszopiclone elimination

### Drug/food

High-fat meal: decreased product action

### Drug/herb

- St. John's wort: Decrease: eszopiclone effect

## NURSING CONSIDERATIONS

### Assessment

- **Anaphylaxis, angioedema:** monitor during first dose
- **Assess sleep pattern:** ability to go to sleep, stay asleep; early morning awakenings; conservative methods used
- Monitor for abuse of this or other products
- **Pregnancy/breastfeeding:** Use in pregnancy only if clearly needed, avoid breastfeeding

### Patient/family education

- Caution patient that daytime drowsiness may occur; not to engage in hazardous activities until effect is known, memory problems may occur
- Advise patient that all other medications and supplements should be avoided unless approved by prescriber
- Advise patient to notify prescriber if pregnancy is suspected or planned
- Discuss alternative methods to improve sleep: reading, quiet environment, warm bath, milk
- Teach patient to avoid use after a high-fat meal
- Teach patient to swallow tab whole
- **CNS Depression/suicidal thoughts behaviors:** Teach patient how to recognize these problems
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, avoid breastfeeding
- **Beers:** Avoid in older adults with or at high risk for delirium
- Teach patient to notify prescriber of facial swelling, rash, complex sleeping disorders (sleep driving, sleep eating) change in thinking or behavior
- Teach patient that tolerance and dependence may occur after extended use
- Teach patient to take immediately before going to bed
- Teach patient to be aware of CNS depression and suicidal thoughts/behaviors, report at once

### Evaluation

**Positive therapeutic outcome**

- Ability to sleep and stay asleep throughout the night

## etanercept (Rx)

(eh-tan′er-sept)

**Enbrel**

*Func. class.:* Antirheumatic agent (disease-modifying) (DMARDs)

*Chem. class.:* Anti-TNF agent

**Do not confuse:** Enbrel/Leubid

**ACTION:** Binds to tumor necrosis factor (TNF), which decreases inflammation and immune response

**Therapeutic outcome:** Decreased pain, inflammation

**USES:** Acute, chronic rheumatoid arthritis that has not responded to other disease-modifying agents; polyarticular course juvenile rheumatoid arthritis (JRA), ankylosing spondylitis, plaque psoriasis, psoriatic arthritis

**Unlabeled uses:** Crohn's disease

## CONTRAINDICATIONS

Sepsis

**Precautions:** Pregnancy, breastfeeding, children <4 yr, geriatric, malignancies, HF, seizures, multiple sclerosis, latex hypersensitivity

**BLACK BOX WARNING:** Infection, lymphoma, neoplastic disease, TB

## DOSAGE AND ROUTES

### Rheumatoid/psoriatic arthritis, ankylosing spondylitis

**Adult:** SUBCUT 50 mg qwk or 25 mg 2×/wk, 3-4 days apart; may be used with methotrexate for psoriatic arthritis

**Child 2-17 yr:** SUBCUT 0.8 mg/kg/wk, max 50 mg/wk

### Plaque psoriasis

**Adult:** SUBCUT 50 mg 2 ×/wk × 3 mo, then 50 mg q wk maintenance

**Adolescent and child 4-17 yr (unlabeled):** SUBCUT 0.8 mg/kg/wk, max 50 mg/wk

### Juvenile rheumatoid arthritis (JRA)

**Adolescent and child 2-17 yr:** SUBCUT 0.8 mg/kg/wk, max 50 mg/wk

**Available forms:** Powder for inj 25 mg; inj 50 mg/ml; auto injector, single use

### Implementation

- May be administered by the patient or a caregiver after instruction. Assess the patient's or caregiver's ability to inject subcut and observe the first injection
- Administration of one 50 mg/ml prefilled syringe or autoinjector provides a dose equivalent to two, 25 mg prefilled syringes or two, 25 mg vials of lyophilized powder
- The needle cap on the prefilled syringe and on the SureClick autoinjector contain dry natural rubber (latex) and should not be handled by persons sensitive to this product

**Inj route**

- Inspect for particulate matter and discoloration prior to use, solution should be clear and colorless, although small white particles may be noted in the autoinjector or prefilled syringe

**Subcut route**

- Injection sites include front of the thigh; abdomen except the 2 inches around the navel; or outer area of the upper arm. Rotate injection sites. Do not administer where skin is tender, bruised, red, or hard. Also, do not inject directly into any raised, thick, red, or scaly skin patches or lesions related to psoriasis

**Reconstitution and administration of the vial**

• Do not mix or transfer the contents of one vial into another vial. Also, do not filter reconstituted product during preparation or administration. Do not add other medications to solutions containing etanercept. ONLY use the supplied diluent

• A vial adaptor is supplied for use when reconstituting the powder; the adaptor should not be used if multiple doses are going to be withdrawn from the vial. To reconstitute using the vial adaptor, slide the plunger into the flange end of the syringe. Attach the plunger to the gray rubber stopper in the syringe by turning the plunger clockwise until a slight resistance is felt. Remove the twist-off cap from the prefilled diluent syringe by turning counterclockwise. Once the twist-off cap is removed, twist the vial adapter onto the syringe clockwise until a slight resistance is felt. Place the vial adaptor over the top of the vial being careful not to bump or touch the plunger; the plastic spike inside the vial adaptor should puncture the gray stopper. Push the plunger down until all the liquid from the syringe is in the vial and gently swirl to dissolve the powder. After the diluent is added, some foaming may occur. Do not shake. Generally, dissolution takes less than 10 min; the solution should be clear and colorless. Each reconstituted vial contains 25 mg/ml of etanercept. Turn the vial upside down and slowly pull the plunger down to the unit markings on the side of the syringe that correspond with the needed dose. Gently tap the syringe to make any air bubbles rise to the top of the syringe, and slowly push the plunger up to remove them. Remove the syringe from the vial adapter by turning the syringe counterclockwise and attach the 27 gauge needle

• If the vial will be used for multiple doses, use a 25-gauge needle for reconstituting and withdrawing the solution. Insert the 25 gauge needle or the vial adapter straight into the center of the gray stopper. A "pop" will be felt. Inject the diluent very slowly. After the diluent is added, some foaming may occur. Do not shake. Swirl contents gently during dissolution. Generally, dissolution takes less than 10 minutes; the solution should be clear and colorless. Write the mixing date on the supplied sticker and attach to the vial. Each reconstituted vial contains 25 mg/ml of etanercept. Withdraw the correct dose of the solution into the syringe; remove any air bubbles. Remove the 25-gauge needle from the syringe. Attach a 27-gauge needle

• Hold the barrel of the syringe with one hand and pull the needle cover straight off. Hold the syringe in one hand like a pencil and use the other hand to gently pinch a fold of skin at the cleaned injection site. Insert the needle at a 45° angle to the skin. Let go of the skin, and hold the syringe near its base to stabilize it. Push the plunger to inject all of the solution at a slow, steady rate. Withdraw the needle at the same angle as insertion. Do NOT rub the site

• Use as soon as possible after reconstitution. Place reconstituted vials for multiple doses in the refrigerator at 2-8° C (36°-46° F) within 4 hr of reconstitution and may be stored up to 14 days. DO NOT FREEZE

**Use of the SureClick autoinjector**

• Allow to reach room temperature, do not shake. Immediately before use, remove the needle shield by pulling it straight off

• Stretch the skin under and around the prefilled autoinjector, place the open end against the injection site at a 90° angle. Without pushing the purple button on top, push the autoinjector firmly against the skin to unlock. Press the purple button on top once and release the button. Listen for the first click. Wait for the second click or wait 15 seconds, and remove the autoinjector from injection site. Do NOT rub the site

• Look at the inspection window. If it is not purple, call 1-888-436-2735; do not try to reuse the autoinjector

**Use of the prefilled syringe**

• **Single-use:** allow to come to room temperature, do not shake. Remove the needle shield. Check to see if the amount of liquid in the prefilled syringe falls between the two purple fill level indicator lines on the syringe. If bubbles are seen, very gently tap the syringe. Turn the syringe so that the purple horizontal lines on the barrel are directly facing you. Do not use if the syringe does not have the right amount of liquid

• Hold the barrel of the prefilled syringe with one hand and pull the needle cover straight off. Holding the syringe with the needle pointing up, check the syringe for air bubbles. If there are bubbles, gently tap until the air bubbles rise to the top of the syringe. Slowly push the plunger up to force the air bubbles out of the syringe

• Insert the needle at a 45° angle to the pinched skin. Push the plunger to inject all of the solution at a slow, steady rate. Withdraw the needle at the same angle as insertion. Do NOT rub the site

## ADVERSE EFFECTS

**CNS:** Headache, asthenia, dizziness, seizures

**CV:** Heart failure

**GI:** Abdominal pain, dyspepsia, vomiting, hepatitis, diarrhea

**HEMA:** Pancytopenia, anemia, thrombocytopenia, leukopenia, neutropenia
**INTEG:** Rash, *inj site reaction,* keratoderma blenorrhagicum
**RESP:** Pharyngitis, rhinitis, *cough, URI,* non-URI sinusitis
**SYST:** Serious infections, sepsis, death, malignancies, Stevens-Johnson syndrome, reactivation of hepatitis B virus, lupuslike syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed (60%) |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 115 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Anakinra, cyclophosphamide, rilonacept: avoid use
SulfaSALAzine: increased neutropenia

### Drug classifications

Immunizations: should be brought up to date before treatment
Immunizations, live virus vaccines: do not give concurrently

### Drug/lab test

Increased: LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Rheumatoid arthritis:** assess for pain; check ROM, inflammation of joints, characteristics of pain
- Assess inj site for pain, swelling; usually occurs after 2 inj (4-5 days)
- **Pregnancy/breastfeeding:** Use only if clearly needed, use cautiously in breastfeeding, enroll in Amgen Pregnancy Surveillance Program 800-772-6436

**BLACK BOX WARNING: Infection:** patients using immunosuppressives, corticosteroids, methotrexate are at greater risk, assess for fever, discontinue in those that develop a serious infection, do not use in active infection, obtain testing before use, TB must be treated before use

**BLACK BOX WARNING:** Hypersensitivity: to this product, latex needle cap, benzyl alcohol; usual reaction to this product lasts 3-5 days

**BLACK BOX WARNING: Secondary malignancy:** Assess for lymphoma and other neoplastic diseases in children and adolescents, avoid in those with a history of malignancy

### Patient/family education

- Teach patient that product must be continued for prescribed time to be effective; to avoid aspirin, alcoholic beverages
- Instruct patient to use caution when driving; dizziness may occur
- Teach patient about self-administration, if appropriate: inj should be made in thigh, abdomen, upper arm; rotate sites at least 1 in from old site, check for injection reactions, reactions usually last 3-5 days

### Evaluation

**Positive therapeutic outcome**

- Decreased pain in arthritic conditions
- Decreased inflammation in arthritic conditions

## ethambutol (Rx)

(e-tham′byoo-tole)
**Etibi, Myambutol**
*Func. class.:* Antitubercular
*Chem. class.:* Diisopropylethylene diamide derivative

**Do not confuse:** ethambutol/Ethmozine

**ACTION:** Inhibits RNA synthesis, decreases tubercle bacilli replication

**Therapeutic outcome:** Resolution of TB infection

**USES:** Pulmonary TB, as an adjunct, other mycobacterial infections

## CONTRAINDICATIONS

Hypersensitivity, optic neuritis, child <13 yr

**Precautions:** Pregnancy, breastfeeding, renal disease, diabetic retinopathy, cataracts, ocular defects, hepatic and hematopoietic disorders

## DOSAGE AND ROUTES

**Adult and child >13 yr:** PO 15-25 mg/kg/day as a single dose or (treatment naive) or 25 mg/kg q day (treatment experienced)

### Renal dose

**Adult:** PO CCr 10-50 ml/min dose q24-36hr; CCr <10 ml/min dose q48hr

### Retreatment

**Adult:** PO 25 mg/kg/day as single dose × 2 mo with at least 1 other product, then decrease to 15 mg/kg/day as single dose, max 2.5 g/day
**Child:** PO 15 mg/kg/day

**Available forms:** Tabs 100, 400 mg

### Implementation
- Give with meals to decrease GI symptoms, at same time each day to maintain blood level
- 4 hr between this product and antacids
- Give antiemetic if vomiting occurs

## ADVERSE EFFECTS
**CNS:** *Headache, confusion,* fever, malaise, dizziness, *disorientation,* hallucinations, peripheral neuropathy
**EENT:** Blurred vision, optic neuritis, photophobia, decreased visual acuity
**GI:** *Abdominal distress, anorexia, nausea, vomiting*
**INTEG:** Dermatitis, pruritus, toxic epidermal necrolysis, erythema multiforme
**META:** *Elevated uric acid, acute gout,* liver function impairment
**MISC:** Thrombocytopenia, joint pain, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Widely distributed, crosses blood-brain barrier, placenta |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, unchanged |
| **Half-life** | 3 hr, increased in liver, kidney disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | 2-4 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Drug classifications
Aluminum, antacids: decreased absorption, separate by 4 hr
Neurotoxic agents, other: increased neurotoxicity

## NURSING CONSIDERATIONS
### Assessment
- Obtain C&S tests including sputum tests before initiating treatment; monitor qmo to detect resistance
- Monitor liver function tests qwk × 2 wk, then q2mo: ALT, AST, bilirubin; renal studies: before, qmo: BUN, creatinine output, specific gravity, urinalysis, uric acid; decreased appetite, jaundice, dark urine, fatigue
- Assess patient's mental status often: affect, mood, behavioral changes; psychosis may occur with hallucinations, confusion
- Assess patient for vision disturbance that may indicate optic neuritis: blurred vision, change in color perception; may lead to blindness
- **Serious skin reaction:** toxic epidermal necrolysis
- **Pregnancy/breastfeeding:** Use only if benefit outweighs risk, product appears in breast milk

### Patient/family education
- Advise patient that compliance with dosage schedule and duration is necessary to eradicate disease; to keep scheduled appointments, including ophthalmic appointments, or relapse may occur
- Caution patient to report weakness, fatigue, loss of appetite, nausea, vomiting, yellowing of skin or eyes, tingling/numbness of hands/feet, weight gain, or decreased urine output
- Instruct patient to report any vision changes; rash; hot, swollen, painful joints; numbness or tingling of extremities to physician
- Caution patient to inform prescriber if pregnancy is suspected

### Evaluation
**Positive therapeutic outcome**
- Decreased symptoms of TB
- Decrease in acid-fast bacteria

## etodolac (Rx)
(ee-toe-doe'lak)
**Ultradol** 🍁
*Func. class.:* Nonsteroidal antiinflammatory, nonopioid analgesic

**Do not confuse:** Lodine/codeine/iodine

**ACTION:** Inhibits COX 1,2; analgesic, antiinflammatory properties

**Therapeutic outcome:** Decreased pain, inflammation

**USES:** Mild to moderate pain, osteoarthritis, rheumatoid arthritis, arthralgia, myalgia, juvenile rheumatoid arthritis

## CONTRAINDICATIONS
Hypersensitivity; patients in whom aspirin, iodides, or other NSAIDs have produced asthma, rhinitis, urticaria, nasal polyps, angioedema, bronchospasm; coronary artery bypass graft surgery (CABG)

**Precautions:** Pregnancy, breastfeeding, children, geriatric, bleeding, GI/cardiac/renal/hepatic disorders, bronchospasm, nasal polyps, alcoholism, bone marrow suppression, MI, hemophilia, neutropenia, ulcerative colitis

**BLACK BOX WARNING:** GI bleeding, perforation, MI, stroke

## DOSAGE AND ROUTES

### Osteoarthritis

**Adult:** PO 300 mg bid-tid, or 400-500 mg bid initially, then adjust to 600-1200 mg/day in divided doses; max 1200 mg/day; ext rel 400-1000 mg/day

### Analgesia

**Adult:** PO 200-400 mg q6-8hr; max 1200 mg/day; patients <60 kg max 20 mg/kg

**Available forms:** Caps 200, 300 mg; tabs 400, 500 mg; ext rel tabs 400, 600 mg

### Implementation

- Do not break, crush, or chew ext rel tabs
- Administer with full glass of water to enhance absorption
- Administer with food or milk to decrease gastric symptoms; food will slow absorption slightly, will not decrease absorption

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, drowsiness, fatigue, tremors, confusion, insomnia, anxiety, depression, light-headedness, vertigo
**CV:** Tachycardia, peripheral edema, fluid retention, palpitations, dysrhythmias, HF
**EENT:** Tinnitus, hearing loss, blurred vision, photophobia
**GI:** *Nausea, anorexia,* vomiting, diarrhea, jaundice, cholestatic hepatitis, constipation, flatulence, cramps, dry mouth, peptic ulcer, dyspepsia, GI bleeding
**GU:** Nephrotoxicity, dysuria, hematuria, oliguria, azotemia, cystitis, UTI
**HEMA:** Blood dyscrasias
**INTEG:** Erythema, urticaria, purpura, rash, pruritus, sweating, Stevens-Johnson syndrome
**SYST:** Angioedema, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Highly bound to plasma protein |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 7 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½ hr |
| **Peak** | 1-2 hr |
| **Duration** | 4-12 hr |

## INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** Aspirin: may increase GI toxicity, NSAIDs

Cidofovir, cycloSPORINE, digoxin, lithium, methotrexate, phenytoin: increased toxicity

### Drug classifications

Aminoglycosides: Increased toxicity
Antacids: delayed etodolac effect
β-Adrenergic blockers: decreased effect
Diuretics: decreased effectiveness of diuretics

### Drug/herb

Arginine, gossypol: increased gastric irritation
Bearberry, bilberry: increased NSAIDs action
Bogbean, chondroitin, saw palmetto, turmeric: increased bleeding risk
St. John's wort: severe photosensitivity

### Drug/Lab

Increased: BUN, creatinine
Decreased: Hgb/Hct, WBC

## NURSING CONSIDERATIONS

### Assessment

- Assess pain: location, frequency, characteristics; relief after medication

**BLACK BOX WARNING:** Assess for GI bleeding: black stools, hematemesis

- Assess for asthma, aspirin hypersensitivity, nasal polyps that may be hypersensitive to etodolac
- Monitor blood counts during therapy; watch for decreasing platelets; if low, therapy may need to be discontinued, then restarted after hematologic recovery; watch for blood dyscrasia (thrombocytopenia): bruising, fatigue, bleeding, poor healing
- **Pregnancy/breastfeeding:** Avoid use unless benefits outweigh risks, avoid in third trimester due to constriction of fetal ductus arteriosus, do not breastfeed
- **Beers:** Avoid chronic use in older adults unless alternatives are not available, increased risk of GI bleeding/peptic ulcer disease

### Patient/family education

- Inform patient that product must be continued for prescribed time to be effective

**BLACK BOX WARNING:** avoid aspirin, alcoholic beverages, NSAIDs

- Caution patient to report bleeding, bruising, fatigue, malaise because blood dyscrasias can occur
- Instruct patient to use caution when driving; drowsiness, dizziness may occur
- Teach patient to take with a full glass of water to enhance absorption

### Evaluation

**Positive therapeutic outcome**

- Decreased pain
- Decreased inflammation
- Increased mobility

## etravirine (Rx)

(e-tra'veer-een)

**Intelence**

*Func. class.:* Antiretroviral

*Chem. class.:* Non-nucleoside reverse transcriptase inhibitor (NNRTI)

**ACTION:** Binds directly to reverse transcriptase, blocking the RNA- and DNA-dependent DNA polymerase action, causing a disruption of the enzyme's catalytic site

**Therapeutic outcome:** Increased CD4 count, decrease viral load

**USES:** In combination with other antiretroviral agents for HIV infection in treatment-experienced patients with evidence of HIV replication despite ongoing antiretroviral therapy

## CONTRAINDICATIONS

Hypersensitivity, breastfeeding

**Precautions:** Pregnancy, impaired hepatic function, children, antimicrobial resistance, geriatric patients, hepatitis, hypercholesterolemia, hypertriglycerides, immune reconstitution syndrome

## DOSAGES AND ROUTES

**Adult/child/adolescent ≥6 yr, ≥30 kg:** PO 200 mg bid

**Child/adolescent ≥6 yr, 25 to 29 kg:** 150 mg bid

**Child/adolescent ≥6 yr, 20 to 24 kg:** 125 mg bid

**Child/adolescent ≥6 yr, 16 to 19 kg:** 100 mg bid

**Available forms:** Tabs 100, 200 mg

### Implementation

- Give in combination with other antiretrovirals with food
- Store in cool environment; protect from light

## ADVERSE EFFECTS

**CNS:** *Headache, insomnia,* amnesia, anxiety, confusion, fatigue, nightmares, peripheral neuropathy, seizures, stroke, tremor

**CV:** Atrial fibrillation, hypertension, MI

**EENT:** Blurred vision

**GI:** *Nausea, vomiting, diarrhea, anorexia,* abdominal pain, increased AST/ALT, constipation, flatulence, gastritis, GERD, hematemesis, hepatitis, hepatomegaly, pancreatitis

**GU:** Renal failure

**HEMA:** Hemolytic anemia, neutropenia, thrombocytopenia, anemia

**INTEG:** *Rash,* erythema multiforme, angioedema, Stevens-Johnson syndrome

**MS:** Rhabdomyolysis

**OTHER:** Diabetes mellitus, gynecomastia, hyperamylasemia, hypercholesterolemia, hyperglycemia, hyperlipidemia

**RESP:** Dyspnea, bronchospasm

**SYST:** DRESS

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Plasma protein binding 99.9% |
| **Metabolism** | By CYP3A4, 2C9, 2C19 |
| **Excretion** | Feces |
| **Half-life** | 21-61 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Atazanavir, carBAMazepine, delavirdine, fosamprenavir, fosphenytoin, phenytoin, PHENobarbital, rifapentine, rifampin, tipranavir: do not use concurrently

CycloSPORINE, sirolimus, tacrolimus: altered effect

CYP3A4 inducers: amiodarone, atazanavir, clarithromycin, flecainide, fosamprenavir, lidocaine, mexiletine, propafenone, quiNIDine, sildenafil, tadalafil, vardenafil: decreased levels

CYP3A4 inhibitors: fluconazole, itraconazole, ketoconazole, lopinavir, posaconazole, ritonavir, voriconazole: increased etravirine levels

Darunavir, dexamethasone, disopyramide, efavirenz, nevirapine, ritonavir, tipranavir: decreased etravirine levels

Diazepam, rifampin, voriconazole, warfarin: increased levels

Methadone: increased withdrawal symptoms

### Drug classifications

HMG-CoA reductase inhibitors: increased myopathy, rhabdomyolysis

### Drug/herb

St. John's wort: decreased etravirine

## NURSING CONSIDERATIONS

### Assessment

- **HIV:** monitor blood counts q2wk; monitor viral load and CD4 counts during treatment; watch for decreasing granulocytes, Hgb; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required; cholesterol/lipid profile
- Assess symptoms of HIV and for possible infections; increased temp

- **Monitor for fatal hypersensitivity reactions:** fever, rash, nausea, vomiting, fatigue, cough, dyspnea, diarrhea, abdominal discomfort; treatment should be discontinued and not restarted; incidence of rash may be worse in women
- **Assess blood dyscrasias (anemia, granulocytopenia):** bruising, fatigue, bleeding, poor healing
- **Renal failure:** monitor renal studies: BUN, serum uric acid, CCr before, during therapy; these may be elevated throughout treatment
- Monitor hepatic studies before, during therapy: bilirubin, AST, ALT, amylase, alk phos, creatine phosphokinase, creatinine, qmo
- **Pregnancy/breastfeeding:** Use only if benefits outweigh risks, enroll pregnant patients in the Antiretroviral Pregnancy Registry 800-258-4263, do not breastfeed

### Patient/family education

- Inform patient that product is not a cure but will control symptoms; patient is still infective, may pass AIDS virus on to others
- Instruct patient to notify prescriber of sore throat, swollen lymph nodes, malaise, fever; other infections may occur; to stop product and notify prescriber immediately if skin rash, fever, cough, shortness of breath, GI symptoms occur; advise all health care providers that allergic reaction has occurred with etravirine
- Advise patient that follow-up visits must be continued since serious toxicity may occur; blood counts must be done
- Instruct patient to use contraception during treatment; still able to transmit disease
- Give patient Medication Guide and Warning Card, discuss points on guide
- Inform patient that other products may be necessary to prevent other infections
- Advise patient to take medication following a meal

### Evaluation

**Positive therapeutic outcome**

- Increased CD4 count, decreased viral load

**⚠ HIGH ALERT**

## everolimus (Rx)

(e-ve-ro'li-mus)

**Afinitor, Afinitor Disperz, Zortress**

*Func. class.:* Antineoplastic (miscellaneous)

*Chem. class.:* Kinase inhibitor

**Do not confuse:** everolimus/sirolimus/tacrolimus/temsirolimus

**ACTION:** Proliferation signal inhibitor that inhibits mammalian target of rapamycin (mTOR); this pathway is dysregulated in cancer

**USES:** Renal cell cancer in those with failed treatment with suritinib or sorafenib or SUNItinib, kidney transplant rejection prophylaxis with cycloSPORINE, subependymal giant cell astrocytoma, progressive pancreatic neuroendocrine tumor (PNET) with unresectable locally advanced metastatic disease, renal angiomyolipoma, tuberous sclerosis complex, breast cancer hormone receptor positive/HER-2 negative, liver transplant rejection prophylaxis

**Therapeutic outcome:** Decreasing tumor size, decreasing spread of malignancy

## CONTRAINDICATIONS

Breastfeeding; hypersensitivity to this product, Rapamune, and Torisel; pregnancy

**Precautions:** Children, renal/hepatic disease, diabetes mellitus, infection, hyperlipidemia, pleural effusion

**BLACK BOX WARNING:** Immunosuppression, infection, renal artery thrombosis, renal impairment, renal vein thrombosis, neoplastic disease, heart transplant

## DOSAGE AND ROUTES

### Kidney transplant rejection prophylaxis (Zortress)

**Adult:** PO 0.75 mg q12hr with cycloSPORINE in combination with basiliximab corticosteroids, reduced doses of cycloSPORINE

### Liver transplant rejection prophylaxis

**Adult:** PO 1 mg bid starting at least 30 days after transplant in combination with reduced-dose tacrolimus and corticosteroids

### Advanced renal cancer (Afinitor)

**Adult:** PO 10 mg qd as long as clinically beneficial; with strong CYP3A4 inducers 10 mg qd, may increase by 5-mg increments to 20 mg qd

### Progressive neuroendocrine tumor (PNET) (Afinitor only)

**Adult:** PO 10 mg/day, reduce dose to 5 mg/day if intolerable adverse reactions occur

### Subependymal giant cell astrocytoma (SEGA) (Afinitor only)

**Adult/adolescent/child ≥3 yr:** PO 4.5 mg/m$^2$, titrate to target trough level of 5-15 ng/ml

### For the treatment of patients with advanced renal cell cancer (RCC):

- For the treatment of patients with advanced renal cell cancer who have failed treatment with SUNItinib or SORAfenib:

**Oral dosage:**
**Adults:** 10 mg orally once daily. Continue treatment for as long as clinical benefit is observed or until unacceptable toxicity develops. Severe or intolerable adverse reactions may require temporary dose reduction and/or interruption of Afinitor. Dose adjustment is necessary if Afinitor is coadministered with some CYP3A4 inhibitors or inducers. Avoid concomitant use with strong CYP3A4 inhibitors

### For the treatment of advanced renal cell cancer (RCC) in combination with lenvatinib, after one previous antiangiogenic therapy:

**Oral dosage:**
**Adult:** 5 mg PO once daily in combination with lenvatinib 18 mg PO once daily; continue until disease progression or unacceptable toxicity. In a multicenter, open-label, phase II clinical trial, patients with advanced or metastatic RCC who had received prior antiangiogenic therapy were randomized to treatment with lenvatinib plus everolimus (combination therapy, $n = 51$) or everolimus monotherapy (10 mg per day, $n = 50$). The primary outcome of investigator-assessed median progression-free survival (PFS) was significantly improved in patients receiving combination therapy compared with everolimus monotherapy (14.6 mo vs. 5.5 mo; HR 0.37; 95% CI, 0.22–0.62); this was supported by a retrospective independent review of radiographs with an observed hazard ratio of 0.43 (95% CI, 0.24–0.75). Additionally, the median overall survival was 25.5 mo with combination therapy compared with 15.4 mo in patients treated with everolimus monotherapy (HR 0.67; 95% CI, 0.42–1.08), and the objective response rate was 37% versus 6%, respectively; all but one response (in a patient who received combination therapy) were partial responses

### For kidney transplant rejection prophylaxis in patients at low–moderate immunologic risk:

NOTE: The safety and efficacy of everolimus have not been established in patients at high immunologic risk
**Oral dosage (Zortress only):**
NOTE: Everolimus is FDA-approved for use with cycloSPORINE, USP modified formulation only; everolimus has not been evaluated in clinical trials with other formulations of cycloSPORINE. cycloSPORINE, USP modified is to be administered as oral capsules twice daily unless cycloSPORINE oral solution or intravenous administration cannot be avoided. cycloSPORINE and everolimus interact, so both the cycloSPORINE dose and the target range for whole blood trough concentrations are to be reduced when cycloSPORINE is given with everolimus. Avoid standard doses of cycloSPORINE with everolimus to reduce the risk of nephrotoxicity.
**Adult:** Initially, 0.75 mg PO every 12 hr (1.5 mg per day) in combination with basiliximab induction and concurrently with reduced doses of cycloSPORINE, USP modified and corticosteroids; administer as soon as possible after transplantation. Therapeutic drug monitoring of everolimus and cycloSPORINE is recommended for all patients. If needed, adjust everolimus dose at 4- to 5-day intervals. The everolimus dose may need adjustment based on blood concentrations, tolerability, individual response, concomitant medication change, or clinical situation. Initiate cycloSPORINE as soon as possible and no later than 48 hr after reperfusion of the graft, and adjust the cycloSPORINE dose to target whole blood trough concentrations from day 5 onward. In a clinical trial, the mean cycloSPORINE starting dose was 5.2 mg/kg per day. Initiate oral prednisone once oral medication is tolerated. According to guidelines, use of everolimus in combination with cycloSPORINE is effective in preventing rejection but is associated with enhanced nephrotoxicity and inferior outcomes, so significant reduction in the cycloSPORINE dosage is advised. If everolimus is used, guidelines recommend that it should not be started until graft function is established and surgical wounds are healed

### For the treatment of subependymal giant cell astrocytoma (SEGA) associated with tuberous sclerosis complex (TSC) in patients who require therapeutic intervention but are not candidates for curative surgical resection:

**Oral dosage (Afinitor only):**
**Adult, adolescent, and Children:** 4.5 mg/m$^2$ PO daily initially, then titrate dose to achieve a target trough level of 5 to 15 ng/ml. Continue therapy until disease progression or unacceptable toxicity; the optimal duration of therapy is unknown. Round dose to nearest strength of either Afinitor tablet or Afinitor DISPERZ. Adjust dose at 2-wk intervals based on trough concentrations, tolerability, clinical response, and concomitant drug changes. Severe or intolerable adverse reactions may require temporary dose reduction and/or interruption of Afinitor. Dose adjustment is necessary if Afinitor is coadministered with some CYP3A4 or P-glycoprotein (P-gp) inhibitors or inducers. Avoid concomitant use with strong CYP3A4 and/or P-gp inhibitors. Treatment with everolimus (median dose intensity, 5.9 mg/m2 per day; median duration of

therapy, 41.9 wk) resulted in a significantly improved subependymal giant cell astrocytoma (SEGA) response rate compared with placebo (35% vs. 0%; $p < .0001$) in patients with progressive SEGA associated with tuberous sclerosis complex (TSC) in a multinational, randomized, double-blind, placebo-controlled, phase III trial (the EXIST-1 trial; $n = 117$). Patients aged 0 to 65 years were eligible for study enrollment, and all patients had two or more main features of TSC; the median age in 78 patients who received everolimus was 9.5 yr (range, 1–23.9 years). A SEGA response rate was defined as at least a 50% total volume reduction from baseline in all target SEGA without evidence of 1) worsening nontarget SEGA, 2) new lesions (1 cm or greater in diameter), or 3) new or worsening hydrocephalus; confirmation of response was required 8 to 12 wk later. At a median follow-up time of 9.7 mo, the estimated 6-mo progression-free rate was significantly improved with everolimus therapy (100% vs. 86%; $p = .0002$). After 24 weeks of treatment, the median seizure frequency per 24 hr was unchanged from baseline with either everolimus or placebo. At a median follow-up time of 3.9 yr (range, 0.2–4.9 yr), the SEGA response rate was 57.7% and the median time to response was 5.3 mo (range, 2.5–33.1 mo) in patients who received everolimus on study or after crossing over from the placebo group (median duration of therapy 3.9 yr). Treatment with everolimus (3 mg/m2 per day PO initially, then titrated to trough concentrations of 5–15 ng/ml) led to a significant reduction in SEGA volume from baseline ($p < .001$) and seizure frequency ($p = .02$) at 6 mo compared with baseline in 28 patients (median age, 11 yr; range, 3–34 yr) with SEGA associated with TSC in a phase I–II study. At 6 mo, the median dose of everolimus was 5.6 mg/$m^2$ per day (range, 1.5–10.5 mg/$m^2$ per day). Additionally, a SEGA volume reduction of 30% or greater was achieved in 75% of patients and of 50% or greater was achieved in 32% of patients. At 60 mo, a SEGA volume reduction of 30% or greater and of 50% or greater occurred in 60.9% and 52.2% of patients, respectively, who received everolimus (median duration of therapy, 67.8 mo; range, 4.7–83.2 mo) in an extension trial ($n = 23$). At 60 mo, daily seizures were reported in 11.1% of patients who received everolimus compared with 26.9% of patients at baseline

### For the treatment of patients with unresectable, locally advanced, or metastatic neuroendocrine tumor (NET) or carcinoid tumors:

• For the treatment of progressive neuroendocrine tumor (NET) of pancreatic origin (also known as PNET) in patients with unresectable, locally advanced, or metastatic disease:

**Oral dosage:**

**Adult:** 10 mg PO once daily. Continue treatment for as long as clinical benefit is observed or until unacceptable toxicity develops. Severe or intolerable adverse reactions may require temporary dose reduction and/or interruption of Afinitor. Dose adjustment is necessary if Afinitor is coadministered with some CYP3A4 inhibitors or inducers. Avoid concomitant use with strong CYP3A4 inhibitors. In a multicenter, randomized, double-blind, placebo-controlled clinical trial of patients with locally advanced or metastatic advanced pancreatic neuroendocrine tumors (PNET) and disease progression within the prior 12 mo, treatment with everolimus ($n = 207$) significantly improved both investigator-assessed, progression-free survival (PFS) (investigator-assessed, 11 mo vs. 4.6 mo; HR 0.35; $p < .001$) and PFS by central review (13.7 mo vs. 5.7 mo; HR 0.38; $p < .001$) compared with placebo ($n = 203$). Overall survival was not significantly different between study arms (HR 0.94; $p = .3$); however, 85% of patients treated with placebo crossed over to receive everolimus after radiologic progression

### For the treatment of progressive, well-differentiated, nonfunctional neuroendocrine tumor (NET) of gastrointestinal or lung origin (also known as carcinoid) in patients with unresectable, locally advanced, or metastatic disease:

NOTE: Everolimus is not indicated for the treatment of patients with functional carcinoid tumors

**Oral dosage:**

**Adult:** 10 mg PO once daily. Continue treatment for as long as clinical benefit is observed or until unacceptable toxicity develops. Severe or intolerable adverse reactions may require temporary dose reduction and/or interruption of Afinitor. Dose adjustment is necessary if Afinitor is coadministered with some CYP3A4 inhibitors or inducers. Avoid concomitant use with strong CYP3A4 inhibitors. In a multicenter, randomized, double-blind, placebo-controlled clinical trial of patients with unresectable, locally advanced or metastatic, well differentiated, nonfunctional neuroendocrine tumors (NET) of gastrointestinal (excluding pancreatic) or lung origin and disease progression within the prior 6 mo, treatment with everolimus ($n = 205$) significantly improved progression-free survival (PFS) per independent radiological review (11 vs. 3.9 mo; HR 0.48; $p < .001$); the overall response rate was 2% in patients treated with Afinitor compared with 1% of those who received placebo. At

the time of the planned interim analysis, there was not a significant difference in overall survival (OS). Everolimus is not indicated for the treatment of patients with functional carcinoid tumors. In a multicenter, randomized, double-blind, placebo-controlled clinical trial, patients with advanced or metastatic functional carcinoid tumors were treated with depot octreotide in combination with Afinitor ($n$ = 429) or placebo; 67% of patients in the placebo group crossed over to receive Afinitor after progression. Combination therapy with Afinitor and depot octreotide did not improve PFS (primary outcome), and overall survival was better in patients who were treated with octreotide alone

## For the treatment of breast cancer:

### • For the treatment of hormone receptor–positive, HER2-negative advanced breast cancer in postmenopausal women who have failed treatment with letrozole or anastrozole in combination with exemestane

**Oral dosage (Afinitor only):**

**Postmenopausal females:** 10 mg PO once daily in combination with exemestane. Continue treatment for as long as clinical benefit is observed or until unacceptable toxicity develops. Severe or intolerable adverse reactions may require temporary dose reduction and/or interruption of Afinitor. Dose adjustment is necessary if Afinitor is coadministered with some CYP3A4 inhibitors or inducers. Avoid concomitant use with strong CYP3A4 inhibitors. Everolimus 10 mg/day PO (median duration, 14.6 wk) plus exemestane 25 mg/day PO (median duration, 17.4 wk) or placebo plus exemestane was evaluated in 724 postmenopausal women with estrogen receptor–positive, human epidermal growth factor receptor 2–negative metastatic or locally advanced breast cancer refractory to letrozole or anastrozole in a randomized, double-blind, phase III trial (the BOLERO-2 trial). The primary endpoint of investigator-assessed median progression-free survival (PFS) was significantly improved with everolimus plus exemestane compared with exemestane only (7.8 vs. 3.2 mo; hazard ratio [HR] = 0.45; p < .0001); median PFS based on central assessment was 11 vs. 4.1 mo (HR = 0.38; p < .0001). At a median follow-up time of 39.3 mo, median overall survival was 31 mo in patients treated with combination therapy compared with 26.6 mo in those who received exemestane alone

### For the treatment of hormone receptor–positive, HER2-negative metastatic breast cancer in postmenopausal women with secondary aromatase inhibitor resistance in combination with tamoxifen

**Oral dosage:**

**Postmenopausal females:** 10 mg PO once daily plus tamoxifen 20 mg PO once daily until disease progression or unacceptable toxicity results in significantly improved clinical benefit rate (primary endpoint, 61.1% vs. 42.1%; p = .045), time to progression (TTP) (7.6 vs. 4.5 mo; p = .0021), and overall survival (OS) (16 vs. 31 events; hazard ratio = 0.45; 95% CI, 0.24 to 0.81; p = .007) compared with tamoxifen alone (median follow-up, 24 mo) in a randomized, phase II study in 111 postmenopausal women with estrogen receptor–positive, human epidermal growth factor receptor 2–negative metastatic breast cancer and primary or secondary aromatase inhibitor resistance. No crossover was permitted. Primary hormone resistance was defined as relapse during adjuvant aromatase inhibitor (AI) therapy or disease progression within 6 mo of starting AI therapy for metastatic disease, and secondary hormone resistance was defined as relapse later than 6 mo or a previous response and subsequent progression after starting AI therapy for metastatic disease. In exploratory analyses, a statistically significant TTP and OS benefit was observed with combination therapy in women with secondary resistance (TTP: 14.8 vs. 5.5 mo, p = .0087; OS: 4 vs. 16 events, p = .002) but not primary resistance (TTP: 5.4 vs. 3.8 mo; OS: 12 vs. 15 events). A higher incidence of grade 3 and 4 stomatitis and anorexia was reported in the everolimus plus tamoxifen arm; 22% of patients in the combination therapy arm and 7% of patients in the tamoxifen alone arm discontinued treatment due to adverse events

### For the treatment of HER2-positive, trastuzumab-resistant, advanced breast cancer in patients previously treated with a taxane in combination with vinorelbine and trastuzumab:

**Oral dosage:**

**Adult:** 5 mg PO once daily plus vinorelbine 25 mg/m2 IV weekly and trastuzumab 4 mg/kg IV once followed by 2 mg/kg IV weekly until disease progression or unacceptable toxicity

### For the treatment of renal angiomyolipoma and tuberous sclerosis complex not requiring immediate surgery:

**Oral dosage (Afinitor only):**

**Adult:** 10 mg orally once daily. Continue treatment for as long as clinical benefit is observed or until unacceptable toxicity develops. Severe or intolerable adverse reactions may require temporary dose reduction and/or interruption of Afinitor. Dose adjustment is necessary if Afinitor is coadministered with some CYP3A4 inhibitors or inducers. Avoid concomitant use with strong CYP3A4 inhibitors. The confirmed response rate was 42% with everolimus therapy (median treatment duration, 38 wk) compared with 0% with placebo ($p < .0001$) in a randomized, double-blind, phase III trial in adult patients with renal angiomyolipoma as a feature of tuberous sclerosis complex ($n = 113$) or sporadic lymphangioleiomyomatosis ($n = 5$). Response was defined as a reduction in angiomyolipoma volume of 50% or more relative to baseline and absence of angiomyolipoma progression. The median time to response in the everolimus arm was 2.9 mo; all responses lasted between 10 and 85 wk. The median time to progression was not reached in the everolimus arm and was 11.4 mo in the placebo arm. Additionally, the 6-mo progression-free rates were 98% and 83% in the everolimus and placebo arms, respectively; the 12-mo progression-free rates were 92% and 25%, respectively

### For liver transplant rejection prophylaxis:

**Oral dosage:**

**Adult:** Initially, 1 mg PO twice daily started at least 30 days after transplantation in combination with reduced-dose tacrolimus and corticosteroids. Steroid doses may be further tapered based on the patient's clinical status and graft function. Therapeutic drug monitoring of everolimus and tacrolimus is recommended. In a trial, patients received tacrolimus plus corticosteroids with or without mycophenolate mofetil for the first 30 days and then tacrolimus (target trough concentration 3 to 5 ng/ml) and everolimus (target trough concentration 3 to 8 ng/ml) plus corticosteroids

### For the treatment of relapsed or refractory Waldenstrom macroglobulinemia:

**Oral dosage:**

**Adult:** 10 mg PO daily was evaluated in a single-arm, phase II trial (n = 60; the RAD001 trial). Each cycle consisted of 4 wk of treatment. Patients with stable disease or better after 6 cycles continued treatment per physician discretion until progression or unacceptable toxicity

### Therapeutic drug monitoring:

**Monitoring serum concentrations:**

• ***Zortress for kidney or liver transplant rejection prophylaxis:*** Guidelines suggest monitoring everolimus concentrations; a trough concentration is probably adequate. According to the manufacturer, routine everolimus whole blood therapeutic drug concentration monitoring is recommended for all patients who take everolimus for kidney or liver transplant rejection prophylaxis. The recommended everolimus therapeutic range is 3 to 8 ng/ml, based on the liquid chromatography mass spectrometry (LCMSMS) assay method used in clinical studies. Either the LCMSMS assay or immunoassay methods may be used to evaluate whole blood everolimus concentrations; however, these values may vary depending on the assay used and may not be interchangeable. Optimally, base everolimus dose adjustments on trough concentrations obtained 4 or 5 days after a previous dosing change. If the trough concentration is below 3 ng/ml, double the total daily dose of everolimus using the available tablet strengths; if the trough concentration is greater than 8 ng/ml on two consecutive measures, decrease the dose of everolimus by 0.25 mg twice daily. For liver transplant patients, ensure that the steady-state everolimus whole blood trough concentration is at least 3 ng/ml before reducing the tacrolimus dose. The recommended tacrolimus whole blood trough concentrations are 3 to 5 ng/ml by 3 wk after the first everolimus dose (approximately month 2) and through month 12 after transplantation. Limited data exist regarding dosing everolimus with tacrolimus trough concentrations of 3 to 5 ng/ml after 12 mo. For renal transplant patients, if impairment of renal function is progressive, adjust the treatment regimen. Ensure that the steady-state everolimus whole blood trough concentration is at least 3 ng/ml before reducing the cycloSPORINE dose. The recommended cycloSPORINE therapeutic range when administered with everolimus is 100 to 200 ng/ml through the first month after transplantation, 75 to 150 ng/ml during months 2 and 3 after transplantation, 50 to 100 ng/ml during month 4 after transplantation, and 25 to 50 ng/ml during months 6 through 12 after transplantation. Limited data exist regarding dosing everolimus with cycloSPORINE trough concentrations of 25 to 50 ng/ml after 12 mo. Also, monitor everolimus blood concentrations in **patients with hepatic impairment**, during concomitant administration of CYP3A4 inducers or inhibitors, when switching cycloSPORINE formulations, and/or when cycloSPORINE dosing is reduced according to recommended target

concentrations; everolimus concentrations may decrease if cycloSPORINE exposure is reduced. In addition to drug concentrations, carefully consider clinical signs and symptoms, tissue biopsies, and laboratory parameters

• ***Afinitor for subependymal giant cell astrocytoma (SEGA) with tuberous sclerosis complex (TSC):*** Routine everolimus whole blood therapeutic drug concentration monitoring is recommended for all patients; use the same assay and laboratory whenever possible. Determine everolimus trough concentrations approximately 2 wk after starting treatment. Titrate the dose to obtain trough concentrations of 5 to 15 ng/ml. Reduce the daily dose by 2.5 mg (Afinitor tablets) or 2 mg (Afinitor DISPERZ) if the trough concentrations are greater than 15 ng/ml. If dose reduction is required for patients receiving the lowest available strength, use alternate-day dosing. If the trough concentration is less than 5 ng/ml, increase the daily dose by 2.5 mg (Afinitor tablets) or 2 mg (Afinitor DISPERZ). Assess trough concentrations approximately 2 wk after any change in dose, after an initiation or change in coadministration of CYP3A4 and/or P-glycoprotein inducers or inhibitors, after any hepatic status change, or after a change in dosage form (e.g., Afinitor tablets to Afinitor DISPERZ). After a stable dose is obtained, monitor trough concentrations every 6 to 12 mo in patients with stable body surface area (BSA) or every 3 to 6 mo in patients with changing BSA

## Afinitor dosage guidance in patients on CYP3A4 and/or P-glycoprotein (P-gp) inducers/inhibitors

### Advanced hormone receptor–positive, HER2-negative breast cancer, advanced renal cell cancer, pancreatic neuroendocrine tumors, or renal angiomyolipoma with tuberous sclerosis complex

• *Strong CYP3A4 and/or P-gp inducers:* Avoid coadministration if possible. If a strong CYP3A4 is required, 10 mg PO once daily initially then consider increasing the dose by 5-mg increments up to 20 mg PO once daily. If the strong 3A4 inducer is discontinued, consider a washout period of 3 to 5 days and then resume the everolimus dose used before the initiation of the strong 3A4 inducer. NOTE: Dosage adjustment is based on pharmacokinetic data; no clinical data are available with this dosage adjustment

• *Strong CYP3A4 and/or P-gp inhibitors:* Avoid concomitant use

• *Moderate CYP3A4 and/or P-gp inhibitors:* Reduce the dose to 2.5 mg PO daily. A dose increase to 5 mg PO daily may be considered based on patient tolerance. If the moderate inhibitor is discontinued, allow a 2- to 3-day washout period before increasing the Afinitor dose; restart the Afinitor dose used before the initiation of the moderate CYP3A4 and/or P-gp inhibitor

### Subependymal giant cell astrocytoma with tuberous sclerosis complex

• *Strong CYP3A4 and/or P-gp inducers:* Avoid concomitant use if alternative therapy is available. If a concomitant strong CYP3A4 inducer is required, double the Afinitor dose or initiate Afinitor at 9 mg/m$^2$ PO once daily (round dose to nearest strength of either Afinitor tablet or Afinitor DISPERZ). Individualize subsequent dosing based on therapeutic drug monitoring. Assess trough concentrations approximately 2 wk after an initiation or change in coadministration with a CYP3A4 inducer and titrate dose to achieve/maintain trough levels of 5 to 15 ng/ml. If the strong CYP3A4 inducer is discontinued, adjust the everolimus dose to the one used before initiation of the CYP3A4 inducer and assess the everolimus trough concentration approximately 2 wk later

• *Strong CYP3A4 and/or P-gp inhibitors:* Avoid concomitant use

• *Moderate CYP3A4 and/or P-gp inhibitors:* Reduce the Afinitor dose by 50% or initiate Afinitor at 2.5 mg/m2 PO once daily (round dose to nearest strength of either Afinitor tablet or Afinitor DISPERZ). Individualize subsequent dosing based on therapeutic drug monitoring. Assess trough concentrations approximately 2 wk after an initiation or change in coadministration with a CYP3A4 inhibitor and titrate dose to achieve/maintain trough levels of 5 to 15 ng/ml. If the moderate inhibitor is discontinued, adjust the everolimus dose in 2 to 3 days to the one used before initiation of the moderate CYP3A4 and/or P-gp inhibitor and assess the everolimus trough concentration approximately 2 wk later

## Afinitor dosage adjustments due to treatment-related toxicity:

NOTE: Reduce dose to approximately 50% of the previous dose if a dose reduction is required due to severe or intolerable adverse reactions. In patients with SEGA with TSC, consider alternate-day dosing if a dose reduction is needed in a patient receiving the lowest available strength

### Noninfectious pneumonitis

• *Grade 1, asymptomatic with radiographic findings only:* No dose adjustment required

• *Grade 2, symptomatic but no interference with activities of daily living (ADL):* Consider withholding therapy. Resume Afinitor at a lower

dose when symptoms improve to grade 1 or less; discontinue Afinitor if symptoms do not improve within 4 wk
• *Grade 3, symptomatic and interfering with ADL and oxygen therapy indicated:* Hold therapy. Consider resuming Afinitor at a lower dose when symptoms improve to grade 1 or less. Consider discontinuing Afinitor if grade 3 toxicity recurs
• *Grade 4, life threatening and ventilator support indicated:* Discontinue Afinitor therapy

***Stomatitis***
• *Grade 1, minimum symptoms and normal diet:* No dose adjustment required
• *Grade 2, symptomatic but can eat and swallow modified diet:* Hold therapy until symptoms improve to grade 1 or less, and resume Afinitor at the same dose. If grade 2 toxicity recurs, hold therapy and resume Afinitor at a lower dose when symptoms improve to grade 1 or less
• *Grade 3, symptomatic and unable to adequately eat or hydrate orally:* Hold therapy. Resume Afinitor at a lower dose when symptoms improve to grade 1 or less
• *Grade 4, symptomatic and life threatening:* Discontinue Afinitor therapy

**Other nonhematologic toxicity (excluding metabolic events)**
• *Grade 1:* No dose adjustment required if toxicity is tolerable
• *Grade 2:* No dose adjustment required if toxicity is tolerable. If toxicity is intolerable, hold therapy until symptoms improve to grade 1 or less, and resume Afinitor at the same dose. If grade 2 toxicity recurs, hold therapy and resume Afinitor at a lower dose when symptoms improve to grade 1 or less
• *Grade 3:* Hold therapy. Consider resuming Afinitor at a lower dose when symptoms improve to grade 1 or less. If grade 3 toxicity recurs, consider discontinuing therapy
• *Grade 4:* Discontinue Afinitor therapy

**Metabolic events (e.g., hyperglycemia, dyslipidemia)**
• *Grade 1 or 2:* No dose adjustment required
• *Grade 3:* Temporarily withhold therapy. Resume Afinitor at a lower dose
• *Grade 4:* Discontinue Afinitor therapy

## Maximum dosage limits

• Adult *Zortress:* Maximum dosage is based on everolimus trough concentrations (target of 3–8 ng/ml) *Afinitor:* 10 mg per day for advanced hormone receptor–positive breast cancer, advanced renal cell carcinoma, and renal angiomyolipoma with tuberous sclerosis complex (TSC); maximum dosage is based on everolimus trough concentrations (target of 5–15 ng/ml) for the treatment of subependymal giant cell astrocytoma (SEGA) associated with TSC
• Geriatric *Zortress:* Maximum dosage is based on everolimus trough concentrations (target of 3–8 ng/ml) *Afinitor:* 10 mg per day for advanced hormone receptor–positive breast cancer, advanced renal cell carcinoma, and renal angiomyolipoma with tuberous sclerosis complex (TSC); maximum dosage is based on everolimus trough concentrations (target of 5–15 ng/ml) for the treatment of subependymal giant cell astrocytoma (SEGA) associated with TSC
• Adolescent *Zortress:* Safety and efficacy have not been established *Afinitor:* Maximum dosage is based on everolimus trough concentrations (target of 5–15 ng/ml) for the treatment of subependymal giant cell astrocytoma (SEGA) associated with tuberous sclerosis complex (TSC). Safety and efficacy for other indications have not been established
• Children *Zortress:* Safety and efficacy have not been established *Afinitor (1 year or older):* Maximum dosage is based on everolimus trough concentrations (target of 5–15 ng/ml) for the treatment of subependymal giant cell astrocytoma (SEGA) associated with tuberous sclerosis complex (TSC). Safety and efficacy for other indications or patients less than 1 year of age have not been established
• Infant Safety and efficacy have not been established
• Neonate Safety and efficacy have not been established

## Patients with hepatic impairment dosing

**Advanced hormone receptor–positive, HER2-negative breast cancer, advanced renal cell cancer, pancreatic neuroendocrine tumors, or renal angiomyolipoma with tuberous sclerosis complex**

*Mild hepatic impairment (Child-Pugh class A):* Afinitor 7.5 mg PO once daily; decrease dose to 5 mg PO once daily if not well tolerated

*Moderate hepatic impairment (Child-Pugh class B):* Afinitor 5 mg PO once daily; decrease dose to 2.5 mg PO once daily if not well tolerated

*Severe hepatic impairment (Child-Pugh class C):* Afinitor 2.5 mg PO once daily may be initiated if the benefits of therapy outweigh the risk of toxicity from increased drug exposure; do not increase dose above 2.5 mg/day

## Subependymal giant cell astrocytoma with tuberous sclerosis complex

*Mild or moderate hepatic impairment (Child-Pugh class A or B):* No initial Afinitor dose

adjustment is necessary; however, individualize subsequent dosing based on therapeutic drug monitoring; assess Afinitor levels after 2 wk of a hepatic status change; titrate dose to achieve trough levels of 5 to 15 ng/ml

*Severe hepatic impairment (Child-Pugh class C):* Initiate Afinitor at 2.5 mg/m2 PO once daily (round dose to nearest strength of either Afinitor tablet or Afinitor DISPERZ); individualize subsequent dosing based on therapeutic drug monitoring; assess Afinitor levels after 2 wk and titrate dose to achieve/maintain trough levels of 5 to 15 ng/ml

### Renal and liver transplant rejection prophylaxis

*Mild hepatic impairment (Child-Pugh class A):* Reduce the initial Zortress daily dosage by approximately one third; monitor whole blood trough concentrations and adjust dose as necessary. Dose titration is needed if a patient's whole blood trough concentration as measured by an LC/MS/MS assay is not within the target trough concentration of 3 to 8 ng/ml

*Moderate hepatic impairment (Child-Pugh class B):* Reduce the initial Zortress daily dosage by approximately one half; monitor whole blood trough concentrations and adjust dose as necessary. Dose titration is needed if a patient's whole blood trough concentration as measured by an LC/MS/MS assay is not within the target trough concentration of 3 to 8 ng/ml

*Severe hepatic impairment (Child-Pugh class C):* Reduce the initial Zortress daily dosage by approximately one half; monitor whole blood trough concentrations and adjust dose as necessary. Dose titration is needed if a patient's whole blood trough concentration as measured by an LC/MS/MS assay is not within the target trough concentration of 3 to 8 ng/ml

### Patients with renal impairment dosing

Specific guidelines for dosage adjustments in renal impairment are not available; it appears that no dosage adjustments are needed

### Hepatic dose

**Adult:** PO (Child-Pugh A) Afinitor 7.5 mg/day; (Child-Pugh B) Afinitor 5 mg qd; not to be used in Child-Pugh C

**Available forms:** Tabs 0.25, 0.5, 0.75, 2.5 mg (Zortress); 2.5, 5, 7.5, 10 mg (Afinitor)

### Implementation

- Swallow tabs whole with a full glass of water; do not chew, crush, or break
- Afinitor: take at same time of day, consistently with or without food; if unable to swallow, disperse in 30 ml of water
- Zortress: must take consistently with or without food, give at same time of day q12h with cycloSPORINE
- Follow procedure for proper handling of antineoplastics
- Give all medications PO if possible, avoiding IM inj; bleeding may occur
- Store protected from light, at room temperature

### Afinitor adjustments for toxicity

**Noninfectious pneumonitis**

Grade 1, asymptomatic with radiographic findings only: No dose change

Grade 2, symptomatic but no interference with activities of daily living (ADL): Consider withholding therapy; resume Afinitor at a lower dose when symptoms improve to ≤ grade 1; discontinue Afinitor if symptoms do not improve within 4 wk

Grade 3, symptomatic and interfering with ADL and oxygen therapy indicated: Hold therapy; consider resuming Afinitor at a lower dose when symptoms improve to ≤ grade 1; consider discontinuing Afinitor if grade 3 toxicity recurs

Grade 4, life-threatening and ventilator support indicated: Discontinue therapy

Stomatitis

Grade 1, minimum symptoms and normal diet: No dose adjustment required

Grade 2, symptomatic but can eat and swallow modified diet: Hold therapy until symptoms improve to ≤ grade 1 and resume Afinitor at the same dose; if grade 2 toxicity recurs, hold therapy and resume Afinitor at a lower dose when symptoms improve to ≤ grade 1

Grade 3, symptomatic and unable to adequately eat or hydrate orally: Hold therapy; resume Afinitor at a lower dose when symptoms improve to ≤ grade 1

Grade 4, symptomatic and life-threatening: Discontinue therapy

Other nonhematologic toxicity (excluding metabolic events)

Grade 1: No dose adjustment required if toxicity is tolerable

Grade 2: No dose adjustment required if toxicity is tolerable; if toxicity is intolerable, hold therapy until symptoms improve to ≤ grade 1 and resume Afinitor at the same dose; if grade 2 toxicity recurs, hold therapy and resume Afinitor at a lower dose when symptoms improve to ≤ grade 1

Grade 3: Hold therapy; consider resuming Afinitor at a lower dose when symptoms improve to ≤ grade 1; if grade 3 toxicity recurs, consider discontinuing therapy
Grade 4: Discontinue Afinitor therapy
Metabolic events (hyperglycemia, dyslipidemia)
Grade 1 or 2: No dose adjustment required
Grade 3: Temporarily withhold therapy; resume Afinitor at a lower dose
Grade 4: Discontinue Afinitor therapy

## ADVERSE EFFECTS

**CNS:** *Headache, insomnia, paresthesia, chills,* fever, seizure, personality changes, dizziness
**CV:** *Hypertension, HF, peripheral edema,* chest pain
**EENT:** Blurred vision, photophobia, eyelid edema, epistaxis, sinusitis, cataracts, conjunctivitis
**GI:** Nausea, vomiting, diarrhea, constipation, stomatitis, anorexia, abdominal pain, dysgeusia, noninfectious hepatitis
**GU:** Renal failure, UTI, renal tubular necrosis
**HEMA:** Anemia, leukopenia, thrombocytopenia, hemorrhage
**INTEG:** *Rash, acne,* leukocytoclastic vasculitis
**META:** Hyperglycemia, increased creatinine, *hyperlipemia,* hypophosphatemia, weight loss
**RESP:** Pleural effusion, *dyspnea,* noninfectious pneumonitis, pneumonitis, pulmonary alveolar proteinosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid |
| **Distribution** | Protein binding 74% |
| **Metabolism** | Extensively by CYP3A4 |
| **Excretion** | Feces 80%, urine 5% |
| **Half-life** | 30 hr, reduced by high-fat meal |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Cimetidine, cycloSPORINE, danazol, erythromycin: increased everolimus effect
CarBAMazepine, PHENobarbital, phenytoin, rifamycin, rifapentine

### Drug classifications

**BLACK BOX WARNING:** Immunosuppressants: increased nephrotoxicity

Antifungals, calcium channel blockers, CYP3A4 inhibitors (strong, moderate), HIV-protease inhibitors: increased everolimus effect
Vaccines: decreased effect of these products
Decrease: everolimus effect: CYP3A4 inducers

### Drug/herb

St. John's wort: may decrease the effect of everolimus

### Drug/food

Alters bioavailability; use consistently with or without food; do not use with grapefruit juice

### Drug/lab test

Increased: bilirubin, calcium, cholesterol, glucose, potassium, lipids, phosphate, triglycerides, uric acid
Decreased: calcium, glucose, potassium, magnesium, phosphate

## NURSING CONSIDERATIONS

### Assessment

- Monitor lipid profile: cholesterol, triglycerides, a lipid-lowering agent may be needed; blood glucose

**BLACK BOX WARNING:** Monitor **immunosuppression:** Hgb, WBC, platelets during treatment qmo; if leukocytes $<3000/mm^3$ or platelets $<100{,}000/mm^3$, product should be discontinued or reduced; decreased hemoglobulin level may indicate bone marrow suppression

- Monitor hepatic studies: alk phos, AST, ALT, amylase, bilirubin, and for hepatotoxicity: dark urine, jaundice, itching, light-colored stools; product should be discontinued

**BLACK BOX WARNING:** **Infection:** bacterial/fungal infections can occur and are more common with combination immunosuppression therapy

**BLACK BOX WARNING:** **Renal artery/vein thrombosis (Zortress):** may result in graft loss within 30 days after transplantation

- **Pregnancy/breastfeeding:** Avoid pregnancy by using effective contraception during and up to 2 mo after final dose, report exposure to the National Transplant Pregnancy Registry 877-955-6877, do not breastfeed

### Patient/family education

**BLACK BOX WARNING:** Advise to report fever, rash, severe diarrhea, chills, sore throat, fatigue; serious infections may occur; clay-colored stools, cramping (hepatotoxicity)

- Advise to avoid crowds, persons with known infections to reduce risk of infection
- Teach to use contraception before, during, and 12 wk after product has been discontinued, avoid breastfeeding

• Teach to notify prescriber if pregnancy is planned or suspected
• Advise not to use with grapefruit juice
• Inform to avoid live virus vaccines, that frequent lab tests are required
• Advise to take up to 6 hr after normally scheduled time if dose is missed
• Advise that product may decrease male/female fertility
• Teach that drinking alcohol is not recommended
• Teach patient to take consistently with or without food
• Teach patient to report visual changes, weight gain, edema, shortness of breath, impaired wound healing

### Evaluation

**Positive therapeutic outcome**
• Decreasing size of tumor, decreasing spread of malignancy

## evolocumab (Rx)

(e′-voe-lok′-ue-mab)
**Repatha**
*Func. class.:* Antilipemic

**ACTION:** Binds to low-density lipoproteins, a human monoclonal antibody (IgG1)

**USES:** Heterozygous, familial hypercholesterolemia, atherosclerotic disease

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, latex sensitivity

## DOSAGE AND ROUTES

**Heterozygous familial hypercholesterolemia or primary hyperlipidemia with established clinical atherosclerosis in patients who require additional lowering of LDL-C:**
**Adults: SUBCUT** 140 mg q2wk or 420 mg qmo. If switching dosage regimens, administer the first dose of the new regimen on the next scheduled date of the previous regimen

**Homozygous familial hypercholesterolemia in patients who require additional lowering of LDL-C:**
**Adults and adolescents:** 420 mg qmo

**Available forms:** Auto injector 140 mg/ml, solutions for inj 140 mg/ml

### Implementation

• Visually inspect for particulate matter and discoloration, solution is clear, colorless to pale yellow

**SUBCUT route**
• Prefilled syringe or SureClick autoinjector
• If stored in the refrigerator, warm to room temperature for ≥ 30 min before use. Do not shake
• Give into areas of the abdomen (except for a 2-in area around the umbilicus), thigh, or upper arm that are not tender, bruised, red, or indurated
• To use the 420-mg dose, give 3 injections consecutively within 30 min
• Rotate the site with each inj
• Do not administer with other injectable drugs at the same inj site

**Prefilled syringe administration**
• Do not pick up or pull the prefilled syringe by the plunger rod or gray needle cap. Hold the syringe by the barrel
• Pull the gray needle cap off. It is normal to see a drop of sol at the end of the needle. Do not remove any air bubbles in the syringe
• Pinch the skin inj site to create a firm surface approximately 2 in wide. Hold the pinch, and insert the needle into the skin using a 45- to 90-degree angle
• Push the plunger rod all the way down until the syringe is empty
• When done, release the plunger, and gently lift the syringe off skin

**SureClick autoinjector administration**
• Do not remove the orange cap until you are ready to inject
• Pull the orange cap off
• Stretch (thigh) or pinch (stomach or upper arm) the skin inj site to create a firm surface approximately 2 in wide. Hold the stretch or pinch, and place the autoinjector on the skin at 90 degrees
• Firmly push down onto the skin; when ready to inject, press the gray button. A click should be heard. Keep pushing on the skin and then lift the thumb. The inj could take about 15 sec. The window on the autoinjector will turn from clear to yellow when the inj is complete. A second click may be heard
• Remove the needle that will be automatically covered

## ADVERSE EFFECTS

**CNS:** Memory impairment, confusion
**GI:** Diarrhea
**MISC:** Edema
**MS:** *Myalgia*
**RESP:** Pharyngitis, sinusitis, cough
**SYST:** Infection, antibody formation
**INTEG:** Pruritus, injection-site reaction, erythema, ecchymosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | At steady state 17-20 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3-7 days |

## INTERACTIONS

### Drug/lab test

Increased: LFTs

## NURSING CONSIDERATIONS

### Assessment

• **Hypercholesterolemia:** obtain diet history; monitor fat content, lipid levels (triglycerides, LDL, HDL, total cholesterol), LFTs baseline and periodically during treatment

### Patient/family education

• Teach patient that compliance is needed
• Advise that risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
• Advise patient to notify prescriber if pregnancy suspected, planned, or if breastfeeding
• Teach patient to report confusion, injection-site reactions

### Evaluation

• Positive therapeutic response: Decreased cholesterol, LDL; increased HDL

## exemestane (Rx)

(x-ee-mes′tane)
**Aromasin**
*Func. class.:* Antineoplastic
*Chem. class.:* Aromatase inhibitor

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Advanced breast carcinoma that has not responded to other therapy in estrogen receptor–positive patients (postmenopausal), estrogen receptor-positive early breast cancer that has received tamoxifen

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, premenopausal women

## DOSAGE AND ROUTES

**Adult:** PO 25 mg/day after meals; may need 50 mg/day if taken with a potent CYP3A4 inhibitor

**⚠ HIGH ALERT**

## exenatide (Rx)

(ex-en′a-tide)
**Bydureon, Byetta**
*Func. class.:* Antidiabetic
*Chem. class.:* Incretin mimetic

**ACTION:** Binds and activates known human GLP-1 receptor, mimics natural physiology for self-regulating glycemic control

**Therapeutic outcome:** Decreased polyuria, polydipsia, polyphagia; improved Hgb A1c

**USES:** Type 2 diabetes mellitus given in combination with metformin, sulfonylurea, or a thiazolidinedione, insulin glargine

## CONTRAINDICATIONS

Hypersensitivity

**BLACK BOX WARNING:** Medullary thyroid carcinoma, multiple endocrine neoplasia syndrome type 2 (MEN-2), thyroid cancer

**Precautions:** Pregnancy, geriatric, severe renal/hepatic/GI disease, vitamin D deficiency

## DOSAGE AND ROUTES

**Adult:** SUBCUT 5 mcg bid 1 hr before morning and evening meal; may increase to 10 mcg bid after 1 mo of therapy; ext rel subcut (Bydureon) 2 mg q7 days; ext rel inj 2 mg q7 days

**Available forms:** Inj 5, 10 mcg pen; ext rel powder for susp for inj 2 mg

### Implementation

• Store in refrigerator; unopened pen may be stored at room temperature after opening for up to 30 days

**Subcut route (regular release—Byetta)**

• Give SUBCUT only, do not give **IV**/IM
• Pen needles must be purchased separately and be compatible
• Prime prior to use
• Inject into thigh, abdomen, upper arm

**Subcut route (extended release—Bydureon)**

• Give 1× wk; the dose can be given at any time of day, without regard to meals
• Available as a single dose tray containing a vial of 2 mg, a prefilled syringe delivering 0.65 ml diluent, a vial connector, and two custom needles (23G, 5/16″) specific to this delivery system (one is a spare needle); do not substitute needles or any other components
• Inject immediately after the white/off-white powder is suspended in the diluent and transferred to the syringe

• Inject subcutaneously into the thigh, abdomen, or upper arm; rotate sites to prevent lipodystrophy
• Give 1 hr before meals, approximately 6 hr apart; if patient is NPO, may need to hold dose to prevent hypoglycemia
• Store in refrigerator; unopened pen may be stored at room temperature after opening for up to 30 days
• If added to insulin glargine, insulin detemir, a dosage reduction in these products may be required

## ADVERSE EFFECTS

**CNS:** *Headache*, *dizziness,* jittery feeling, restlessness, weakness
**ENDO:** Hypoglycemia, thyroid hyperplasia
**GI:** Nausea, vomiting, diarrhea, dyspepsia, anorexia, gastroesophageal reflux, weight loss, pancreatitis
**SYST:** Angioedema, anaphylaxis
**INTEG:** Serious injection-site reactions (cellulitis, abscess, skin necrosis)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Glomerular filtration |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Immediate release: 2.1 hr; ext rel: 2 wk |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Acetaminophen: may decrease the effect of acetaminophen
Acetaminophen (elixir), digoxin, lovastatin: decreased action of these products
Alcohol, disopyramide: increased hypoglycemia
Dextrothyroxine, niacin, triamterene: decreased hypoglycemia efficacy
Erythromycin, metoclopramide: do not use with exenatide

### Drug classifications

ACE inhibitors, anabolic steroids, androgens, fibric acid derivatives, sulfonylureas: increased hypoglycemia
Corticosteroids, phenothiazines: increased hyperglycemia
Estrogens, MAOIs, oral contraceptives, progestins, thiazide diuretics: decreased hypoglycemia

## NURSING CONSIDERATIONS

### Assessment

• Monitor fasting blood, glucose, A1c levels, postprandial glucose during treatment to determine diabetes control
• **Pancreatitis:** severe abdominal pain, with/without vomiting; product should be discontinued
• Assess for hypo/hyperglycemic reaction that can occur soon after meals; for severe hypoglycemia give **IV** $D_5W$, then **IV** dextrose solution
• **Anaphylaxis, angioedema:** product should be discontinued immediately
• Assess for nausea, diarrhea, vomiting, ability to tolerate product, may cause dehydration
• **Pregnancy/breastfeeding:** Use only if benefits clearly outweigh risks, if pregnant enroll in the Exenatide Pregnancy Registry 800-633-9081, do not breastfeed

### Patient/family education

• Teach patient symptoms of hypo/hyperglycemia, what to do about each; to have glucagon emergency kit available; to carry a glucose source (candy, sugar cube) to treat hypoglycemia
• Advise patient that product must be continued on daily or weekly basis (ext rel); explain consequences of discontinuing product abruptly
• Teach patient that diabetes is a lifelong illness; product will not cure disease
• Advise patient to carry emergency ID with prescriber and medications
• Advise patient to continue weight control, dietary restrictions, exercise, hygiene
• Inform patient that regular blood glucose monitoring and A1c testing is needed
• Advise patient to notify prescriber if pregnant or intend to become pregnant
• Advise patient to read "Information for the Patient" and "Pen User Manual"; provide education on self-injection
• **Pancreatitis:** if severe abdominal pain with or without vomiting occurs, seek medical attention immediately
• Review injection procedure, to store product in refrigerator, room temperature after first use, discard 30 days after first use, do not freeze, protect from light (Byetta)

### Evaluation

**Positive therapeutic outcome**

• Decrease in polyuria, polydipsia, polyphagia, clear sensorium; improved A1c, weight; absence of dizziness, stable gait

## ezetimibe (Rx)

(ehz-eh-tim′bee)
**Ezetrol, Zetia**
*Func. class.:* Antilipemic

**ACTION:** Inhibits absorption of cholesterol by the small intestine

**Therapeutic outcome:** Decreased cholesterol levels

**USES:** Hypercholesterolemia, homozygous familial hypercholesterolemia (HoFH), homozygous sitosterolemia

## CONTRAINDICATIONS

Hypersensitivity, severe hepatic disease

**Precautions:** Pregnancy, breastfeeding, children, hepatic disease

## DOSAGE AND ROUTES

**Adult: PO** 10 mg/day; may be given with HMG-CoA reductase inhibitor at same time; may be given with bile acid sequestrant; give ezetimibe 2 hr before or 4 hr after the bile acid sequestrant

**Available forms:** Tabs 10 mg

### Implementation

- Give without regard to meals

## ADVERSE EFFECTS

**CNS:** Fatigue, dizziness, headache
**GI:** Diarrhea, abdominal pain
**MISC:** Chest pain
**MS:** *Myalgias, arthralgias,* back pain, myopathy, rhabdomyolysis
**RESP:** Pharyngitis, sinusitis, cough, URI
**EENT:** Sinusitis, nasopharyngitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Small intestine, liver |
| **Excretion** | Urine (11%), feces (78%) |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Cholestyramine: decreased ezetimibe action
CycloSPORINE: increased action of ezetimibe

### Drug classifications

Antacids: decreased action of ezetimibe
Fibric acid derivatives, bile acid sequestrants: increased ezetimibe action

### Drug/lab test

Increase: LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Hypercholesterolemia:** obtain diet history; monitor fat content, lipid levels (triglycerides, LDL, HDL, total cholesterol), LFTs baseline and periodically during treatment
- **Myopathy/rhabdomyolysis:** monitor for increased CPK; myalgia, muscle cramps, musculoskeletal pain, lethargy, fatigue, fever; more common when combined with statins
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Teach patient that compliance is needed
- Advise that risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
- Advise patient to notify prescriber if pregnancy is suspected or planned or if breastfeeding
- Advise patient to notify prescriber if unexplained weakness, or muscle pain is present
- Teach patient to notify prescriber of dietary/herbal supplements

### Evaluation

**Positive therapeutic outcome**

- Decreased cholesterol

## famciclovir (Rx)

(fam-sye-klo'vir)
**Famvir**
*Func. class.:* Antiviral
*Chem. class.:* Guanosine nucleoside

**ACTION:** Inhibits DNA polymerase and viral DNA synthesis by conversion of this guanosine nucleoside to penciclovir

**Therapeutic outcome:** Decreasing size and number of lesions

**USES:** Treatment of acute herpes zoster (shingles), genital herpes, recurrent mucocutaneous herpes simplex virus (HSV) in HIV patients, initial episodes of herpes genitalis, herpes labialis in the immunocompromised

## CONTRAINDICATIONS

Hypersensitivity to this product, penciclovir, acyclovir, ganciclovir, valacyclovir, or valganciclovir

**Precautions:** Pregnancy, breastfeeding, renal disease, lactose intolerance

## DOSAGE AND ROUTES

### Herpes zoster

**Adult:** PO 500 mg q8hr × 7 days

### Renal dose

**Adult:** PO; 40-59 ml/min 500 mg q12hr; 20-39 ml/min 500 mg q24hr; CCr <20 ml/min 250 mg q24hr

### Suppression of recurrent Herpes simplex virus, including recurrent herpes genitalis and herpes labialis

**Adult:** PO 250 mg q12hr up to 1 yr

**Renal impairment: Recurrent herpes labialis:** CCr 60 ml/min or greater, usual dose; CCr 40 to 59 ml/min, 750 mg as a single dose; CCr 20 to 39 ml/min, 500 mg as single dose; CCr less than 20 ml/min, 250 mg as a single dose; hemodialysis, 250 mg as a single dose after dialysis

**Renal impairment: Recurrent orolabial or genital herpes in HIV-infected patients:** CCr 40 ml/min or greater, usual dose; CCr 20 to 39 ml/min, 500 mg every 24 hr; CCr less than 20 l/min, 250 mg every 24 hr; hemodialysis, 250 mg after each dialysis

### Recurrent genital herpes

**Adult:** PO 1000 mg bid in a single dose

### Renal dose

**Adult:** PO CCr 40-59 ml/min 500 mg q12hr × 1 day; CCr 20-39 ml/min 500 mg as a single dose; CCr <20 ml/min 250 mg as a single dose

### Suppression of recurrent genital herpes

**Adult:** PO 250 mg bid for up to a year

### Renal dose

**Adult:** PO CCr 20-39 ml/min 125 mg q12hr; CCr <20 ml/min 125 mg q24hr

### Herpes genitalis initial episodes

**Adult:** PO 250 mg tid × 7-10 days

**Available forms:** Tabs 125, 250, 500 mg

### Implementation

- Give with or without meals; absorption does not appear to be lowered when taken with food
- Give within 72 hr of the appearance of rash in herpes zoster

## ADVERSE EFFECTS

**CNS:** *Headache, fatigue, dizziness,* paresthesia, somnolence, fever
**GI:** Nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia
**GU:** Decreased sperm count
**INTEG:** *Pruritus*
**MS:** Back pain, arthralgia
**RESP:** Pharyngitis, sinusitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed, 77% |
| **Distribution** | Protein binding 20% |
| **Metabolism** | Intestinal tissue, blood, liver |
| **Excretion** | Breast milk, kidney, bile |
| **Half-life** | Terminal 2-3 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr |
| **Duration** | 12 hrs |

## INTERACTIONS

### Individual drugs

Probenecid: increased effect of famciclovir
Zoster vaccine: decreased effect of vaccine, varicella virus

## NURSING CONSIDERATIONS

### Assessment

- **Herpes zoster:** assess number and distribution of lesions; also burning, itching, or pain (early symptoms of herpes infection); neuralgia during, after treatment; monitor for postherpetic neuralgia
- **Acute renal failure:** usually in high doses or in those >65 yr; monitor renal function tests: urine CCr, BUN before, during treatment if patient has decreased renal function; dosage may need to be lowered; hepatic studies: LFTs

- Monitor bowel pattern before, during treatment; diarrhea may occur
- Assess for posttherapeutic neuralgia during and after treatment
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, enroll pregnant patient in Fanvir Pregnancy Registry 888-689-6682, use if potential benefits to the mother outweigh risks to the infant

### Patient/family education

- Teach patient how to recognize signs of beginning of infection (pain, itching, tingling); use product within 48 hr of rash
- Teach patient how to prevent the spread of infection to others, that until crusting of lesions has taken place, not to be around those who have not had the chicken pox vaccine or those who are immunocompromised, that product must be taken for whole course of treatment
- Teach patient reason for medication and expected results
- Teach patient to avoid driving or other hazardous activities until results are known, dizziness may occur
- Advise patient that this medication does not prevent spread of disease to others, that condoms should be used
- Advise women with genital herpes to have yearly Pap smears; cervical cancer is more likely

### Evaluation

**Positive therapeutic outcome**

- Decreased size and spread of lesions
- Prevention of recurrence (genital herpes)
- Decreased time for healing

## famotidine (Rx, OTC)

(fa-moe'ti-deen)

**Acid Control, Pepcid, Pepcid AC, Peptic Guard, Ulcidine**

*Func. class.:* $H_2$-histamine receptor antagonist, antiulcer agent

**ACTION:** Inhibits histamine at $H_2$-receptor site in gastric parietal cells, which inhibits gastric acid secretion while pepsin remains at a stable level

**Therapeutic outcome:** Healing of duodenal ulcers or gastric ulcers; prevention of duodenal ulcers; decreases symptoms of gastroesophageal reflux disease or Zollinger-Ellison syndrome, heartburn

**USES:** Short-term treatment of duodenal ulcer, maintenance therapy for duodenal ulcer, Zollinger-Ellison syndrome, multiple endocrine adenomas, gastric ulcers, heartburn, gastroesophageal reflux disease

**Unlabeled uses:** GI disorders in those taking NSAIDs, urticaria, prevention of stress ulcers, aspiration pneumonitis, prevention of paclitaxel hypersensitivity reactions

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children <12 yr, geriatric, severe renal/hepatic disease

## DOSAGE AND ROUTES

### Short-term treatment of gastric ulcer

**Adult:** PO 40 mg/day at bedtime × 4-8 wk, then 20 mg/day at bedtime if needed (maintenance); **IV** 20 mg q12hr if unable to take PO

**Child 1-16 yr:** PO 0.5 mg/kg/day at bedtime or divided bid, max 40 mg/day; IV 1-2 mg/kg/day in 1-2 divided doses

### Short-term treatment of duodenal ulcer

**Adult:** PO 40 mg at bedtime or 20 mg bid, maintenance 20 mg qday at bedtime

### Pathologic hypersecretory conditions

**Adult:** PO 20 mg q6hr; may give up to 160 mg q6hr if needed; **IV** 20 mg q12hr if unable to take PO

**Child 1-16 yr:** PO 1 mg/kg/day in two divided doses, max 40 mg bid

**Child 3 mo to <1 yr:** PO 0.5 mg/kg/dose bid ≤ 8 wk; child <30 mo: PO 0.5 mg/kg/dose qday, ≤8 wk

### GERD

**Adult:** PO 20 mg bid ≤ 6 wk; 40 mg bid ≤ 2 wk (ulcerative esophagitis)

### Heartburn relief/prevention

**Adult:** PO 10 mg with water, 15 min-1 hr before eating

### Renal dose

**Adult:** PO CCr <50 ml/min; give 50% of dose or extend interval to q36-48hr

### Stress ulcer prevention (ICU, head/thermal injury patients)

**Adult:** PO 20 mg by NG tube, IV 20 mg bid, cont IV inf 1.7 mg/hr

**Available forms:** Tabs 10, 20, 40 mg; powder for oral susp 40 mg/5 ml; inj 0.4 mg/ml premixed in normal saline, 10 mg/ml, 20 mg/50 ml 0.9% NaCl; orally disintegrating tabs (RPD) 20, 40 mg; chew tabs 10 mg

### Implementation

**PO route**

- Administer oral susp after shaking well; discard unused sol after 1 mo
- Store in cool environment (oral)

**Direct IV route**
- Give **IV** direct after diluting 2 ml of product (10 mg/ml) in 0.9% NaCl to total volume of 5-10 ml; inject over 2 min to prevent hypotension

**Intermittent IV infusion route**
- Administer after diluting 20 mg of product in 100 ml of LR, 0.9% NaCl, $D_5W$, $D_{10}W$; run over 15-30 min

**Continuous IV infusion route**
- **Adults:** Dilute 40 mg/250 ml $D_5W$ or NS, infuse over 24 hr, run at 11 ml/hr, use infusion device
- Store in cool environment (oral); **IV** sol is stable for 48 hr at room temperature; do not use discolored sol

**Y-site compatibilities:** Acyclovir, allopurinol, amifostine, aminophylline, amphotericin, ampicillin, ampicillin/sulbactam, inamrinone, amsacrine, atropine, aztreonam, bretylium, calcium gluconate, ceFAZolin, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, ceftAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cephalothin, cephapirin, chlorproMAZINE, CISplatin, cladribine, cyclophosphamide, cytarabine, dexamethasone, dextran 40, digoxin, diphenhydrAMINE, DOBUTamine, DOPamine, DOXOrubicin, droperidol, enalaprilat, EPINEPHrine, erythromycin lactobionate, esmolol, filgrastim, fluconazole, fludarabine, folic acid, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, imipenem/cilastatin, regular insulin, isoproterenol, labetalol, lidocaine, LORazepam, magnesium sulfate, melphalan, meperidine, methotrexate, methylPREDNISolone, metoclopramide, mezlocillin, midazolam, morphine, nafcillin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, PACLitaxel, perphenazine, phenylephrine, phenytoin, phytonadione, piperacillin, potassium chloride, potassium phosphate, procainamide, propofol, sargramostim, sodium bicarbonate, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, verapamil, vinorelbine

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* paresthesia, depression, anxiety, somnolence, insomnia, fever, seizures in renal disease
**CV:** Dysrhythmias, QT prolongation (impaired renal functioning)
**EENT:** Taste change, tinnitus, orbital edema
**GI:** *Constipation,* nausea, vomiting, anorexia, cramps, abnormal liver enzymes, diarrhea
**HEMA:** Thrombocytopenia, aplastic anemia
**INTEG:** Rash, toxic epidermal necrolysis, Stevens-Johnson syndrome
**MS:** Myalgia, arthralgia
**RESP:** Pneumonia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 50% absorbed (PO) |
| **Distribution** | Plasma, protein binding (15%-20%) |
| **Metabolism** | Liver (30% active metabolizing) |
| **Excretion** | Kidneys (70%) |
| **Half-life** | 2½-3½ hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | 60 min | Immediate |
| **Peak** | 1-3 hr | 1-4 hr |
| **Duration** | 12 hr | 12 hr |

F

## INTERACTIONS

### Individual drugs

Cefditoren, cefpodoxime, itraconazole, ketoconazole: decreased absorption of each specific product
Atazanivir, delavirdine: decreased effects of each specific product

### Drug classifications

Antacids: decreased absorption of famotidine

## NURSING CONSIDERATIONS

### Assessment

- **Assess patient with ulcers or suspected ulcers:** epigastric, abdominal pain, hematemesis, occult blood in stools, blood in gastric aspirate before treatment; throughout treatment, monitor gastric pH (maintain at pH 5)
- **Renal function:** Patients with decreased renal function are at risk for prolonged QT
- **Beers:** Avoid in older adults with or at high risk of delirium, may induce or worsen delirium, assess for confusion, healing of duodenal ulcers, decreased gastroesophageal reflux
- **Pregnancy/breastfeeding:** Use cautiously in pregnancy, breastfeeding
- Monitor I&O ratio, BUN, creatinine, CBC with differential monthly

### Patient/family education

- Caution patient to avoid driving, other hazardous activities until stabilized on this medication; dizziness may occur
- Advise patient to avoid black pepper, caffeine, alcohol, harsh spices, NSAIDs, extremes in temperature of food; tell patient to avoid OTC preparations: aspirin, cough/cold preparations; condition may worsen
- Advise patient to avoid taking OTC and prescription preparations of this product concurrently, do not take for extended periods, risk of $B_{12}$ malabsorption

• Tell patient that smoking decreases the effectiveness of the product; that smoking cessation should be considered
• Instruct patient that product must be continued for prescribed time to be effective and taken exactly as prescribed; doses are not to be doubled; take missed dose when remembered up to 1 hr before next dose
• Tell patient to report diarrhea, black tarry stools, sore throat, rash, dizziness, confusion, or delirium to prescriber immediately

### Evaluation

**Positive therapeutic outcome**
• Decreased pain in abdomen
• Healing of ulcers, decreased gastroesophageal reflux

## febuxostat (Rx)

(feb-ux′oh-stat)
**Uloric**
*Func. class.:* Antigout drug, antihyperuricemic
*Chem. class.:* Xanthine oxidase inhibitor

**ACTION:** Inhibits the enzyme xanthine oxidase, reducing uric acid synthesis; more selective for xanthine oxidase than allopurinol

**Therapeutic outcome:** Decreased signs/symptoms of gout, hyperuricemia

**USES:** Chronic gout, hyperuricemia

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, renal/hepatic/cardiac/neoplastic disease, stroke, MI, organ transplant, Lesch-Nyhan syndrome

## DOSAGE AND ROUTES

**Adult:** PO 40 mg daily, may increase to 80 mg daily if uric acid levels are >6 mg/dl after 2 wk of therapy

**Available forms:** Tabs 40, 80 mg

### Implementation

**PO route**
• Give without regard to meals or antacid; may crush and add to foods or fluids

## ADVERSE EFFECTS

**CNS:** Dizziness
**CV:** MI, atrial fibrillation, atrial flutter, AV block, bradycardia, hyper/hypotension, palpitations, sinus tachycardia, stroke, angina
**GI:** *Nausea*
**GU:** Renal failure, urinary urgency/frequency/incontinence, nephrolithiasis, hematuria
**INTEG:** Rash
**MISC:** Arthralgia, gout flare

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 99.2%, max lowering of uric acid 2 wk |
| **Metabolism** | Unknown |
| **Excretion** | Feces, urine |
| **Half-life** | 5-8 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-1.5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

AzaTHIOprine, didanosine, mercaptopurine: do not use together increased toxicity
Rasburicase: increased xanthine nephropathy, calculi

### Drug classifications

Antineoplastics: increased xanthine nephropathy, calculi
Increase: Effect of theophylline

### Drug/lab

Increase: LFTs, alkaline phosphatase, serum cholesterol, triglycerides, amylase, BUN, creatinine, aPTT, PT, CPK, creatine
Decrease: Hct/Hgb, RBC, platelets, lymphocytes, neutrophils, TSH, blood glucose

## NURSING CONSIDERATIONS

### Assessment

• **Hyperuricemia:** Monitor uric acid levels q2wk; uric acid levels should be 6 mg/dl or less
• Hepatic studies prior to use, then at 2, 4 mo, and then periodically; assess for fatigue, anorexia, right upper abdominal discomfort, dark urine, jaundice
• **Renal disease:** Monitor I&O ratio; increase fluids to 2 L/day to prevent stone formation and toxicity
• Assess for rash, hypersensitivity reactions; discontinue
• **Assess for gout:** joint pain, swelling; may use with NSAIDs for acute gouty attacks and gout flare (first 6 wk)
• **Pregnancy/breastfeeding:** It is unknown if product crosses the placenta or appears in breast milk, use only if benefit outweighs risk

### Patient/family education

- Inform patient that tabs may be crushed
- Teach patient to take as prescribed; if dose is missed, take as soon as remembered; do not double dose
- Teach patient to increase fluid intake to 2 L/day unless contraindicated
- Advise patient to avoid alcohol, caffeine; will increase uric acid levels
- Advise patient to report cardiovascular events to prescriber, immediately (chest pain, dyspnea, slurred speech, weakness)
- **Gout:** teach patient that flares may occur during first 6 wk of treatment, continue and notify prescriber

### Evaluation

**Positive therapeutic outcome**

- Decreased pain in joints, decreased stone formation in kidneys, decreased uric acid levels

## felodipine (Rx)

(feh-loh'dih-peen)
**Renedil**
*Func. class.:* Calcium-channel blocker, antihypertensive, antianginal
*Chem. class.:* Dihydropyridine

**ACTION:** Inhibits calcium ion influx across cell membrane, resulting in inhibition of excitation/contraction of vascular smooth muscle

**Therapeutic outcome:** Decreased B/P in hypertension

**USES:** Essential hypertension, alone or with other antihypertensives

## CONTRAINDICATIONS

Hypersensitivity to this product or dihydropyridines, sick sinus syndrome, 2nd- or 3rd-degree heart block, hypotension <90 mm Hg systolic

**Precautions:** Pregnancy, breastfeeding, children, geriatric, HF, hepatic injury, renal disease, coronary artery disease

## DOSAGE AND ROUTES

**Adult:** Hypertension PO 5 mg/day initially, usual range 2.5-10 mg/day; max 10 mg/day; do not adjust dosage at intervals of <2 wk
**Geriatric:** PO 2.5 mg/day, max 10 mg/day

### Hepatic dose

**Adult:** PO 2.5-5 mg/day, max 10 mg/day

**Available forms:** Ext rel tabs 2.5, 5, 10 mg

### Implementation

**PO route**

- Do not break, crush, or chew ext rel tabs
- Give once a day with food for GI symptoms

## ADVERSE EFFECTS

**CNS:** *Headache,* fatigue, drowsiness, dizziness, anxiety, depression, nervousness, insomnia, light-headedness, paresthesia, tinnitus, psychosis, somnolence
**CV:** Dysrhythmias, *edema,* HF, hypotension, palpitations, MI, pulmonary edema, tachycardia, syncope, AV block, angina
**GI:** Nausea, vomiting, diarrhea, gastric upset, constipation, dry mouth
**GU:** Nocturia, polyuria, sexual dysfunction, decreased libido
**HEMA:** Anemia
**INTEG:** Rash, pruritus, peripheral edema
**MISC:** Flushing, sexual difficulties, cough, nasal congestion, shortness of breath, wheezing, epistaxis, respiratory infection, chest pain, angioedema, gingival hyperplasia, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown; protein binding >99% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | 11-16 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1 hr |
| **Peak** | 2½-5 hr |
| **Duration** | <24 hr |

## INTERACTIONS

### Individual drugs

Alcohol, carBAMazepine, cimetidine, clarithromycin, conivaptan, cycloSPORINE, dalfopristin, delavirdine, dilTIAZem, erythromycin, itraconazole, ketoconazole, miconazole, phenytoin, propanolol, quiNIDine, quinupristin, zileuton: increased hypotension
Digoxin, disopyramide, phenytoin: increased bradycardia, increased HF

### Drug classifications

β-Adrenergic blockers: increased bradycardia, HF
Nitrates: increased hypotension
NSAIDs: decreased antihypertensive effects

### Drug/herb

Ginkgo, ginseng, hawthorn: increased antihypertensive effect
Ephedra, St. John's wort: decreased antihypertensive effect

### Drug/food

Grapefruit juice: increased felodipine level

## NURSING CONSIDERATIONS

### Assessment

- **HF:** Assess fluid volume status: I&O ratio and record; weight; skin turgor; adequacy of pulses; moist mucous membranes; bilateral lung sounds; peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth, and mucous membranes should be reported; for HF: weight gain, crackles, dyspnea, edema, jugular venous distention
- Monitor ALT, AST, bilirubin daily if these are elevated
- Monitor cardiac status: B/P, pulse, respiration, ECG, periodically during prolonged treatment
- **Assess for anginal pain:** duration; intensity; ameliorating, aggravating factors; **Hypertension:** Check for compliance, number of refills
- **Pregnancy/breastfeeding:** Fetal anomalies have occurred, avoid use in pregnancy, do not breastfeed

### Patient/family education

- Caution patient to avoid hazardous activities until stabilized on product and dizziness is no longer a problem
- Instruct patient to limit caffeine consumption; to avoid alcohol and OTC products unless directed by prescriber
- **Urge patient to comply in all areas of medical regimen:** diet, exercise, stress reduction, product therapy; to notify prescriber of irregular heartbeat, shortness of breath, swelling of feet and hands, pronounced dizziness, constipation, nausea, hypotension
- Advise patient to use protective clothing, sunscreen to prevent photosensitivity
- Teach patient to change positions slowly to prevent orthostatic hypotension
- Advise patient to obtain correct pulse; to contact prescriber if pulse is <50 bpm
- Teach patient to use as directed even if feeling better; may be taken with other CV products (nitrates, β-blockers); that capsules may appear in stools but are insignificant
- Teach patient to practice good oral hygiene to prevent gingival hyperplasia
- Advise patient not to stop medication abruptly
- Advise patient to avoid grapefruit juice

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P
- Decreased anginal attacks
- Increase in activity tolerance

## fenofibrate (Rx)

(fen-oh-fee'brate)

**Antara, Lipidil EZ, Lipidil, Lipidil Supra, Lipofem, Lofibra, Tricor, Triglide**

*Func. class.:* Antilipemic

*Chem. class.:* Fibric acid derivative

**Do not confuse:** Tricor/Tracleer

**ACTION:** Increases lipolysis and elimination of triglyceride-rich particles from plasma by activating lipoprotein lipase, resulting in triglyceride change in size and composition of LDL, leading to rapid breakdown of LDL; mobilizes triglycerides from tissue; increases excretion of neutral sterols

**Therapeutic outcome:** Decreasing cholesterol levels and low-density lipoproteins, decreased pruritus

**USES:** Hypercholesterolemia, patients with types IV, V hyperlipidemia who do not respond to other treatment and who are at risk for pancreatitis; Fredrickson type IV, V hypertriglyceridemia

## CONTRAINDICATIONS

Hypersensitivity, severe renal/hepatic disease, primary biliary cirrhosis, preexisting gallbladder disease, breastfeeding

**Precautions:** Pregnancy, geriatric, peptic ulcer, pancreatitis, renal/hepatic disease, diabetes mellitus

## DOSAGE AND ROUTES

### Hypertriglyceridemia

**Adult:** PO (Antara) 30-90 mg/day; (Fenoglide) 40-120 mg/day; (Lofibra) 67-200 mg/day; (Tricor) 48-145 mg/day; (Triglide) 50-160 mg/day; Lipofen) 50 mg qday

### Primary hypercholesterolemia/mixed hyperlipidemia

**Adult:** PO (Antara) 90 mg/day; (Lofibra) 200 mg/day; (Tricor) 145 mg/day; (Triglide) 160 mg/day; (Lipofen) 50 mg/day

### Renal dose (geriatric)

**Adult:** PO (Tricor) CCr 30-80 ml/min 48 mg/day; CCr <30 ml/min contraindicated

**Adult:** PO (Triglide, Lipofem) CCr 11-49 ml/min 50 mg/day; (Antara) 30 mg/day; (Fenoglide) 40 mg/day; (Lofibra) 67 mg/day; (Antara, Lipofem, Lofibra, Triglide) CCr <30 ml/min, contraindicated

**Available forms:** Cap: **Antara** 30, 90 mg; **Lipofen** 50, 150 mg tab: **Triglide** 50, 160 mg;

**Lofibra** 54, 160 mg; **Tricor** 48, 145 mg; **Fenoglide** 40, 120 mg

### Implementation

- Do not break, crush, or chew tabs
- Give with evening meal; if dose is increased, give with breakfast and evening meal (Lipofen, Lofibra); Triglide, Antara without regard to food; may increase q4-8wk
- Brands are not interchangeable; therapy should be discontinued if there is not adequate response after 2 mo
- Store in cool environment in tight, light-resistant container
- Caps must be swallowed whole
- Protect Lipofen, Triglide, from light, moisture

## ADVERSE EFFECTS

**CNS:** **Fatigue**, headache, paresthesia, drowsiness, **dizziness**
**CV:** Angina, **hypertension**, hypotension
**GI:** Nausea, **vomiting**, **dyspepsia**, **flatulence**, **hepatomegaly**, **gastritis**, pancreatitis, cholelithiasis
**GU:** diarrhea, constipation
**HEMA:** Anemia, leukopenia, thrombosis, pulmonary embolism
**INTEG:** ***Rash***, **pruritus**
**MS:** **Myalgias, arthralgias,** myopathy, rhabdomyolysis
**RESP:** Pharyngitis, bronchitis, cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 99% |
| **Metabolism** | Liver |
| **Excretion** | Urine 60%, feces 25% |
| **Half-life** | 20 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 6-8 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CycloSPORINE: increased nephrotoxicity

### Drug classifications

Anticoagulants (oral): increased effect of anticoagulants
Bile acid sequestrants: decreased absorption
HMG-CoA reductase inhibitors: do not use together, rhabdomyolysis may occur

### Drug/herb

Red yeast rice: increased effects

### Drug/food

Increased absorption

### Drug/lab test

Increase: ALT, AST, BUN, CK, creatinine
Decrease: WBC, uric acid, Hgb

## NURSING CONSIDERATIONS

### Assessment

- **Hypercholesterolemia:** Hyperlipidemia: Diet history, monitor lipid levels (triglycerides, LDL, HDL, total cholesterol), fat content
- Liver function tests, baseline and periodically during treatment; if >3 × ULN, discontinue CPK if muscle pain occurs, CBC, Hct, Hgh, protime with anticoagulant therapy, serum bilirubin (total and direct)
- Assess for pancreatitis, cholelithiasis, renal failure, rhabdomyolysis (when combined with HMG-CoA reductase inhibitors), myositis; product should be discontinued; Assess often for muscle pain, weakness, fever
- Assess nutrition: Obtain fat, protein, carbohydrates, nutritional analysis should be completed by dietitian
- **Pregnancy/breastfeeding:** Avoid in pregnancy unless benefits outweigh risk to the fetus, do not breastfeed

### Patient/family education

- Inform patient that compliance is needed
- Instruct patient not to consume chipped or broken tabs (Triglide)
- Teach patient that risk factors—high-fat diet, smoking, alcohol consumption, absence of exercise—should be decreased
- Caution patient to notify prescriber if pregnancy is planned or suspected, not to breastfeed
- Teach patient to notify prescriber if the GI symptoms of diarrhea, abdominal or epigastric pain, nausea, or vomiting occur
- Advise patient to notify prescriber of muscle pain, weakness, fever, fatigue, epigastric pain

### Evaluation

#### Positive therapeutic outcome

- Decrease in cholesterol to desired level after 8 wk

**⚠ HIGH ALERT**

# fentaNYL (Rx)

(fen'ta-nill)

**RAN-Fentanyl, Sublimaze**

# fentaNYL transdermal (Rx)

**Duragesic, Ionsys**

*Func. class.:* Opioid analgesic

*Chem. class.:* Synthetic phenylpiperidine derivative

# fentaNYL nasal spray (Rx)

**Lazanda**

# fentaNYL SL spray (Rx)

**Subsys**

# fentaNYL SL

**Abstral**

# fentaNYL buccal

**Fentora**

# fentaNYL lozenge

**Actiq**

**Controlled substance schedule II**

**Do not confuse:** fentaNYL/SUFentanil

**ACTION:** Inhibits ascending pain pathways in CNS, increases pain threshold, alters pain perception by binding to opiate receptors

**Therapeutic outcome:** Relief of pain, supplement to anesthesia

**USES:** Controls moderate to severe pain; preoperatively, postoperatively; adjunct to general anesthetic, adjunct to regional anesthesia; **FentaNYL:** for anesthesia as premedication, conscious sedation; **Actiq:** for breakthrough cancer pain

## CONTRAINDICATIONS

Hypersensitivity to opiates, myasthenia gravis

**BLACK BOX WARNING:** headache, migraine (Actiq), Astral, Fentora, Lazanda, Onsolis, emergency dept use (Abstral, Lazanda), outpatient surgeries (Duragesic TD), opioid-naive patients, respiratory disorders, depression

**Precautions:** Pregnancy, breastfeeding, geriatric, increased ICP, seizure disorders, cardiac dysrhythmias, severe respiratory disorders

**BLACK BOX WARNING:** Children, accidental exposure, ambient temperature increase, fever, skin abrasion (TD patch), substance abuse, surgery, requires an experienced clinician

## DOSAGE AND ROUTES

### >> FentaNYL

**Anesthetic (adjust to regional anesthesia)**

**Adult: IV** 50-100 mcg/kg over 1-2 min, max 150 mcg/kg

**Anesthesia supplement to general anesthesia**

**Adult and child >12 yr:** Low dose 1-2 mg/kg; (IV) moderate dose 2-20 mcg/kg; High dose 20-50 mcg/kg, then 25 mcg to half initial loading dose as needed

**Induction and maintenance**

**Child 2-12 yr: IV** 2-3 mcg/kg

**Preoperatively**

**Adult and child >12 yr:** IM/**IV** 50-100 mcg q30-60 min before surgery

**Postoperatively**

**Adult and child >12 yr:** IM/**IV** 50-100 mcg q1-2hr prn

**Moderate/severe pain**

**Adult:** IV/IM 50-100 mcg q1-2hr

### >> Actiq

**Adult:** Transmucosal 200 mcg, redose if needed 15 min after completion of 1st dose, max 2 doses during titration period, max 4 doses/day

### >> Fentora

**Adult:** BUCCAL/SL 100 mcg placed above rear molar between upper cheek and gum, a second 100 mcg dose, if needed, may be started 30 min after first dose

### >> ABSTRAL

**Adult:** SL 100 mcg, another dose may be taken 30 min after first, max 2 doses per episode of breakthrough pain, ≥2 hr must elapse before treating again, titrate stepwise over consecutive episodes

### >> FentaNYL transdermal

**Adult: Duragesic:** 12.5-25 mcg/hr; may increase until pain relief occurs; apply patch to flat surface on upper torso and wear for 72 hr; apply new patch to different site for continued relief; **Ionsys:** Use only after patient has been titrated to acceptable level of analgesics, one dose activation = 40 mcg TD over 10 min, max 6 (40 mcg doses/hr)

### >> FentaNYL nasal spray

**Adult:** 100 mcg (1 spray in 1 nostril), may re-treat after ≥2 hr, titrate upward to adequate analgesia, treat a max of 4 episodes q day

### >> FentaNYL SL spray

**Adult:** SL 100 mcg sprayed under the tongue; titrate stepwise carefully

**Available forms:** Inj 0.05 mg/ml; lozenges 100, 200, 300, 400, 600, 800, 1200, 1600 mcg; lozenges on a stick 200, 400, 600, 800, 1200, 1600 mcg; buccal tab 100, 200, 400, 600, 800 mcg; transdermal patch 12, 25, 50, 75, 100 mcg/hr; SL tab (ABSTRAL) 100, 200, 300, 400, 600, 800 mcg; SL spray: 100, 200,400, 600, 1200, 1600 mcg/spray; nasal spray 100, 400 mcg/actuation

## Implementation

- Store in light-resistant area at room temperature
- Overdose has been fatal when confusing products/dose; recheck both before using

**Transmucosal route**

- Remove foil just before administration; instruct patient to place between cheek and lower gum, moving it back and forth and sucking, not chewing (Actiq); place above rear molar (Fentora); place film on the inside of the cheek (Onsolis); all products not used or partially used should be flushed down the toilet; this product may be used SL

**Transdermal route**

***Duragesic***

- Apply patch to chest on a flat area with skin intact; for skin preparation, use clear water with no soap; clip hair, skin should be dry before applying patch; apply immediately after removing from package and press firmly in place with palm of hand; flush old patch down toilet immediately upon removal

**Ionsys (iontophoretic transdermal system) route:**

- Apply only one system at any given time. Always wear gloves when handling
- Remove the foil pouch and the controller from the tray. Remove the drug unit from the foil pouch and place on a hard, flat surface
- Assemble the system. Align the matching shapes of the controller and the unit. Press on both ends of the device to ensure that the snaps at both ends are fully engaged. One or two clicks will be heard when the snaps are engaged
- The digital display of the controller will complete a short self-test during which there is one audible beep, the red light will blink once, and the digital display will flash the number 88. Then the display will show 0 and a green light will blink
- Choose an application site of healthy, unbroken skin on the upper outer arm or chest only. Clip excessive hair. Do not shave, as this may irritate the skin
- Clean the site with alcohol and let dry. Do not use soaps, lotions, or other agents
- Peel off and discard the clear plastic liner covering the adhesive and hydrogels. Do not pull the red tab while preparing to apply the system; the red tab is only to be used during disposal
- Press and hold the system in place for ≥ 15 sec with sticky side facing the skin. Make sure the edges adhere to the skin
- If the system loosens from the skin, secure it by pressing the edges or use a nonallergenic tape to secure the edges. Do not apply tape if skin is blistered or broken. Apply tape along the long edges of the system. Do not tape over the button, light, or digital display. After taping if the system beeps again, remove it and apply a new system on a different skin site
- To initiate administration of a dose, the patient should press the recessed button on the top housing of the system twice within 3 sec. A single beep indicates the start of dose delivery that occurs over 10 min. During this time the system is locked out and another dose cannot be delivered. When dose delivery is complete, the display will show the number of doses delivered
- Each system will function for 24 hr or 80 doses, whichever comes first. At this time, the green light will turn off and the number of doses delivered will flash on and off. To turn off the digital display, press the dosing button for 6 sec
- Remove the system from the patient's skin. Ensure both hydrogels (one contains fentanyl) remain within the removed system. If a hydrogel becomes separated during removal, use gloves or tweezers to remove it from the skin and properly dispose of in accordance with state and federal regulations for controlled substances
- Do not touch exposed hydrogel compartments or adhesive. If a hydrogel is touched accidentally, rinse the area with water. Do not use soap
- If additional analgesia is needed, a new system must be applied to a different site on the upper outer arm or chest
- *Disposal:* With gloves on, pull the red tab to separate the red bottom housing containing fentanyl from the system. Fold the red housing in half with the sticky side facing in. Dispose of the red housing per policies for disposal of schedule II drugs or by flushing it down the toilet. Hold the dosing button down until the display goes blank, and then dispose of the remaining part of the system containing electronics in waste designated for batteries

**Use pain dosing**

- Dosage is titrated based on patient's report of pain; dosage is determined by calculating the previous 24-hr requirement and converting to equianalgesic morphine dose
- To convert to another opioid analgesic, remove transdermal patch and begin treatment with half the equal pain-controlling dose of the new analgesic in 12-18 hr

**SL spray**

- Open blister package with scissors immediately prior to use; spray contents under tongue;

dispose of unit by placing it into disposable bags provided; seal bag, discard into trash container out of reach of children.

**IV route**
- Give by inj (IM, **IV**), only with resuscitative equipment available; give slowly to prevent rigidity
- Give **IV** undiluted by anesthesiologist or diluted with 5 ml or more sterile water or 0.9% NaCl given through Y-tube or 3-way stopcock given at 0.1 mg or less/1.2 min
- Muscular rigidity may occur with rapid IV administration

**Y-site compatibilities:** Abciximab, acyclovir, alemtuzumab, alfentanil, alprostadil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAXone, cefuroxime, cephalothin, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cloNIDine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etomidate, etoposide, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methotrimeprazine, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANTRONE, mivacurium, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, scopolamine, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Dizziness, delirium, euphoria, sedation, confusion, weakness, dizziness, seizures
**CV:** Bradycardia, cardiac arrest, hypo/hypertension, DVT, PE
**EENT:** Blurred vision, miosis
**GI:** Nausea, vomiting, constipation
**GU:** Urinary retention
**INTEG:** Rash, diaphoresis
**MS:** Muscle rigidity
**RESP:** Respiratory depression, arrest, laryngospasm

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM), completely absorbed (**IV**) |
| **Distribution** | Unknown, crosses placenta |
| **Metabolism** | Extensively, liver; 80% bound to plasma proteins |
| **Excretion** | Kidneys, up to 25% unchanged; breast milk |
| **Half-life** | IV 2-4 hr; transdermal 13-22 hr; transmucosal 7 hr; buccal 4-12 hr |

### Pharmacodynamics

| | IM | IV | TD | TM |
|---|---|---|---|---|
| **Onset** | 7-15 min | Rapid | 6 hr | 5-15 min |
| **Peak** | 30 min | 3-5 min | 12-24 hr | 30 min |
| **Duration** | 1-2 hr | ½-1 hr | 72 hr | |

| | Intranasal | TD | Transmucosal |
|---|---|---|---|
| **Onset** | 15-20 min | 12-24 hr, | 5-15 min |
| **Peak** | 25-30 min | 1-3 days, | 30 min |

## INTERACTIONS

### Individual drugs

Alcohol: increased respiratory depression, hypotension, increased sedation

**BLACK BOX WARNING:** Cimetidine, conivaptan, cycloSPORINE, fluconazole, itraconazole, ketoconazole, nefazodone, ranolazine, zafirlukast, zileuton: increased fentaNYL effect, fatal respiratory depression, CYP3A4 inhibitors

diazePAM: increased CV depression
Droperidol: increased hypotension

### Drug classifications

Antipsychotics, opioids, skeletal muscle relaxants: effects increased, protease inhibitors
CNS depressants, sedative/hypnotics: increased respiratory depression, hypotension
CYP3A4 inducers (carBAMazepine, PHENobarbital, phenytoin, rifampin): decreased fentaNYL effect
MAOIs: increased fatal reactions

### Drug/herb

St. John's wort, valerian: increased fentaNYL action
Echinacea: decreased effect of fentaNYL

### Drug/lab test

Increased: amylase, lipase

## NURSING CONSIDERATIONS

### Assessment

- Monitor VS after parenteral route (B/P, pulse, respiration); note muscle rigidity; take drug history before administering product; check renal/liver function tests

**BLACK BOX WARNING:** Respiratory depression: Monitor character, rate, rhythm; notify prescriber if respirations <10/min

- Monitor CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- Monitor allergic reactions: rash, urticaria; product should be discontinued
- **Assess for pain:** intensity, location, duration, type, before and 15 min after IM route or 3-5 min after **IV** route

**BLACK BOX WARNING: Headache, migraine:** Abstral, Actiq, Fentora, Lazanda, Onsolis are not to be used for this condition; Abstral, Lazanda is not to be used in the ED; Duragesic TD is not to be used for outpatient surgery patients

**BLACK BOX WARNING: Apnea, respiratory arrest in opioid-naive patients:** Do not use Abstral, Actiq, Duragesic, Fentora, Lazanda, Onsolis, opioid tolerant are those using ≥60 ml/day oral morphine, ≥30 mg/day oxyCODONE PO, 8 mg/day HYDROmorphone, 25 mcg tid fentaNYL/hr

- **Pregnancy/breastfeeding:** Use in pregnancy only if potential benefit outweighs risks, not recommended in breastfeeding
- **Beers:** Avoid in older adults unless safer alternative is not available, may cause ataxia, impaired psychomotor function

### Patient/family education

- Discuss the dangers of children or pets getting the product
- Advise patient to report any symptoms of CNS changes, allergic reactions
- Instruct patient to avoid CNS depressants: alcohol, sedative-hypnotics for at least 24 hr after taking this product
- Teach patient that dizziness, drowsiness, confusion are common, and to avoid getting up without assistance
- Discuss in detail with patient all aspects of the product
- Teach patient CNS changes: physical dependence; not to use with alcohol, other CNS depressants

**Transdermal route**

**BLACK BOX WARNING: Ambient temperature increase:** Discuss with patient that excessive heat may increase absorption; excessive perspiration may alter adhesiveness; do not use with heating pads, electric blankets, heat/tanning lamps, saunas, hot tubs, heated waterbeds, sunbathing

- Discuss with patient that hair may need to be clipped before applying
- Teach patient how to dispose of patch: place sticky sides together and flush in toilet
- May add first aid tape around the edges if there is a problem with adhesion

### Evaluation

**Positive therapeutic outcome**

- Maintenance of anesthesia
- Decreased breakthrough cancer pain
- General pain relief

## TREATMENT OF OVERDOSE:

Naloxone 0.2-0.8 **IV**, $O_2$, **IV** fluids, vasopressors

## ferrous fumarate (Rx)
**Femiron, Feostat, Ferrate, Ferretts, Ferrocite, Hemocyte, Palafer**
## ferrous gluconate (Rx)
**Fergon**
## ferrous sulfate (Rx)
**Feosol, Fer-Gen-Sol, Fer-In-Sol, FeroSul**
## carbonyl iron (OTC)
(kar′boh-nil)
**ICAR Pediatric, Iron Chews**
## iron polysaccharide (OTC)
**iFerex, Niferex, Nu-Iron**

*Func. class.:* Hematinic
*Chem. class.:* Iron preparation

**ACTION:** Replaces iron stores needed for red blood cell development, energy and $O_2$ transport, utilization; fumarate contains 33% elemental iron; gluconate, 12%; sulfate, 20%; iron, 30%; ferrous sulfate exsiccated

**Therapeutic outcome:** Prevention and correction of iron deficiency

**USES:** Iron deficiency anemia, prophylaxis for iron deficiency in pregnancy, nutritional supplementation

## CONTRAINDICATIONS
Sideroblastic anemia, thalassemia, hemosiderosis/hemochromatosis

**Precautions:** Pregnancy; anemia (long-term), peptic ulcer disease, hemolytic anemia, cirrhosis, ulcerative colitis/regional enteritis, sulfite sensitivity

**BLACK BOX WARNING:** Accidental exposure

## DOSAGE AND ROUTES
### Fumarate
**Adult:** PO 50-100 mg tid
**Child:** PO 3 mg/kg/day (elemental iron) tid-qid
**Infant:** PO 10-25 mg/day (elemental iron) in 3-4 divided doses, max 15 mg/day

### Gluconate
**Adult:** PO 60 mg bid-qid
**Child 6-12 yr:** PO 3 mg/kg/day divided

### Sulfate
**Adult:** PO 0.750-1.5 g/day in divided doses tid
**Child 6-12 yr:** 600 mg/day in divided doses

### Pregnancy
**Adult:** PO 300-600 mg/day in divided doses

### Iron polysaccharide
**Adult:** 100-200 mg tid
**Child:** PO 4-6 mg/kg/day in 3 divided doses (severe iron deficiency)

**Available forms:** **Fumarate:** tabs 90, 150, 200, 300, 324, 325 mg; chewable tabs 100 mg; extended release tabs 18 mg; **gluconate:** tabs 225, 240, 324, 325 mg; **sulfate:** tabs 195, 300, 325 mg; elixir 220 mg/5 ml; dried: tabs 200 mg; ext rel tabs 160 mg; ext rel caps 160 mg; **iron polysaccharide:** tabs 50 mg; caps 150 mg; sol 100 mg/5 ml

### Implementation
**PO route**
- Swallow all tabs whole; do not break, crush, or chew
- Give between meals for best absorption; may give with juice; do not give with antacids or milk, delay at least 1 hr; if GI symptoms occur, give after meals even if absorption is decreased; eggs, milk products, chocolate, caffeine interfere with absorption; ferrous gluconate is less GI irritating than ferrous sulfate
- Give **liquid** preparations through plastic straw to avoid discoloration of tooth enamel; dilute thoroughly
- Store in tight, light-resistant container
- Give at least 1 hr before bedtime because corrosion may occur in stomach
- Give for <6 mo for anemia
- Store at room temperature; protect from moisture

## ADVERSE EFFECTS
**GI:** *Nausea, constipation, epigastric pain, black and red tarry stools,* vomiting, diarrhea
**INTEG:** Temporarily discolored tooth enamel and eyes
**SYST:** Hypersensitivity reactions (Ferrlecit)

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Up to 30% |
| **Distribution** | Bound to transferrin, crosses placenta |
| **Metabolism** | Recycled |
| **Excretion** | Feces, urine, skin, breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual drugs
Chloramphenicol, vit C: increased absorption of iron products
Cholestyramine, L-thyroxine, levodopa, methyldopa, penicillamine, tetracycline, vitamin E: decreased absorption of each product

### Drug classifications
Antacids, $H_2$ antagonists, proton pump inhibitors: decreased absorption of iron preparations
Fluoroquinolones: decreased absorption of fluoroquinolone

### Drug/food
Caffeine, dairy products, eggs: decreased absorption

### Drug/lab test
False positive: occult blood

## NURSING CONSIDERATIONS
### Assessment
- Monitor blood studies: Hct, Hgb, reticulocytes, bilirubin before treatment, at least monthly; iron studies (Fe, TIBC, ferritin), avoid use with blood transfusions, iron overload may occur
- **Assess for toxicity:** nausea, vomiting, diarrhea (green, then tarry stools) hematemesis, pallor, cyanosis, shock, coma
- Assess bowel elimination; if constipation occurs, increase water, bulk, activity before laxatives are required
- **Assess nutrition:** amount of iron in diet (meat, dark green leafy vegetables, dried beans, dried fruits, eggs); provide referral to dietitian if indicated
- **Pregnancy/breastfeeding:** Use in pregnancy only if benefit outweighs fetal risks to fetus, excreted in breast milk, avoid use
- Identify cause of iron loss or anemia, including salicylates, sulfonamides, antimalarials, quiNIDine

### Patient/family education
- Advise patient that iron will make stools black or dark green, stain teeth; that iron poisoning may occur if increased beyond recommended level
- **Accidental exposure:** advise patient to keep out of reach of children, pets
- Caution patient not to substitute one iron salt for another; elemental iron content differs (e.g., 300 mg ferrous fumarate contains about 100 mg elemental iron, whereas 300 mg ferrous gluconate contains only about 30 mg elemental iron)
- Caution patient to avoid reclining position for 15-30 min after taking product to avoid esophageal corrosion; to follow diet high in iron
- Caution patient to avoid taking iron, dairy products, calcium supplements, vit C together; they compete for absorption

### Evaluation
**Positive therapeutic outcome**
- Decreased fatigue, weakness
- Improvement in Hct, Hgb, reticulocytes

## TREATMENT OF OVERDOSE:
Induce vomiting; give eggs, milk until lavage can be done

## fesoterodine (Rx)
(fess′oh-ter-oh-deen)
**Toviaz**
*Func. class.:* Overactive bladder product
*Chem. class.:* Muscarinic receptor antagonist

F

## ACTION:
Relaxes smooth muscles in urinary tract by inhibiting acetylcholine at postganglionic sites

**Therapeutic outcome:** Absence of urinary frequency, urgency, incontinence

## USES:
Overactive bladder (urinary frequency, urgency), urinary incontinence

## CONTRAINDICATIONS
GI obstruction, ileus, pyloric stenosis, urinary retention, gastric retention, hypersensitivity, closed-angle glaucoma

**Precautions:** Pregnancy, breastfeeding, children, renal/hepatic disease, urinary tract obstruction, ambient temperature increase, autonomic neuropathy, constipation, contact lenses, hazardous activity, GERD, gastroparesis, myasthenia gravis, prostatic hypertrophy, toxic megacolon, ulcerative colitis, possible cross-sensitivity with tolterodine

## DOSAGE AND ROUTES
**Adult and geriatric:** PO EXT REL 4 mg/day, may increase to 8 mg/day based on response, max 4 mg/day in those taking potent CYP3A4 inhibitors

### Renal dose
**Adult:** PO EXT REL CCr <30 ml/min max 4 mg

**Available forms:** Ext rel tabs 4, 8 mg

### Implementation
- Do not break, crush, or chew ext rel product
- Give without regard to meals
- Store at room temperature; protect from moisture

## ADVERSE EFFECTS
**CNS:** Insomnia, headache, dizziness
**CV:** Chest pain, angina, QT prolongation, peripheral edema
**EENT:** Xerophthalmia
**GI:** *Nausea, vomiting,* abdominal pain, constipation, dry mouth
**GU:** Dysuria, urinary retention, urinary tract infection
**INTEG:** Rash, angioedema
**MISC:** Peripheral edema, insomnia
**MS:** Back pain

**RESP:** Cough, upper respiratory infection
**SYST:** Infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid |
| **Distribution** | Protein binding 50% |
| **Metabolism** | Unknown |
| **Excretion** | Urine, feces |
| **Half-life** | 7 hr |

### Pharmacodynamics

| | |
|---|---|
| **Peak** | 5 hr |

## INTERACTIONS

### Drug classifications

Anticholinergics, antimuscarinics: increased anticholinergic effect
CYP3A4 inhibitors (antiretroviral protease inhibitors, azole antifungals), avoid use with doses >4 mg, not recommended, macrolide antiinfectives: increased action of fesoterodine

### Drug/herb

Caffeine, green tea, guarana: decreased fesoterodine

### Drug/lab test

Increase: ALT

## NURSING CONSIDERATIONS

### Assessment

- **Assess urinary patterns:** distention, nocturia, frequency, urgency, incontinence
- **Angioedema:** Assess for swelling of face, tongue, throat, may occur anytime during treatment, have emergency equipment nearby
- **Pregnancy/breastfeeding:** Avoid in pregnancy/breastfeeding unless benefits outweigh fetal risk, no controlled studies

### Patient/family education

- Advise patient not to drink liquids before bedtime
- Instruct the patient on the importance of bladder maintenance
- Teach patient to avoid increased temperature
- Teach patient not to drive or operate machinery until response is known
- Teach patient to avoid alcohol, drowsiness may occur
- Teach patient to report immediately allergic reactions, including, rash, swelling of mouth, face, lips, trouble breathing
- Teach patient not to use new meds, herbs without prescriber approval

### Evaluation

#### Positive therapeutic outcome

- Absence of urinary frequency, urgency, incontinence

# fexofenadine (Rx, OTC)

(fex-oh-fin'a-deen)
**Allegra, Mucinex Allergy**
*Func. class.:* Histamine antagonist, 2nd generation
*Chem. class.:* Piperidine, peripherally selective

**Do not confuse:** Allegra/Viagra

## ACTION:

Acts on blood vessels, GI, respiratory system by competing with histamine for $H_1$-receptor site

**Therapeutic outcome:** Absence of allergy symptoms and rhinitis

## USES:

Rhinitis, allergy symptoms, chronic idiopathic urticaria

## CONTRAINDICATIONS

Breastfeeding, newborn or premature infants, hypersensitivity

**Precautions:** Pregnancy, children, geriatric, respiratory disease, closed-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, asthma, renal failure

## DOSAGE AND ROUTES

**Adult and child >12 yr:** PO Rx only 60 mg bid or 180 mg/day; PO OTC only 60 mg bid or 180 mg/day (self-treatment of allergic rhinitis)
**Child 6-11 yr:** PO 30 mg bid; Orally disintegrating tab 30 mg bid dissolved on tongue

### Renal dose

**Adult and child ≥12 yr:** PO CCr <80 ml/min 60 mg/day
**Child 2-11 yr:** PO CCr <80 ml/min 30 mg/day
**Child <2 yr:** PO CCr <80 ml/min 15 mg/day

**Available forms:** Caps 60 mg; tabs 30, 60, 180 mg; oral susp 6 mg/ml; orally disintegrating tab 30 mg

### Implementation

- Give without regard to meals; caps/tabs should not be given with or right before grapefruit, orange, or apple juice
- **Orally disintegrating tab:** allow to dissolve, swallow
- **Oral susp:** shake well, use calibrated measuring device
- Store in tight, light-resistant container

## ADVERSE EFFECTS

**CNS:** Headache, stimulation, drowsiness, sedation, fatigue, confusion, blurred vision, tinnitus, restlessness, tremors, paradoxical excitation in children or geriatric

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1 hr |
| **Peak** | 2-3 hr |
| **Duration** | 12-24 hr |

## INTERACTIONS

### Individual drugs

Erythromycin, ketoconazole: increased fexofenadine effect
Rifampin: decreased fexofenadine effect
Aluminum, antacids, magnesium: decreased fexofenadine effect

### Drug/food

Apple, orange, grapefruit juice: decreased absorption

### Drug/lab test

False negative: skin allergy tests (discontinue antihistamine 3 days before testing)

## NURSING CONSIDERATIONS

### Assessment

- **Allergy:** assess for itchy, runny, watery eyes; congested nose; before and during treatment
- Assess respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness; provide fluids to 2 L/day to decrease secretion thickness
- **Pregnancy/breastfeeding:** Avoid use in first trimester, no well-controlled studies, use only if benefits outweigh fetal risk, use cautiously in breastfeeding

### Patient/family education

- Teach all aspects of product uses; to notify prescriber if confusion, sedation, hypotension occur; to avoid driving or other hazardous activity if drowsiness occurs; to avoid alcohol or other CNS depressants that may potentiate effect
- Instruct patient to take 1 hr before or 2 hr after meals to facilitate absorption
- Teach patient that hard candy, gum, frequent rinsing of mouth may be used for dryness
- Teach patient to take with water, avoid fruit juices as they may decrease effectiveness

### Evaluation

#### Positive therapeutic outcome

- Absence of running or congested nose, rashes

## TREATMENT OF OVERDOSE:

Administer lavage, diazePAM, vasopressors, **IV** phenytoin

# fidaxomicin (Rx)

(fye-dax-oh-mye'sin)
**Dificid**
*Func. class.:* Antiinfective-macrolide

**ACTION:** Bactericidal against *Clostridium difficile;* is a fermentation product obtained from *Dactylosporangium aurantiacum;* inhibits RNA synthesis by inhibiting transcription of bacterial RNA polymerases; may act at the early stages of transcription

**Therapeutic outcome:** Resolution of *C. difficile* based on stool culture

**USES:** Pseudomembranous colitis, *C. difficile*-associated diarrhea

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children

## DOSAGE AND ROUTES

**Adult: PO** 200 mg bid × 10 days

**Available forms:** Tab 200 mg

### Implementation:

- Give without regard to food
- Store at room temperature

## ADVERSE EFFECTS

**GI:** Nausea, vomiting, abdominal pain, GI bleeding, intestinal obstruction
**HEMA:** Anemia, neutropenia
**INTEG:** Rash, pruritus
**META:** Metabolic acidosis, hyperglycemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Minimal |
| **Distribution** | GI tract |
| **Metabolism** | P-glucoprotein |
| **Excretion** | Feces 92%; parent drug |
| **Half-life** | 12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | <1 hr |
| **Peak** | 1 hr |
| **Duration** | 1-5 hr |

## INTERACTIONS

### Individual drugs

CycloSPORINE: Increased fidaxomicin action

### Drug/lab test
Increased: glucose, LFTs, alk phos
Decreased: sodium bicarbonate, platelets

## NURSING CONSIDERATIONS
### Assessment
• **Pseudomembranous colitis:** Assess for diarrhea, abdominal pain, fever, fatigue, anorexia, possible anemia, elevated WBC and low serum albumin; this product may be used in place of vancomycin (PO); monitor CBC with differential, and stool culture (*C. difficile*); not to be used for systemic infection; obtain C&S prior to use; monitor glucose (diabetic patients); monitor fluid, electrolyte depletion
• Pregnancy/breastfeeding: No harm to fetus in animal studies, no well-controlled studies in pregnant women, use only if clearly needed, use cautiously in breastfeeding

### Patient/family education
• Advise patient to report GI bleeding, severe abdominal pain, continuing diarrhea
• Teach patient to report if pregnancy is planned or suspected or if breastfeeding
• Teach patient to take without regard to food, to take as directed, must take all of the medication

### Evaluation
**Positive therapeutic outcome**
• Resolution of *C. difficile,* decreased diarrhea

**⚠ HIGH ALERT**

## filgrastim (Rx)
(fill-gras'stim)
**Neupogen, Zarxio**
*Func. class.:* Biological modifier
*Chem. class.:* Granulocyte colony-stimulating factor

**Do not confuse:** Neupogen/Neumega

**ACTION:** Stimulates proliferation and differentiation of neutrophils; a glycoprotein

**Therapeutic outcome:** Absence of infection

**USES:** To decrease infection in patients receiving antineoplastics that are myelosuppressive; to increase WBC in patients with product-induced neutropenia; bone marrow depression, acute radiation exposure

**Unlabeled uses:** Neutropenia in HIV infection, aplastic anemia, ganciclovir-induced neutropenia, zidovudine-induced neutropenia

## CONTRAINDICATIONS
Hypersensitivity to proteins of *Escherichia coli*

**Precautions:** Pregnancy, breastfeeding, children, myeloid malignancies, radiation therapy, sepsis, sickle cell disease, chemotherapy, respiratory disease

## DOSAGE AND ROUTES
### After myelosuppressive chemotherapy
**Adult and child:** **IV**/SUBCUT 5 mcg/kg/day in a single dose up to 14 days; may increase by 5 mcg/kg in each chemotherapy cycle

### After myelosuppresive doses of radiation
**Adult and child >7 mo:** SUBCUT 10 mcg/kg/day, start as soon as possible after receiving ≥2 gray (Gy)

### After bone marrow transplantation
**Adult:** **IV**/SUBCUT 10 mcg/kg as an INF (**IV**) over 4 or 24 hr, begin 24 hr after chemotherapy and 24 hr after bone marrow transplantation

### Peripheral blood progenitor cell collection/therapy
**Adult:** 10 mcg/kg/day as a BOL or CONT INF × 4 days or more before leukapheresis, continue to last leukapheresis, may alter dose if WBC >100,000/mm$^3$

### Severe neutropenia (chronic), idiopathic/cyclical
**Adult:** SUBCUT 5 mcg/kg daily

### Neutropenia neonates
IV/SUBCUT: 5-10 mcg/kg/day × 3-5 days

**Available forms:** Inj 300 mcg/ml, 480 mcg/1.6 ml, 480 mcg/0.8 ml

### Implementation
• Store in refrigerator; do not freeze; may store at room temp up to 24 hr
• Given by subcut injection, short IV infusion, continuous SC or IV infusion
• Avoid use within 24 hr before or after chemotherapy
• Do not shake commercial single-dose vials prior to withdrawing the dose. If the vial is shaken and froth or bubbles form, allow the vial to stand undisturbed for a few min until the froth or bubbles dissipate
• Prior to injection, filgrastim may be allowed to reach room temperature for a maximum of 24 hr. Any vial or syringe exposed to room temperature for more than 24 hr should be discarded
• Visually inspect for particulate matter and discoloration prior to use

**IV route**
- May be diluted with 5% dextrose. Do not dilute with NS; product may precipitate
- May be diluted to concentrations 5-15 mcg/ml; should be protected from absorption to plastic by the addition of albumin to a final albumin concentration of 2 mg/ml. Do not dilute filgrastim to a concentration <5 mcg/ml

**IV infusion**
- Infuse IV over 15-30 min or as a continuous infusion over 24 hr

**SUBCUT route**
- May divide into 2 injections if dose is >1 ml
- Subcut injection: no dilution is necessary; inject by rapid subcut injection taking care not to inject intradermally, inject into abdomen, upper outer buttock, upper outer arm, rotate sites
- Subcut continuous infusion: infuse subcut at a rate not to exceed 2 ml/hour

**Y-site compatibilities:** Acyclovir, allopurinol, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, carmustine, cefAZolin, cefoTEtan, cefTAZidime, chlorproMAZINE, cimetidine, CISplatin, cyclophosphamide, cytarabine, dacarbazine, DAUNOrubicin, dexamethasone, diphenhydrAMINE, DOXOrubicin, doxycycline, droperidol, enalaprilat, famotidine, floxuridine, fluconazole, fludarabine, gallium, ganciclovir, granisetron, haloperidol, hydrocortisone, hydroMORPHONE, hydrOXYzine, IDArubicin, ifosfamide, leucovorin, LORazepam, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, miconazole, minocycline, mitoXANTRONE, morphine, nalbuphine, netilmicin, ondansetron, plicamycin, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, ticarcillin, ticarcillin/clavulanate, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vinBLAStine, vinCRIStine, vinorelbine, zidovudine

## ADVERSE EFFECTS

**CNS:** Fever, headache
**GI:** Nausea, vomiting, diarrhea, mucositis, anorexia, splenic rupture
**HEMA:** Thrombocytopenia, excessive leukocytosis
**INTEG:** Alopecia, exacerbation of skin conditions, urticaria, cutaneous vasculitis, allergic reactions
**MS:** Osteoporosis, skeletal pain
**OTHER:** Chest pain, hypotension
**RESP:** Acute respiratory distress syndrome, wheezing, alveolar hemorrhage

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (SUBCUT), completely absorbed (**IV**) |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | IV | SUBCUT |
|---|---|---|
| **Onset** | 5-60 min | 5-60 min |
| **Peak** | 24 hr | 2-8 hr |
| **Duration** | up to 1 wk | up to 1 wk |

F

## INTERACTIONS

### Individual drugs

Lithium: do not use concurrently

### Drug classifications

Antineoplastics: increased neutrophils, do not use together 24 hr before or after antineoplastics

### Drug/lab test

Increased: uric acid, lactate dehydrogenase, alkaline phosphatase, WBC

## NURSING CONSIDERATIONS

### Assessment

- Monitor blood studies: CBC, platelet count before treatment and twice weekly; neutrophil counts (ANC) drop by 50% if filgrastim is discontinued the next day but treatment should continue until ANC >10,000/mm$^3$
- Assess for bone pain: frequency, intensity, duration; analgesics may be given; opiates should not be used
- Check B/P, heart rate, respiration; baseline, during treatment
- **Respiratory distress syndrome:** fever, dyspnea; withhold product if these occur
- **Allergic reactions:** rash, wheezing, facial edema, dyspnea may occur within 30 min of use; give antihistamines, bronchodilators and EPINEPHrine if needed
- **Splenic rupture:** severe left upper abdominal pain
- **Pregnancy/breastfeeding:** If used in pregnancy, enroll in the Amgen Surveillance Program 800-772-6436, use only if benefits outweigh risk to fetus, use caution in breastfeeding

### Patient/family education

- Teach patient technique for self-administration: dose, side effects, disposal of containers and needles; provide instruction sheet
- That bone pain is common

### Evaluation
**Positive therapeutic outcome**
- Absence of infection

## finasteride (Rx)
(fin-ass′te-ride)
**Propecia, Proscar**
*Func. class.:* Androgen hormone inhibitor, hair stimulant
*Chem. class.:* 5-α-Reductase inhibitor

**Do not confuse:** Proscar/ProSom/Prozac, finasteride/furosemide

**ACTION:** Inhibits 5-α-reductase and reduction in dihydrotestosterone (DHT); DHT induces androgenic effects by binding to androgen receptors in the cell nuclei of the prostate gland, liver, skin; prevents development of benign prostatic hypertrophy (BPH)

**Therapeutic outcome:** Reduced prostate size

**USES:** Symptomatic BPH; male-pattern baldness (Propecia)

## CONTRAINDICATIONS
Pregnancy, breastfeeding, children, women who are pregnant or may become pregnant should not handle tabs, hypersensitivity

**Precautions:** Large residual urinary volume, severely diminished urinary flow, liver function abnormalities

## DOSAGE AND ROUTES
### BPH
**Adult:** PO 5 mg/day × 6-12 mo

### Male-pattern baldness
**Adult:** PO 1 mg/day for 3 mo or more for results

**Available forms:** Tabs (Propecia) 1 mg, (Proscar) 5 mg

### Implementation
- Administer without regard to meals; give for a minimum of 6 mo; not all patients will respond
- Store at temp <86° F (30° C); protect from light; keep container tightly closed

## ADVERSE EFFECTS
**GU:** Impotence, decreased libido, decreased volume of ejaculate, sexual dysfunction, gynecomastia
**INTEG:** Rash
**MISC:** Breast tenderness, secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 63%, readily |
| **Distribution** | Plasma protein binding, crosses blood-brain barrier |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, metabolites (39%); feces (57%) |
| **Half-life** | 6-15 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Immediate |
| **Peak** | 1-2 hr |
| **Duration** | 14 days |

## INTERACTIONS
### Drug classifications
Anticholinergics, bronchodilators (adrenergic), theophylline: decreased effect of finasteride

### Drug/lab test
Decreased: PSA levels (finasteride)

## NURSING CONSIDERATIONS
### Assessment
- **BPH:** Assess urinary patterns, residual urinary volume, severely diminished urinary flow; PSA levels and digital rectal exam results before initiating therapy and periodically thereafter
- Monitor liver function tests before initiating treatment; extensively metabolized in liver

### Patient/family education
- Advise patient that pregnant women or women who may become pregnant should not touch crushed tab or come into contact with semen of a patient taking this product; may adversely affect development of male fetus
- **Pregnancy/breastfeeding:** Contraindicated in pregnancy, breastfeeding, pregnant women or those trying to conceive should not handle crushed or broken tabs or come in contact with semen from male using product
- Inform patient that volume of ejaculate may be decreased during treatment; impotence and decreased libido may also occur and may continue after discontinuing treatment
- Inform patient that Propecia results may not occur for 3 mo
- Inform patient that Proscar results may not occur for 6-12 mo

### Evaluation
**Positive therapeutic outcome**
- Decreased postvoiding dribbling, frequency, nocturia

- Increased urinary flow
- Regression of prostate size
- Hair growth within 3-6 mo

## fingolimod (Rx)

(fin-gol′i-mod)
**Gilenya**
*Func. class.:* Immunosuppressant
*Chem. class.:* Sphingosine 1-phosphate receptor modulator

**ACTION:** Binds with high affinity to sphingosine 1 phosphate receptors, blocks lymphocyte egress to lymph nodes, reducing the number of peripheral blood lymphocytes, may reduce lymphocyte migration into the CNS

**Therapeutic outcome:** Improved symptoms of multiple sclerosis and prevention of increasing disability

**USES:** To reduce frequency of exacerbation, to delay physical disability of relapsing forms of MS

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** AIDS, asthma, AV block, bradycardia, breastfeeding, dysrhythmias, cardiac disease, children, COPD, diabetes mellitus, heart failure, hepatic disease, HIV, hypertension, immunosuppression, infants, leukemia, lymphoma, neonates, pregnancy, QT prolongation, respiratory insufficiency, sick sinus syndrome, syncope, uveitis

## DOSAGE AND ROUTES

**Adult:** PO 0.5 mg/day

### Hepatic dose

**Adult:** PO Child-Pugh C, total score >10: Closely monitor, fingolimod exposure is doubled

**Available forms:** Cap 0.5 mg

### Implementation

**PO route**

- Watch patient for 6 hr after initial dose or if product is not given for >2 wk for development of bradycardia. Give without regard to food
- Store at room temperature, protect from moisture

## ADVERSE EFFECTS

**CNS:** Asthenia, depression, fatigue, headache, dizziness, progressive multifocal leukoencephalopathy, migraine, paresthesias, stroke
**CV:** AV block, bradycardia, chest pain, hypertension, palpitations, QT prolongation
**EENT:** Blurred vision, vision impairment, ocular pain, macular edema
**GI:** Abdominal pain, anorexia, diarrhea, jaundice, vomiting, weight loss, hepatotoxicity
**HEMA:** Leukopenia, lymphopenia, neutropenia
**INTEG:** Alopecia, pruritus
**MS:** Back pain
**RESP:** Dyspnea, cough
**SYST:** Infection, influenza, secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Protein binding (99.7%) |
| **Distribution** | Distributed to RBCs (86%) |
| **Metabolism** | Metabolized by CYP4F2 and CYP2D6 to a lesser extent |
| **Excretion** | Excreted in urine (81% inactive metabolites) |
| **Half-life** | Terminal half-life 6-9 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 12-16 hr |
| **Duration** | Steady state 1-2 mo |

## INTERACTIONS

### Individual drugs

Digoxin: increased risk of heart block, serious bradycardia, avoid if possible
Ketoconazole: increased fingolimod effect

### Drug classifications

Class Ia/III antidysrhythmics: increased risk of torsades de pointes
β-blockers, calcium channel blockers: increased risk of heart block, serious bradycardia
Antineoplastics, immunosuppressants, immune modulating therapies: increased immunosuppression
Inactive vaccines, toxoids: decreased effects
Live vaccines: increased infection risk

## NURSING CONSIDERATIONS

### Assessment

- **Multiple sclerosis:** Assess for improving paresthesia, muscle weakness, clonus, muscle spasms, difficulty in moving, difficulty in coordination in balance, speech, swallowing, vision problems, fatigue; prevention of increasing disability
- **Monitor laboratory values:** obtain before initial dose, CBC, LFTs, serum bilirubin, ophthalmologic exam, antibodies to VZ V if there is not a history of chickenpox or without vaccination, may give VZV vaccination of antibody-negative patient before giving

product, postpone for 1 month after vaccination; obtain ECG for evidence of bradycardia, or AV block
- **Progressive multifocal leukoencephalopathy (PML):** Assess for confusion, apathy, dizziness, unstable gait; may be fatal; discontinue product; contact prescriber
- **Bradycardia:** Monitor for ≥6 hr after beginning dose, ECG before and after 1st dose, if heart rate 45 bpm or new heart block (2nd degree) occurs, do not use until resolved
- Monitor for QT prolongation
- **Pregnancy/breastfeeding:** No well-controlled studies, may cause fetal harm, pregnant women should enroll in Gilenya Pregnancy Registry 877-598-7237, use contraception during and for 2 mo after final dose, do not breastfeed

### Patient/family education
- Provide med guide to patient and explain use of product and expected results
- Advise patient that continuing follow-up exams and laboratory tests will be required on a regular basis
- Advise patient to use contraception during and for 2 months after conclusion of treatment
- **Liver dysfunction:** Teach patient to report jaundice, nausea, vomiting, anorexia, abdominal pain, fatigue, dark urine
- **Cardiac changes:** Chest pain, palpitations

### Evaluation
**Positive therapeutic outcome**
- Improved symptoms of multiple sclerosis and prevention of increasing disability

## fluconazole (Rx)
(floo-kon'a-zole)
**Diflucan Canesoral, Diflucan, Monicure**
*Func. class.:* Antifungal
*Chem. class.:* Triazole

**Do not confuse:** Diflucan/Diprivan

**ACTION:** Inhibits ergosterol biosynthesis, causes direct damage to membrane phospholipids in the cell wall of fungi

**Therapeutic outcome:** Fungistatic fungicidal against the following susceptible organisms: *Candida, Cryptococcus neoformans*

**USES:** Oropharyngeal candidiasis; chronic mucocutaneous candidiasis; systemic, vaginal, urinary candidiasis; cryptococcal meningitis; prevention of candidiasis in bone marrow transplant in those who receive chemotherapy and/or radiation therapy, cystitis, fungal prophylaxis, peritonitis, pneumonia, pyelonephritis

## CONTRAINDICATIONS
Hypersensitivity to this product or azoles, pregnancy

**Precautions:** Breastfeeding, renal/hepatic disease, torsades de pointes

## DOSAGE AND ROUTES
### Vulvovaginal candidiasis
**Adult:** PO 150 mg as a single dose; prevention of recurrence (unlabeled) 150 mg/day × 3 days, then qwk × 6 mo

### Serious fungal infections
**Adult:** PO/**IV** 50-400 mg initially, then 200 mg once daily for 4 wk
**Child:** PO/**IV** 6-12 mg/kg/day

### Oropharyngeal candidiasis
**Adult:** PO/**IV** 200 mg initially, then 100 mg/day for at least 2 wk
**Child >14 days:** PO/**IV** 6 mg/kg initially, then 3 mg/kg/day for ≥2 wk
**Neonates <14 days, 30-60 wk gestation:** PO/**IV** 6 mg/kg q48hr

### Esophageal candidiasis
**Adult:** PO/**IV** 200 mg on 1st day, then 100 mg/day × ≥3 wk and for ≥2 wk after resolution of symptoms
**Child:** PO/**IV** 6 mg/kg on 1st day, then 3 mg/kg/day × ≥3 wk and for ≥2 wk after resolution of symptoms

### Cryptococcal meningitis
**Adult:** PO/**IV** 400 mg on 1st day, then 200 mg/day × 10-12 wk after CSF culture negative, suppressive therapy 200 mg qday
**Child/infant/neonate >14 days:** PO/**IV** 12 mg/kg on 1st day, then 6-12 mg/kg/day × 10-12 wk after negative CSF culture, suppressive therapy 6 mg/kg/day
**Neonate 0-14 days:** PO/**IV** 12 mg/kg on 1st day, then 6-12 mg/kg q72hr × 10-12 wk after negative CSF culture

### Prevention of candidiasis in bone marrow transplant
**Adult:** PO/**IV** 400 mg/day; those anticipated to have neutrophils <500/mm$^3$, start several days prior to anticipated onset of neutropenia and continue for 7 days after rise of neutrophils >1000/mm$^3$

**Child >14 days:** PO/**IV** 10-12 mg/kg/day, max 600 mg/day

## Renal dose

**Adult:** PO CCr <50 ml/min after loading dose, give 50% of usual dose; hemodialysis give 100% of usual dose after dialysis treatment, give dose as per CCr on nondialysis days

**Available forms:** Tabs 10, 40, 50, 100, 150, 200 mg; inj 2 mg/ml; powder for oral susp 50, 200 mg/ml

## Implementation

- Take with food to reduce GI effects

**PO route**

- Add water in 2 portions, review manufacturer reconstitution instructions
- Shake oral susp before each use; use within 2 wk

**Intermittent IV infusion route**

- Give after diluting according to package directions; run at 200 mg/hr or less; do not use plastic containers in connections
- Do not admix
- Administer **IV** using an in-line filter, using distal veins; check for extravasation and necrosis q2hr
- Give product only after C&S confirms organism, product needed to treat condition
- Store protected from moisture and light, diluted sol is stable for 24 hr

**Y-site compatibilities:** Acyclovir, aldesleukin, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, CARBOplatin, caspofungin, ceFAZolin, cefepime, cefmetazole, cefonicid, cefoTEtan, cefOXitin, cefpirome, cefTAZidime, ceftizoxime, ceftobiprole, cephalothin, cephapirin, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dilTIAZem, dimenhyDRINATE, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, drotrecogin alfa, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fludarabine, fluorouracil, folic acid, foscarnet, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, IV immune globulin, inamrinone, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANTRONE, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phenytoin, phytonadione, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, temocillin, teniposide, theophylline, thiotepa, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** Amphotericin B, ampicillin, dantrolene, diazePAM, gemtuzumab, pantoprazole, trimethoprim/sulfamethoxazole

## ADVERSE EFFECTS

**CNS:** *Headache,* seizures
**CV:** QT prolongation, torsades de pointes
**GI:** *Nausea, vomiting,* diarrhea, cramping, flatus, increased AST, ALT, hepatotoxicity, abdominal pain, cholestasis
**HEMA:** Agranulocytosis, eosinophilia, leukopenia, neutropenia, thrombocytopenia
**INTEG:** Stevens-Johnson syndrome, angioedema, anaphylaxis, exfoliative dermatitis, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO) |
| **Distribution** | Widely distributed (peritoneum, CSF) |
| **Metabolism** | <10%, liver |
| **Excretion** | 80% kidneys (unchanged) |
| **Half-life** | 30 hr, increased in renal disease |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Unknown | Immediate |
| **Peak** | 1-2 hr | Infusion's end |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Alfentanil, buprenorphine, ergot, fentaNYL, methadone, saquinavir, SUFentanil, zidovudine: increased effect of each specific drug

CycloSPORINE, phenytoin, rifabutin, sirolimus, tacrolimus, theophylline, zidovudine, zolpidem: increased plasma concentrations

Lovastatin, simvastatin: increased myopathy, rhabdomyolysis risk

Warfarin: increased anticoagulation

### Drug classification

Calcium channel blockers: decreased effect

Oral sulfonylureas (glipiZIDE): hypoglycemia

Proton pump inhibitors: decreased fluconazole

### Drug/herb

Gossypol: increased nephrotoxicity

### Drug/lab test

Increased: alk phos, LFTs

Decreased: WBC, platelets

## NURSING CONSIDERATIONS

### Assessment

- **Assess for signs and symptoms of infection:** clearing of CSF culture during treatment, obtain C&S baseline and during treatment, product may be started as soon as culture is taken
- **QT prolongation:** Avoid with other products that cause QT prolongation
- **Monitor for hepatotoxicity:** increased AST, ALT, alkaline phosphatase, bilirubin; discontinue product if hepatotoxicity occurs
- **Pregnancy/breastfeeding:** Do not use in pregnancy for most indications, birth defects may occur, use cautiously in breastfeeding
- **Monitor for skin symptoms:** color, lesions, injection site reactions; if lesions progress, discontinue product; monitor rash, usually after second week of treatment and disappears in 2 wk if continuing product

### Patient/family education

- Caution patient that long-term therapy may be needed to clear infection; to take entire course of medication; take in equal intervals (PO), not to add new meds, herbs without prescriber approval
- **Teach patient the signs and symptoms of hepatotoxicity:** nausea, vomiting, clay-colored stools, dark urine, anorexia, fatigue, jaundice, skin rash; prescriber should be notified immediately, abdominal pain, fever, bruising, bleeding
- Inform patient that medication may be taken with food to reduce GI effects

### Evaluation

**Positive therapeutic outcome**

- Decreasing oral candidiasis, fever, malaise, rash
- Negative C&S for infecting organism

**RARELY USED**

## fludrocortisone (Rx)

(floo-droe-kor'ti-sone)

**Florinef**

*Func. class.:* Synthetic corticosteroid

**Do not confuse:** Florinef/Floranex/Florastor

**ACTION:** Promotes increased reabsorption of sodium and loss of potassium, water, hydrogen from distal tubules

**Therapeutic outcome:** Correction of adrenal insufficiency

**USES:** Adrenal insufficiency, salt-losing adrenogenital syndrome, Addison's disease

## CONTRAINDICATIONS

Children <2 yr, hypersensitivity

**Precautions:** HF, hypertension, diabetes, acute glomerulonephritis, amebiasis, psychosis, Cushing's syndrome, fungal infections, pregnancy, breastfeeding, children >2 yrs, osteoporosis

## DOSAGE AND ROUTES

**Adult:** PO 100-200 mcg/day

**Child:** PO 50-100 mcg/day

**Available forms:** Tabs 100 mcg (0.1 mg)

### Implementation

- Titrate to lowest dose
- Give with food or milk to decrease GI symptoms
- Tabs are scored and may be divided

## ADVERSE EFFECTS

**CV:** Hypertension, circulatory collapse, thrombophlebitis, embolism, tachycardia, HF, edema

**CNS:** Flushing, sweating, headache, paralysis, dizziness, seizure

**ENDO:** Weight gain, adrenal suppression, hyperglycemia

**META:** Hypokalemia

**MISC:** Hypersensitivity, cataracts, GI ulcers, anaphylaxis, infection
**MS:** Fractures, osteoporosis, weakness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Urine |
| **Half-life** | 18-36 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1.5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Barbiturates: decreased fludrocortisone action
Loop/thiazide diuretics, potassium-wasting products: increased potassium levels
Sodium-containing products: increased B/P

### Drug/lab test

Increased: potassium, sodium
Decreased: HCT

## NURSING CONSIDERATIONS

### Assessment

- Assess weight daily, notify prescriber of weekly gain >5 lb
- Monitor I&O, be alert for decreasing output, increasing edema
- Monitor B/P, pulse, notify prescriber of chest pain
- Potassium depletion: assess for paresthesia, fatigue, nausea, vomiting, dysrhythmias, weakness, depression, polyuria
- Electrolytes: monitor sodium, potassium, chloride; hypokalemia is common
- **Beers:** Avoid in older adults with or at high risk of delirium

### Patient/family education

- Teach patient that emergency ID as corticosteroid user should be carried
- Teach patient not to discontinue abruptly
- Instruct patient to notify health care provider of muscle cramps, weight gain, edema, nausea, infection, trauma, stress
- Advise patient to avoid exposure to disease, trauma

### Evaluation

**Positive therapeutic outcome**

- Correction of adrenal insufficiency

## flumazenil (Rx)

(flu-maz'e-nil)
**Anexate, Romazicon**
*Func. class.:* Antidote: Benzodiazepine receptor antagonist
*Chem. class.:* Imidazobenzodiazepine derivative

**Do not confuse:** flumazenil/influenza virus vaccine

F

**ACTION:** Antagonizes the actions of benzodiazepines on the CNS, competitively inhibits the activity at the benzodiazepine receptor complex

**Therapeutic outcome:** Reversed benzodiazepine toxic effects

**USES:** Reversal of the sedative effects of benzodiazepines

## CONTRAINDICATIONS

Hypersensitivity to this product or benzodiazepines, serious tricyclic overdose, patients given benzodiazepine for control of life-threatening condition

**Precautions:** Pregnancy, breastfeeding, children, geriatric, ambulatory patients, renal/hepatic disease, status epilepticus, head injury, labor and delivery, hypoventilation, panic disorder, drug/alcohol dependency, Benzodiazepine dependence

**BLACK BOX WARNING:** Benzodiazepine dependence, seizures

## DOSAGE AND ROUTES

### Reversal of conscious sedation or in general anesthesia

**Adult: IV** 0.2 mg (2 ml) given over 15 sec; wait 45 sec, then give 0.2 mg (2 ml) if consciousness does not occur; may be repeated at 60-sec intervals as needed (max 3 mg/hr) or 1 mg/5 min
**Child: IV** 10 mcg (0.01 mg)/kg; cumulative dose of 1 mg or less

### Management of suspected benzodiazepine overdose

**Adult: IV** 0.2 mg (2 ml) given over 30 sec; wait 30 sec, then give 0.3 mg (3 ml) over 30 sec if consciousness does not occur; further doses of 0.5 mg (5 ml) can be given over 30 sec at intervals of 1 min up to cumulative dose of 3 mg
**Child: IV** 10 mcg (0.01 mg/kg); cumulative dose of less than 1 mg

**Available forms:** Inj 0.1 mg/ml

### Implementation

**Direct IV route**
- Give directly undiluted or diluted in 0.9% NaCl, $D_5W$, or LR; give over 15-30 sec into running **IV**, check for extravasation
- Use large vein
- Check airway and **IV** access before administration
- Stable for 24 hr if drawn into a syringe or mixed with other solutions

## ADVERSE EFFECTS

**CNS:** Dizziness, agitation, emotional lability, confusion, seizures, somnolence, panic attacks
**CV:** Hypertension, palpitations, cutaneous vasodilatation, dysrhythmias, bradycardia, tachycardia, chest pain
**EENT:** Abnormal vision, blurred vision, tinnitus
**GI:** Nausea, vomiting, hiccups
**SYST:** Headache, inj site pain, increased sweating, fatigue, rigors

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Unknown |
| **Half-life** | 41-79 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1-2 min |
| **Peak** | 10 min |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Zaleplon, zolpidem: antagonize action

### Drug classifications

Benzodiazepines: antagonize action
Toxicity: mixed product overdosage

## NURSING CONSIDERATIONS

### Assessment

- Assess cardiac status using continuous monitoring
- Assess for seizures, protect patient from injury; most likely in those who usually experience withdrawal from sedatives
- Assess for GI symptoms: nausea, vomiting; place in side-lying position to prevent aspiration
- **Assess for allergic reactions:** flushing, rash, urticaria, pruritus
- **Pregnancy/breastfeeding:** Use only if benefits outweigh risks to the fetus, use cautiously in breastfeeding, it is not known if product is excreted in breast milk

**BLACK BOX WARNING: Seizures/benzodiazepine dependence:** Do not use in those who have used these products for interictal psychosis, status epilepticus, use in ICU cautiously where there may be unrecognized benzodiazepine dependence

- Teach patient not to use with alcohol or other medications for at least 24 hr
- Teach patient sedation may occur after treatment

### Evaluation

**Positive therapeutic outcome**
- Decreased sedation, respiratory depression
- Absence of toxicity

## flunisolide nasal agent

*See Appendix B*

## fluocinolone topical

*See Appendix B*

## fluorometholone ophthalmic

*See Appendix B*

**⚠ HIGH ALERT**

## fluorouracil (Rx)

(flure-oh-yoor'a-sil)
**Adrucil, Carac, Efudex, Fluoroplex, Tolak**
*Func. class.:* Antineoplastic, antimetabolite
*Chem. class.:* Pyrimidine antagonist

**Do not confuse:** Cara/Kuric

**ACTION:** Inhibits DNA, RNA synthesis; interferes with cell replication by competitively inhibiting thymidylate synthesis; cell cycle specific (S phase)

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES: Systemic:** cancer of breast, colon, rectum, stomach, pancreas; **Topical:** superficial basal cell carcinoma; multiple actinic keratoses

**Unlabeled uses:** Anal, biliary tract, cervical, head and neck, hepatocellular, and ovarian cancers

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, poor nutritional status, serious infections, dihydropyrimidine dehydrogenase deficiency (DPD), bone marrow suppression

**Precautions:** Children, renal/hepatic disease, angina, stomatitis, diarrhea, sunlight exposure, vaccination, occlusive dressing, GI bleeding

**BLACK BOX WARNING:** Requires a specialized care setting and experienced clinician

## DOSAGE AND ROUTES

Doses vary widely, doses are based on actual body weight, unless obese, then based on lean body weight

### Colon, rectal, breast, stomach, pancreatic cancer

**Adult: IV** 12 mg/kg/day × 4 days (max 800 mg), then 6 mg/kg on days 6, 8, 10, 12 if no toxicity, then 10-15 mg/kg as a single dose weekly maintenance dose (max 1 g/wk); *poor-risk patients:* 6 mg/kg/day × 3 days, then 3 mg/kg on days 5, 7, 9 if no toxicity (max 400 mg/day)

### Actinic/solar keratoses

**Adult:** TOP, (Carac) 1% cream/solution bid or 2%-5% SOL for hands

### Superficial basal cell carcinoma

**Adult:** TOP, (Efudex) 5% cream/solution 2 ×/day × 3-12 wk

**Available forms:** Inj 50 mg/ml; cream 0.5%, 1%, 4%, 5%; topical solution, 2%, 5%

### Implementation

- Avoid contact with skin (very irritating); wash completely to remove
- Give fluids **IV** or PO before chemotherapy to hydrate patient
- Give antiemetic 30-60 min before giving product to prevent vomiting, and prn for several days thereafter; antibiotics for prophylaxis of infection
- Provide liquid diet: carbonated beverages; gelatin may be added if patient is not nauseated or vomiting
- Rinse mouth tid-qid with water, club soda; brush teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

**Topical route**

- The 1% strength is used on face, other higher strengths are used on other parts of the body
- Wear gloves when applying; may use with a loose dressing; use a plastic or wooden applicator, do not use occlusive dressings; may use gauze dressing

**IV route**

- Prepare in biological cabinet using gloves, gown, mask
- Double-check all amounts and type of product to be used, fatalities have occurred
- **IV Direct:** undiluted; may inject through Y-tube or 3-way stopcock; give over 1-3 min
- May be diluted in 0.9% NaCl, $D_5W$; given as an **Intermittent infusion:** infusion in plastic containers over 2-8 hr; do not refrigerate/freeze; protect from light; discard unused portion, stable for 24 hr at room temperature; do not use discolored, cloudy solution; solution is pale yellow; for crystals, dissolve by warming slowly and shaking; cool to body temperature before use

**Y-site compatibilities:** Acyclovir, alatrofloxacin, alfentanil, allopurinol, amifostine, amikacin, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, butorphanol, calcium gluconate, CARBOplatin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cimetidine, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, DAPTOmycin, dexamethasone, digoxin, DOCEtaxel, DOPamine, doripenem, DOXOrubicin liposomal, enalaprilat, ePHEDrine, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, leucovorin, levorphanol, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylPREDNISolone, metoprolol, metroNIDAZOLE, milrinone, mitoMYcin, mitoXANTRONE, morphine sulfate, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, ofloxacin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride/phosphates, procainamide, propofol, propranolol, ranitidine, remifentanil, riTUXimab, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, trastuzumab, vasopressin, vecuronium, vinBLAStine, vinCRIStine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** Droperidol, vinorelbine

## ADVERSE EFFECTS

### SYSTEMIC use

**CNS:** Lethargy, malaise, weakness, acute cerebellar dysfunction
**EENT:** Epistaxis, light intolerance, lacrimation
**GI:** *Anorexia, stomatitis,* diarrhea, nausea, vomiting, hemorrhage, enteritis, glossitis
**HEMA:** Thrombocytopenia, leukopenia, myelosuppression, anemia, agranulocytosis
**INTEG:** *Rash,* fever, photosensitivity, anaphylaxis, alopecia, hand-foot syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely bioavailable (**IV**), minimal (topical) |
| **Distribution** | Widely distributed, concentration in tumor |
| **Metabolism** | Liver, converted to active metabolite |
| **Excretion** | Lungs (60%-80%), kidneys (up to 15%) |
| **Half-life** | 16 min (IV) |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Leucovorin: increased toxicity, bone marrow depression
MetroNIDAZOLE: increased toxicity, irinotecan
Phenytoin: decreased effect of phenytoin
Radiation: increased toxicity, bone marrow suppression

### Drug classifications

Anticoagulants, NSAIDs, platelet inhibitors, thrombolytics: increased bleeding
Antineoplastics: increased toxicity, bone marrow depression
Live virus vaccines: decreased antibody response

### Drug/lab test

Increased: AST, ALT, LDH, serum bilirubin, Hct, Hgb, WBC, platelets, 5-HIAA
Decreased: albumin

## NURSING CONSIDERATIONS

### Assessment

- Monitor ECG; watch for ST-T wave changes, low QRS and T, possible dysrhythmias (sinus tachycardia, heart block, PVCs)
- Assess buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine)
- Assess tachypnea, ECG changes, dyspnea, edema, fatigue; identify dyspnea, crackles, unproductive cough, chest pain, tachypnea
- **Bone marrow suppression:** Monitor daily during IV treatment: monitor CBC, differential, platelet count daily (**IV**); withhold product if WBC is $<4000/mm^3$ or platelet count is $<100,000/mm^3$; notify prescriber of results if WBC $<20,000/mm^3$, platelets $<50,000/mm^3$; nadir of leukopenia within 2 wk, recovery 1 mo; if pretreatment of WBC $<2000/mm^3$ or platelets $<100,000/mm^3$, delay until recovery of counts above this level; nadir usually 9-14 days, recovery 30 days

**BLACK BOX WARNING:** Use only in a specialized care setting and with experienced clinician

- **Palmar-plantar erythrodysesthesia:** hand/foot tingling changing to pain, redness
- **Infiltration:** monitor frequently for pain, redness, inflammation at site; if present, stop infusion and start at new site; may use ice at site
- Monitor renal function studies: BUN, creatinine, serum uric acid, urine CCr before, during therapy; I&O ratio; report fall in urine output to $<30$ ml/hr
- Monitor temp q4hr (may indicate beginning of infection)
- Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; jaundice of skin, sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea
- **Assess for bleeding:** hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr; avoid IM injections, rectal temperatures, inflammation of mucosa, breaks in skin
- **Pregnancy/breastfeeding:** Assess for pregnancy before starting therapy, do not use in pregnancy, breastfeeding
- **Assess for infection:** (fever, chills, cough, sore throat) those with current infections should be treated prior to receiving 5-FU, the dose reduced or discontinued if infection occurs
- **Toxicity:** Assess for hemorrhage, severe vomiting, severe diarrhea, stomatitis, WBC $<3500/mm^3$, platelets $<100,000$ notify prescriber
- **Acute cerebellar dysfunction:** Monitor for dizziness, weakness

### Patient/family education

- Caution patient that contraceptive measures are recommended during therapy

• **Bleeding:** Teach patient to avoid using aspirin, NSAIDs, or ibuprofen-containing products, razors, commercial mouthwash because bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools), IM injections if counts are low
• **Instruct patient to report signs of anemia** (fatigue, headache, irritability, faintness, SOB)
• **Instruct patient to report signs of stomatitis** (bleeding, white spots, ulcerations in the mouth); tell patient to examine mouth daily, to report symptoms; viscous lidocaine (Xylocaine) may be used
• Teach patient to avoid crowds, persons with known infections
• Advise patient to avoid vaccinations during therapy, to use sunscreen or stay out of the sun to prevent burns; about hair loss; explore use of wigs or other products until hair regrowth occurs

### Evaluation

**Positive therapeutic outcome**
• Prevention of rapid division of malignant cells

## FLUoxetine (Rx)

(floo-ox′uh-teen)
**PROzac, PROzac Weekly, Sarafem**
*Func. class.:* Antidepressant, selective serotonin reuptake inhibitor

**Do not confuse:** FLUoxetine/Loxitane, PROzac/Prograf/Provera/PriLOSEC, Sarafem/Serophene, FLUoxetine/DULoxetine/Loxitane, PARoxetine

**ACTION:** Inhibits CNS neuron uptake of serotonin but not of norepinephrine

**Therapeutic outcome:** Decreased symptoms of depression after 2-3 wk

**USES:** Major depressive disorder, obsessive-compulsive disorder (OCD), bulimia nervosa; *Sarafem:* premenstrual dysphoric disorder (PMDD), panic disorder

**Unlabeled uses:** Alcoholism, anorexia nervosa, borderline personality disorder, obesity, posttraumatic stress disorder, social phobia

## CONTRAINDICATIONS

Hypersensitivity, MAOI therapy

**Precautions:** Pregnancy, breastfeeding, geriatric, diabetes mellitus, narrow-angle glaucoma, cardiac malformations in infants (exposed to FLUoxetine in utero), osteoporosis, QT prolongation

**BLACK BOX WARNING:** Children, suicidal ideation

## DOSAGE AND ROUTES

### Depression/OCD

**Adult:** PO 20 mg/day AM; after 4 wk if no clinical improvement is noted, dosage may be increased to 20 mg bid in AM, afternoon; max 80 mg/day; PO 90 mg weekly
**Geriatric:** PO 10 mg/day, increase as needed
**Child 7-17 yr:** PO 5-10 mg/day, max 20 mg/day

### Alcoholism (unlabeled)

**Adult:** PO 20-80 mg/day

### Anorexia nervosa (unlabeled)

**Adult:** PO 10 mg every other day-20 mg/day

### Borderline personality disorder (unlabeled)

**Adult:** PO 20 mg/day, max 80 mg/day

### Kleptomania (unlabeled)

**Adult:** PO 60-80 mg/day

### Posttraumatic stress disorder (unlabeled)

**Adult:** PO 10-80 mg/day

### Premenstrual dysphoric disorder (Sarafem)

**Adult:** PO 20 mg/day, may be taken daily 14 days before menses

**Available forms:** Caps 10, 20, 40 mg; tabs 10, 20, 60 mg; oral sol 20 mg/5 ml; del rel caps (PROzac Weekly) 90 mg

### Implementation

• Give without regard to meals
• Give dose at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric may not tolerate once/day dosing, crush if patient unable to swallow whole (tabs only), immediate-release product should be given in AM unless sedation occurs
• **PROzac Weekly:** Give on same day each week, swallow whole, do not crush, cut, chew
• Store at room temperature; do not freeze
• Sarafem is only used for premenstrual dysphoric disorder

## ADVERSE EFFECTS

**CNS:** *Headache, nervousness, insomnia, drowsiness, anxiety, tremor, dizziness, fatigue, sedation, poor concentration, abnormal dreams, agitation,* seizures, apathy, euphoria, hallucinations, delusions, psychosis, suicidal ideation, neuroleptic malignant syndrome–like reactions, serotonin syndrome

**CV:** *Hot flashes, palpitations,* angina pectoris, hemorrhage, hypertension, tachycardia, 1st-degree AV block, bradycardia, MI, thrombophlebitis, generalized edema, torsades de pointes
**EENT:** Visual changes, ear/eye pain, photophobia, tinnitus, increased intraocular pressure
**GI:** *Nausea, diarrhea, dry mouth, anorexia, dyspepsia, constipation,* taste changes, flatulence, decreased appetite
**GU:** *Dysmenorrhea, decreased libido, urinary frequency, urinary tract infection,* amenorrhea, cystitis, impotence, urine retention
**INTEG:** *Sweating, rash, pruritus,* acne, alopecia, urticaria; angioedema, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis
**MS:** *Pain,* arthritis, twitching
**RESP:** *Pharyngitis, cough, dyspnea, bronchitis,* asthma, hyperventilation, pneumonia
**SYST:** *Asthenia,* serotonin syndrome, flulike symptoms, neonatal abstinence syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Crosses blood-brain barrier |
| **Metabolism** | Liver, extensively to norfluoxetine by CYP2D6 isoenzyme, some patients may be poor metabolizers |
| **Excretion** | Kidneys, unchanged (12%), metabolite (7%); steady state 28-35 days, protein binding 94% |
| **Half-life** | 1-3 days metabolite up to 1 wk |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 6-8 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Antidiabetics: increased levels or toxicity
Bosentan, budesonide, carBAMazepine, darifenacin, diazePAM, digoxin, donepezil, lithium, paricalcitol, phenytoin, thioridazine, vinBLAStine, warfarin: increased toxicity
Cyproheptadine: decreased FLUoxetine effect
BusPIRone, haloperidol, loxapine, selegiline, thiothixene, tryptophan: increased serotonin syndrome, do not use concurrently

### Drug classifications

Increase: QT prolongation: pimozide, thioridazine, antidysrythmics class III
Anticoagulants, NSAIDs, platelet inhibitors, salicylates, thrombolytics: increased bleeding risk
Antidepressants, opioids, sedative/hypnotics: increased CNS depression
MAOIs, linezolid, methylene blue: hypertensive crisis, seizures; do not use with or 14 days prior to FLUoxetine
SSRIs, SNRIs, serotonin-receptor agonists, tricyclics: increased serotonin syndrome, do not use concurrently

### Drug/herb

Hops, kava, lavender, valerian: increased CNS effect
St. John's wort, SAM-e: do not use together; increased risk of serotonin syndrome

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P (lying, standing), pulse; if systolic B/P drops 20 mm hg, hold product and notify prescriber; take VS q4hr in patients with CV disease
- Monitor **blood studies:** CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy; check platelets, bleeding can occur; thyroid growth rate (children)
- Monitor **hepatic studies:** AST, ALT, bilirubin
- Check weight qwk; appetite may increase with product
- Assess ECG for flattening of T-wave, bundle branch block, AV block, dysrhythmias in cardiac patients
- **Pregnancy/breastfeeding:** Use in pregnancy only if benefits outweigh risks to the fetus, avoid use in breastfeeding, excreted in breast milk

**BLACK BOX WARNING:** Assess mental status: mood, sensorium, affect, suicidal tendencies; increase in psychiatric symptoms: depression, panic; monitor for seizures; seizure potential is increased; Sarafem is not approved for children

- **Beers:** Avoid use in older adults unless safer alternative is not available, may cause ataxia, impaired psychomotor function
- Monitor urinary retention, constipation; constipation is more likely to occur in children or geriatric
- Identify patient's alcohol consumption; if alcohol is consumed, hold dose until AM
- **QT prolongation:** May be more severe in those with history of QT prolongation, if thioridazine is being used discontinue for 5 wk before using this product
- **Neuroleptic malignant syndrome:** Fever, seizures, diaphoresis, dyspnea, hyper/hypotension, report immediately

- **Serotonin syndrome:** symptoms can occur anytime after first dose, nausea/vomiting, sedation, dizziness, diaphoresis, mental changes, elevated B/P; if these occur product should be stopped, notify prescriber
- **Assess appetite in bulimia nervosa,** monitor weight daily, increase nutritious foods in diet, watch for bingeing and vomiting
- **Serious skin reactions:** angioedema, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis
- **Assess allergic reactions:** itching, rash, urticaria, product should be discontinued; may need to give antihistamine

### Patient/family education

- Teach patient that therapeutic effects may take 1-4 wk, not to discontinue abruptly, that follow-up will be required
- Instruct patient to use caution in driving or other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing, especially geriatric; to use sunscreen to prevent photosensitivity
- Caution patient to avoid alcohol ingestion, other CNS depressants
- Teach patient that decreased libido, erectile dysfunction may occur
- Advise patient not to discontinue medication quickly after long-term use: may cause nausea, headache, malaise
- Instruct patient to increase fluids, bulk in diet if constipation, urinary retention occur, especially geriatric
- Advise patient to take gum, hard sugarless candy, or frequent sips of water for dry mouth
- Teach patient to avoid all OTC products unless approved by prescriber
- Advise patient to notify prescriber if allergic reactions occur (rash, trouble breathing, itching)
- Advise patient to change positions slowly, orthostatic hypotension may occur
- Teach that suicidal thoughts, behavior may occur in young adults, children, usually during early treatment
- Inform patient to notify prescriber of worsening symptoms or if insomnia, anxiety, or depression continues
- **Serotonin syndrome:** Teach patient to report fever, sweating, diarrhea, poor coordination, nausea/vomiting, sedation, flushing, mental changes

### Evaluation

**Positive therapeutic outcome**

- Decrease in depression
- Absence of suicidal thoughts
- Decreased symptoms of OCD

## TREATMENT OF OVERDOSE:

Supportive care

## flurandrenolide topical

*See Appendix B*

## flurbiprofen ophthalmic

*See Appendix B*

**⚠ HIGH ALERT**

## flutamide (Rx)

(floo'ta-mide)

**Euflex** 🍁

*Func. class.:* Antineoplastic hormone

*Chem. class.:* Antiandrogen

F

**ACTION:** Interferes with androgen uptake in the nucleus or androgen activity in target tissues; arrests tumor growth in androgen-sensitive tissue (i.e., prostate gland)

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Metastatic prostatic carcinoma, stage ($B_2$, C, $D_2$) $D_2$ in combination with LHRH agonistic analogs (leuprolide), $B_2$-C in combination with goserelin and radiation

## CONTRAINDICATIONS

Pregnancy, hypersensitivity

**BLACK BOX WARNING:** Severe hepatic disease

**Precautions:** G6PD deficiency, hemoglobinopathy, lactase deficiency, polycystic ovary syndrome, tobacco smoking

## DOSAGE AND ROUTES

**Adult:** PO 250 mg q8hr for a daily dose of 750 mg

**Available forms:** Caps 125, 250 🍁 mg

### Implementation

- Used in combination with LHRH agonist (leuprolide)
- Give without regard to food with a full glass of water
- Use cytotoxic handling procedures

## ADVERSE EFFECTS

**CNS:** *Hot flashes,* drowsiness, confusion, depression, anxiety, paresthesia

**GI:** *Diarrhea, nausea, vomiting,* increased liver function studies, hepatitis, anorexia, hepatotoxicity, abdominal pain, cholestasis, hepatic necrosis/failure

**GU:** *Decreased libido, impotence, gynecomastia*
**HEMA:** Leukopenia, thrombocytopenia, hemolytic anemia
**INTEG:** Irritation at site, rash, photosensitivity
**MISC:** Edema, neuromuscular and pulmonary symptoms, hypertension, secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown; protein binding |
| **Metabolism** | Liver |
| **Excretion** | Unknown |
| **Half-life** | 6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Leuprolide: decreased flutamide action
Warfarin: increased PT

### Drug/lab test

Increased: LFTs, BUN, creatinine
Decreased: WBC, platelets

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Severe hepatic disease:** Monitor before start of therapy and q month × 4 months, monitor AST, ALT, alkaline phosphatase, which may be elevated; product may need to be discontinued; CBC, bilirubin, creatinine periodically

- Identify CNS symptoms: drowsiness, confusion, depression, anxiety

### Patient/family education

- Tell the patient to report side effects: decreased libido, impotence, breast enlargement, hot flashes, diarrhea, which occur when the two products are given together; also nausea, vomiting; jaundice in eyes, skin; dark urine, clay-colored stools; hepatotoxicity may occur
- Inform patient that this product is taken with leuprolide for medical castration; do not change dosing
- Advise patient to use contraception during treatment
- Teach patient to use with full glass of water, without regard to food

### Evaluation

**Positive therapeutic outcome**
- Prevention of rapid division of malignant cells

## fluticasone (Rx)

(floo-tic'a-sone)
**Flonase, Flovent HFA, Flovent Diskus, Veramyst (nasal spray)**
*Func. class.:* Corticosteroids, inhalation; antiasthmatic

**Do not confuse:** Flonase/Flovent

**ACTION:** Decreases inflammation by inhibiting mast cells, macrophages, and leukotrienes; antiinflammatory and vasoconstrictor properties

**Therapeutic outcome:** Decreased severity of asthma

**USES:** Prevention of chronic asthma during maintenance treatment in those requiring oral corticosteroids; nasal symptoms of seasonal/perennial and allergic/nonallergic rhinitis

## CONTRAINDICATIONS

Hypersensitivity to this product or milk protein, primary treatment in status asthmaticus, acute bronchospasm

**Precautions:** Pregnancy, breastfeeding, active infections, glaucoma, diabetes, immunocompromised patients, Cushing syndrome

## DOSAGE AND ROUTES

**Prevention of chronic asthma during maintenance treatment in those requiring oral corticosteroids**

**>> Flovent HFA**

**Adult and child ≥12 yr:** INH 88-440 mcg bid (in those previously taking bronchodilators alone); INH 88-220 mcg bid, max 440 mcg bid (in those previously taking inhaled corticosteroids); INH 440 mcg bid, max 880 mcg bid (in those previously taking oral corticosteroids)
**Child 4-11 yr:** INH 88 mg bid

**>> Flovent Diskus**

**Adult and child ≥12 yr:** INH 100 mcg bid, max 500 mcg bid (in those previously taking bronchodilators alone); INH 100-250 mcg bid, max 500 mcg bid (in those previously taking inhaled corticosteroids); INH 500-1000 mcg bid, max 1000 mcg bid (in those previously taking oral corticosteroids)
**Child 4-11 yr:** INH initially 50 mcg bid, max 100 mcg bid (in those previously taking bronchodilators alone or inhaled corticosteroids)

### >> Arnuity Ellipta

**Adult, child ≥ 12 yr:** INH 100 mcg via oral inhalation qday initially, may increase to 200 mcg qday after 2 wk, max 200 mcg/day

### Nasal symptoms of seasonal, perennial allergic, nonallergic rhinitis

### >> Flonase

**Adult:** Nasal 2 sprays initially, in each nostril per day or 1 spray bid, when controlled, lower to 1 spray in each nostril per day

**Adolescent/child >4 yr:** Nasal 1 spray in each nostril per day, may increase to 2 sprays in each nostril per day, when controlled, lower to 1 spray in each nostril per day

### >> Veramyst

**Adult/child ≥12 yr:** Nasal 2 sprays in each nostril per day

**Child 2-11 yr:** Nasal 1 spray in each nostril per day

**Available forms:** Oral inh aerosol 44, 110, 220 mcg; oral inh powder 50, 100, 250 mcg; nasal spray (Veramyst) 27.5 mcg/actuation, (propionate) 50 mcg/actuation, 27.5 mcg/spray (furoate); inhalation powder 100, 200 mcg/actuation (Arnuity Ellipta)

### Implementation

- Give at 1 min intervals
- Decrease dose to lowest effective dose after desired effect; decrease dose at 2- to 4-wk intervals
- Blow nose prior to use

**Inhalation route: powder for oral inhalation (Flovent Diskus)**

- Fill in the "Pouch opened" and "Use by" dates in the blank lines on the label. The "Use by" date for Flovent diskus 50 mcg is 6 wk from the date the pouch is opened. The "Use by" date for diskus 100 mcg and 250 mcg is 2 months from the date pouch is opened
- Open the diskus by holding in one hand and using the thumb of the other to push the thumbgrip away as far as it will go until the mouthpiece shows and snaps into place
- Hold and slide the lever away from the patient as far as it will go until it clicks. The number on the dose counter will count down by 1; the diskus is now ready to use
- Before inhaling the dose, have patient breathe out, hold the diskus level and away from the mouth. Breathe out into the mouthpiece
- Instruct the patient to put the mouthpiece to the lips and breathe in through the mouth quickly and deeply through the diskus. The patient should then remove the diskus from the mouth, hold breath for about 10 sec, and breathe out slowly
- After taking a dose, close the diskus by sliding the thumbgrip back as far as it will go. The diskus will click shut. The lever will automatically return to its original position
- The counter displays how many doses are left. The counter number will count down each time the patient uses the diskus. After 55 doses (23 doses from the sample pack), numbers 5 to 0 appear in red to warn that there are only a few doses left
- After use, instruct patient to rinse mouth with water and spit out the water; patient should not swallow it
- To avoid the spread of infection, do not use the inhaler for more than one person

**Intranasal**

- Prime before first use
- Shake well before each use
- Rinse tip after use, dry with tissue

## ADVERSE EFFECTS

**CNS:** Fever, headache, nervousness, dizziness, fatigue, migraines, numbness in fingers

**EENT:** *Pharyngitis,* sinusitis, rhinitis, laryngitis, hoarseness, dry eyes, cataracts, nasal discharge, epistaxis, blurred vision

**GI:** Diarrhea, abdominal pain, nausea, vomiting, *oral candidiasis,* gastroenteritis

**GU:** UTI

**INTEG:** Urticaria, dermatitis

**META:** Hyperglycemia, growth retardation in children, cushingoid features

**MISC:** Influenza, eosinophilic conditions, angioedema, Churg-Strauss syndrome, adrenal insufficiency (high doses), bone mineral density reduction

**MS:** Osteoporosis, muscle soreness, joint pain, arthralgia

**RESP:** *Upper respiratory infection,* dyspnea, cough, bronchitis, bronchospasm

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 30% aerosol, 13.5% powder |
| **Distribution** | Protein binding 91% |
| **Metabolism** | In liver after absorption in lung |
| **Excretion** | <5% in urine and feces |
| **Half-life** | 7.8 hr |

### Pharmacodynamics

| | Intranasal | INH |
|---|---|---|
| **Onset** | 12 hr | 24 hr |
| **Peak** | Several days | Several days |
| **Duration** | 1-2 wk | 1-2 wk |

## INTERACTIONS

### Individual drugs

Amprenavir, atazanavir, darunavir, delavirdine, fosamprenavir, nelfinavir, ritonavir, saquinavir: increased fluticasone levels

Isoproterenol (asthma patients): increased cardiac toxicity

Mecasermin: decreased effects of mecasermin

### Drug classifications

CYP3A4 inhibitors (ketoconazole, itraconazole): increased fluticasone levels

## NURSING CONSIDERATIONS

### Assessment

- **Assess respiratory status:** lung sounds, pulmonary function tests during and several months after change from systemic to inhalation corticosteroids
- Assess for withdrawal symptoms from oral corticosteroids: depression, pain in joints, fatigue
- **Monitor adrenal insufficiency:** nausea, weakness, fatigue, hypotension, hypoglycemia, anorexia; may occur when changing from systemic to inhalation corticosteroids; may be life-threatening
- Monitor growth rate in children; blood glucose, serum potassium in all patients
- Monitor adrenal function tests periodically: hypothalamic-pituitary-adrenal axis suppression in long-term treatment
- **Pregnancy/breastfeeding:** Use in pregnancy only if benefits outweigh risks, avoid use in breastfeeding
- **Beers:** Avoid use in older adults with or at high risk of delirium; may worsen delirium

### Patient/family education

- **Teach patient to report immediately cushingoid symptoms:** no appetite, nausea, weakness, fatigue, decreased B/P
- Teach patient how to use and when it may be empty
- Advise patient to use bronchodilator first before using inhalation, if taking both
- Caution patient not to use for acute asthmatic attack; acute asthma may require oral corticosteroids
- Advise patient to avoid smoking, smoke-filled rooms, those with URIs, those not immunized against chickenpox or measles
- Advise patient to use medical ID identifying corticosteroid use

### Evaluation

#### Positive therapeutic outcome

- Decreased severity of asthma, COPD, allergies

## fluticasone topical

*See Appendix B*

## fluvastatin (Rx)

(flu′vah-stay-tin)

**Lescol, Lescol XL**

*Func. class.:* Antilipidemic

*Chem. class.:* HMG-CoA reductase inhibitor

**ACTION:** Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis

**Therapeutic outcome:** Decreased cholesterol levels and LDLs, increased HDLs

**USES:** As an adjunct in primary hypercholesterolemia (types Ia, Ib), coronary atherosclerosis in CAD; secondary prevention of coronary events in patients with CAD; adjunct to diet to reduce LDL, total cholesterol, apo B levels in heterozygous familial hypercholesterolemia (LDL-C ≥190 mg/dl) or LDL-C >160 mg/dl with history of premature CV disease

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, active liver disease

**Precautions:** Past liver disease, alcoholism, severe acute infections, trauma, hypotension, uncontrolled seizure disorders, severe metabolic disorders, electrolyte imbalance, myopathy, rhabdomyolysis

## DOSAGE AND ROUTES

**Adult:** PO 20-40 mg/day in PM initially, usual range 20-80 mg, max 80 mg; may be given in 2 doses (40 mg AM, 40 mg PM); dosage adjustments may be made in 4-wk intervals

### Heterozygous familial hypercholesterolemia

**Adolescent ≥1 yr postmenarche (10-16 yr):** PO 20 mg daily at bedtime, may increase q6wk, max 40 mg bid (cap) or 80 mg (ext rel)

**Available forms:** Caps 20, 40 mg; ext rel tab 80 mg

### Implementation

- Give without regard to food at any time of day (tab) or in the evening (cap)
- Store at room temperature, protected from light

## ADVERSE EFFECTS

**CNS:** Headache, dizziness, insomnia, confusion

**EENT:** Lens opacities

**GI:** *Nausea, constipation, diarrhea, abdominal pain, cramps, dyspepsia, flatus,* liver dysfunction, pancreatitis

**HEMA:** Thrombocytopenia, hemolytic anemia, leukopenia

**INTEG:** Rash, pruritus
**MISC:** Fatigue, influenza, photosensitivity
**MS:** Myalgia, *arthritis, arthralgia,* myositis, rhabdomyolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Steady state 4-5 wk |
| **Metabolism** | Liver |
| **Excretion** | Feces, kidneys |
| **Half-life** | 9 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol, cimetidine, ranitidine, omeprazole: increased fluvastatin effect, rifampin
Cholestyramine, colestipol: decreased fluvastatin effect; separate by ≥4 hr
Colchicine, cycloSPORINE, niacin: increased myopathy
Digoxin, phenytoin, warfarin: increased action, monitor closely
Fluconazole, itraconazole, ketoconazole: increased adverse reactions
TraMADol: increased serotonin syndrome

### Drug classifications

Fibric acid derivatives, protease inhibitors: increased myopathy, erythromycin

### Drug/herb

Red yeast rice: increased adverse reactions
Gotu kola, St. John's wort: decreased effect

### Drug/lab test

Increased: LFTs, CK
Decreased: platelets, WBC

## NURSING CONSIDERATIONS

### Assessment

- **Hypercholesterolemia:** Assess nutrition: fat, protein, carbohydrates; nutritional analysis should be completed by dietitian before treatment
- Assess fasting lipid profile (cholesterol, LDL, HDL, triglycerides) q4-6wk, then q3-6mo when stable
- Monitor bowel pattern daily; diarrhea may be a problem
- **Hepatotoxicity/pancreatitis:** Monitor liver function studies q1-2mo during the first 1½ yr of treatment; AST, ALT, liver function test results may be increased
- Monitor renal studies in patients with compromised renal system: BUN, I&O ratio, creatinine
- Obtain ophth exam before, 1 mo after treatment begins, annually; lens opacities may occur
- **Myopathy, rhabdomyolysis:** Assess for muscle pain, tenderness; obtain baseline CPK, if elevated or if symptoms occur, product should be discontinued
- **Pregnancy/breastfeeding:** Do not use in pregnancy/breastfeeding

### Patient/family education

- Inform patient that compliance is needed for positive results to occur, not to double doses
- Advise patient to notify prescriber if GI symptoms of diarrhea, abdominal or epigastric pain, nausea, vomiting, or if chills, fever, sore throat occur; also muscle pain, weakness, tenderness
- Advise patient that blood studies and eye exam will be necessary during treatment, that effect may take ≥4 wk
- Instruct patient to report suspected pregnancy, not to use during pregnancy or breastfeeding
- Advise patient that previously prescribed regimen will continue, including diet, exercise, smoking cessation
- Instruct patient to notify all health care providers of products taken
- Teach patient to take without regard to meals, to take immediate release product in the evening, to separate by ≥4 hr with bile-acid product

### Evaluation

**Positive therapeutic outcome**

- Decreased LDL, VLDL, total cholesterol levels
- Improved ratio of HDLs

## folic acid (vitamin $B_9$) (PO, OTC; IM/IV, Ph)

(foe-lik a'sid)
**Apo-Folic, Folvite, Novo-Folacid**
*Func. class.:* Vitamin B-complex group, water-soluble vitamin
*Chem. class.:* Supplement

**ACTION:** Needed for erythropoiesis; increases RBC, WBC, and platelet formation in megaloblastic anemias

**Therapeutic outcome:** Absence of macrocytic, megaloblastic anemias

**USES:** Megaloblastic or macrocytic anemia caused by folic acid deficiency; liver disease; alcoholism; hemolysis; intestinal obstruction; pregnancy; to reduce risk of neural tube defect

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, anemias other than megaloblastic/macrocytic anemia, vit $B_{12}$ deficiency anemia, uncorrected pernicious anemia

## DOSAGE AND ROUTES

### RDA

**Adult (pregnant/breastfeeding):** PO 600 mcg/day
**Adult and child ≥14 yr:** PO 400 mcg
**Child 9-13 yr:** PO 300 mcg
**Child 4-8 yr:** PO 200 mcg
**Child 1-3 yr:** PO 150 mcg
**Infant 6 mo-1 yr:** PO 80 mcg
**Neonate and infant <6 mo: PO 65 mcg**

### Megaloblastic/macrocytic anemia due to folic acid or nutritional deficiency

**Pregnant/lactating:** PO 800-1000 mcg

### Therapeutic dose

**Adult and child:** PO/IM/SUBCUT/**IV** up to 1 mg/day

### Maintenance dose

**Adult and child >4 yr:** PO/IM/**IV**/SUBCUT 0.4 mg/day
**Child <4 yr:** PO/IM/**IV**/SUBCUT up to 0.3 mg/day
**Infant:** PO/IM/**IV**/SUBCUT up to 0.1 mg/day
**Pregnant/lactating:** PO/IM/**IV**/SUBCUT 0.8-1 mg/day

### Prevention of neural tube defects during pregnancy

**Adult:** PO 0.6 mg/day

### Prevention of megaloblastic anemia during pregnancy

**Adult:** PO/IM/SUBCUT up to 1 mg/day during pregnancy

### Tropical sprue

**Adult:** PO 3-15 mg/day

**Available forms:** Tabs 0.1, 0.4, 0.8, 1, 5 mg; inj 5, 10 mg/ml

### Implementation

**SUBCUT route**
- Do not inject intradermally

**IM route**
- Inject deeply in large muscle mass, aspirate

**Direct IV route**
- Give **IV** directly, undiluted 5 mg or less over 1 min or more

**Continuous IV route**
- May be added to most **IV** sol or TPN
- Store in light-resistant container

## ADVERSE EFFECTS

**CNS:** Confusion, depression, excitability, irritability
**GI:** Anorexia, nausea, bitter taste
**INTEG:** Flushing, pruritus, rash, erythema
**RESP:** Bronchospasm
**SYST:** Anaphylaxis (rare)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Liver, crosses placenta |
| **Metabolism** | Liver (converted to active metabolite) |
| **Excretion** | Kidneys (unchanged) |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | ½-1 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CarBAMazepine: increased need for folic acid
Fosphenytoin: decreased fosphenytoin levels, may increase seizures
Methotrexate, sulfaSALAzine, trimethoprim: decreased action of folic acid
Phenytoin: decreased phenytoin levels, may increase seizures

### Drug classifications

Estrogens, glucocorticoids, hydantoins: increased need for folic acid
Sulfonamides: decreased action of folic acid

## NURSING CONSIDERATIONS

### Assessment

- **Megaloblastic anemia:** Assess patient for fatigue, dyspnea, weakness, activity intolerance (signs of megaloblastic anemia)
- Monitor Hgb, Hct, and reticulocyte count; folate levels: 6-15 mcg/ml baseline, throughout treatment
- Assess nutritional status: bran, yeast, dried beans, nuts, fruits, fresh vegetables, asparagus; if high folic acid foods are missing from the diet, a referral to a dietitian may be indicated
- Identify products currently taken: alcohol, oral contraceptives, estrogens, methotrexate, trimethoprim, carBAMazepine, hydantoins, trimethoprim; these products may cause increased folic acid use by the body and contribute to deficiency if taking other neurotoxic products
- **Pregnancy/breastfeeding:** May use in pregnancy, breastfeeding

### Patient/family education

- Advise patient to take product exactly as prescribed; not to double doses, toxicity may occur

- Instruct patient to notify prescriber of side effects; rash or fever may indicate hypersensitivity
- Advise patient that urine may become more yellow
- Instruct patient to increase intake of foods rich in folic acid in diet as recommended by dietitian or health care provider
- Advise patient to avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Absence of fatigue, weakness, dyspnea
- Absence of symptoms of megaloblastic anemia
- Increase in reticulocyte count within 5 days
- Absence of neural tube defect

**⚠ HIGH ALERT**

## fondaparinux (Rx)

(fon-dah-pair'ih-nux)

**Arixtra**

*Func. class.:* Anticoagulant, antithrombotic

*Chem. class.:* Synthetic, selective factor Xa inhibitor

**Do not confuse:** Arixtra/Anti-Xa/Arista AH

**ACTION:** Inhibits factor Xa; interrupts blood coagulation and inhibits thrombin formation; does not inactivate thrombin (activated factor II) or affect platelets

**Therapeutic outcome:** Prevention of deep vein thrombosis

**USES:** Prevention/treatment of deep vein thrombosis, pulmonary emboli in hip and knee replacement, hip fracture or abdominal surgery, acute MI, unstable angina

## CONTRAINDICATIONS

Hypersensitivity to this product; hemophilia, leukemia with bleeding, peptic ulcer disease, hemorrhagic stroke, surgery, thrombocytopenic purpura, weight <50 kg, severe renal disease (CCr <30 ml/min), active major bleeding, bacterial endocarditis

**Precautions:** Pregnancy, breastfeeding, children, geriatric, alcoholism, hepatic disease (severe), blood dyscrasias, heparin-induced thrombocytopenia, uncontrolled severe hypertension, acute nephritis, mild to moderate renal disease

**BLACK BOX WARNING:** Spinal/epidural anesthesia, lumbar puncture

## DOSAGE AND ROUTES

### Deep vein thrombosis/PE

**Adult <50 kg:** SUBCUT 5 mg/day × 5 days or more until INR is 2-3; give warfarin within 72 hr of fondaparinux

**Adult 50-100 kg:** SUBCUT 7.5 mg/day × 5 days or more until INR is 2-3; give warfarin within 72 hr of fondaparinux

**Adult >100 kg:** SUBCUT 10 mg/day × 5 days or more until INR is 2-3; give warfarin within 72 hr of fondaparinux

### Prevention of deep vein thrombosis

**Adult:** SUBCUT 2.5 mg/day, given 6 hr after surgery (hemostasis established); continue for 5-9 days; hip surgery up to 32 days; abdominal surgery up to 24 days

### Renal disease

**Adult:** Do not use if CCr <30 ml/min; CCr 30-50 ml/min, use cautiously

**Available forms:** Inj 2.5 mg/0.5 ml, 5 mg/0.4 ml, 7.5 mg/0.6 ml, 10 mg/0.8 ml prefilled syringes

### Implementation

- Do not mix with other products or solutions; cannot be used interchangeably (unit to unit) with other anticoagulants
- Give only after screening patient for bleeding disorders
- Store at 77° F (25° C); do not freeze

**SUBCUT route**

- Administer SUBCUT only; do not give IM
- Check for discolored sol or sol with particulate; if present, do not give
- Administer to recumbent patient, rotate inj sites (left/right anterolateral, left/right posterolateral abdominal wall), administer 6-8 hr after surgery
- Wipe surface of inj site with alcohol swab, twist plunger cap and remove, remove rigid needle guard by pulling straight off needle, do not aspirate, do not expel air bubble from surface
- Insert whole length of needle into skin fold held with thumb and forefinger
- When product is injected, a soft click may be felt or heard
- Give at same time each day to maintain steady blood levels
- Avoid all IM inj that may cause bleeding
- Administer only this product when ordered; not interchangeable with heparin

## ADVERSE EFFECTS

**CNS:** *Fever,* confusion, headache, dizziness, *insomnia*

**GI:** *Nausea, vomiting,* diarrhea, dyspepsia, *constipation,* increased AST, ALT
**GU:** UTI, urinary retention
**HEMA:** *Anemia,* minor bleeding, purpura, hematoma, thrombocytopenia, major bleeding (intracranial, cerebral, retroperitoneal hemorrhage), postoperative hemorrhage, heparin-induced thrombocytopenia
**INTEG:** Local reaction—*rash,* pruritus, inj site bleeding, increased wound drainage, bullous eruption
**META:** Hypokalemia
**MISC:** Hypotension, pain, *edema*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly, completely absorbed |
| **Distribution** | Blood; does not bind to plasma proteins except 94% to ATIII |
| **Excretion** | Eliminated unchanged in 72 hr in normal renal function |
| **Half-life** | 17-21 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3 hr |
| **Duration** | Unknown |

## INTERACTIONS

Do not mix with other products or inf fluids

### Individual drugs

Abciximab, clopidogrel, dipyridamole, eptifibatide, quiNIDine, tirofiban, valproic acid, some cephalosporins: increased risk of bleeding

### Drug classifications

NSAIDs, salicylates: increased risk of bleeding

### Drug/herb

Feverfew, garlic, ginger, ginkgo, ginseng, green tea, horse chestnut, kava: increased risk of bleeding

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Monitor patients who have received epidural/spinal anesthesia or lumbar puncture for neurological impairment, including spinal hematoma, may lead to permanent disability or paralysis

- **Hemorrhage:** Assess for hemorrhage if coadministered with other products that may cause bleeding
- Assess blood studies (Hct, CBC, coagulation studies, platelets, occult blood in stools), anti-Xa; if platelets $<100{,}000/mm^3$, treatment should be discontinued; renal studies: BUN, creatinine
- **Beers:** Avoid in older adults, increased risk of bleeding, lower creatinine clearance
- Assess for bleeding: gums, petechiae, ecchymosis, black tarry stools, hematuria; notify prescriber
- **Pregnancy/breastfeeding:** Use in pregnancy only if benefits outweigh risks to the fetus, avoid use in breastfeeding, it is not known if product is excreted in breast milk

### Patient/family education

- Advise patient to use soft-bristle toothbrush to avoid bleeding gums, to use electric razor
- Advise patient to report any signs of bleeding: gums, under skin, urine, stools
- Caution patient to avoid OTC products containing aspirin, NSAIDs

### Evaluation

**Positive therapeutic outcome**
- Absence of deep vein thrombosis

## formoterol (Rx)

(for-moh'ter-ahl)
**Foradil Aerolizer, Oxeze, Perforomist**
*Func. class.:* β-Adrenergic agonist
*Chem. class.:* Sympathomimetic catecholamine

**Do not confuse:** Foradil/Toradol

**ACTION:** Has $\beta_1$ and $\beta_2$ action; relaxes bronchial smooth muscle and dilates the trachea and main bronchi by increasing levels of cyclic AMP, which relaxes smooth muscles; causes increased contractility and heart rate by acting on β-receptors in the heart

**Therapeutic outcome:** Bronchodilatation, increased heart rate and cardiac output from action on β-receptors in heart

**USES:** Maintenance, treatment of asthma, COPD, prevention of exercise-induced bronchospasm

## CONTRAINDICATIONS

Hypersensitivity to sympathomimetics, monotherapy for asthma, COPD, status asthmaticus

**Precautions:** Pregnancy, geriatric, cardiac disorders, hyperthyroidism, diabetes mellitus, prostatic hypertrophy, hypertension, African descendants

**BLACK BOX WARNING:** Asthma-related death

## DOSAGE AND ROUTES

### Maintenance, treatment of asthma

**Adult and child ≥5 yr:** INH AM and PM long-term, 1 cap (12 mcg) q12hr using aerolizer inhaler

### Maintenance of COPD

**Adult:** INH 12 mcg q12hr

### Prevention of exercise-induced bronchospasm

**Adult and child ≥12 yr:** INH prn 1 cap (12 mcg) at least 15 min before exercise, do not use additional doses for ≥12 hr

**Available forms:** INH powder in cap 12 mcg; nebulizer sol for inhalation 20 mcg/2 ml

### Implementation

- Store at room temperature; protect from heat, moisture

**Inhalation route**

- Place cap in aerolizer inhaler; the cap is punctured; do not wash aerolizer inhaler
- Pull off cover, twist mouthpiece to open, push buttons in; make sure the four pins are visible; remove cap from blister pack, place cap in chamber; twist to close, press (a click will be heard), release; patient should exhale, place inhaler in mouth, inhale rapidly

## ADVERSE EFFECTS

**CNS:** Tremors, *anxiety*, insomnia, headache, dizziness, stimulation
**CV:** Palpitations, tachycardia, hypertension, chest pain
**GI:** Nausea, vomiting, xerostomia
**RESP:** Bronchial irritation, dryness of oropharynx, bronchospasms (overuse); infection, inflammatory reactions (child)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid (INH) |
| **Distribution** | Plasma protein binding 61%-64% at concentrations of 0.1-100 ng/mL; 31%-38% at concentrations of 5-500 ng/mL |
| **Metabolism** | Liver, lungs, GI tract |
| **Excretion** | Urine, feces |
| **Half-life** | 10 hr mean terminal elimination half-life |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 5 min (INH) |
| **Duration** | Unknown |

## INTERACTIONS

Amoxapine, arsenic trioxide, chloroquine, clarithromycin, dasatinib, dolasetron, droperidol, erythromycin, halofantrine, levomethadyl, ondansetron, paliperidone, palonosetron, pentamidine, probucol, ranolazine, SUNItinib, vorinostat, pimozide, risperiDONE, ziprasidone: increased QT prolongation

### Drug classifications

Class IA/III antidysrhythmics, phenothiazines, halogenated anesthetics, tricyclics, some quinolones: increase QT prolongation
β-blockers: decreased action of formoterol
MAOIs, antidepressants (tricyclics): serious dysrhythmias
Sympathomimetics, thyroid hormones, tricyclics, some quinolones: increased action of both products
Loop/thiazide diuretics: increased hypokalemia

## NURSING CONSIDERATIONS

### Assessment

- Assess respiratory function: B/P, pulse, lung sounds, be alert for bronchospasm may occur with this patient
- Cardiac status: Assess for hypertension, palpitations, tachycardia; if CV reactions occur, product may need to be discontinued
- Assess I&O ratio; check for urinary retention, frequency, hesitancy
- Assess for paresthesias and coldness of extremities; peripheral blood flow may decrease
- **Pregnancy/breastfeeding:** Use in pregnancy only if benefits outweigh risk, use cautiously in breastfeeding

### Patient/family education

- Review package insert with patient and inform about all aspects of product
- Teach correct use of inhaler; not to swallow caps
- Teach use of spacer device in children or geriatric
- Advise patient to avoid getting aerosol in eyes
- Advise patient to wash inhaler in warm water and dry daily
- Advise patient to avoid smoking, smoke-filled rooms, persons with respiratory infections

**BLACK BOX WARNING:** Asthma-related death, severe asthma exacerbations: if wheezing worsens and cannot be relieved during an acute asthma attack, immediate medical attention should be sought

### Evaluation

**Positive therapeutic outcome**

- Absence of dyspnea, wheezing
- Improved airway exchange
- Improved ABGs

## TREATMENT OF OVERDOSE:

Administer β-blocker

## foscarnet (Rx)

(foss-kar′net)

**Foscavir**

*Func. class.:* Antiviral

*Chem. class.:* Inorganic pyrophosphate organic analog

**ACTION:** Antiviral activity is produced by selective inhibition at the pyrophosphate binding site on virus-specific DNA polymerases and reverse transcriptases at concentrations that do not affect cellular DNA polymerases

**Therapeutic outcome:** Virostatic agents against CMV retinitis

**USES:** Treatment of CMV, retinitis in patients with AIDS acyclovir-resistant, herpes simplex virus (HSV) infections; used with ganciclovir for relapsing patients

## CONTRAINDICATIONS

Hypersensitivity, CCr <0.4 ml/min/kg

**Precautions:** Pregnancy, breastfeeding, children, geriatric, seizure disorders, severe anemia

**BLACK BOX WARNING:** Nephrotoxicity electrolyte/mineral imbalances, seizures

## DOSAGE AND ROUTES

### Acyclovir-resistant mucocutaneous herpes simplex virus infection (herpes labialis, herpes febrilis, herpes genitalis) in HIV-infected patients

**Adult/adolescent (unlabeled):** **IV** 40 mg/kg q8-12hr × 2-3 wk or until lesions are healed

### Cytomegalovirus (CMV) encephalitis (unlabeled); cytomegalovirus (CMV) neurological disease (unlabeled) (including encephalitis) in HIV-infected patients

**Adult/adolescent:** **IV** 90 mg/kg q12hr or 60 mg/kg q8hr × 3 wk (or until symptomatic improvement) with ganciclovir 5 mg/kg **IV** q12hr × 2-3 wk

### Encephalitis (unlabeled) caused by human herpesvirus 6 (HHV-6) in immunocompromised patients

**Adult:** **IV** 60 mg/kg q8hr or 90 mg/kg q12hr alone or in combination with ganciclovir 5 mg/kg **IV** q12hr

### Cytomegalovirus (CMV) retinitis or disseminated disease (unlabeled) in HIV-infected patients, recurrent or relapsed cytomegalovirus (CMV) retinitis in HIV-infected patients

**Adult:** **IV** Induction with 90 mg/kg q12hr or 60 mg/kg **IV** q8hr for 14-21 days, depending upon the clinical response

### Renal dose

**Adult:** HSV induction dosage equivalent to 80 mg/kg/day (40 mg/kg IV q12hr)

**Adult:** IV CCr >1.4 ml/min/kg: no change; CCr >1-1.4 ml/min/kg: decrease to 30 mg/kg q12hr; CCr >0.8-1 ml/min/kg: decrease to 20 mg/kg q12hr; CCr >0.6-0.8 ml/min/kg: decrease to 35 mg/kg/day; CCr >0.5-0.6 ml/min/kg: decrease to 25 mg/kg/day; CCr ≥0.4-0.5 ml/min/kg: decrease to 20 mg/kg/day; CCr <0.4 ml/min/kg: not recommended

### HSV induction dosage equivalent to 120 mg/kg/day (40 mg/kg IV q8hr)

**Adult:** IV CCr >1.4 ml/min/kg: no change; CCr >1-1.4 ml/min/kg: decrease to 30 mg/kg q8hr; CCr >0.8-1 ml/min/kg: decrease to 35 mg/kg q12hr; CCr >0.6-0.8 ml/min/kg: decrease to 25 mg/kg q12hr; CCr >0.5-0.6 ml/min/kg: decrease to 40 mg/kg/day; CCr ≥0.4-0.5 ml/min/kg: decrease to 35 mg/kg/day; CCr <0.4 ml/min/kg: not recommended

### CMV induction dosage equivalent to 180 mg/kg/day (60 mg/kg q8hr)

**Adult:** IV CCr >1.4 ml/min/kg: no change; CCr >1-1.4 ml/min/kg: decrease to 45 mg/kg q8hr; CCr >0.8-1 ml/min/kg: decrease to 50 mg/kg q12hr; CCr >0.6-0.8 ml/min/kg: decrease to 40 mg/kg q12hr; CCr >0.5-0.6 ml/min/kg: decrease to 60 mg/day; CCr ≥0.4-0.5 ml/min/kg: decrease to 50 mg/kg/day; CCr <0.4 ml/min/kg: not recommended

### CMV induction dosage equivalent to 180 mg/kg/day (90 mg/kg IV q12hr)

**Adult:** IV CCr >1.4 ml/min/kg: no change; CCr >1-1.4 ml/min/kg: decrease to 70 mg/kg q12hr; CCr >0.8-1 ml/min/kg: decrease to 50 mg/kg q12hr; CCrl >0.6-0.8 ml/min/kg: decrease to 80 mg/kg/day; CCr >0.5-0.6 ml/min/kg: decrease to 60 mg/kg/day; CCr ≥0.4-0.5 ml/min/kg: decrease to 50 mg/kg/day; CCr <0.4 ml/min/kg: not recommended

**Available forms:** Inj 6000 mg/250 ml, 12,000 mg/500 ml (24 mg/ml)

### Implementation

**Intermittent IV infusion route**
- Administer increased fluids before, during product administration to induce diuresis and minimize renal toxicity
- Administer via inf pump, at no more than 1 mg/kg/min; do not give by rapid or bolus **IV;** give by central venous line or peripheral vein; standard 24 mg/ml sol may be used without dilution if using by central line; dilute the 24 mg/ml sol to 12 mg/ml with $D_5W$ or 0.9% NaCl if using peripheral vein
- Monitor patient closely during therapy; if tingling, numbness, paresthesias occur, stop inf and obtain lab sample for electrolytes

**Y-site incompatibilities:** Manufacturer recommends that product not be given with other medications in syringe or admixed

## ADVERSE EFFECTS

**CNS:** *Fever,* dizziness, *headache,* seizures, *fatigue,* neuropathy, asthenia, encephalopathy, malaise, meningitis, *paresthesia,* depression, *confusion, anxiety*

**CV:** ECG abnormalities, 1st-degree AV block, nonspecific ST-T segment changes, cerebrovascular disorder, cardiomyopathy, cardiac arrest, atrial fibrillation, HF, sinus tachycardia

**GI:** *Nausea, vomiting, diarrhea, anorexia,* abdominal pain, pancreatitis

**GU:** Acute renal failure, decreased CCr and increased serum creatinine, azotemia, diabetes mellitus

**HEMA:** Anemia, granulocytopenia, leukopenia, thrombocytopenia, thrombosis, lymphadenopathy, neutropenia

**INTEG:** *Rash,* sweating, pruritus, skin discoloration

**RESP:** *Coughing, dyspnea,* pneumonia, pulmonary infiltration, pneumothorax, hemoptysis

**SYST:** *Hypokalemia, hypocalcemia, hypomagnesemia,* hypophosphatemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete (**IV**) |
| **Distribution** | 14%-17% plasma protein binding |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys (79%-92%) unchanged, breast milk |
| **Half-life** | 18-88 hr; increased in renal disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 48 hr |
| **Peak** | 2 wk |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Acyclovir, cidofovir, CISplatin, tacrolimus, tenofovir, vancomycin, amphotericin B, cycloSPORINE, calcium products (decreases ionized calcium), lithium: increased nephrotoxicity

Pentamidine: increased hypocalcemia

### Drug classifications

**BLACK BOX WARNING:** Aminoglycosides, gold compounds, NSAIDs: increased nephrotoxicity

## NURSING CONSIDERATIONS

### Assessment

- **General** culture should be done before treatment with foscarnet is begun; cultures of blood, urine, and throat may all be taken; CMV is not confirmed by this method; the diagnosis is made by an ophth exam

**BLACK BOX WARNING: Renal tubular disorders:** Assess kidney: BUN, serum creatinine, creatinine clearance, if CCr <0.4 ml/min/kg, discontinue product, provide adequate hydration before and during infusion to prevent toxicity

- Blood counts should be done q2wk; watch for decreasing granulocytes, Hgb; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required
- Assess for GI symptoms: severe nausea, vomiting, diarrhea; severe symptoms may necessitate discontinuing product
- **Seizures:** May be caused by alterations in minerals and electrolytes, monitor electrolytes and minerals: calcium, phosphorous, magnesium, sodium, potassium; watch closely for tetany during first administration
- Assess for symptoms of blood dyscrasias (anemia, granulocytopenia); bruising, fatigue, bleeding, poor healing
- **Assess for symptoms of allergic reactions:** flushing, rash, urticaria, pruritus
- **CMV retinitis:** Ophthalmic exam should confirm diagnosis

### Patient/family education

- Advise patient to notify prescriber if sore throat, swollen lymph nodes, malaise, fever occur; may indicate presence of other infections

• **Pregnancy/breastfeeding:** Use cautiously in pregnancy only if clearly needed, do not breastfeed
• Advise patient to report perioral tingling, numbness in extremities, and paresthesias; inf should be stopped and electrolytes should be requested
• Caution patient that serious product interactions may occur if OTC products are ingested; check first with prescriber
• Inform patient that product is not a cure but will control symptoms
• Advise patient that ophth exams must be continued

### Evaluation

**Positive therapeutic outcome**
• Improvement in CMV retinitis

## fosinopril (Rx)

(foss-in-o′pril)
Func. class.: Antihypertensive
*Chem. class.:* Angiotensin-converting enzyme (ACE) inhibitor

**Do not confuse:** Monopril/minoxidil/Monurol

**ACTION:** Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE; prevents conversion of angiotensin I to angiotensin II; results in dilatation of arterial, venous vessels

**Therapeutic outcome:** Decreased B/P in hypertension

**USES:** Hypertension, alone or in combination with thiazide diuretics, systolic HF

## CONTRAINDICATIONS

Breastfeeding, children, hypersensitivity to ACE inhibitors, history of ACE inhibitor–induced angioedema

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Geriatric, impaired liver function, hypovolemia, blood dyscrasias, HF, COPD, asthma, angioedema, hyperkalemia, renal artery stenosis, renal disease, aortic stenosis, autoimmune disorders, collagen vascular disease, febrile illness, Black patients

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO 5-10 mg/day initially, then 20-40 mg/day divided bid or daily, max 80 mg/day

### HF

**Adult:** PO 10 mg/day, then up to 40 mg/day, increased over several weeks; use lower dose in those undergoing diuresis before fosinopril

**Available forms:** Tabs 10, 20, 40 mg

### Implementation

• Store in tight container at 86° F (30° C)
• Severe hypotension may occur after 1st dose of this medication; hypotension may be prevented by reducing or discontinuing diuretic therapy 3 days before beginning benazepril therapy

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* fatigue, syncope
**CV:** *Hypotension,* orthostatic hypotension, tachycardia
**GI:** *Nausea,* constipation, *vomiting,* diarrhea, hepatotoxicity, cholestatic jaundice, fulminant hepatic necrosis, hepatic failure, death
**GU:** Increased BUN, creatinine, azotemia, renal artery stenosis
**HEMA:** Decreased Hct, Hgb, eosinophilia, leukopenia, neutropenia, agranulocytosis
**META:** *Hyperkalemia*
**RESP:** *Cough*
**SYST:** Anaphylaxis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 30% |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver, converted to fosinoprilat |
| **Excretion** | 50% kidneys (metabolites), 50% feces |
| **Half-life** | 12 hr: fosinoprilat |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1 hr |
| **Peak** | 2-6 hr |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Alcohol (acute ingestion): increased hypotension (large amounts)
Digoxin, hydrALAZINE, lithium, prazosin: increased toxicity

### Drug classifications

Adrenergic blockers, antihypertensives, diuretics, ganglionic blockers, nitrates: increased hypotension
Antacids: decreased absorption
Diuretics (potassium-sparing), sympathomimetics, NSAIDs, vasodilators: increased toxicity
Salicylates: decreased antihypertensive effect

### Drug/herb
Hawthorn: increased antihypertensive effect
Ephedra: decreased antihypertensive effect

### Drug/lab test
Increased: AST, ALT, alkaline phosphatase, glucose, bilirubin, uric acid, BUN, potassium
Positive: ANA titer
False positive: urine acetone

## NURSING CONSIDERATIONS
### Assessment
- **Hypertension:** Monitor B/P, check for orthostatic hypotension, syncope; if changes occur, dosage change may be required
- **Collagen vascular disease:** Monitor blood studies: neutrophils, decreased platelets; obtain WBC with differential at baseline and qmo × 6 mo, then q2-3mo × 1 yr; if neutrophils <1000/mm$^3$, discontinue
- Monitor renal studies: protein, BUN, creatinine; watch for increased levels that may indicate nephrotic syndrome and renal failure; monitor urine daily for protein; monitor renal symptoms: polyuria, oliguria, frequency, dysuria
- Establish baselines in renal, liver function tests before therapy begins
- Check potassium levels throughout treatment
- **HF:** Check for edema in feet, legs daily, monitor weight daily
- **Assess for allergic reactions:** rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education
- Advise patient not to discontinue product abruptly; warn patient to tell all persons associated with his or her care
- Teach patient not to use OTC products (cough, cold, allergy) unless directed by prescriber because serious side effects can occur; xanthines such as coffee, tea, chocolate, cola can prevent action of product
- Teach patient the importance of complying with dosage schedule, even if feeling better; to continue with medical regimen to decrease B/P: exercise, smoking cessation, decreasing stress, diet modifications
- Emphasize the need to rise slowly to sitting or standing position to minimize orthostatic hypotension; not to exercise in hot weather or increased hypotension can occur
- Advise patient to notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, coughing, shortness of breath
- Instruct patient to report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P
- Caution patient that product may cause dizziness, fainting, light-headedness; may occur during 1st few days of therapy; to avoid activities that may be hazardous
- Teach patient how to take B/P, normal readings for age-group

**BLACK BOX WARNING:** Advise patient to notify prescriber if pregnancy is planned or suspected, to use contraception during treatment

### Evaluation
**Positive therapeutic outcome**
- Decreased B/P in hypertension

## TREATMENT OF OVERDOSE:
0.9% NaCl **IV** inf, hemodialysis

## fosphenytoin (Rx)
(foss-fen'i-toy-in)
**Cerebyx**
*Func. class.:* Anticonvulsant
*Chem. class.:* Hydantoin, phosphate phenytoin ester

**ACTION:** Inhibits spread of seizure activity in motor cortex by altering ion transport; increases AV conduction; prodrug of phenytoin

**Therapeutic outcome:** Decreased seizures, absence of dysrhythmias

**USES:** Generalized tonic-clonic seizures, status epilepticus, partial seizures

## CONTRAINDICATIONS
Pregnancy, hypersensitivity, bradycardia, SA and AV block, Stokes-Adams syndrome

**Precautions:** Breastfeeding, allergies, renal/hepatic disease, myocardial insufficiency, hypoalbuminemia, hypothyroidism, Asian patients positive for HLA-B 1502, abrupt discontinuation, agranulocytosis, alcoholism, carBAMazepine/barbiturate hypersensitivity, bone marrow suppression, CAD, geriatrics, hemolytic anemia, hyponatremia, methemoglobinemia, myasthenia gravis, psychosis, suicidal ideation

**BLACK BOX WARNING:** Dysrhythmias, hypotension (rapid IV infusion)

## DOSAGE AND ROUTES
All doses in PE (phenytoin sodium equivalent)

### Status epilepticus
**Adult and adolescent: IV** 15-20 mg PE/kg

### Nonemergency/maintenance dosing
**Adult and adolescent >16 yr: IM/IV** 10-20 mg PE/kg 10 mg dose; 4-6 mg PE/kg/day (maintenance); start maintenance 12 hr after loading dose; give in 2-3 divided doses

**Available forms:** Inj 150 mg (100 mg PE), 750 mg (500 mg PE), 50 mg/ml vials

### Implementation
**Injectable routes**
- Give IM/IV; the dosage, concentration, and infusion rate of fosphenytoin should always be expressed, prescribed, and dispensed in phenytoin sodium equivalents (PE); exercise extreme caution when preparing and administering fosphenytoin; the concentration and dosage should be carefully confirmed; fatal overdoses have occurred in children when the per-ml concentration of the product (50 mg PE/mL) was misinterpreted as the total amount of drug in the vial
- Visually inspect for particulate matter and discoloration prior to use

**IV infusion route**
- Prior to infusion, dilute in 5% dextrose or 0.9% saline solution to a concentration ranging from 1.5-25 mg PE/ml

**BLACK BOX WARNING:** Because of the risk of hypotension, do not exceed recommended infusion rates. Continuous monitoring of ECG, B/P, and respiratory function is recommended, especially throughout the period when phenytoin concentrations peak (about 10-20 min after the end of the infusion)

- Loading doses should always be followed by maintenance doses of oral or parenteral phenytoin or parenteral fosphenytoin

**BLACK BOX WARNING:** Adult: Infuse IV at a rate max 150 mg PE/min

- Elderly or debilitated adult: infuse IV at a max 3 mg PE/kg/min or 150 mg PE/min, whichever is less

**BLACK BOX WARNING:** Child: infuse IV at a rate of 0.5-3 mg PE/kg/min, max 150 mg PE/min, whichever is less

**BLACK BOX WARNING:** Infant, neonate: infuse IV at a rate max 0.5-3 mg PE/kg/min

**Y-site compatibilities:** Aminocaproic acid, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, atenolol, bivalirudin, bleomycin, CARBOplatin, CISplatin, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, dilTIAZem, DOCEtaxel, doxacurium, eptifibatide, ertapenem, etoposide, fludarabine, fluorouracil, gatifloxacin, gemcitabine, gemtuzumab, granisetron, ifosfamide, levofloxacin, linezolid, LORazepam, mechlorethamine, meperidine, methotrexate, metroNIDAZOLE, nesiritide, octreotide, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pantoprazole, PEMEtrexed, PHENobarbital, piperacillin-tazobactam, rocuronium, sodium acetate, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, vinCRIStine, vinorelbine, voriconazole, zoledronic acid

**Y-site incompatibilities:** Caspofungin, DOXOrubicin, epirubicin, fenoldopam, IDArubicin, midazolam, mitoXANTRONE, mycophenolate, quinupristin-dalfopristin

## ADVERSE EFFECTS
**CNS:** *Drowsiness,* dizziness, insomnia, paresthesias, depression, suicidal tendencies, aggression, headache, confusion, paresthesia, emotional lability, syncope, cerebral edema
**CV:** Hypotension, hypertension, HF, shock, dysrhythmias
**EENT:** Nystagmus, diplopia, blurred vision
**GI:** Nausea, vomiting, diarrhea, constipation, anorexia, weight loss, hepatitis, jaundice, gingival hyperplasia
**HEMA:** Agranulocytosis, leukopenia, aplastic anemia, thrombocytopenia, megaloblastic anemia
**INTEG:** Rash, lupus erythematosus, Stevens-Johnson syndrome, hirsutism, hypersensitivity, pruritus
**RESP:** Bronchospasm, cough
**SYST:** Hyperglycemia, hypokalemia, toxic epidermal necrolysis HLA-B (Asian patients positive for HLA-B 1502), DRESS, purple glove syndrome, anaphylaxis

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 99% |
| **Metabolism** | Liver: converted to phenytoin |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual drugs
Alcohol: decreased effects of fosphenytoin (chronic use)

Amiodarone, chloramphenicol, cimetidine: increased fosphenytoin level
CarBAMazepine, folic acid, rifampin, theophylline, tramadol: decreased effects of fosphenytoin
Delavirdine: do not use concurrently; decreased virologic response, resistance

### Drug classifications

Antacids, antihistamines, antineoplastics, CYP1A2 inducers: decreased effects of fosphenytoin
Antidepressants (tricyclics), CYP1A2 inhibitors, estrogens, $H_2$-receptor antagonists, phenothiazines, salicylates, sulfonamides: increased fosphenytoin level

### Drug/herb

Ginseng, valerian: decreased anticonvulsant effect
Ginkgo: increased anticonvulsant effect

### Drug/lab test

Increased: glucose, alkaline phosphatase
Decreased: dexamethasone, metyrapone test serum, PBI, urinary steroids, potassium

## NURSING CONSIDERATIONS

### Assessment

- Assess drug level: target level 10-20 mcg/ml; toxic level 30-50 mcg/ml, wait at least 2 hr after dose before testing, 4 hr after IM dose
- Assess seizure activity including type, location, duration, and character; provide seizure precaution
- Assess renal studies: urinalysis, BUN, urine creatinine
- Monitor hepatic studies: ALT, AST, bilirubin, creatinine
- Assess allergic reaction: red raised rash; if this occurs, product should be discontinued
- **Monitor for toxicity:** bone marrow depression, nausea, vomiting, ataxia, diplopia, cardiovascular collapse, slurred speech, confusion
- **Pregnancy/breastfeeding:** Do not use in pregnancy, birth defects have occurred, avoid breastfeeding
- Assess product level: toxic level 30-50 mcg/ml
- Assess for rash, discontinue as soon as rash develops, serious adverse reactions such as Stevens-Johnson syndrome can occur
- **Assess mental status:** mood, sensorium, affect, memory (long, short), especially geriatric; suicidal thoughts/behaviors
- **Serious skin reactions:** usually occurring within 28 days of treatment; if a rash develops, patient should be evaluated for DRESS
- **Assess for blood dyscrasias:** fever, sore throat, bruising, rash, jaundice, epistaxis (long-term treatment only)
- Monitor blood studies: RBC, Hct, Hgb, reticulocyte counts weekly for 4 wk, then monthly; also check thyroid function tests, serum calcium, albumin, phosphorus, potassium

### Patient/family education

- Teach patient the reason for and expected outcome of treatment
- Instruct patient not to use machinery or engage in hazardous activity; drowsiness, dizziness may occur
- Advise patient to carry/wear emergency ID identifying product used, name of prescriber
- Advise patient to notify prescriber of rash, bleeding, bruising, slurred speech, jaundice of skin or eyes, joint pain, nausea, vomiting, severe headache, depression, suicidal ideation
- Advise patient to keep all medical appointments, including lab work, physical assessment
- Advise patient to notify prescriber if pregnancy is planned or suspected; to use contraception with this product; not to use in pregnancy, avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Decreased seizure activity

## frovatriptan (Rx)

(froh-vah-trip'tan)

**Frova**

*Func. class.:* Antimigraine agent
*Chem. class.:* 5-$HT_1$ receptor agonist

**ACTION:** Binds selectively to the vascular 5-$HT_{1B}$, 5-$HT_{1D}$ receptor subtypes, exerts antimigraine effect; binds to benzodiazepine receptor sites, causes vasoconstriction in cranium

**Therapeutic outcome:** Absence of migraines

**USES:** Acute treatment of migraine with or without aura

## CONTRAINDICATIONS

Angina pectoris, history of MI, documented silent ischemia, Prinzmetal's angina, ischemic heart disease, concurrent ergotamine-containing preparations, uncontrolled hypertension, hypersensitivity, basilar or hemiplegic migraine; ischemic bowel disease; peripheral vascular disease, severe hepatic disease, prophylactic migraine treatment

**Precautions:** Pregnancy, breastfeeding, children, geriatric, postmenopausal women, men >40 yr, risk factors for CAD, hypercholesterolemia, obesity, diabetes, impaired hepatic function, seizure disorder

## DOSAGE AND ROUTES

**Adult:** PO 2.5 mg; a 2nd dose may be taken after ≥2 hr; max 3 tabs/day (7.5 mg)

**Available forms:** Tabs 2.5 mg

### Implementation

- Ensure that tablets are swallowed whole
- Provide quiet, calm environment with decreased stimulation from noise, bright light, excessive talking

## ADVERSE EFFECTS

**CNS:** *Hot sensation,* paresthesia, *dizziness,* headache, fatigue, cold sensation, insomnia, anxiety, somnolence, seizures
**CV:** *Flushing,* chest pain, palpitation, coronary artery vasospasm, MI, myocardial ischemia, ventricular tachycardia, ventricular fibrillation
**GI:** Dry mouth, dyspepsia, abdominal pain, diarrhea, vomiting, nausea
**MS:** Skeletal pain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Absolute bioavailability of PO dose ~20% in males, 30% in females |
| **Distribution** | Protein binding 15%; reversibly bound to blood cells at equilibrium 60% |
| **Metabolism** | Liver, by CYP1A2 |
| **Excretion** | Urine (32%), feces (62%) |
| **Half-life** | 25-29 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 10 min-2 hr |
| **Peak** | 2-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Estrogen, propranolol: increased effects of frovatriptan

### Drug classifications

CYP1A2 inhibitors (cimetidine, ciprofloxacin, erythromycin), hormonal contraceptives: increased frovatriptan levels
Selective serotonin reuptake inhibitors, other serotonin agonists (dextromethorphan, antidepressants): increased toxicity, MAOIs

## NURSING CONSIDERATIONS

### Assessment

- **Migraine:** aura, alleviating/exacerbating factor, diet, character
- Assess for ingestion of tyramine-containing foods (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches
- **Serious cardiac reactions:** May occur within a few hours of taking a 5-HT1 agonist, dysrhythmias, ventricular fibrillation leading to death
- **Serotonin syndrome:** Assess for agitation, confusion, diaphoresis, increased B/P, nausea, vomiting, diarrhea, product should be discontinued
- Assess B/P; signs/symptoms of coronary vasospasms
- Assess for stress level, activity, recreation, coping mechanisms
- Assess neurologic status: LOC, paresthesia, hot/cold sensations, dizziness, headache, fatigue
- **Pregnancy/breastfeeding:** Use only if benefits outweigh risk to the fetus, do not breastfeed

### Patient/family education

- Instruct patient to report any side effects to prescriber
- Advise patient that photosensitivity may occur, to use sunscreen and wear protective clothing when outdoors
- Advise patient to have dark, quiet environment available
- **Serotonin syndrome:** Teach patient to report immediately agitation, confusion, sweating, nausea, vomiting, diarrhea
- **Serious cardiac reactions:** Advise patient to report immediately pain, chest tightness

### Evaluation

**Positive therapeutic outcome**

- Decrease in frequency, severity of migraine

## TREATMENT OF OVERDOSE:

No specific antidote; monitor patient closely for ≥48 hr, treat any symptoms as necessary

**furosemide (Rx)**
(fur-oh'se-mide)
**Lasix**
*Func. class.:* Loop diuretic
*Chem. class.:* Sulfonamide derivative

**Do not confuse:** furosemide/torsemide, Lasix/Lanoxin/Lomotil/Losec/Luvox

**ACTION:** Acts on the ascending loop of Henle in the kidney, inhibiting reabsorption of electrolytes sodium and chloride, causing excretion of sodium, calcium, magnesium, chloride, water, and some potassium; decreases reabsorption of sodium and chloride and increases excretion of potassium in the distal tubule of the kidney; responsible for slight

antihypertensive effect and peripheral vasodilatation

**Therapeutic outcome:** Decreased edema in lung tissue, peripherally; decreased B/P

**USES:** Pulmonary edema, edema in HF, nephrotic syndrome, ascites, hepatic disease, hypertension

**Unlabeled uses:** Hypercalcemia in malignancy

## CONTRAINDICATIONS

Anuria, hypovolemia

**Precautions:** Pregnancy, diabetes mellitus, dehydration, severe renal disease, cirrhosis, ascites, hypersensitivity to sulfonamides, breastfeeding, infants, electrolyte depletion

## DOSAGE AND ROUTES

**Adult:** PO 20-80 mg/day in AM, may give another dose in 6 hr, up to 600 mg/day; IM/**IV** 20-40 mg, increased by 20 mg q2hr until desired response
**Child:** PO/IM/**IV** 1-2 mg/kg, may increase by 1-2 mg/kg/q6-8hr up to 6 mg/kg

### Antihypercalcemia

**Adult:** IM/**IV** 80-100 mg q1-4hr or PO 120 mg/day or divided bid
**Child:** IM/**IV** 25-50 mg, repeat q4hr if needed

### Acute/chronic renal failure

**Adult:** PO 80 mg/day, increase by 80-120 mg/day to desired response; **IV** 100-200 mg, max 600-800 mg

**Available forms:** Tabs 20, 40, 80 mg; oral sol 8 mg/ml, 10 mg/ml; inj IM, **IV** 10 mg/ml

### Implementation

- Give in AM to avoid interference with sleep
- Potassium replacement if potassium level is <3.0 mg/dl; product may be crushed if patient is unable to swallow

**PO route**

- With food or milk or use oral sol if nausea occurs; absorption may be reduced slightly

**IV route**

- Do not use sol that is yellow, has a precipitate or crystals

**IV, direct route**

- Give undiluted through Y-tube on 3-way stopcock; give 20 mg or less/min

**Intermittent IV inf route**

- May be added to 0.9% NaCl, $D_5W$, use within 24 hr to ensure compatibility; give through Y-tube or 3-way stopcock; give at 4 mg/min or less, use inf pump

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B cholesteryl/lipid complex/liposome, anidulafungin, argatroban, ascorbic acid, atenolol, atropine, azaTHIOprine, aztreonam, bivalirudin, bleomycin, bumetanide, calcium chloride/gluconate, CARBOplatin, cefamandole, ceFAZolin, cefepime, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAXone, cefuroxime, chloramphenicol, CISplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, DOCEtaxel, doripenem, doxacurium, DOXOrubicin liposome, enalaprilat, ePHEDrine, EPINEPHrine, etoposide, fentaNYL, fludarabine, fluorouracil, folic acid, foscarnet, gallium nitrate, ganciclovir, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), isosorbide, kanamycin, leucovorin, lidocaine, linezolid, LORazepam, LR, mannitol, mechlorethamine, melphalan, meropenem, methicillin, methotrexate, methylPREDNISolone, metoprolol, metroNIDAZOLE, mezlocillin, micafungin, miconazole, mitoMYcin, moxalactam, multiple vitamins injection, nafcillin, naloxone, nitroprusside, octreotide, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pantoprazole, PEMEtrexed, penicillin G, PENTobarbital, PHENobarbital, phytonadione, piperacillin, piperacillin-tazobactam, potassium chloride, procainamide, propofol, propranolol, ranitidine, remifentanil, Ringer's, ritodrine, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, temocillin, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, urokinase, vit B/C, voriconazole, zoledronic acid

**Y-site incompatibilities:** Amsacrine, bleomycin, DOXOrubicin, droperidol, esmolol, fluconazole, gentamicin, IDArubicin, metoclopramide, milrinone, netilmicin, ondansetron, quiNIDine, vinBLAStine, vinCRIStine

## ADVERSE EFFECTS

**CNS:** Headache, fatigue, weakness, vertigo, paresthesias
**CV:** Orthostatic hypotension, chest pain, ECG changes, circulatory collapse
**EENT:** *Loss of hearing,* ear pain, tinnitus, blurred vision
**ELECT:** *Hypokalemia, hypochloremic alkalosis, hypomagnesemia, hyperuricemia, hypocalcemia, hyponatremia,* metabolic alkalosis

**ENDO:** *Hyperglycemia*
**GI:** *Nausea,* diarrhea, dry mouth, vomiting, anorexia, cramps, oral or gastric irritations, pancreatitis
**GU:** *Polyuria,* renal failure, *glycosuria,* bladder spasms
**HEMA:** Thrombocytopenia, agranulocytosis, leukopenia, neutropenia, anemia
**INTEG:** *Rash, pruritus, purpura,* sweating, photosensitivity, urticaria
**MS:** Cramps, stiffness
**SYST:** Toxic epidermal necrolysis, erythema muliforme, Stevens-Johnson syndrome

### Pharmacokinetics

| | PO |
|---|---|
| **Absorption** | GI tract (60%-70%) |
| | **PO/IM/IV** |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver (30%-40%) |
| **Excretion** | Breast milk, urine, feces |
| **Half-life** | ½-1 hr |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | 1 hr | ½ hr | 5 min |
| **Peak** | 1-2 hr | Unknown | ½ hr |
| **Duration** | 6-8 hr | 4-8 hr | 2 hr |

## INTERACTIONS

### Individual drugs

CISplatin, vancomycin: increased risk of ototoxicity
Digoxin: increased toxicity
Lithium: decreased renal clearance, causing increased toxicity
Probenecid: decreased furosemide effect

### Drug classifications

Aminoglycosides: increased ototoxicity
Anticoagulants, salicylates: increased effects
Antihypertensives: increased antihypertensive effect
Nitrates: increased hypotensive action
Nondepolarizing skeletal muscle relaxants, salicylates, aminoglycosides, CISplatin: increased toxicity

### Drug/lab test

Interference: GTT
Increase: LDL

## NURSING CONSIDERATIONS

### Assessment

- **Ototoxicity:** Assess patient for tinnitus, hearing loss, ear pain; periodic testing of hearing is needed when high doses of this product are given by **IV** route
- **Hypokalemia:** acidic urine, reduced urine osmolality, nocturia, polyuria and polydipsia; hypotension, broad T-wave, U-wave, ectopy, tachycardia, weak pulse; muscle weakness, altered LOC, drowsiness, apathy, lethargy, confusion, depression; anorexia, nausea, cramps, constipation, distention, paralytic ileus; hypoventilation, respiratory muscle weakness
- Monitor for CV, GI, neurologic manifestations of hyponatremia: increased B/P, cold, clammy skin, hypovolemia or hypervolemia; anorexia, nausea, vomiting, diarrhea, abdominal cramps; lethargy, increased ICP, confusion, headache, seizures, coma, fatigue, tremors, hyperreflexia
- Monitor for neurologic, respiratory manifestations of hyperchloremia: weakness, lethargy, coma; deep rapid breathing
- **HF:** Assess fluid volume status: I&O ratios and record, count or weigh diapers as appropriate, weight, distended red veins, crackles in lung, color, quality, and specific gravity of urine, skin turgor, adequacy of pulses, moist mucous membranes, bilateral lung sounds, peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth and mucous membranes should be reported
- Monitor electrolytes: potassium, sodium, chloride, magnesium; also include BUN, blood pH, ABGs, uric acid, CBC, blood glucose
- **Hypertension:** Assess B/P before and during therapy lying, standing, and sitting as appropriate; orthostatic hypotension can occur rapidly
- **Beers:** Use with caution in older adults, may exacerbate or cause syndrome of inappropriate antidiuretic hormone secretion or hyponatremia, monitor sodium level closely when changing dose
- **Serious rash:** Monitor for skin rash often, Stevens-Johnson syndrome, toxic epidermal necrolysis, erythema multiforme may occur and is life threatening
- **Pregnancy/lactation:** Use only if benefits outweigh risks to the fetus, use cautiously in breastfeeding, excreted in breast milk

### Patient/family education

- Teach patient to take the medication early in the day to prevent nocturia
- Instruct the patient to take with food or milk if GI symptoms of nausea and anorexia occur
- Teach patient to maintain a record of weight on a weekly basis and notify physician of weight loss of >5 lb
- Caution the patient that this product causes a loss of potassium, that food rich in potassium should be added to the diet; refer to a dietitian for assistance in planning
- Caution the patient to rise slowly from sitting or reclining positions, not to exercise in hot

weather or stand for prolonged periods because orthostatic hypotension will be enhanced; lie down if dizziness occurs
• Advise patient to wear protective clothing and sunscreen to prevent photosensitivity
• Caution patient not to use alcohol or any OTC medications without physician's approval; serious product reactions may occur
• Emphasize the need to contact physician immediately if muscle cramps, weakness, nausea, dizziness, or numbness occurs
• Teach patient to take and record own B/P and pulse
• Advise patient to continue taking medication even if feeling better; this product controls symptoms but does not cure the condition
• Advise the patient with hypertension to continue other medical treatment (exercise, weight loss, relaxation techniques, cessation of smoking)
• Teach patient to contact prescriber if rash, cramps, nausea, dizziness, numbness, weakness occur

## Evaluation

### Positive therapeutic outcome

• Decreased edema
• Decreased B/P
• Lowered calcium level in malignancy
• Increased diuresis

## gabapentin (Rx)

(gab'a-pen-tin)
**Gralise, Horizant, Neurontin**
*Func. class.:* Anticonvulsant
*Chem. class.:* GABA analogue

**Do not confuse:** Neurontin/Noroxin/Neoral

**ACTION:** Mechanism unknown; may increase seizure threshold; structurally similar to GABA, but does not bind to GABAa or GABAb; gabapentin binding sites in neocortex, hippocampus

**Therapeutic outcome:** Decreased seizure activity

**USES:** Adjunct treatment of partial seizures, with or without generalization in patients >12 yr; adjunct in partial seizures in children 3-12 yr, postherpetic neuralgia, primary restless leg syndrome (RLS) in adults

**Unlabeled uses:** Neuropathic pain, bipolar disorder, migraine prophylaxis, fibromyalgia

## CONTRAINDICATIONS

Hypersensitivity to this product

**Precautions:** Pregnancy, breastfeeding, children <3 yr, geriatric, renal disease, hemodialysis, suicidal thoughts, depression

## DOSAGE AND ROUTES

### Seizures with or without secondary generalized tonic-clonic seizures (Neurontin only)

**Adult and child >12 yr:** PO 900-1800 mg/day in 3 divided doses; may titrate to 1800 mg/day
**Child 3-12 yr:** PO 10-15 mg/kg/day in 3 divided doses, initially titrate dose upward over approximately 3 days; if >5 yr old, 40 mg/kg/day in 3 divided doses; all given in 3 divided doses

### Postherpetic neuralgia

**Adult:** PO (Neurontin) 300 mg on day 1, 600 mg/day divided bid on day 2, 900 mg/day divided tid on day 3, may titrate to 1800-3600 mg divided tid if needed; ext rel tab (Gralise only) 300 mg on day 1, then 600 mg on day 2, 900 mg on days 3-6, 1200 mg on days 7-10, 1500 mg on days 11-14, 1800 mg on day 15 and thereafter; Horizant only: 600 mg in AM × 3 days, day 4 give 600 mg bid

### Moderate to severe RLS (Horizant only)

**Adult:** PO ext rel tab 600 mg qd with food at about 5 PM; if dose is missed, take next day at 5 PM

### Hot flashes (unlabeled)

**Adult:** PO 300-400 mg at night, may titrate up q 3-7 days to max 2400 mg/day divided bid-tid × 4 wk

### Diabetic neuropathy pain (unlabeled)

**Adult:** PO 900 mg-3.6 g/day in divided doses tid

### Moderate to severe restless legs syndrome (RLS) (Horizant only)

**Adult:** PO ext rel 600 mg daily with food at about 5 PM; if dose missed, take next day at 5 PM

### Fibromyalgia (unlabeled)

**Adult:** PO 300 mg at bedtime × 1 wk, then gradually increase (target dose 2400 mg), 300 mg bid × 1 wk, 300 mg bid and 600 mg at bedtime × 2 wk, then 600 mg tid × 2 wk with 1200 mg at bedtime; to discontinue, taper by 300 mg/day

### Renal Dose

**Adult and child >12 yr PO immediate release:** CCr ≥ 60 ml/min: No change; CCr >30-59 ml/min: Total dose range 400—1400 mg/day given divided bid; CCr >15-29 ml/min: Total dose range 200-700 mg/day PO given in a single daily dose; CCr = 15 ml/min: Total dose range 100-300 mg/day given in one daily dose as 100, 125, 150, 200, or 300 mg; CCr <15 ml/min: Reduce daily dose in proportion to CCr (CCr = 7.5 ml/min should receive one-half the dose that patients with CCr of 15 ml/min receive)
**Adult: PO ext rel tablets (Gralise tablets only):** CCr ≥ 60 ml/min: No change; CCr 30-59 ml/min: 600-1800 mg/day as tolerated; CCr <30 ml/min: Do not use;
**ext rel tablets (Horizant tablets only):** CCr ≥ 60 ml/min: No change; before discontinuing reduce the dose to 600 mg q daily × 1 wk before discontinuing; CCr 30-59 ml/min: for RLS, start at 300 mg/day, increase to 600 mg/day as needed; for PHN, start at 300 mg in the AM × 3 days, then increase to 300 mg bid, increase to 600 mg bid as needed; for dose tapering before discontinuation, reduce the maintenance dose to q daily in the AM × 1 wk before discontinuing; CCr 15-29 ml/min: for RLS, 300 mg/day; for PHN, 300 mg PO on day 1 and day 3, then 300 mg qday in the AM, increase dose to 300 mg bid as needed for dose tapering, if dose is 300 mg bid, reduce dose to 300 mg qday in AM × 1 wk before discontinuation; if the dose is 300 qday, no taper is required;
CCr <15 ml/min: for RLS and PHN, 300 mg every other day, for PHN, dose can be increased to 300 mg qday in AM, no dose taper is required before discontinuing

### Fibromyalgia (unlabeled)

**Adult:** PO 300 mg at bedtime × 1 wk, then gradually increase (target dose 2400 mg), 300 mg bid and 600 mg at bedtime × 2 wk, then 600 mg tid × 2 wk with 1200 mg at bedtime, to discontinue, taper by 300 mg/day

**Available forms:** Caps 100, 300, 400 mg; tabs 600, 800 mg; oral sol 250 mg/5 ml; Horizant: ext rel tab 300, 600 mg (Gralise)

### Implementation

- Do not break, crush, or chew caps, ext rel tabs; cap may be opened and contents put in applesauce or dissolved in juice; scored tab may be cut in half
- Gradually withdraw over 7 days; abrupt withdrawal may precipitate seizures
- Give at least 2 hr apart when giving antacids; give without regard to meals (immediate release)
- Store at room temperature away from heat and light
- Provide assistance with ambulation during early part of treatment; dizziness occurs
- **Provide seizure precautions:** padded side rails, move objects that may harm patient
- **Oral sol:** measure with calibrated device, refrigerate
- **Ext release:** give with food at about 5 PM, bioavailability is increased with food; do not interchange Gralise with Horizant

## ADVERSE EFFECTS

**CNS:** *Drowsiness, confusion,* dizziness, fatigue, anxiety, somnolence, ataxia, amnesia, abnormal thinking, unsteady gait, depression; 3-12 yr old: emotional lability, aggression, thought disorder, hyperkinesia, hostility, seizures, suicidal ideation, impaired cognition, euphoria
**CV:** Vasodilatation, peripheral edema, hypotension, hypertension
**EENT:** Dry mouth, blurred vision, diplopia, nystagmus, conjunctivitis; otitis media (child 3-12 yr)
**GI:** Constipation/diarrhea, weight gain, increased appetite, dental abnormalities, nausea, vomiting; diarrhea (Gralise) G
**GU:** Impotence, bleeding, *UTI*; (Gralise)
**HEMA:** Leukopenia, thrombocytopenia, decreased WBC
**INTEG:** Pruritus, abrasion, Stevens-Johnson syndrome, acne vulgaris
**MS:** Myalgia, back pain, gout
**RESP:** Rhinitis, pharyngitis, coughing, upper respiratory infection (child 3-12 yr)
**Syst:** Drug reaction with eosinophilia and systemic symptoms (DRESS); dehydration (child 3-12 yr)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | None |
| **Excretion** | Urine unchanged |
| **Half-life** | 5-7 hr |

### Pharmacodynamics

| | Immediate Release | Extended Release |
|---|---|---|
| **Onset** | Unknown | Unknown |
| **Peak** | 2 hr | 8 hr-Gralise, 5-7 hr-Horizant |
| **Duration** | Unknown | Unknown |

G

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Cimetidine, sevelamer, separate by 2 hr: decreased gabapentin levels
HYDROcodone, dosage reduction may be needed: Increased effect of HYDROcodone

### Drug classifications

Antacids: decreased gabapentin levels
Antihistamines, sedatives, all other CNS depressants: increased CNS depression

### Drug/lab test

False positive: urinary protein using Ames N-multistix SG

## NURSING CONSIDERATIONS

### Assessment

- **Assess seizures:** aura, location, duration, frequency, activity at onset
- Assess renal studies: urinalysis, BUN, urine creatinine q3mo
- **Assess mental status:** mood, sensorium, affect, behavioral changes, suicidal thoughts/behaviors; if mental status changes, notify prescriber
- Assess eye problems, need for ophth exam before, during, after treatment (slit lamp, fundoscopy, tonometry)
- Monitor WBC, gabapentin level (therapeutic 5.9-21 mcg/ml, toxic >85 mcg/ml), serum creatinine/BUN, weight
- Monitor for drug reaction with eosinophilia and systemic symptoms
- Provide increased fluids, bulk in diet for constipation
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk
- **Beers:** Avoid in older adults unless safer alternative is not available, ataxia, impaired psychomotor function may occur

### Patient/family education

- Advise patient to carry/wear emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
- Advise patient to avoid driving, other activities that require alertness
- **Seizures:** Teach patient not to discontinue medication quickly after long-term use, withdrawal-precipitated seizures may occur, not to double dose; if dose is missed, take if 2 hr or more before next dose
- Teach patient to gradually withdraw over 7 days; abrupt withdrawal may precipitate seizures
- Teach patient to use hard candy, gum, and frequent rinsing of mouth for dry mouth
- Teach patient to increase fluids, bulk in diet for constipation
- Advise patient to notify prescriber if pregnancy is planned or suspected, avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Decreased seizure activity; document on patient's chart

## TREATMENT OF OVERDOSE:

Lavage, VS

## galantamine (Rx)

(gah-lan′tah-meen)

**Razadyne, Razadyne ER, Reminyl**

*Func. class.:* Anti-Alzheimer's agent

*Chem. class.:* Cholinesterase inhibitor

**Do not confuse:** Razadyne/Rozerem

## ACTION:

Enhances cholinergic functioning by increasing acetylcholine

**Therapeutic outcome:** Decreased signs and symptoms of Alzheimer's dementia

## USES:

Mild to moderate dementia of Alzheimer's disease, vascular dementia, dementia with Lewy bodies

## CONTRAINDICATIONS

Hypersensitivity to this product, children, GI bleeding, jaundice, renal failure

**Precautions:** Pregnancy, respiratory/renal/hepatic/cardiac disease, seizure disorder, peptic ulcer, asthma, bradycardia, heart block, geriatric patients, surgery, urinary tract obstruction, breastfeeding

## DOSAGE AND ROUTES

**Adult:** PO 4 mg bid with morning and evening meals; after 4 wk or more may increase to 8 mg bid; after another 4 wk may increase to 12 mg bid; usual dose 16-24 mg/day in 2 divided doses; EXT REL 8 mg/day in AM; may increase to 16 mg/day after 4 wk, and 24 mg/day after another 4 wk

### Hepatic dose

**Adult:** (Child-Pugh 7-9) PO max 16 mg/day
**Adult:** (Child-Pugh 10-15) avoid PO use

### Renal dose

**Adult:** PO CCr 10-70 ml/min; max 16 mg/day; CCr <9 ml/min: PO avoid use

**Available forms:** Tabs 4, 8, 12 mg; ext rel caps 8, 16, 24 mg; oral sol 4 mg/ml

### Implementation

- Give with meals, morning and evening, ext rel product can be opened and sprinkled on food; do not crush/chew
- Dose increase after minimum of 4 wk at prior dose; if dose is interrupted for several days, restart at lower dose, titrate to current dose
- Provide assistance with ambulation during beginning therapy
- Perform complete suicide assessment
- Oral solution: use pipette provided; put in liquid and have patient consume

## ADVERSE EFFECTS

**CNS:** *Tremors, insomnia,* depression, dizziness, headache, somnolence, fatigue
**CV:** Bradycardia, chest pain
**GI:** *Nausea, vomiting, anorexia, abdominal distress, flatulence,* diarrhea
**GU:** Urinary incontinence, bladder outflow obstruction, hematuria
**HEMA:** Anemia
**META:** Weight decrease
**MS:** Asthenia
**RESP:** URI, rhinitis
**INTEG:** Stevens-Johnson syndrome, acute generalized exanthematous pustulosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly and completely absorbed |
| **Distribution** | 18% protein binding |
| **Metabolism** | Liver |
| **Excretion** | Kidneys; clearance decreased in geriatric, hepatic/renal disease, females (20% lower) |
| **Half-life** | 7 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr (regular release), 4.5-5 hr (extended release) |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Cholinesterase inhibitors, cholinomimetics: synergistic effect, avoid concurrent use before anesthesia

CYP3A4/CYP2D6 inducers (bosentan, carBAMazepine, fosphenytoin, nevirapine, OXcarbazepine, phenytoin, rifabutin, rifampin, rifapentine, troglitazone), anticholinergics: decreased galantamine effect, monitor for decreased effect

CYP3A4/CYP2D6 inhibitors (antiretroviral protease inhibitors, clarithromycin, conivaptan, delavirdine, diltiazem, efavirenz, erythromycin, fluconazole, fluvoxaMINE, imatinib, itraconazole, ketoconazole, nefazodone, niCARdipine, troleandomycin, verapamil, voriconazole, zafirlukast): increased galantamine effect, monitor for increased effect

NSAIDs: increased GI effects, bleeding

### Drug/herb

St. John's wort: decreased galantamine effect, avoid concurrent use

## NURSING CONSIDERATIONS

### Assessment

- **Alzheimer's disease:** Assess mental status: affect, mood, behavioral changes, depression, memory, attention, confusion, cognitive functioning
- Assess liver function enzymes: AST, ALT, alkaline phosphatase, LDH, bilirubin, CBC
- Assess for severe GI effects: nausea, vomiting, anorexia, weight loss; GU effects: urinary retention, bladder obstruction
- Assess B/P, heart rate, respiration during initial treatment, rash
- Pregnancy/breastfeeding: Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Teach patient or caregiver correct procedure for giving oral sol, using instruction sheet provided
- Instruct patient or caregiver to notify prescriber of severe GI effects
- Instruct patient or caregiver to report hypo/hypertension, slow heart rate
- Teach patient to take with food to minimize side effects
- Teach patient to notify prescriber immediately and stop taking product if rash occurs.

### Evaluation

#### Positive therapeutic outcome

- Decreased symptoms of dementia
- Increased coherence
- Improved cognitive performance (memory, orientation, attention, reasoning, language, praxis)

## TREATMENT OF OVERDOSE:

Administer **IV** atropine titrated to effect at an initial dose of 0.5-1 mg, with subsequent doses based on clinical response; provide general supportive measures

## ganciclovir (Rx)

(gan-sye'kloe-vir)

**Cytovene, Vitrasert, Zirgan**

*Func. class.:* Antiviral

*Chem. class.:* Synthetic nucleoside analog

G

**Do not confuse:** Cytovene/Cytosar

**ACTION:** Inhibits replication of herpes viruses in vitro; competitively inhibits human cytomegalovirus (CMV) DNA polymerase and is incorporated, resulting in termination of DNA elongation

**Therapeutic outcome:** Decreased proliferation of virus responsible for CMV retinitis

**USES:** Cytomegalovirus (CMV) retinitis in immunocompromised persons, including those with AIDS, after indirect ophthalmoscopy confirms diagnosis; prophylaxis of CMV in transplantation

## CONTRAINDICATIONS

Hypersensitivity to acyclovir, famciclovir, penciclovir, valacyclovir, valganciclovir, or ganciclovir

**BLACK BOX WARNING:** ANC $<500/mm^3$, platelet count $<25,000/mm^3$ (intravitreal)

**Precautions:** Pregnancy, breastfeeding, children <6 mo, geriatric, preexisting cytopenias, renal function impairment, radiation therapy

**BLACK BOX WARNING:** Secondary malignancy, bone marrow suppression, anemia, infertility, neutropenia, pregnancy, male-mediated teratogenicity

## DOSAGE AND ROUTES

### Induction treatment

**Adult: IV** 5 mg/kg/dose given over 1 hr q12hr × 2-3 wk

### Maintenance treatment

**Adult: IV** INF 5 mg/kg/day given over 1 hr, daily × 7 days/wk; or 6 mg/kg/day × 5 days/wk; PO 1000 mg tid with food or 500 mg q3hr while awake; Intravitreal 4.5-mg implant

### Prevention of CMV infection

**Adult: IV** 5 mg/kg/dose over 1 hr q12hr × 1-2 wk, then 5 mg/kg/day × 7 days/wk, then 6 mg/

kg/day × 5 days/wk; PO 1000 mg tid, starting 10 days posttransplant × 14 days

### Renal dose

**Adult:** IV CCr 50-69 ml/min, reduce to 2.5 mg/kg q12hr (induction), 2.5 mg/kg q24hr (maintenance); PO 1500 mg/day or 500 mg tid; IV CCr 25-49 ml/min reduce to 2.5 mg q24hr (induction); 1.25 mg/kg q24hr (maintenance); PO 1000 mg/day or 500 mg bid; IV CCr 10-24 ml/min reduce to 1.25 mg/kg q24hr (induction); 0.625 mg/kg q24hr (maintenance); PO 500 mg/day; IV CCr <10 ml/min reduce to 1.25 mg/kg 3×/wk after hemodialysis (induction); 0.625 mg/kg 3×/wk after hemodialysis (maintenance); PO 500 mg 3×/wk after hemodialysis

**Available forms:** Powder for inj 500 mg/vial, caps 250, 500 mg; implant, intravitreal 4.5 mg

### Implementation

**PO route**

- Give with food, do not open or crush caps

**IV route**

- Product should be mixed under strict aseptic conditions using gloves, gown, and mask and using precautions for antineoplastics, do not use if particulate matter is present

**Intermittent IV inf route**

- Administer **IV** after reconstituting 500 mg/10 ml of sterile water for inj (50 mg/ml); shake; further dilute in 100 ml of $D_5W$, 0.9% NaCl, LR, Ringer's and run over 1 hr; use inf pump, in-line filter, flush line well before and after product
- Do not give by BOL **IV**, IM, SUBCUT inj
- Use reconstituted sol within 12 hr, do not refrigerate or freeze; do not use sol with particulate matter or discoloration, fludarabine, sargramostim

**Y-site compatibilities:** Allopurinol, CISplatin, cyclophosphamide, enalaprilat, etoposide, filgrastim, fluconazole, gatifloxacin, granisetron, linezolid, melphalan, methotrexate, PACLitaxel, propofol, tacrolimus, teniposide, thiotepa

**Y-site incompatibilities:** Amsacrine, fludarabine, foscarnet, ondansetron, sargramostim, vinorelbine

**Intravitreal implant route**

- Implanted by surgeon only
- Handle carefully to prevent damage to coating

## ADVERSE EFFECTS

**CNS:** *Fever,* chills, coma, *confusion,* abnormal thoughts, dizziness, bizarre dreams, *headache,* psychosis, tremors, somnolence, *paresthesia, weakness,* seizures, peripheral neuropathy

**CV:** Dysrhythmia, hypo/hypertension

**EENT:** Retinal detachment in CMV retinitis, cataracts, ocular hypertension, ocular pain, conjunctival scarring

**GI:** *Abnormal liver function tests, nausea, vomiting, anorexia, diarrhea, abdominal pain,* hemorrhage, perforation, pancreatitis

**GU:** Hematuria, *increased creatinine,* BUN

**HEMA:** Granulocytopenia, thrombocytopenia, irreversible neutropenia, anemia, eosinophilia, pancytopenia

**INTEG:** *Rash,* alopecia, *pruritus,* urticaria, pain at inj site, phlebitis

**RESP:** Dyspnea, pneumonia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed, increased bioavailability with fatty foods |
| **Distribution** | Crosses blood-brain barrier, CSF |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys (90%) unchanged, breast milk |
| **Half-life** | 3 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Adriamycin, amphotericin B, cycloSPORINE, dapsone, DOXOrubicin, flucytosine, mycophenolate, pentamidine, probenecid, tacrolimus, trimethoprim/sulfa combinations, vinBLAStine, vinCRIStine: increased ganciclovir toxicity

Didanosine: increased didanosine effect

Imipenem with cilastatin: increased risk for seizures

Probenecid: decreased renal clearance of ganciclovir

Radiation, zidovudine: severe granulocytopenia; do not give together

Tenofovir: increased effect

### Drug classifications

Antineoplastics: severe granulocytopenia; do not give together

Nucleoside analogs, NSAIDs: increased toxicity

## NURSING CONSIDERATIONS

### Assessment

- **CMV retinitis:** Cultures of blood, urine, and throat may all be taken; CMV is not confirmed by this method; the diagnosis is made by an ophthalmic exam
- Assess kidney, liver function; increases in hemopoietic studies: BUN, serum creatinine, AST

creatinine clearance, ALT, A:G ratio, baseline, and drip treatment; blood counts should be done q2wk; watch for decreasing granulocytes, Hgb; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required
• Assess for GI symptoms: severe nausea, vomiting, diarrhea; severe symptoms may necessitate discontinuing product
• Monitor electrolytes and minerals: calcium, phosphorus, magnesium, sodium, potassium; watch closely for tetany during 1st administration
• Assess for symptoms of allergic reactions: flushing, rash, urticaria, pruritus

**BLACK BOX WARNING: Monitor for leukopenia/neutropenia/thrombocytopenia:** WBCs, platelets q2day during 2 ×/day dosing and qwk thereafter; check for leukopenia with daily WBC count in patients with prior leukopenia with other nucleoside analogs or for whom leukopenia counts are <1000 cells/mm$^3$ at start of treatment; bruising, fatigue, bleeding, poor healing

• Assess for seizures, dysrhythmias

**BLACK BOX WARNING:** Assess for secondary malignancy; avoid direct contact with powder in caps/solution; if skin contact occurs, wash thoroughly with soap and water; do not get in the eyes

### Patient/family education
• Advise patient to notify prescriber if sore throat, swollen lymph nodes, malaise, fever occur; may indicate other infections
• Advise patient to report perioral tingling, numbness in extremities, and paresthesias
• Caution patient that serious product interactions may occur if OTC products are ingested; check first with prescriber
• Inform patient that product is not a cure, but will control symptoms
• Advise patient that regular blood tests, ophth exams must be continued
• Inform patient that major toxicities may necessitate discontinuing product

**BLACK BOX WARNING: Pregnancy:** Instruct patient to use contraception during treatment of males, females and that infertility may occur; men should use barrier contraception for 90 days after treatment; not to breastfeed (IV)

• Teach patient to take PO with food, do not open or crush caps
• Teach patient to report infection: fever, chills, sore throat; blood dyscrasias: bruising, bleeding, petechiae
• Tell patient to avoid crowds, persons with respiratory infection
• Advise patient to use sunscreen to prevent burns
• Advise patient to report itching, redness, or eye pain (ophthalmic treatment)

### Evaluation
**Positive therapeutic outcome**
• Decreased symptoms of CMV infection

G

## ganciclovir ophthalmic
*See Appendix B*

## gatifloxacin ophthalmic
*See Appendix B*

**⚠ HIGH ALERT**

## gemcitabine (Rx)
(gem-sit'a-been)
**Gemzar**
*Func. class.:* Antineoplastic—miscellaneous
*Chem. class.:* Pyrimidine analog

**Do not confuse:** Gemzar/Zinecard

**ACTION:** Exhibits antitumor activity by killing cells undergoing DNA synthesis (S phase) and blocking $G_1$/S-phase boundary

**Therapeutic outcome:** Prevention of growth of tumor

**USES:** Adenocarcinoma of the pancreas (nonresectable stage II, III, or metastatic stage IV); in combination with CISplatin for inoperable, advanced, or metastatic non–small cell lung cancer; advanced breast cancer in combination with PACLitaxel; with CARBOplatin for ovarian cancer, biliary tract cancer

### CONTRAINDICATIONS
Pregnancy, breastfeeding, hypersensitivity

**Precautions:** Children, geriatric, myelosuppression, radiation therapy, renal/hepatic disease

### DOSAGE AND ROUTES
**Pancreatic carcinoma (nonresectable stage II, III, IV)**
**Adult: IV** 1000 mg/m$^2$ given over ½ hr qwk × 7 wk, then 1 wk rest period; subsequent cycles should be infused once qwk × 3 wk out of every 4 wk depending on hematologic toxicity

### Non–small cell lung cancer, inoperable locally advanced stage IIIA or IIIB or metastatic stage IV

#### 4 wk schedule

**Adult: IV** 1000 mg/m$^2$ given over ½ hr on days 1, 8, 15 of each 28-day cycle; give CISplatin **IV** 100 mg/m$^2$ on day 1 after gemcitabine

#### 3 wk schedule

**Adult:** IV 1250 mg/m$^2$ given over ½ hr on days 1, 8 of each 21-day cycle; give CISplatin 100 mg/m$^2$ after the INF of gemcitabine on day 1

### Advanced breast cancer

**Adult: IV** 1250 mg/m$^2$ over ½ hr on days 1 and 8 of a 21-day cycle; give with PACLitaxel on day 1, 175 mg/m$^2$ over 3 hr prior to gemcitabine

**Available forms:** Lyophilized powder for inj 200 mg, 1 gm, 2 gm; solution for inj 1 gm/26.3 ml, 200 mg/ 5.26 ml, 2 gm/52.6 ml

### Implementation

- Give increased fluid intake to 2-3 L/day to prevent dehydration, unless contraindicated
- Provide antiemetic agents before and after treatment

**IV route**

- Prepare in biological cabinet using gown, mask, gloves, infusion related reactions including hypotension, severe flulike symptoms, myelosuppression, asthenia
- After reconstituting with 0.9% NaCl 5 ml/200 mg vial of product or 25 ml/1 g of product, shake (38 mg/ml); may be further diluted with 0.9% NaCl to concentrate as low as 0.1 mg/ml; discard unused portion, give over ½ hr, do not admix

**Y-site compatibilities:** Alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, ampicillin, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, butorphanol, calcium gluconate, caspofungin, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, clindamycin, cyclophosphamide, cytarabine, DACTINomycin, DAUNOrubicin, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin, droperidol, enalaprilat, etoposide, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, leucovorin, linezolid, LORazepam, mannitol, meperidine, mesna, metoclopramide, metroNIDAZOLE, minocycline, mitoXANtrone, morphine, nalbuphine, ondansetron, PACLitaxel, promethazine, ranitidine, streptozocin, teniposide, thiotepa, ticarcillin, tigecycline tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vinBLAStine, vinCRIStine, vinorelbine, voriconazole zidovudine, zoledronic acid

**Y-site incompatibilities:** Acyclovir, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, cefepime, cefoperazone, cefotaxime, chloramphenicol, dantrolene, DAPTOmycin, diazepam, furosemide, ganciclovir, imipenem-cilastatin, irinotecan, ketorolac, lansoprazole, methotrexate, methylPREDNISolone, mitoMYcin, nafcillin, pantoprazole, PEMEtrexed, phenytoin, piperacillin, prochlorperazine, thiopental

## ADVERSE EFFECTS

**GI:** Diarrhea, nausea, vomiting, anorexia, constipation, stomatitis, diarrhea, hepatotoxicity
**GU:** Proteinuria, hematuria
**HEMA:** Leukopenia, anemia, neutropenia, thrombocytopenia
**INTEG:** Irritation at site, rash, alopecia
**MISC:** Dyspnea, fever, hemorrhage, infection, flulike syndrome, paresthesia, peripheral edema, myalgia, capillary leak syndrome
RESP: Dyspnea, bronchospasm, pneumonitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Crosses placenta |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 2.5-18 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drug

Alcohol: increased bleeding

### Drug classifications

Anticoagulants, NSAIDs, salicylates: increased bleeding
Antineoplastics, radiation: increased myelosuppression, diarrhea
Bleomycin: Increase: Pulmonary toxicity
cloZAPine: Avoid concurrent use
DOXOrubicin: Increase: Hemolytic-uremic disorder
Live virus vaccines: decreased antibody response

### Drug/lab test

Increased: BUN, AST, ALT, alkaline phosphatase, bilirubin, creatinine

## NURSING CONSIDERATIONS

### Assessment

- **Bone marrow depression:** monitor CBC, differential, platelet count before each

dose; single agent: absolute granulocyte count >1000, and platelets >100,000, give complete dose; absolute granulocyte count 500-999/mm$^3$, platelets 50,000-99,999/mm$^3$, give 75%; absolute granulocyte count <500 or platelets <50,000/mm$^3$, do not give; combination with PACLitaxel in breast cancer: absolute granulocyte count >1200/mm$^3$ and platelets >75,000/mm$^3$, give complete dose; absolute granulocyte count 1000-1199/mm$^3$ or platelets 50,000-75,000/mm$^3$, give 75%; absolute granulocyte 700-999/mm$^3$ or platelets ≥50,000/mm$^3$, give 50%; granulocyte count <700/mm$^3$ or platelets <50,000/mm$^3$, do not give; combination with CARBOplatin in ovarian cancer: absolute granulocyte count >1500/mm$^3$ and platelet count >100,000/mm$^3$, give complete dose; absolute granulocyte count 1000-1499/mm$^3$ or platelets 75,000-99,999/mm$^3$, give 75%; absolute granulocyte count <1000/mm$^3$ or platelets <75,000/mm$^3$, do not give

- **Assess for blood dyscrasias:** bruising, bleeding, petechiae
- Monitor I&O, nutritional intake
- Monitor renal/hepatic studies before, during treatment; may increase AST, ALT, alkaline phosphatase, bilirubin, BUN, creatinine
- Assess food preferences: list likes, dislikes
- Assess buccal cavity for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia
- Assess GI symptoms: frequency of stools; cramping
- Capillary leak syndrome: Monitor for hemoconcentration, decreased albumin, B/P; discontinue
- Assess signs of dehydration: rapid respirations, poor skin turgor, decreased urine output, dry skin, restlessness, weakness
- Hemolytic uremic syndrome (HUS) may occur more frequently when given with bleomycin, assess renal function before use and periodically, anemia with microangiopathic hemolysis, elevated bilirubin or LDH, reticulocytosis, severe thrombocytopenia, increased BUN/creatinine are indications of HUS; permanently discontinue this product; pneumonitis, pulmonary edema, acute respiratory distress syndrome (ARDs)
- Pulmonary fibrosis or evidence of pulmonary toxicity, may occur ≤ 2 wk after last dose

### Patient/family education

- Teach patient to rinse mouth tid-qid with water, club soda; brush teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss
- Advise patient to avoid foods with citric acid or hot or rough texture if stomatitis is present; to drink adequate fluids
- Advise patient to report stomatitis; any bleeding, white spots, ulcerations in mouth; tell patient to examine mouth daily, report symptoms
- Advise patient to report signs of anemia: fatigue, headache, faintness, shortness of breath, irritability; hematuria, dysuria
- **Pregnancy/breastfeeding:** Advise patient to use contraception during therapy and for 4 mo after
- Instruct patient to avoid use with NSAIDs, salicylates, alcohol; not to receive vaccinations during treatment
- Teach about possible hair loss and what can be done
- Advise to report flulike symptoms, swelling of feet/legs, bruising; bleeding of gums, blood in urine, stools, emesis
- Teach to avoid crowds, persons with known upper respiratory infections
- Advise patient to use electric razor

### Evaluation

**Positive therapeutic outcome**

- Decrease in tumor size, decrease in spread of cancer, symptom relief

**TREATMENT OF OVERDOSE:** Induce vomiting, provide supportive care

## gemfibrozil (Rx)

(gem-fye'broe-zil)
**Lopid**
*Func. class.:* Antilipemic
*Chem. class.:* Fibric acid derivative

**Do not confuse:** Lopid/Levbid/Slo-bid

**ACTION:** Inhibits biosynthesis of VLDL, decreases triglycerides production in the liver, increases HDLs

**Therapeutic outcome:** Decreased hepatic triglyceride production, VLDL; accelerates removal of cholesterol from liver

**USES:** For use as an adjunct to diet for the treatment of hyperlipoproteinemia and for hypertriglyceridemia, including type IV (elevated triglycerides, VLDL) and type V (elevated triglycerides, chylomicrons, VLDL) in patients who have significant risk of coronary artery disease or pancreatitis and have not responded to diet

## CONTRAINDICATIONS
Severe renal/hepatic disease, preexisting gallbladder disease, primary biliary cirrhosis, hypersensitivity

**Precautions:** Pregnancy, breastfeeding, renal disease, cholelithiasis, children

## DOSAGE AND ROUTES
**Adult:** PO 600 mg bid 30 min before meals

### Hepatic/renal dose
Avoid use

**Available forms:** Tabs 600 mg; caps 300 mg

### Implementation
- Give 30 min before AM and PM meals

## ADVERSE EFFECTS
**CNS:** Fatigue, vertigo, headache, paresthesia, dizziness, somnolence
**GI:** Nausea, vomiting, *dyspepsia, diarrhea, abdominal pain*
**HEMA:** Leukopenia, anemia, eosinophilia, thrombocytopenia
**INTEG:** Rash, urticaria, pruritus
**MISC:** Task perversion
**MS:** Myopathy, rhabdomyolysis
**SYST:** Angioedema, exfoliative dermatitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown, plasma protein binding >95% |
| **Metabolism** | Liver, minimal |
| **Excretion** | Kidney, unchanged (70%), feces (6%) |
| **Half-life** | 1½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1-2 hr |
| **Peak** | 1-2 hr |
| **Duration** | 2-4 months |

## INTERACTIONS
### Individual drugs
Do not use with repaglinide, simvastatin
Repaglinide, metformin, glyburide, pioglitazone, other antidiabetic agents: increased hypoglycemic effect
Warfarin, avoid concurrent use: increased anticoagulant effect

### Drug classifications
Bile acid sequestrants: decreased effect of gemfibrozil, separate by >2 hr
HMG-CoA reductase inhibitors: increased risk of myositis, myalgia, rhabdomyolysis
Sulfonylureas: increased hypoglycemic effect
Cyclosporine: Increase: nephrotoxicity, monitor renal function
CYP2C*, CYP2C9, CYP2C19: Increased levels, monitor for toxicities

### Drug/lab test
Increased: liver function tests, CK, bilirubin, alkaline phosphatase
Decreased: Hgb, Hct, WBC, potassium

## NURSING CONSIDERATIONS
### Assessment
- **Hypercholesteremia:** Assess nutrition: fat, protein, carbohydrates; nutritional analysis should be performed by dietitian before treatment is initiated; monitor triglycerides, cholesterol, lipids baseline, during treatment; LDL and VLDL should be watched closely and if increased, product should be discontinued
- Assess renal, liver function tests, CBC, blood glucose if patient is on long-term therapy; if liver function test results increase, product should be discontinued; monitor hematologic and hepatic function
- Monitor bowel pattern daily; diarrhea may be a problem
- **Myopathy, rhabdomyolysis:** Assess for muscle pain, tenderness; obtain baseline CPK: if elevated or if these occur, product should be discontinued
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown

### Patient/family education
- Inform patient that compliance is needed for positive results to occur; not to double doses, take missed dose as soon as remembered unless almost time for next dose; that product may be discontinued if no improvement in 3 mo
- Caution patient to decrease risk factors: high-fat diet, smoking, alcohol consumption, lack of exercise
- Advise patient to notify prescriber if GI symptoms of diarrhea, abdominal or epigastric pain, nausea, vomiting occur; or if chills, fever, sore throat occur; also occurrence of muscle cramps, abdominal cramps, severe flatulence

### Evaluation
#### Positive therapeutic outcome
- Decreased cholesterol levels, serum triglyceride and improved ratio with HDLs

## gemifloxacin (Rx)

(gem-ah-flox′a-sin)

**Factive**

*Func. class.:* Antiinfective

*Chem. class.:* Fluoroquinolone

**ACTION:** Inhibits DNA gyrase, which is an enzyme involved in replication, transcription, and repair of bacterial DNA

**Therapeutic outcome:** Negative C&S, decreasing symptoms of infection

**USES:** Acute bacterial exacerbation of chronic bronchitis caused by *Streptococcus pneumoniae, Haemophilus influenzae, Haemophilus parainfluenzae, Moraxella catarrhalis;* community-acquired pneumonia caused by *Streptococcus pneumoniae* including multiproduct-resistant strains, *H. influenzae, M. catarrhalis, Mycoplasma pneumoniae, Chlamydia pneumoniae, Klebsiella pneumoniae*

## CONTRAINDICATIONS

Hypersensitivity to quinolones

**Precautions:** Pregnancy, breastfeeding, children, geriatric, hypokalemia, hypomagnesemia, renal disease, seizure disorders, excessive exposure to sunlight, psychosis, increased intracranial pressure, history of QT interval prolongation, dysrhythmias, myasthenia gravis, torsades de pointes

**BLACK BOX WARNING:** Tendon pain/rupture, tendinitis, neurotoxicity

## DOSAGE AND ROUTES

**Adult:** PO 320 mg/day × 3-5 days depending on type of infection

### Renal dose

**Adult:** PO CCr ≤40 ml/min 160 mg q24hr

**Available forms:** Tabs 320 mg

### Implementation

- Give with or without food
- Theophylline should not be used with this product; toxicity may result
- Administer 2 hr before or 3 hr after antacids, iron, zinc, or buffered products
- Provide adequate hydration

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache,* somnolence, depression, insomnia, nervousness, confusion, agitation, seizures, pseudotumor cerebri

**CV:** QT prolongation, vasodilatation

**EENT:** Visual disturbances, retinal detachment

**GI:** Diarrhea, *nausea,* vomiting, anorexia, flatulence, heartburn, dry mouth; increased AST, ALT; constipation, abdominal pain, pseudomembranous colitis

**GU:** Crystalluria (rare), vaginitis, interstitial nephritis

**INTEG:** Rash, pruritus, urticaria, *photosensitivity*

**SYST:** Anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly, bioavailability 71% |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | In urine as active product, metabolites |
| **Half-life** | 4-12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | $^1/_2$ hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Amoxapine, chloroquine, cloZAPine, dasatinib, dolasetron, dronedarone, droperidol, erythromycin, flecainide, haloperidol, lapatinib, maprotiline, methadone, octreotide, ondansetron, palonosetron, pentamidine, pimozide, propafenone, ranolazine, risperidone, sertindole, SUNItinib, tacrolimus, telithromycin, troleandomycin, vardenafil, vorinostat, ziprasidone: increased QT prolongation

Probenecid: may increase toxicity

**BLACK BOX WARNING:** Corticosteroids: Increase: Tendon rupture

Theophylline: toxicity; do not use concurrently

### Drug classifications

Antacids containing aluminum, iron, magnesium, sucralfate, zinc: decreased absorption; give 2 hr before or 3 hr after meals

Antiarrhythmics (amiodarone, disopyramide, procainamide, quiNIDine, sotalol), antidepressants (tricyclics), b-blockers, halogenated/local anesthetics: may decrease effect, resulting in life-threatening dysrhythmias, QT prolongation

Drugs that increase QT prolongation: increased QT prolongation

NSAIDs: increased CNS stimulation

## NURSING CONSIDERATIONS

### Assessment

- Monitor renal, liver function tests: BUN, creatinine, AST, ALT, electrolytes
- Monitor I&O ratio; urine pH, <5.5 is ideal
- Assess CNS symptoms: insomnia, vertigo, headache, agitation, confusion

**BLACK BOX WARNING: Tendon rupture**
Assess for tendon pain, inflammation; if present discontinue use; more common with corticosteroids; discontinue immediately if tendon pain, inflammation occurs

- **Assess allergic reactions and anaphylaxis:** rash, flushing, urticaria, pruritus, chills, fever, joint pain; may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction
- **Pseudomembranous colitis:** Monitor bowel pattern daily; if severe diarrhea, fever, abdominal pain occurs, product should be discontinued
- **Assess for overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- **QT prolongation:** Avoid use of quinolones in those with known QT prolongation; females and those with ongoing proarrhythmic conditions (TdP) are at greater risk; monitor ECG and/or Holter monitoring if product is used
- **Toxic psychosis/pseudotumor cerebri:** Assess for headache, blurred vision, neck/shoulder pain, nausea/vomiting, dizziness, tinnitus; discontinue immediately, may occur within hours to weeks after starting product
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk

### Patient/family education

- Advise patient that fluids must be increased to 2 L/day to avoid crystallization in kidneys
- Instruct patient that if dizziness or light-headedness occurs, to ambulate, perform activities with assistance
- Instruct patient to complete full course of product therapy
- Teach patient to contact prescriber if adverse reactions occur
- Teach patient to avoid iron- or mineral-containing supplements or aluminum/magnesium antacids within 2 hr before or 3 hr after dosing
- Advise patient that photosensitivity may occur and sunscreen should be used
- Advise patient to use frequent rinsing of mouth, sugarless candy or gum for dry mouth
- Teach patient to avoid other medication unless approved by prescriber
- **Tendon pain:** To immediately report pain, inflammation in tendons, weakness, tingling in extremities
- **Allergic reactions:** To report rash and stop product if it occurs

### Evaluation

**Positive therapeutic outcome**

- Negative C&S, absence of signs/symptoms of infection

## gentamicin (Rx)

(jen-ta-mye'sin)
**Cidomycin**
*Func. class.:* Antiinfective
*Chem. class.:* Aminoglycoside

**Do not confuse:** gentamicin/kanamycin/clindamycin/ tobramycin/erythromycin/vancomycin

**ACTION:** Interferes with protein synthesis in bacterial cell by binding to 30S ribosomal subunit, causing misreading of genetic code; inaccurate peptide sequence forms in protein chain, causing bacterial death

**Therapeutic outcome:** Bactericidal effects for the following organisms: *Pseudomonas aeruginosa, Proteus, Klebsiella, Serratia, Escherichia coli, Enterobacter, Citrobacter, Staphylococcus, Shigella, Salmonella, Acinetobacter, Bacillus anthracis*

**USES:** Severe systemic infections of CNS; respiratory, GI, and urinary tracts; bone; skin; soft tissues; caused by susceptible strains

## CONTRAINDICATIONS

Hypersensitivity to this or other aminoglycosides

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Breastfeeding, geriatric, neonates, pseudomembranous colitis

**BLACK BOX WARNING:** Myasthenia gravis, Parkinson's disease, infant botulism, tinnitus, nephrotoxicity, neurotoxicity, ototoxicity

## DOSAGE AND ROUTES

### Severe systemic infections

**Adult: IV** INF 3-6 mg/kg/day in 3 divided doses q8hr; IM 3-5 mg/kg/day in divided doses q8hr
**Child: IV/IM** 2-2.5 mg/kg q8hr

**Neonate and infant:** IV/IM 2.5 mg/kg q8-12hr

**Neonate <1 wk:** 2.5 mg/kg q12hr

### Renal dose

**Adult:** IM/IV CCr 70-100 ml/min reduce dose by multiplying maintenance dose by 0.85, give q8-12hr; CCr 50-69 ml/min reduce dose as above, give q12hr; CCr 25-49 ml/min reduce as above, give q24hr; CCr <25 ml/min reduce as above, give based on serum concentrations

### Renal dose: extend interval (unlabeled)

**Adult:** IV CCr 40-59 ml/min, 5-7 mg/kg q36hr; CCr 20-39 ml/min, 5-7 mg/kg q48hr; CCr <20 ml/min, 5-7 mg/kg once, then base on serial levels

**Available forms:** Inj 10, 40 mg/ml; premixed inj 40, 60, 70, 80, 90, 100, 120 mg/100 ml NS

### Implementation

**IM route**

- Give inj deeply in large muscle mass; rotate sites

**IV route**

- Give in even doses around the clock; product must be given for 10-14 days to ensure organism death and prevent superinfection
- After diluting in 50-200 ml normal saline, $D_5W$, decrease volume of diluent in child; maintain 0.1% solution, run over $^1/_2$-1 hr (adults), up to 2 hr (child). Give by intermittent inf, flush with 0.9% NaCl or $D_5W$ after inf
- Separate aminoglycosides and penicillins by ≥1 hr
- Store in tight container

**IV compatibility of gentamicin sulfate with:** Alatrofloxacin, aldesleukin, alemtuzumab, alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amsacrine, anidulafungin, argatroban, arsenic trioxide, ascorbic acid injection, asparaginase, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, cefamandole, ceFAZolin, cefepime, cefotaxime, cefOXitin, cefpirome, ceftaroline, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorothiazide, chlorpheniramine, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clarithromycin, clindamycin, cloxacillin, codeine, colistimethate, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin citrate liposome, DAUNOrubicin hydrochloride, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhyDRINATE, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin hydrochloride, DOXOrubicin hydrochloride liposomal, doxycycline, edetate calcium disodium, edetate disodium, enalaprilat, EPHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ergonovine, ertapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fenta-NYL, fluconazole, fludarabine, fluorouracil, foscarnet, gallamine, gallium, gatifloxacin, gemcitabine, glycopyrrolate, granisetron, HYDROmorphone, hydrOXYzine, ifosfamide, imipenemcilastatin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, lactated Ringer's injection, lansoprazole, lepirudin, leucovorin, levofloxacin, lidocaine, lincomycin, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mephentermine sulfate, meropenem, mesna, metaraminol, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, nalorphine, naloxone, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxacillin, oxaliplatin, oxytocin, PACLitaxel (solvent/surfactant), palonosetron, pamidronate, pancuronium, papaverine, penicillin G potassium/sodium, pentazocine, perphenazine, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, polymyxin B, posaconazole, potassium acetate/chloride, procainamide, prochlorperazine, promazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine gluconate, ranitidine, remifentanil, Ringer's injection, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate/citrate, streptomycin, succinylcholine, SUFentanil, tacrolimus, telavancin, temocillin, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, topotecan, TPN (2-in-1), trastuzumab, trimetaphan, tubocurarine, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, vitamin B complex with C, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Confusion, depression, numbness, tremors, seizures, muscle twitching, neurotoxicity, dizziness, vertigo, encephalopathy, fever, headache, lethargy
**CV:** Hypotension, hypertension, palpitations, edema
**EENT:** Ototoxicity, deafness, visual disturbances, tinnitus
**GI:** *Nausea, vomiting, anorexia,* increased ALT, AST, bilirubin, hepatomegaly, hepatic necrosis, splenomegaly
**GU:** Oliguria, hematuria, renal damage, azotemia, renal failure, nephrotoxicity, proteinuria
**HEMA:** Agranulocytosis, thrombocytopenia, leukopenia, eosinophilia, anemia
**INTEG:** *Rash,* burning, urticaria, dermatitis, alopecia, photosensitivity, anaphylaxis
**MS:** Twitching, myasthenia gravis–like symptoms
**RESP:** Apnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM) |
| **Distribution** | Distributed in extracellular fluids, poorly distributed in CSF; crosses placenta |
| **Metabolism** | Liver, minimal |
| **Excretion** | Mostly unchanged (79%) kidneys |
| **Half-life** | 1-2 hr; infants 6-7 hr; increased in renal disease |

### Pharmacodynamics

| | IM | IV |
|---|---|---|
| **Onset** | Rapid | Rapid |
| **Peak** | 30-90 min | Infusion's end |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** Acyclovir, amphotericin B, cidofovir, CISplatin, cycloSPORINE, ethacrynic acid, foscarnet, furosemide, ganciclovir, mannitol, methoxyflurane, pamidronate, polymyxin, tacrolimus, vancomycin, zoledronic acid: increased ototoxicity, neurotoxicity, nephrotoxicity

### Drug classifications

**BLACK BOX WARNING:** Aminoglycosides, cephalosporins, penicillins: increased otoxicity, neurotoxicity, nephrotoxicity

Nondepolarizing neuromuscular blockers: increased neuromuscular blockade, respiratory depression
Penicillins: Do not use at the same time as or physically mix with penicillins

### Drug/lab test

Increase: LDH, AST, ALT, bilirubin, BUN, creatinine, eosinophils
Decrease: Hgb, WBC, platelets, granulocytes

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction
- **Assess patient for signs and symptoms of infection** including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, fever; obtain baseline during treatment

**BLACK BOX WARNING: Neurotoxicity (myasthenia gravis, Parkinson's disease, infant botulism):** Assess for paresthesias, tetany, Chvostek's/Trousseau's signs, confusion (adults) tetany, muscle weakness (infants); correct electrolyte imbalance

- Complete C&S before beginning product therapy; this will ensure that correct treatment has been initiated
- **Assess for allergic reactions:** rash, urticaria, pruritus, chills, fever, joint pain may occur a few days after therapy begins

**BLACK BOX WARNING: Nephrotoxicity** Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also, increased BUN, creatinine, urine CCr <80 ml/min; monitor I&O ratio; urinalysis daily for proteinuria, cells, casts; report sudden change in urine output; assess urine pH if product is used for UTI; urine should be kept alkaline

- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride, magnesium monthly if patient is on long-term therapy
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria; assess stool guaiac daily if on long-term therapy
- **Assess for overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- Obtain weight before treatment; calculation of dosage is usually based on ideal body weight but may be calculated on actual body weight

• Monitor VS during inf, watch for hypotension, change in pulse
• Assess **IV** site for thrombophlebitis including pain, redness, swelling q30min, change site if needed; apply warm compresses to discontinued site
• Obtain serum peak, measured at 30-60 min after **IV** inf or 60 min after IM inj, trough level measured just before next dose; blood level should be 2-4 times bacteriostatic level (based on traditional dosing)

**BLACK BOX WARNING: Ototoxicity: Assess for deafness** by audiometric testing, ringing, roaring in ears, vertigo; assess hearing before, during, after treatment

• Assess for dehydration: high specific gravity, decrease in skin turgor, dry mucous membranes, dark urine
• **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, use only if benefits outweigh fetal risk, avoid breastfeeding

### Patient/family education

• Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
• Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superimposed infection
• Teach patient to drink adequate fluids
• Teach patient to avoid hazardous activities until reaction is known

**BLACK BOX WARNING:** Advise patient to report loss of hearing, ringing, roaring in ears; feeling of fullness in the head

### Evaluation

**Positive therapeutic outcome**

• Absence of signs/symptoms of infection (WBC $<10{,}000/mm^3$, temp WNL, absence of red, draining wounds)
• Reported improvement in symptoms of infection

## TREATMENT OF OVERDOSE:

Withdraw product, hemodialysis

## gentamicin ophthalmic

*See Appendix B*

## gentamicin topical

*See Appendix B*

**⚠ HIGH ALERT**

# glimepiride (Rx)

(gly-meh'pih-ride)
**Amaryl**

# glipiZIDE (Rx)

(glip-i'zide)
**Glucotrol, Glucotrol XL**
*Func. class.:* Antidiabetic
*Chem. class.:* Sulfonylurea (2nd generation)

**Do not confuse:** glipiZIDE/glucotrol/glyBURIDE

## ACTION:

Causes functioning β cells in pancreas to release insulin, leading to drop in blood glucose levels; may improve insulin binding to insulin receptors or increase the number of insulin receptors with prolonged administration; may also reduce basal hepatic glucose secretion; not effective if patient lacks functioning β cells

**Therapeutic outcome:** Decrease in polyuria, polydipsia, polyphagia, clear sensorium, absence of dizziness, stable gait

## USES:

Type 2 diabetes mellitus

## CONTRAINDICATIONS

Hypersensitivity to sulfonylureas/sulfonamides, type 1 diabetes, diabetic ketoacidosis

**Precautions:** Pregnancy, geriatric, cardiac disease, severe renal/hepatic disease, G6PD deficiency

## DOSAGE AND ROUTES

### Glimepiride

**Adult:** PO 1-2 mg/day with breakfast, then increase by ≤2 mg/day at q1-2wk, max 8 mg/day
**Geriatric:** PO 1 mg/day, may increase if needed

### Renal/Hepatic dose

**Adult:** PO 1 mg/day with breakfast, may titrate upward as needed

### GlipiZIDE

**Adult:** PO 5 mg initially before breakfast, then increase by 2.5-5 mg after several days, to desired response; max 40 mg/day in divided doses or 15 mg/dose; (XL) PO 5 mg/day with breakfast, may increase to 10 mg/day; max 20 mg/day
**Geriatric:** PO 2.5 mg/day, may increase if needed

### Hepatic dose

**Adult:** PO 2.5 mg initially, then increase to desired response; max 40 mg/day in divided doses or 15 mg/dose

**Available forms:** Glimepiride: tabs 1, 2, 4 mg; glipiZIDE: tabs 5, 10 mg scored; EXT REL tabs 2.5, 5, 10 mg

### Implementation

- Do not break, crush, or chew ext rel tabs
- Convert from other oral hypoglycemic agents or insulin dosage of <40 units/day; change may be made without gradual dosage change
- Patients taking >40 units/day of insulin convert gradually by receiving oral hypoglycemic agents and 50% of previous insulin dosage for 3-5 days
- Monitor serum or urine glucose and ketones 3 ×/day during conversion
- **GlipiZIDE:** Give 30 min before meals (regular release); with breakfast (ext rel)
- **Glimepiride:** with breakfast; if patient is NPO, may need to hold dose to prevent hypoglycemia
- Give tab crushed and mixed with meal or fluids for patients with difficulty swallowing
- For severe hypoglycemia give **IV** $D_{50}W$, then **IV** dextrose solution
- Store in tight container in cool environment

## ADVERSE EFFECTS

**CNS:** *Headache, weakness, dizziness, drowsiness,* tinnitus, fatigue, vertigo
**ENDO:** Hypoglycemia
**GI:** Hepatotoxicity, cholestatic jaundice, nausea, vomiting, diarrhea, heartburn
**HEMA:** Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia, increased AST, ALT, alkaline phosphatase, pancytopenia, hemolytic anemia
**INTEG:** Rash, allergic reactions, pruritus, urticaria, eczema, photosensitivity, erythema, allergic vasculitis
SYST: Serious hypersensitivity

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed, GI tract |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Via kidneys |
| **Half-life** | 2-4 hr; 5 hr glimepiride |

### Pharmacodynamics

| | glipiZIDE | glimepiride |
|---|---|---|
| **Onset** | 1-1½ hr | |
| **Peak** | 1-2 hr | 2-3 hr |
| **Duration** | 10-12 hr | |

## INTERACTIONS

### Individual drugs

Charcoal, cholestyramine, diazoxide, isoniazid, rifampin: possible decreased action of glipiZIDE
Chloramphenicol, cimetidine, clarithromycin, clofibrate, fenfluramine, fluconazole, gemfibrozil, guanethidine, insulin, methyldopa, phenylbutazone, probenecid, sulfinpyrazone, voriconazole: increased hypoglycemia, monitor blood glucose
Digoxin: increased action of digoxin, cycloSPORINE

### Drug classifications

Androgens, anticoagulants, fibric acid derivatives, $H_2$-antagonists, magnesium salts, MAOIs, NSAIDs, salicylates, sulfonamides, tricyclics, urinary acidifiers: increased hypoglycemia
β-Blockers: may mask symptoms of hypoglycemia
Diuretics (thiazide), corticosteroids, hydantoins, colesevelam, urinary alkalinizers: possible decreased action of glipiZIDE
Glycosides: increased action of glycosides

### Drug/herb

Garlic, horse chestnut: increased antidiabetic effect
Chromium: decreased antidiabetic effect
Chromium, coenzyme Q10, fenugreek, ginseng: increased or decreased hypoglycemic effect
Green tea: decreased hypoglycemic effect

### Drug/lab test

Increase: AST, ALT, LDH, BUN, creatinine
Decrease: Platelets, WBC, sodium

## NURSING CONSIDERATIONS

### Assessment

- **Assess for hypoglycemic/hyperglycemic reactions** that can occur soon after meals; hypoglycemic reactions (sweating, weakness, dizziness, anxiety, tremors, hunger); hyperglycemic reactions; A1c (baseline, q3mo) during treatment
- **Blood dyscrasias:** Monitor CBC
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, use only if benefits outweigh fetal risk, breastfed infant may be hypoglycemic

### Patient/family education

- **Teach patient to check for symptoms of cholestatic jaundice:** dark urine, pruritus, yellow sclera; if these occur, prescriber should be notified
- Teach patient to use capillary blood glucose test
- Teach patient to report bleeding, bruising, weight gain, edema, SOB, weakness, sore throat, swelling in ankles, rash
- Teach patient symptoms of hypo/hyperglycemia, what to do about each
- Instruct patient that product must be continued on daily basis; explain consequence of discontinuing product abruptly

- Caution patient to avoid OTC medications unless approved by a prescriber
- Teach patient that diabetes is a lifelong illness; that this product is not a cure
- Teach patient to avoid alcohol; inform about disulfiram reaction (nausea, headache, cramps, flushing, hypoglycemia)
- Instruct patient that all food included in diet plan must be eaten to prevent hypoglycemia
- Advise patient to use sunscreen or stay out of the sun to prevent burns
- Advise patient to carry/wear emergency ID and carry a glucagon emergency kit for emergency purposes; also prescriber name, phone number, and medications taken
- Teach patient ext rel tab may appear in stool

### Evaluation

**Positive therapeutic outcome**

- Decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait
- Improved serum glucose, A1c

**⚠ HIGH ALERT**

## glyBURIDE (Rx) (glibenclamide)

(glye′byoor-ide)

**DiaBeta, Euglucon, Glynase PresTab**

*Func. class.:* Antidiabetic

*Chem. class.:* Sulfonylurea (2nd generation)

**Do not confuse:** glyBURIDE/Glucotrol/glipiZIDE, DiaBeta/Zebeta

**ACTION:** Causes functioning β cells in pancreas to release insulin, leading to drop in blood glucose levels; may improve insulin binding to insulin receptors and increase number of insulin receptors with prolonged administration; may also reduce basal hepatic glucose secretion; not effective if patient lacks functioning β cells

**Therapeutic outcome:** Decrease in polyuria, polydipsia, polyphagia, clear sensorium, absence of dizziness, stable gait

**USES:** Type 2 diabetes mellitus

## CONTRAINDICATIONS

Hypersensitivity to sulfonylureas, type 1 diabetes, diabetic ketoacidosis, renal failure

**Precautions:** Pregnancy, geriatric, cardiac/thyroid disease, severe renal/hepatic disease, severe hypoglycemic reactions, sulfonamide/sulfonylurea hypersensitivity, G6PD deficiency

## DOSAGE AND ROUTES

### To replace insulin

**Adults:** PO if insulin was <40 U/day, switch directly when glyBURIDE is stopped; if insulin <20 U/day give 2.5-5 mg or (1.5-3 mg micronized); if insulin was 20-40 U/day give 5 mg or (3 mg micronized); if insulin >40 U/day, give 5 mg (3 mg micronized) initially with 50% insulin dose, gradually taper insulin and increase glyBURIDE

### DiaBeta

**Adult:** PO 1.25-5 mg initially, then increased to desired response at weekly intervals up to 20 mg/day; may be given as a single or divided dose

**Geriatric:** PO 1.25 mg initially, then increased to desired response; max 20 mg/day, maintenance 1.25-20 mg/day

### Renal dose

**Adult:** PO CCr 50 ml/min, use conservative dose

**Geriatric:** PO 0.75-3 mg/day, may increase by 1.5 mg/wk

### Glynase PresTab (micronized)

**Adult:** PO 1.5-3 mg/day initially, may increase by 1.5 mg/wk, max 12 mg/day

**Geriatric:** PO 0.75-3 mg/day, may increase by 1.5 mg/wk

**Available forms:** Tabs (DiaBeta) 1.25, 2.5, 5 mg; tabs micronized (Glynase PresTab) 1.5, 3, 6 mg

### Implementation

- Conversion from other oral hypoglycemic agents or insulin dosage of <40 units/day; change may be made without gradual dosage change
- Patients taking >40 units/day of insulin convert gradually by receiving oral hypoglycemic agents and 50% of previous insulin dosage for 3-5 days
- Monitor serum or urine glucose and ketones 3 ×/day during conversion
- Give product 30 min before breakfast; if large dose is required, may be divided into two; give with meals to decrease GI upset and provide best absorption; if patient is NPO, may need to hold dose to avoid hypoglycemia, take at same time each day
- Give tab crushed and mixed with meal or fluids for patients with difficulty swallowing
- For severe hypoglycemia, give **IV** $D_{50}W$, then **IV** dextrose sol
- Store in tight container in cool environment

## ADVERSE EFFECTS

**CNS:** *Headache, weakness,* paresthesia, tinnitus, fatigue, vertigo

**EENT:** Blurred vision

**ENDO:** Hypoglycemia
**GI:** Nausea, fullness, heartburn, hepatoxicity, cholestatic jaundice, vomiting, diarrhea, hepatic failure (rare)
**HEMA:** Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia, increased AST, ALT, alkaline phosphatase
**INTEG:** Rash, allergic reactions, pruritus, urticaria, eczema, photosensitivity, erythema
**MS:** Joint pains, vasculitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed GI tract |
| **Distribution** | 99% plasma protein binding |
| **Metabolism** | Liver |
| **Excretion** | Urine, feces (metabolites), crosses placenta |
| **Half-life** | 10 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 2 hr |
| **Peak** | 2-4 hr |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Bosentan: increased LFTs, avoid concurrent use
Charcoal, cholestyramine, isoniazid, rifampin thyroid: decreased action of glyBURIDE
Clarithromycin, chloramphenicol, fenfluramine, fluconazole, gemfibrozil, guanethidine, insulin, methyldopa, phenylbutazone, probenecid, sulfinpyrazone: increased hypoglycemia
Colesevelam: increased triglyceride levels
CycloSPORINE: increased action of cycloSPORINE
Diazoxide: both products may have action decreased
Digoxin: increased level

### Drug classifications

Androgens, anticoagulants, antidepressants (tricyclics), β-blockers, $H_2$-antagonists, magnesium salts, MAOIs, NSAIDs, salicylates, sulfonamides, urinary acidifiers: increased hypoglycemia, voriconazole, monitor blood glucose
β-Adrenergic blockers: increased masking of symptoms of hypoglycemia
Diuretics (thiazide), hydantoins, urinary alkalinizers, corticosteroids, phenothiazines, oral contraceptives, estrogens: decreased action of glyBURIDE, monitor blood glucose

### Drug/herb

Garlic, horse chestnut: increased antidiabetic effect
Green tea: decreased hypoglycemic effect

### Drug/lab test

Increased: AST, ALT, LDH, BUN, creatinine, alkaline phosphatase
Decrease: Hgb, sodium, glucose, platelets, WBC

## NURSING CONSIDERATIONS

### Assessment

- Assess for hypo/hyperglycemic reactions that can occur soon after meals; hypoglycemic reactions (sweating, weakness, dizziness, anxiety, tremors, hunger); hyperglycemic reactions; A1c (baseline, q3mo) during treatment
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, insulin is usually used in pregnancy, breastfed infant may be hypoglycemic
- **Blood dyscrasias:** Monitor CBC, check liver function tests periodically, AST, LDH, and renal studies: BUN, creatinine during treatment
- **Beers:** Avoid in older adults, severe prolonged hypoglycemia

### Patient/family education

- **Teach patient to check for symptoms of cholestatic jaundice:** dark urine, pruritus, yellow sclera; if these occur, prescriber should be notified
- Teach patient to use capillary blood glucose test
- **Teach patient symptoms of hypo/hyperglycemia,** what to do about each
- Instruct patient that product must be continued on daily basis; explain consequence of discontinuing product abruptly
- Teach patient to report bleeding, bruising, weight gain, edema, shortness of breath, weakness, sore throat
- Teach patient to take product in AM to prevent hypoglycemic reactions at night
- Caution patient to avoid OTC medications unless approved by a prescriber
- Teach patient that diabetes is a lifelong illness; that this product is not a cure
- Instruct patient that all food included in diet plan must be eaten to prevent hypoglycemia
- Advise patient to carry/wear emergency ID and carry a glucagon emergency kit for emergency purposes: have sugar packets available; also prescriber name, phone number, and medications
- Advise patient to use sunscreen or stay out of the sun to prevent burns

### Evaluation

#### Positive therapeutic outcome

- Decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait
- Improved serum glucose, A1c

## golimumab (Rx)

(goal-lim'yu-mab)
**Simponi, Simponi Aria**
*Func. class.:* Antirheumatic agent (disease modifying), immunomodulator
*Chem. class.:* Monoclonal antibody, DMARDS, tumor necrosis factor (TNF) modifier

**ACTION:** Monoclonal antibody specific for human tumor necrosis factor (TNF); elevated levels of TNF are found in patients with rheumatoid arthritis

**Therapeutic outcome:** Decreased pain, decreased inflammation in joints, better ROM

**USES:** Rheumatoid arthritis, ankylosing spondylitis, psoriatic arthritis, ulcerative colitis

## CONTRAINDICATIONS

Hypersensitivity active infections

**Precautions:** Pregnancy, breastfeeding, children, geriatric patients, CNS demyelinating disease, Guillain-Barré syndrome, HF, hepatitis B carriers, blood dyscrasias, surgery, MS, neurological disease, diabetes, immunosuppression

**BLACK BOX WARNING:** Infection

## DOSAGE AND ROUTES

### Moderate to severe rheumatoid arthritis

**Adult:** SUBCUT 50 mg qmo; for RA give with methotrexate; IV (Simponi Aria only) 2 mg/kg over 30 min, repeat in 4 wk, then q8wk; give with methotrexate

### Ankylosing spondylitis/psoriatic arthritis

**Adult:** SUBCUT 50 mg monthly

### Moderate to severe ulcerative colitis

**Adult:** SUBCUT 200 mg for 1 dose, then 100 mg in 2 wk; maintenance 100 mg q4wk starting at wk 6

**Available forms:** Inj 50 mg/0.5 ml, 100 mg/ml prefilled syringe, SmartJect Auto Injector; inj 50 mg/4 ml single-use vial

### Implementation

**SUBCUT route**

- Refrigerate; do not freeze; allow to warm to room temp before using
- Visually inspect solution for particulate or discoloration, solution should be clear to slightly opalescent and colorless to slightly yellow; there may be tiny white particles; do not shake
- ***SmartJect autoinjector:*** Allow to reach room temperature for 30 min prior to use, remove cap, inject within 5 min of removing cap, do not put cap back on, place the open end against the inj site at a 90-degree angle, without pushing button, push the injector firmly against the skin, press the button once and release, listen for the first click, wait for the second click or 15 sec, and remove the injector; do not rub site
- ***Prefilled syringe:*** Allow to warm to room temperature for 30 min, remove needle cover by pulling straight off, do not twist or recap, inject within 5 min of needle cover removal, hold the syringe in one hand like a pencil and use the other to pinch the skin, inject needle at a 45-degree angle, push plunger down as far as it will go, keep pressure on the plunger head and remove needle from skin, remove pressure from the plunger head, the needle guard will cover the needle, do not rub site

**IV route (Simponi Aria)**

- Calculate number of vials needed; do not shake; dilute total volume of product in NS to yield 100 ml for infusion, slowly add product, mix gently
- Infuse over 30 min; use infusion set with in-line, sterile, non-pyrogenic, low-protein binding filter (≤0.22 mm pore size)

## ADVERSE EFFECTS

**CNS:** Dizziness, paresthesia, CNS demyelinating disorder, weakness
**CV:** Hypertension, HF
**GI:** Hepatitis
**HEMA:** Agranulocytosis, aplastic anemia, leukopenia, polycythemia, thrombocytopenia, pancytopenia
**INTEG:** Psoriasis
**MISC:** Increased risk of cancer, antibody development to this drug, risk of infection (TB, invasive fungal infections, other opportunistic infections); may be fatal, inj site reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Terminal 2 wk |

### Pharmacodynamics

IV peak 12 wk,
SUBCUT peak 2-5 days

## INTERACTIONS

### Individual drugs

Abatacept, adalimumab, anakinra, etanercept, immunosuppressants, infliximab, rilonacept, rituximab: increased infection, avoid concurrent use

Warfarin, cycloSPORINE, theophylline: dosage change may be needed

### Drug classifications

Live vaccines: do not give concurrently or within 3 mo; immunization should be brought up to date before treatment

### Drug/lab tests

Increase: LFTs

Decrease: Platelets, WBC

## NURSING CONSIDERATIONS

### Assessment

- **Assess for pain,** stiffness, ROM, swelling of joints during treatment
- Check for inj site pain, swelling; usually occur after 2 inj (4-5 days)

**BLACK BOX WARNING: Check for infections** (fever, flulike symptoms, dyspnea, change in urination, redness/swelling around any wounds), stop treatment if present; some serious infections including sepsis may occur, may be fatal; patients with active infections should not be started on this product

- **Blood dyscrasias:** CBC, differential before and periodically during treatment

**BLACK BOX WARNING: TB:** Obtain TB skin test before starting treatment; treat latent TB before starting therapy, continue to monitor for TB, even if TB test is negative

**BLACK BOX WARNING: Neoplastic disease:** May occur in those <18 yr; avoid use in those with known malignancies, monitor for secondary malignancies during treatment

- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown
- **HF:** Monitor B/P, pulse, edema, shortness of breath, may occur or worsen with treatment
- **Psoriasis:** May occur or worsen; LFTs, hepatitis B serology, may reactivate HBV

### Patient/family education

- Teach patient about self-administration if appropriate: inj should be made in thigh, abdomen, upper arm; rotate sites at least 1 inch from old site; do not inject in areas that are bruised, red, hard
- Advise patient that if medication is not taken when due, inject next dose as soon as remembered and inject next dose as scheduled

**BLACK BOX WARNING:** Teach patient to report signs, symptoms of infection, allergic reaction, or lupuslike syndrome

- **HBV infection:** Test for HBV before starting treatment, HBV can be fatal in HBV carriers, monitor

### Evaluation

**Positive therapeutic outcome**

- Decreased inflammation, pain in joints

## goserelin (Rx)

(goe'se-rel-lin)

**Zoladex**

*Func. class.:* Gonadotropin-releasing hormone, antineoplastic

*Chem. class.:* Synthetic decapeptide analog of LHRH

**ACTION:** Inhibitor of pituitary gonadotropin secretion; initially increases LH and FSH, with increases in testosterone, reduction in sex steroid levels (substitute serum testosterone levels)

**Therapeutic outcome:** Decrease in tumor size and spread of malignant cells

**USES:** Advanced prostate cancer Stage B2-C (10.8 mg); endometriosis, advanced breast cancer, endometrial thinning (3.6 mg)

## CONTRAINDICATIONS

Pregnancy **D** (breast cancer), **X** (endometriosis), breastfeeding, nondiagnosed vaginal bleeding, children, 10.8 mg dose in women, hypersensitivity to LHRH, LHRH-agonist analogs

**Precautions:** Spinal cord decompression, renal disease, bone mineral density loss

## DOSAGE AND ROUTES

**Adult:** SUBCUT 3.6 mg q4wk (implant) or 10.8 mg q12wk

### Endometrial thinning

**Adult:** SUBCUT 1-2 depot inj (usually 1 depot, surgery performed at 4 wk); (if 2 depots, surgery performed 2-4 wk after 2nd depot)

**Available forms:** Depot inj 3.6, 10.8 mg

### Implementation

**Depot**

- Give SUBCUT using implant, inserted by qualified person into upper subcutaneous tissue in abdominal wall q28days or q12wk (10.8 mg), do not attempt to remove air bubbles from syringe, assess for injection site reaction

## ADVERSE EFFECTS

**CNS:** Headaches, spinal cord compression, anxiety, depression, dizziness, insomnia, lethargy, hot flashes, emotional lability
**CV:** Dysrhythmia, cerebrovascular accident, hypertension, MI, chest pain, HF; sudden cardiac death, stroke (men)
**ENDO:** Gynecomastia, breast tenderness, hot flashes; hyperglycemia, diabetes (men)
**GI:** Nausea, vomiting, constipation, diarrhea, ulcer
**GU:** *Spotting, breakthrough bleeding, decreased libido,* renal insufficiency, urinary obstruction, urinary tract infection, impotence
**INTEG:** Rash, pain on inj, diaphoresis
**MS:** Osteoneuralgia
**RESP:** *COPD, URI*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 4½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 14-28 days |
| **Duration** | Treatment length |

## INTERACTIONS

### Drug/lab test

Increased: alkaline phosphatase, estradiol, FSH, LH
Decreased: progesterone

## NURSING CONSIDERATIONS

### Assessment

- **Reproductive studies:** monitor pelvic ultrasound, pelvic exam, PSA, serum estradiol/testosterone, pregnancy test prior to therapy
- Monitor I&O ratios; palpate bladder for distention in urinary obstruction
- **Cancer metastases:** monitor for relief of bone pain (back pain), change in motor function
- Blood studies: monitor acid phosphatase; calcium in breast/prostate cancer, hypercalcemia may occur
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Caution patient that gynecomastia and postmenopausal symptoms may occur but will decrease after treatment is discontinued; that bone pain may increase, then decrease, may use analgesics
- Teach patient to contact prescriber for difficulty urinating, hot flashes occur during treatment
- Advise patient not to breastfeed while taking product; use effective nonhormonal contraception
- Advise patient to notify prescriber if chest pain, weakness, difficulty breathing occur; may indicate MI or stroke

### Evaluation

**Positive therapeutic outcome**

- More normal levels of PSA, acid phosphatase, alkaline phosphatase; testosterone level of <25 mg/dl

## granisetron (Rx)

(grane-iss'e-tron)
**Granisol, Kytril, Sancuso, Sustol**
*Func. class.:* Antiemetic
*Chem. class.:* 5-$HT_3$ receptor antagonist

**ACTION:** Prevents nausea, vomiting by blocking serotonin peripherally, centrally, and in the small intestine

**Therapeutic outcome:** Absence of nausea and vomiting

**USES:** Prevention of nausea, vomiting associated with cancer chemotherapy including high-dose CISplatin, radiation

**Unlabeled uses:** Acute nausea, vomiting after surgery

## CONTRAINDICATIONS

Hypersensitivity to this product or benzyl alcohol

**Precautions:** Pregnancy, breastfeeding, children, geriatric, ondansetron/palonosetron/dolasetron hypersensitivity, cardiac dysrhythmias, cardiac/hepatic disease/GI, electrolyte imbalances

## DOSAGE AND ROUTES

### Nausea, vomiting in chemotherapy

**Adult and child ≥2 yr: IV** 10 mcg/kg over 5 min, 30 min before the start of cancer chemotherapy, TD apply 1 patch (3.1 mg/24 hr) to upper arm 24-48 hr before chemotherapy; patch may be worn up to 7 days
**Adult:** PO 1 mg bid, give 1st dose 1 hr before chemotherapy and next dose 12 hr after 1st or 2 mg as a single dose anytime within 1 hr prior to chemotherapy or radiation

### Nausea, vomiting in radiation therapy

**Adult:** PO 2 mg/day 1 hr prior to radiation

**Available forms:** Inj 0.1 mg/ml, 1 mg/ml; tabs 1 mg, oral sol 2 mg/10 ml; patch TD 3.1 mg/24 hr

## Implementation

### PO route

- Give dose 1 hr prior to chemotherapy/radiation and another dose 12 hr after the first
- **Transdermal:** Apply to clean, dry skin on upper arm q24-48hr prior to chemotherapy
- Do not cut in pieces
- Apply immediately after opening pouch

### IV route

- May give undiluted over 30 sec via Y-site

### IV intermittent infusion route

- Dilute in 0.9% NaCl for inj or $D_5W$ (20-50 ml), give over 5-15 min, ½ hr prior to chemotherapy
- Store at room temp for 24-hr dilution, do not freeze vials

**Y-site compatibilities:** Acetaminophen, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B cholesteryl, ampicillin, ampicillin/sulbactam, amsacrine, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, carmustine, ceFAZolin, cefepime, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin, dexamethasone, diphenhydrAMINE, DOBUTamine, DOPamine, DOXOrubicin, DOXOrubicin liposome, doxycycline, droperidol, enalaprilat, etoposide, famotidine, filgrastim, floxuridine, fluconazole, fluorouracil, fludarabine, furosemide, gallium, ganciclovir, gentamicin, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, leucovorin, LORazepam, magnesium sulfate, melphalan, meperidine, mesna, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, mezlocillin, miconazole, minocycline, mitoMYcin, mitoXANtrone, morphine, nalbuphine, netilmicin, ofloxacin, PACLitaxel, piperacillin, piperacillin/tazobactam, plicamycin, potassium chloride, prochlorperazine, promethazine, propofol, ranitidine, sargramostim, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** Amphotericin B colloidal, diazepam, phenytoin

**Solution compatibilities:** $D_5W$, 0.9% NaCl

### Transdermal route

- Apply to dry, clean, intact skin of upper, outer arm 24 hr prior to chemotherapy; firmly press on skin; keep on during chemotherapy; can bathe; avoid swimming, whirlpool; remove ≥24 hr after chemotherapy

## ADVERSE EFFECTS

**CNS:** *Headache, asthenia,* anxiety, dizziness, EPS (rare)
**CV:** Hypertension, QT prolongation
**GI:** Diarrhea, *constipation,* increased AST, ALT, *nausea*
**HEMA:** Leukopenia, anemia, thrombocytopenia
**MISC:** Rash, bronchospasm, serotonin syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Unknown |
| **Half-life** | 10-12 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Amoxapine, arsenic, chloroquine, cloZAPine, dasatinib, dolasetron, dronedarone, droperidol, erythromycin, flecainide, fluconazole, haloperidol, lapatinib, maprotiline, methadone, octreotide, ondansetron, palonosetron, pentamidine, pimozide, posaconazole, propafenone, ranolazine, risperiDONE, sertindole, SUNItinib, tacrolimus, telithromycin, troleandomycin, vardenafil, voriconazole, vorinostat, ziprasidone: increased QT prolongation
Apomorphine: Increase: Hypotension, do not use together

### Drug classifications

Antipsychotics: increased EPS
β-blockers, class I, III antidysrhythmics, halogenated/local anesthetics, phenothiazines, tricyclics: increased QT prolongation

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for absence of nausea, vomiting during chemotherapy

- **Assess patient for hypersensitive reaction:** rash, bronchospasm
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk
- **Extrapyramidal symptoms:** Grimacing, shuffling gait, tremors, involuntary movements, rare
- **QT prolongation:** Monitor ECG in those with heart disease, renal disease, or the elderly
- **Serotonin syndrome:** Assess for hallucinations, seizures, diaphoresis, dizziness, flushing, hyperthermia, nausea, vomiting, diarrhea

### Patient/family education

- Advise patient to report diarrhea, constipation, rash, or changes in respirations
- Teach patient to take second dose of PO 12 hr after first dose
- Teach patient that allergic reactions can occur up to 7 days after use (ext rel) or later (SUBCUT)
- **Serotonin syndrome:** Teach patient to report mental changes, including, agitation, hallucinations, dizziness, sweating, flushing, tremors, seizures, discontinue immediately and notify prescriber

### Evaluation

**Positive therapeutic outcome**

- Absence of nausea, vomiting during cancer chemotherapy

## guaiFENesin (Rx, OTC)

(gwye-fen′e-sin)

**Alfen, Altarussin, Balminil, Benylin Chest Congestion Extra Strength, Benylin E, Bidex, Bismutal, Bronchophan, Expectorant, Calmylin Expectorant, Cough Syrup Expectorant, Diabetic Tussin, Expectorant Syrup, Guiatuss, Jack & Jill, Miltuss EX, Mucinex, Naldecon Senior EX, Organidin NR, Robitussin GuaiFENesin, Scot-Tussin Expectorant, Siltussin DAS, Siltussin SA, Vicks Chest Congestion Relief, Vicks DayQuil Mucus Control**

*Func. class.:* Expectorant

**Do not confuse:** guaiFENesin/guanFACINE
Mucinex/Mucomyst

**ACTION:** Increases the volume and reduces the viscosity of secretions in the trachea and bronchi to facilitate secretion removal

**Therapeutic outcome:** Decreased cough

**USES:** Productive and nonproductive cough

## CONTRAINDICATIONS

Hypersensitivity, chronic persistent cough

**Precautions:** Pregnancy, breastfeeding, HF, asthma, emphysema, fever

## DOSAGE AND ROUTES

**Adult and child ≥12 yr:** PO 200-400 mg q4hr, or EXT REL 600-1200 mg q12hr; max 2.4 g/day
**Child 6-11 yr:** PO 100-200 mg q4hr or EXT REL 600 mg q12hr; max 1.2 g/day
**Child 2-5 yr:** PO: 50-100 mg q4hr; max 600 mg/day, EXT REL 300 mg q12hr, max 600 mg/day

**Available forms:** Tabs 100, 200, 400 mg; ext rel tabs 600, 1200 mg; syr 100 mg/5 ml; oral sol 100 mg/5 ml; oral granules 50, 100 mg/packet; caps 200 mg; liquid 100, 200 mg/5 ml

### Implementation

- Store at room temperature; provide room humidification to assist with liquefying secretions
- Avoid fluids for ½ hr after administration

## ADVERSE EFFECTS

**CNS:** Drowsiness, headache, dizziness
**GI:** Nausea, anorexia, vomiting, diarrhea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 1 hr |

### Pharmacodynamics

| | PO | PO–EXT REL |
|---|---|---|
| **Onset** | ½ hr | Unknown |
| **Peak** | Unknown | Unknown |
| **Duration** | 4-6 hr | 12 hr |

## NURSING CONSIDERATIONS

### Assessment

- **Assess cough:** type, frequency, character, including characteristics of sputum; lung sounds bilaterally; fluids should be increased to 2 L/day to decrease secretion viscosity (thickness)
- **Pregnancy/breastfeeding:** Use only if benefits outweigh risk

## Patient/family education

- Caution patient to avoid driving, other hazardous activities if drowsiness occurs (rare)
- Advise patient to avoid smoking, smoke-filled rooms, perfumes, dust, environmental pollutants, cleansers
- Instruct patient to notify prescriber if dry, nonproductive cough lasts over 7 days
- Teach patient to avoid if breastfeeding
- Advise patient to avoid in child <2 yr

## Evaluation

### Positive therapeutic outcome

- Absence of dry cough
- Thinner, more productive cough that raises secretions

gabapentin (Rx)
ganciclovir ophthalmic
gemfibrozil (Rx)
gentamicin ophthalmic
glipiZIDE (Rx)

## halcinonide topical

*See Appendix B*

## haloperidol (Rx)

(hal-oh-pehr'ih-dol)
**Novo-Peridol** ✱,
## haloperidol decanoate (Rx)
## haloperidol lactate (Rx)
**Haldol**
*Func. class.:* Antipsychotic/neuroleptic
*Chem. class.:* Butyrophenone

**Do not confuse:** haloperidol/Halotestin

**ACTION:** Depresses cerebral cortex, hypothalamus, limbic system, which control activity and aggression; blocks neurotransmission produced by dopamine at synapse; exhibits strong α-adrenergic, anticholinergic blocking action; mechanism for antipsychotic effects unclear

**Therapeutic outcome:** Decreased signs and symptoms of psychosis

**USES:** Psychotic disorders, control of tics, vocal utterances in Tourette's syndrome, short-term treatment of hyperactive children showing excessive motor activity, prolonged parenteral therapy in chronic schizophrenia, organic mental syndrome with psychotic features, emergency sedation of severely agitated or delirious patients, ADHD

**Unlabeled uses:** Nausea, vomiting in chemotherapy, hiccups, autism, migraine headache

### CONTRAINDICATIONS

Children <3 yr, hypersensitivity, coma, Parkinson's disease, CNS depression

**Precautions:** Pregnancy, breastfeeding, geriatric, seizure disorders, hypertension, hepatic/cardiac/pulmonary disease, prostatic hypertrophy, hyperthyroidism, thyrotoxicosis, blood dyscrasias, brain damage, bone marrow depression, alcohol and barbiturate withdrawal states, angina, epilepsy, urinary retention, closed-angle glaucoma

**BLACK BOX WARNING:** Dementia; increased mortality in elderly patients with dementia-related psychosis

### DOSAGE AND ROUTES

#### Acute psychosis

**Adult and child >12 yr: IM/IV** (lactate) 2-10 mg, may repeat q1hr, convert to **PO** as soon as possible, **PO** should be 150% of total parenteral dose required

**Child 6-12 yr: IM/IV** (lactate) (unlabeled) 1-3 mg q4-8hr, max 0.15 mg/kg/day, switch to **PO** as soon as possible

#### Chronic psychosis

**Adult: IM** (decanoate) 50-200
**Child 3-12 yr: PO/IM** 0.05-0.15 mg/kg/day

#### Tourette's syndrome

**Adult and adolescent: PO** 0.5-2 mg bid-tid, increased until desired response occurs
**Elderly: PO** 0.5-2 mg bid-tid; may increase gradually
**Child 3-12 yr or weighing 15-40 kg: PO** 0.25-0.5 mg/day in 2-3 divided doses, increase by 0.05-0.075 mg q5-7days, max 0.15 mg/kg/day

#### Nonpsychotic behavior disorders

**Child:** 3-12 yr PO 0.05-0.075 mg/kg in 2-3 divided doses, max 6 mg/day

**Available forms:** Tabs 0.5, 1, 2, 5, 10, 20 mg; **lactate:** oral sol 2 mg/ml; inj 5 mg/ml; **decanoate:** 50 mg/ml, 100 mg/ml

#### Implementation

**PO route—oral liquid**
- Give product in liquid form mixed in glass of juice or caffeine-free cola if hoarding is suspected; do not mix in caffeine drinks, tannics, pectins
- Give decreased dosage in geriatric because of slower metabolism
- Give PO with full glass of water, milk; or give with food to decrease GI upset
- Give antacids 2 hr before or after this product
- Store in tight, light-resistant container; oral sol in amber bottle
- Avoid skin contact with oral susp or sol: may cause contact dermatitis

**IM route**
- Inject in deep muscle mass, do not give SUBCUT; use 21-gauge 2-in needle; do not administer sol with a precipitate; give <3 ml per inj site; give slowly, may be painful
- Patient should remain lying down after IM inj for at least 30 min

**IV route (lactate) (unlabeled)**
- Give undiluted for psychotic episode at 5 mg/min
- Only use lactate for IV
- Closely monitor ECG for QT prolongation
- Switch to oral as soon as possible if needed; give first PO dose within 12-24 hr of last parenteral dose

**Y-site compatibilities:** alcohol 10%, dextrose 5%, alemtuzumab, amifostine, aminocaproic acid, amiodarone, amphotericin B liposome (AmBisome), amsacrine, anidulafungin, argatroban, Arsenic trioxide, asparaginase, atenolol, azithromycin, bleomycin, Cangrelor,

CARBOplatin, carmustine, Caspofungin, ceftaroline, cisatracurium, CISplatin, Cladribine, cloNIDine, codeine phosphate, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin liposome, DAUNOrubicin, Dexmedetomidine, Dexrazoxane, diltiazem, DOCEtaxel, dolasetron, Doxacurium, DOXOrubicin, DOXOrubicin liposomal, epirubicin, eptifibatide, ertapenem, etoposide, etoposide phosphate, fenoldopam, filgrastim, Fludarabine, gatifloxacin, gemcitabine, granisetron, HYDROmorphone, IDArubicin, ifosfamide, irinotecan, Ketamine, lepirudin, leucovorin, levofloxacin, linezolid, LORazepam, mechlorethamine, melphalan, Mesna, methadone, metroNIDAZOLE, milrinone, MitoXANtrone, Mivacurium, morphine, moxifloxacin, mycophenolate mofetil, nesiritide, niCARdipine, octreotide, oritavancin, oxaliplatin, PAClitaxel (solvent/surfactant), palonosetron, pamidronate, pancuronium, PEMEtrexed, potassium acetate, propofol, QuinupristinDalfopristin, remifentanil, riTUXimab, rocuronium, Sodium acetate, tacrolimus, Teniposide, Thiotepa, tigecycline, tirofiban, topotecan, TPN (2-in-1), vecuronium, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zoledronic acid

## ADVERSE EFFECTS

**CNS:** *EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia, drowsiness, headache,* seizures, neuroleptic malignant syndrome, confusion

**CV:** *Orthostatic hypotension,* hypertension, cardiac arrest, ECG changes, tachycardia, QT prolongation, sudden death

**EENT:** Blurred vision, glaucoma, dry eyes

**GI:** *Dry mouth, nausea, vomiting, anorexia, constipation,* diarrhea, jaundice, weight gain, ileus, hepatitis

**GU:** Urinary retention, urinary frequency, dysuria, enuresis, impotence, amenorrhea, gynecomastia

**INTEG:** *Rash,* photosensitivity, dermatitis

**HEMA:** Agranulocytosis, anemia, neutropenia, leukopenia

**RESP:** Laryngospasm, dyspnea, respiratory depression

**SYST:** Risk of death (dementia)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM); decanoate (IM) absorbed slowly |
| **Distribution** | High concentrations in liver, crosses placenta, protein binding 92% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | Terminal half-life 12-36 hr (metabolized) |

### Pharmacodynamics

| | PO | IM | IM (decanoate) |
|---|---|---|---|
| **Onset** | Erratic | ½ hr | 3-9 days |
| **Peak** | 2-6 hr | 30-45 min | 4-11 days |
| **Duration** | 8-12 hr | 4-8 hr | 3 wk |

## INTERACTIONS

### Individual drugs

Alcohol: increased effects of both products, oversedation

Amoxapine, chloroquine, cloZAPine, dasatinib, dolasetron, dronedarone, droperidol, erythromycin, flecainide, lapatinib, maprotiline, methadone, octreotide, ondansetron, palonosetron, pentamidine, pimozide, propafenone, ranolazine, risperiDONE, sertindole, SUNItinib, tacrolimus, telithromycin, troleandomycin, vardenafil, vorinostat, ziprasidone: increased QT prolongation, usually with IV use

CarBAMazepine: decreased effects of haloperidol

EPINEPHrine: increased toxicity

Levodopa: decreased effects of levodopa

Lithium: increased toxicity; decreased effects of lithium

PHENobarbital: decreased effects of haloperidol

### Drug classifications

Anticholinergics: increased anticholinergic effects

Barbiturate anesthetics: oversedation

β-Adrenergic blockers: increased effects of both products

Class IA, III antidysrhythmics, halogenated/local anesthetics, phenothiazines, tricyclics, β-blockers: increased QT prolongation

CNS depressants: oversedation

SSRIs, SNRIs: increased serotonin syndrome, increased neuroleptic malignant syndrome

### Drug/lab test

Increased: liver function tests

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess for dementia, affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances, risk for death in dementia-related psychosis

- **Mental status:** Mood, behavior, orientation, presence of delusions, hallucinations, baseline periodically

• Assess mental status: orientation, mood, behavior, presence and type of hallucinations before initial administration and monthly; this product should significantly reduce psychotic behavior
• Monitor I&O ratio; palpate bladder if low urinary output occurs, especially in geriatric; urinalysis is recommended before, during prolonged therapy
• Monitor bilirubin, CBC, liver function tests monthly
• Assess affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
• Monitor B/P with patient sitting, standing, and lying; take pulse and respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of ≥30 mm Hg; obtain baseline ECG, Q-wave and T-wave changes
• Check for dizziness, faintness, palpitations, tachycardia on rising; severe orthostatic hypotension is common
• **Assess for neuroleptic malignant syndrome:** hyperpyrexia, muscle rigidity, increased CPK, altered mental status; product should be discontinued immediately; if seizures, hypo/hypertension, tachycardia occur, notify prescriber immediately
• **Dehydration:** I&O, daily weight, lethargy, decreased thirst, low intake
• **Assess for EPS** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (ragged tremors, pill rolling, shuffling gait); an antiparkinsonian product should be prescribed
• Assess for constipation and urinary retention daily; if these occur, increase bulk, water in diet
• **Abrupt discontinuation:** Do not withdraw abruptly, taper
• **QT prolongation:** More common with IV use at high doses; monitor ECG in those with CV disease
• **Beers:** Avoid use in older adults except for schizophrenia, bipolar disorder, increased risk of stroke and cognitive decline, mortality
• **Pregnancy/breastfeeding:** No well-controlled studies, use in third trimester results in infant extrapyramidal symptoms, avoid breastfeeding

### Patient/family education

• Teach patient to use good oral hygiene; use frequent rinsing of mouth, sugarless gum for dry mouth; oral candidiasis may occur
• Advise patient to avoid hazardous activities until product response is determined and effects are known; dizziness, blurred vision are common
• Inform patient that orthostatic hypotension occurs often and to rise from sitting or lying position gradually; tell patient that in hot weather heat stroke may occur; take extra precautions to stay cool
• Instruct patient to avoid abrupt withdrawal of this product, or EPS may result; product should be withdrawn slowly
• Caution patient to avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber, since serious product interactions may occur; avoid use with alcohol, CNS depressants since increased drowsiness may occur
• Tell patient to report impaired vision, jaundice, muscle twitching

### Evaluation

**Positive therapeutic outcome**

• Decrease in emotional excitement, hallucinations, delusions, paranoia, reorganization of patterns of thought, speech; improvement in specific behaviors
• Teach patient to use sunscreen, protective clothing, to minimize photosensitivity, avoid being overheated
• Teach patient to take as prescribed, not to use OTC, herbal products unless directed by prescriber
• Teach patient to use good oral hygiene, frequent sips of water, sugarless gum, candy for dry mouth

**TREATMENT OF OVERDOSE:** Lavage if orally ingested; provide airway; *do not induce vomiting*

**⚠ HIGH ALERT**

## heparin (Rx)

(hep′a-rin)

**BD Posiflush, Heparin Lock Flush, Hepalean, Heparin Leo, Hep-Lock, Hep-Lock U/P, Monoject Prefill, PosiHeparin Lock Flush**

*Func. class.:* Anticoagulant, antithrombotic

**Do not confuse:** heparin/Hespan

**ACTION:** Prevents conversion of fibrinogen to fibrin and prothrombin to thrombin by enhancing inhibitory effects of antithrombin III

**Therapeutic outcome:** Prevention of thrombi

**USES:** Prevention and treatment of MI, open heart surgery, disseminated intravascular clotting syndrome, atrial fibrillation with embolization; as an anticoagulant in transfusion and dialysis

procedures; to maintain patency of indwelling venipuncture devices; diagnosis, treatment of disseminated intravascular coagulation (DIC)

## CONTRAINDICATIONS

Bleeding, hypersensitivity to this product, corn, porcine protein (pork product)

**Precautions:** Pregnancy **C,** children, geriatric, alcoholism, hyperlipidemia, diabetes, renal disease, heparin-induced thrombocytopenia (HIT), hemophilia, leukemia with bleeding, peptic ulcer disease, severe thrombocytopenic purpura, renal/hepatic disease (severe), blood dyscrasias, severe hypertension, subacute bacterial endocarditis, acute nephritis; benzyl alcohol products in neonates, infants, pregnancy, lactation

## DOSAGE AND ROUTES

### For the treatment of deep venous thrombosis (DVT) or pulmonary embolism; for the treatment of arterial thromboembolism, including cerebral thromboembolism; or for the treatment of mural thrombosis

**IV infusion dosage (weight based)**

**Adult:** 80 units/kg IV bolus, then maintenance infusion of 18 units/kg/hour IV continuous infusion. If the aPTT is less than 35 (1.2 times normal), increase infusion rate by 4 units/kg/hour and rebolus with 80 units/kg IV. If aPTT is 35 to 45 (1.2 to 1.5 times normal), increase infusion rate by 2 units/kg/hour and rebolus with 40 units/kg IV. If aPTT is 46 to 70 (1.5 to 2.3 times normal), maintain infusion. If aPTT is 71 to 90 (2.3 to 3 times normal), decrease infusion rate by 2 units/kg/hr. If aPTT is more than 90 (more than 3 times normal), hold infusion for 1 hr and decrease rate by 3 units/kg/hr. Repeat aPTT every 6 hr for the first 24 hr, then every morning, unless it is outside the therapeutic range. Patients should be treated for 5 days or more, and oral anticoagulation should be overlapped for 4 to 5 days or more. Heparin can be discontinued on day 5 to 6 if the INR has been within the therapeutic range for 2 consecutive days. Patients with massive PE or severe iliofemoral thrombosis should be offered a longer period of heparin therapy (about 10 days)

**Children and Adolescent:** 75 to 100 units/kg IV load then 20 units/kg/hr IV as an initial maintenance dose. Adjust dose to maintain aPTT 60 to 85 seconds, assuming this reflects an antifactor Xa level of 0.3 to 0.7 units/ml

**Neonate and infant:** 75 to 100 units/kg IV load then 28 units/kg/hr IV as an initial maintenance dose. Adjust dose to maintain aPTT 60 to 85 seconds, assuming this reflects an antifactor Xa level of 0.3 to 0.7 units/ml

**Intermittent IV dosage**

**Adult:** 5000 to 10,000 units IV every 4 to 6 hr or 100 units/kg IV every 4 hr. Dosage should be adjusted according to coagulation test results

**Infant, children, and adolescent:** Initially, 50 units/kg IV as a loading dose then 100 units/kg IV every 4 hr. Adjust dosage according to aPTT results. Continuous infusion is preferred over intermittent administration in pediatric patients

**SUBCUT dosage**

**Adult:** 8000 to 10,000 units SUBCUT every 8 hr or 15,000 to 20,000 units SUBCUT every 12 hr

### For the treatment of deep venous thrombosis (DVT) or pulmonary embolism; for the treatment of arterial thromboembolism, including cerebral thromboembolism; or for the treatment of mural thrombosis

**IV infusion dosage (weight based)**

**Adult:** 80 units/kg IV bolus, then maintenance infusion of 18 units/kg/hr IV continuous infusion. If the aPTT is less than 35 (1.2 times normal), increase infusion rate by 4 units/kg/hr and rebolus with 80 units/kg IV. If aPTT is 35 to 45 (1.2 to 1.5 times normal), increase infusion rate by 2 units/kg/hr and rebolus with 40 units/kg IV. If aPTT is 46 to 70 (1.5 to 2.3 times normal), maintain infusion. If aPTT is 71 to 90 (2.3 to 3 times normal), decrease infusion rate by 2 units/kg/hr. If aPTT is more than 90 (more than 3 times normal), hold infusion for 1 hr and decrease rate by 3 units/kg/hr. Repeat aPTT every 6 hr for the first 24 hr, then every morning, unless it is outside the therapeutic range. Patients should be treated for 5 days or more, and oral anticoagulation should be overlapped for 4 to 5 days or more. Heparin can be discontinued on day 5 to 6 if the INR has been within the therapeutic range for 2 consecutive days. Patients with massive PE or severe iliofemoral thrombosis should be offered a longer period of heparin therapy (about 10 days)

**Children and adolescent:** 75 to 100 units/kg IV load then 20 units/kg/hr IV as an initial maintenance dose. Adjust dose to maintain aPTT 60 to 85 sec, assuming this reflects an antifactor Xa level of 0.3 to 0.7 units/ml

**Neonate and infant:** 75 to 100 units/kg IV load then 28 units/kg/hr IV as an initial maintenance dose. Adjust dose to maintain aPTT 60 to 85 sec, assuming this reflects an antifactor Xa level of 0.3 to 0.7 units/ml

**Intermittent IV dosage**

**Adult:** 5000 to 10,000 units IV every 4 to 6 hr or 100 units/kg IV every 4 hr. Dosage should be adjusted according to coagulation test results

**Infant, children, and adolescent:** Initially, 50 units/kg IV as a loading dose then 100 units/kg IV every 4 hr. Adjust dosage according to aPTT results. Continuous infusion is preferred over intermittent administration in pediatric patients

**Subcutaneous dosage**

**Adult:** 8000 to 10,000 units SUBCUT every 8 hr or 15,000 to 20,000 units SUBCUT every 12 hr

### For thrombosis prophylaxis, including arterial thromboembolism prophylaxis, during extracorporeal circulation in patients undergoing open heart or other cardiovascular surgery

**IV dosage**

**Adult:** Initially, at least 150 units/kg IV. For procedures expected to last less than 60 min, doses up to 300 units/kg IV may be used. For procedures expected to last longer than 60 min, doses up to 400 units/kg IV may be used. Further dosage should be based on coagulation test results (e.g., activated clotting time [ACT])

### For thrombosis prophylaxis, including arterial thromboembolism prophylaxis, during hemodialysis

**IV dosage**

**Adult:** 2000 to 5000 units IV bolus at the initiation of dialysis, followed by 10 to 20 units/kg/hr IV infusion directly into the arterial port of the dialysis circuit or repeated bolus doses as needed to maintain the activated clotting time (ACT) or whole blood partial thromboplastin time (WBPTT) at about 150% of baseline. The extent of anticoagulation is based on risk factors for bleeding and coexisting conditions. In patients at moderate risk for bleeding, administration of lower loading doses and lower maintenance infusion rates can be used to maintain the ACT or WBPTT at about 115% to 125% of baseline

### For coronary artery thrombosis prophylaxis during percutaneous coronary intervention (PCI) in patients not receiving abciximab therapy

**IV dosage**

**Adult:** 60 to 100 units/kg IV bolus; maintain the activated clotting time (ACT) within 250 to 300 sec by the HemoTec device or 300 to 350 sec by the Hemochron device. Postprocedural heparin is not routinely given for uncomplicated PCI. Early femoral sheath removal is recommended (e.g., when the ACT falls to less than 150 to 180 sec) to reduce access site complications

### For coronary artery thrombosis prophylaxis during percutaneous coronary intervention (PCI) in patients receiving abciximab concomitantly

**IV dosage**

**Adult:** 50 to 70 units/kg IV bolus; maintain the activated clotting time (ACT) at 200 sec or more with either the HemoTec or Hemochron device. Remove femoral sheaths after the procedure when the ACT falls to less than 150 to 180 sec

### For thrombosis prophylaxis and/or pulmonary embolism prophylaxis in patients at increased risk after sustaining an acute MI (e.g., Q-wave infarction, severe LV dysfunction, HF, history of systemic or pulmonary embolism, 2D echo evidence of mural thrombus, or atrial fibrillation)

**IV or SUBCUT dosage**

Adults: In patients not receiving thrombolytic therapy, 75 units/kg IV bolus, followed by 1250 units/hr IV, with a target aPTT of 1.5 to 2 times control (also see dosage for treatment of an evolving acute MI). For patients who have received heparin after thrombolytic therapy (see acute myocardial infarction indication for initial heparin dosage recommendations after thrombolytic therapy), continue IV heparin or change to SUBCUT heparin (initial dose about 17,500 units every 12 hr) beyond 48 hr to maintain the aPTT 1.5 to 2 times control, LMWH, or convert to oral anticoagulation

**Available forms:** Sol for inj 10, 100, 1000, 2000, 5000, 7500, 10,000, 20,000, 40,000 units/ml; premixed 1000 units/500 ml, 2000 units/1000 ml, 12,500 units/250 ml, 25,000 units/250 ml, 25,000 units/500 ml; lock flush preparations 10 units/ml

### Implementation

- Heparin and low-molecular-weight heparins are not interchangeable
- Give at same time each day to maintain steady blood levels
- Store at room temperature

**SUBCUT route**

- Give SUBCUT with at least 25-G $^{3}/_{8}$-in needle; do not massage area or aspirate fluid when giving SUBCUT inj; give in abdomen between pelvic bones, rotate sites; leave in for 10 sec; apply gentle pressure for 1 min
- Changing needles is not recommended

**Heparin lock route**

- Do not mistake heparin sodium injection 10,000 units/ml and Hep-Lock U/P 10 units/ml; they have similar blue labeling; deaths

in pediatric patients have occurred when heparin sodium injection vials were confused with heparin flush vials

- Inject 10-100 units/0.5-1 ml after each inf or q8-12hr

**Direct IV route**

- Give loading dose undiluted over ≥1 min; use before continuous infusion

**IV route**

- Obtain baseline coagulation tests before use
- Use infusion pump, make sure pressure dressings are used after drawing blood
- Draw coagulation studies 30 min before next dose, never draw from tubing or from infused vein, use other

**Continuous IV infusion route**

- Dilute 25,000 units/250-500 ml 0.9% NaCl or $D_5W$ (50-100 units/ml); some solutions are premixed and ready for use
- When product is added to inf sol for cont **IV**, invert container at least 6 × to ensure adequate mixing
- **Flush:** Inject to prevent clots in heparin lock, inject dilute heparin solution (10-100 units) 0.5-1 ml after each injection of q8hr, flush lock before and after each use with sterile water or 0.9% NaCl

**Y-site compatibilities:** acetaminophen, acetylcysteine, acyclovir, Alcohol 10%, dextrose 5%, alemtuzumab, alfentanil, allopurinol, Amifostine, Aminocaproic acid, aminophylline, amphotericin B lipid complex, Amphotericin B liposome, anidulafungin, argatroban, Arsenic trioxide, ascorbic acid injection, asparaginase, atenolol, atropine, azaTHIOprine, azithromycin, Aztreonam, Benztropine, Betamethasone, Bivalirudin, bleomycin, Bretylium, bumetanide, buprenorphine, butorphanol, Caffeine, calcium chloride/gluconate, Cangrelor, CARBOplatin, carmustine, Cefamandole, ceFAZolin, Cefoperazone, cefotaxime, cefoTEtan, Cefotiam, cefOXitin, ceftaroline, cefTAZidime, ceftizoxime, Ceftobiprole, cefTRIAXone, cefuroxime, Cephapirin, chloramphenicol succinate, chlordiazePOXIDE, chlorothiazide, chlorpheniramine, cimetidine, CISplatin, Cladribine, clindamycin, Cloxacillin, codeine, Colistimethate, Cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin citrate liposome, dexamethasone, Dexmedetomidine, Dexrazoxane, digoxin, DOCEtaxel, DOPamine, doripenem, Doxacurium, Doxapram, DOXOrubicin liposomal, Edetate calcium disodium, Edrophonium, enalaprilat, Ephedrine sulfate, EPINEPHrine, epoetin alfa, eptifibatide, Ergonovine, ertapenem, esmolol, estrogens conjugated, Ethacrynate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, flecainide, fluconazole, Fludarabine, fluorouracil, folic acid (as sodium salt), foscarnet, Gallamine, Gallium, ganciclovir, gemcitabine, Gemtuzumab, Glycopyrrolate, granisetron, hydrocortisone, HYDROmorphone, ibuprofen lysine, ifosfamide, imipenem-cilastatin, indomethacin, irinotecan, Isoproterenol, ketorolac, Lactated Ringer's Injection, lansoprazole, leucovorin, lidocaine, Lincomycin, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, Mephentermine, meropenem, Mesna, Metaraminol, methadone, Methohexital, methotrexate, Methoxamine, Methyldopate, methylergonovine, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoMYcin, Mivacurium, morphine, moxifloxacin, Multiple vitamins injection, nafcillin, Nalbuphine, Nalorphine, naloxone, neostigmine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PAClitaxel (solvent/surfactant), palonosetron, pamidronate, pancuronium, PEMEtrexed, penicillin G potassium/sodium, PENTobarbital, Phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin sodium, piperacillin-tazobactam, potassium acetate/chloride, procainamide, prochlorperazine, Promazine, propofol, propranolol, pyridostigmine, pyridoxine, ranitidine, remifentanil, Ringer's injection, riTUXimab, rocuronium, sargramostim, scopolamine, Sodium acetate/Bicarbonate/fusidate, succinylcholine, Sufentanil, tacrolimus, theophylline, thiamine, Thiopental, Thiotepa, Ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, Tolazoline, topotecan, TPN (2-in-1), Tranexamic acid, trastuzumab, Trimetaphan, trimethobenzamide, Tubocurarine, urokinase, vasopressin, vecuronium, verapamil, vinBLAstine, vinCRIStine, voriconazole, warfarin, zidovudine, zoledronic acid.

## ADVERSE EFFECTS

**CNS:** *Fever,* chills, headache
**GU:** Hematuria
**HEMA:** Hemorrhage, thrombocytopenia, anemia, heparin-induced thrombocytopenia (HIT)
**INTEG:** *Rash,* dermatitis, urticaria, pruritus, delayed transient alopecia, hematoma, cutaneous necrosis (SUBCUT), injection site reactions
**META:** Hyperlipidemia
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (SUBCUT) |
| **Distribution** | Unknown |
| **Metabolism** | Partially in kidney, liver |
| **Excretion** | Lymph, spleen, in urine (<50% unchanged) |
| **Half-life** | 1-2 hr (dose dependent) |

### Pharmacodynamics

| | SUBCUT | IV |
|---|---|---|
| **Onset** | ½-1 hr | 5 min |
| **Peak** | 2 hr | 10 min |
| **Duration** | 8-12 hr | 2-6 hr |

## INTERACTIONS

### Individual drugs

Dextran, dipyridamole, ticlopidine, clopidogrel, presgrel: increased action of heparin
Digoxin: decreased action of heparin
Nicotine: decreased action of heparin

### Drug classifications

Anticoagulants (oral), cephalosporins, NSAIDs, penicillins, platelet inhibitors, salicylates, antineoplastics, SSRIs, SNRIs: increased action of heparin, quinidine, valproic acid
Antihistamines, tetracyclines, cardiac glycosides: decreased action of heparin, nitroglycerin
Corticosteroids: decreased action of corticosteroids

### Drug/herb

Anise, arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, green tea, horse chestnut: increased bleeding risk

### Drug/lab test

Increased: ALT, AST, INR, pro-time, PTT, potassium
Decreased: platelets

## NURSING CONSIDERATIONS

### Assessment

- **Thrombosis:** Monitor for increased thrombosis daily
- Assess for blood studies (Hct, occult blood in stools) q3mo if patient is on long-term therapy
- Monitor PPT, which should be 1½-2 × control, PTT; often done daily, APTT, ACT, PTT 1.5-2.5 × control
- Monitor platelet count q2-3day; thrombocytopenia may occur on fourth day of treatment and resolve, or continue to fifth to tenth day of treatment
- **Bleeding, hemorrhage:** Assess for bleeding gums, petechiae, ecchymosis, black tarry stools, hematuria, epistaxis, decrease in Hct, B/P; notify prescriber immediately; HIT may occur after product discontinuation, check periodically for sign of decreasing clots
- **Monitor for hypersensitivity:** fever, skin rash, urticaria; notify prescriber immediately
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, do not use products with benzyl alcohol in pregnancy, breastfeeding

### Patient/family education

- Advise patient to avoid OTC preparations that may cause serious product interactions unless directed by prescriber; may contain aspirin or other anticoagulants, notify all health care persons of heparin use
- Tell patient that product may be withheld during active bleeding (menstruation), depending on condition
- Caution patient to use soft-bristle toothbrush to avoid bleeding gums; avoid contact sports; use electric razor; avoid IM inj
- Instruct patient to carry/wear emergency ID or other identification identifying product taken and condition treated
- **Advise patient to report any signs of bleeding:** gums, under skin, urine, stools; or unusual bruising even after discontinuing product

### Evaluation

**Positive therapeutic outcome**

- Prevention of new clots
- PTT of 1.5-2.5 × control
- Free-flowing **IV**, DVT and pulmonary emboli

## TREATMENT OF OVERDOSE:

Withdraw product, give protamine sulfate 1 mg protamine/100 units heparin

## homatropine ophthalmic

*See Appendix B*

## hydrALAZINE (Rx)

(hye-dral′a-zeen)
**Apresoline**
*Func. class.:* Antihypertensive, direct-acting peripheral vasodilator
*Chem. class.:* Phthalazine

**Do not confuse:** hydrALAZINE/ hydrOXYzine

**ACTION:** Vasodilates arterioles in smooth muscle by direct relaxation; reduces B/P with reflex increases in heart rate, stroke volume, cardiac output

**Therapeutic outcome:** Decreased B/P in hypertension, decreased afterload in HF

**USES:** Essential hypertension, hypertensive emergency/urgency, preeclampsia

**Unlabeled uses:** Heart failure not responsive to cardiac glycosides and diuretics

## CONTRAINDICATIONS

Hypersensitivity to hydrALAZINEs, mitral valvular rheumatic heart disease, CAD

**Precautions:** Pregnancy, breastfeeding, geriatric, CVA, advanced renal disease, liver disease, SLE, dissecting aortic aneurysm

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO 10 mg qid 2-4 days, then 25 mg qid for rest of 1st wk, then 50 mg qid individualized to desired response; max 300 mg/day
**Child:** PO 0.75-1 mg/kg/day in 2-4 divided doses; max 25 mg/dose, increase over 3-4 wk to max 7.5 mg/kg/day or 200 mg, whichever is less

### Hypertensive crisis

**Adult:** **IV** BOL 10-20 mg q4-6hr; administer PO as soon as possible; IM 10-50 mg q4-6hr
**Child:** **IV** BOL 0.1-0.6 mg/kg q4hr; IM 0.1-0.6 mg/kg q4-6hr, max 1.7-3.5 mg/kg/day

### HF (unlabeled)

**Adult:** PO 10-25 mg bid, max 75 mg tid

**Available forms:** Inj 20 mg/ml; tabs 10, 25, 50, 100 mg

### Implementation

**PO route**
- Give with meals to enhance absorption
- Store protected from light and heat

**IM route**
- Do not admix; switch to PO as soon as possible

**Direct IV route**
- Give by **IV** undiluted through Y-tube or 3-way stopcock, give each 10 mg over 1 min or more
- Administer with patient in recumbent position; keep in that position for 1 hr after administration

**Y-site compatibilities:** Heparin, hydrocortisone, potassium chloride, verapamil, vit B/C

**Y-site incompatibilities:** Aminophylline, ampicillin, diazoxide, furosemide, PACLitaxel

## ADVERSE EFFECTS

**CNS:** *Headache, tremors, dizziness, anxiety,* peripheral neuritis, depression, fever, chills
**CV:** *Palpitations, reflex tachycardia, angina,* shock, rebound hypertension, orthostatic hypotension
**GI:** *Nausea, vomiting, anorexia, diarrhea,* constipation, paralytic ileus, hepatotoxicity
**GU:** Urinary retention, glomerulonephritis, hematuria
**HEMA:** Leukopenia, agranulocytosis, anemia, thrombocytopenia
**INTEG:** Rash, pruritus, urticaria
**MISC:** Nasal congestion, muscle cramps, *lupuslike symptoms,* flushing, edema, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed (PO); well absorbed (IM); completely absorbed (**IV**) |
| **Distribution** | Widely distributed; crosses placenta, protein binding 89% |
| **Metabolism** | GI mucosa, liver extensively [illegible]; half of Mexicans, Blacks, South Indians, and Caucasians are at risk for toxicity |
| **Excretion** | Kidneys, urine (12%-14%) |
| **Half-life** | 3-7 hr |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | ½ hr | 10-30 min | 5-20 min |
| **Peak** | 1-2 hr | 1 hr | 10-80 min |
| **Duration** | 6-12 hr | 2-6 hr | Up to 12 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased hypotension
Indomethacin: decreased effects of hydrALAZINE

### Drug classifications

β-Adrenergic blockers: metoprolol, propranolol; increased effects
MAOIs: severe hypotension
Other antihypertensives, thiazide diuretics: increased hypotension
Sympathomimetics (EPINEPHrine, norepinephrine): increased tachycardia, angina
NSAIDs, estrogens: decreased hydrALAZINE effects

### Drug/Food

Increase: drug absorption; have patient take with food

## NURSING CONSIDERATIONS

### Assessment

- **Assess cardiac status:** B/P q5min for 2 hr, then qhr for 2 hr, then q4hr; pulse, jugular venous distention q4hr decreased after level
- Monitor electrolytes, blood studies: potassium, sodium, chloride, carbon dioxide, CBC,

serum glucose; LE prep, ANA titer before starting treatment
• Monitor weight daily, I&O; check for edema in feet, legs daily; check skin turgor, dryness of mucous membranes for hydration status
• Assess for crackles, dyspnea, orthopnea; peripheral edema, fatigue, weight gain, jugular vein distention (HF)
• For fever, joint pain, rash, sore throat (lupus-like symptoms), notify prescriber, number of refills to determine compliance
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, third-trimester toxicity has occurred, cautious use in breastfeeding
• **Beers:** Use with caution in older adults, may exacerbate syncope in those with a history of syncope

### Patient/family education
• Teach patient to take with food to increase bioavailability (PO)
• Teach patient to avoid OTC preparations unless directed by prescriber
• Advise patient to notify prescriber if chest pain, severe fatigue, fever, muscle or joint pain occur
• Advise patient to rise slowly to prevent orthostatic hypertension
• Advise patient to notify prescriber if pregnancy is suspected
• Advise patient that follow up will be needed, to comply with other requirements such as exercise, weight loss, avoiding smoking

### Evaluation
**Positive therapeutic outcome**
• Decreased B/P, decreased afterload in hypertension

## TREATMENT OF OVERDOSE:
Administer vasopressors, volume expanders for shock; if PO, lavage

## hydrochlorothiazide (Rx)
(hye-droe-klor-oh-thye'a-zide)
**Apo-Hydrol** 🍁**, Microzide, Neo-Codema** 🍁**, Oretic, Urozide** 🍁
*Func. class.:* Diuretic, antihypertensive
*Chem. class.:* Thiazide, sulfonamide derivative

**ACTION:** Acts on the distal tubule in the kidney, increasing excretion of sodium, water, chloride, and potassium

**Therapeutic outcome:** Decreased B/P, decreased edema in lung tissues peripherally

**USES:** Edema, hypertension, diuresis, HF; idiopathic lower extremity edema therapy

## CONTRAINDICATIONS
Hypersensitivity to thiazides or sulfonamides, anuria, renal decompensation, pregnancy (D) preeclampsia

**Precautions:** Pregnancy, breastfeeding, hypokalemia, renal/hepatic disease, gout, COPD, lupus erythematosus, diabetes mellitus, hyperlipidemia, CCr <30 ml/min, hypomagnesemia

## DOSAGE AND ROUTES
### Hypertension
**Adult/adolescent:** PO 12.5-25 mg/day, may increase to 50 mg/day in 1-2 divided doses, max 100 mg/day
**Child >6 mo:** PO 1-2 mg/kg/day in divided doses; max 37.5 mg/day for 6 mo-2 yr; max 37.5 mg/day
**Child <6 mo:** PO up to 2-3.3 mg/kg/day in divided doses
**Geriatric:** PO 12.5 mg qday

### Renal dose
**Adult:** PO CCr <30 ml/min, do not use, not effective

**Available forms:** Tabs 12.5, 25, 50, 100 🍁 mg; caps 12.5 mg

### Implementation
**PO route**
• Give in AM to avoid interference with sleep
• Provide potassium replacement if potassium level is ≤3.0 mg/dl; give whole tab or use oral sol lightly; product may be crushed if patient is unable to swallow, replace magnesium if needed
• Administer with food; if nausea occurs, absorption may be increased

## ADVERSE EFFECTS
**CNS:** Drowsiness, paresthesia, depression, headache, *dizziness, fatigue, weakness,* fever
**CV:** Irregular pulse, *orthostatic hypotension,* palpitations, volume depletion, allergic myocarditis
**EENT:** Blurred vision
**ELECT:** *Hypokalemia,* hypercalcemia, hyponatremia, hypochloremia, hypomagnesemia
**GI:** *Nausea, vomiting, anorexia,* constipation, diarrhea, cramps, pancreatitis, GI irritation, hepatitis
**GU:** *Frequency,* polyuria, uremia, glucosuria, hyperuricemia, jaundice, erectile dysfunction
**HEMA:** Aplastic anemia, hemolytic anemia, leukopenia, agranulocytosis, thrombocytopenia, neutropenia
**INTEG:** *Rash,* urticaria, purpura, photosensitivity, alopecia, erythema multiforme
**META:** *Hyperglycemia, hyperuricemia,* renal failure, increased creatinine, BUN
**SYST:** Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Variable |
| **Distribution** | Extracellular spaces; crosses placenta |
| **Metabolism** | Excreted unchanged in urine |
| **Excretion** | Breast milk |
| **Half-life** | 6-15 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 2 hr |
| **Peak** | 4 hr |
| **Duration** | 6-12 hr |

## INTERACTIONS

### Individual drugs

Amphotericin B, piperacillin, ticarcillin: increased hypokalemia
Cholestyramine, colestipol: decreased absorption of hydrochlorothiazide
Diazoxide: increased hyperglycemia, hyperuricemia, hypotension
Lithium: increased toxicity

### Drug classifications

Antidiabetics: decreased effect of antidiabetic agent
Cardiac glycosides, nondepolarizing skeletal muscle relaxants: increased toxicity
Diuretics (loop): increased effects of diuretic
Corticosteroids: increased hypokalemia
NSAIDs: decreased thiazide effect

### Drug/food

Licorice: increased severe hypokalemia

### Drug/lab test

Increased: parathyroid test, uric acid, calcium, glucose, cholesterol, triglycerides
Decreased: potassium, sodium, Hgb, WBC, platelets

## NURSING CONSIDERATIONS

### Assessment

- Monitor glucose in urine if patient is diabetic
- Assess improvement in CVP q8hr
- Check for rashes, temp elevation daily
- Assess for confusion, especially in geriatric patients; take safety precautions if needed
- Monitor for acidic urine, reduced urine, osmolality, nocturia; hypotension, broad T-wave, U-wave, ectopy, tachycardia, weak pulse; muscle weakness, altered LOC, drowsiness, apathy, lethargy, confusion, depression; anorexia, nausea, cramps, constipation, distention, paralytic ileus; hypoventilation, respiratory muscle weakness
- **Beers:** Use with caution in older adults, may exacerbate or cause syndrome of inappropriate antidiuretic hormone secretion or hyponatremia
- Assess fluid volume status: I&O ratios, electrolytes baseline and periodically record, count, or weigh diapers as appropriate; weight; distended red veins; crackles in lungs; color, quality, and specific gravity of urine; skin turgor; adequacy of pulses; moist mucous membranes; bilateral lung sounds; peripheral pitting edema; assess for dehydration: symptoms of decreasing output, thirst, hypotension; dry mouth and mucous membranes should be reported
- Monitor electrolytes: potassium, sodium, calcium, magnesium; also include BUN, blood pH, ABGs, uric acid, CBC, blood glucose, renal function
- Assess **hypertension** B/P before, during therapy with patient lying, standing, and sitting as appropriate; orthostatic hypotension can occur rapidly
- **Hypersensitivity to sulfonamides:** rash, discontinue; fatal Stevens-Johnson syndrome may occur, if skin rash occurs discontinue product
- Pregnancy, breastfeeding: May affect fetus, crosses placenta barrier, do not breastfeed

### Patient/family education

- Teach patient to take the medication early in the day at same time of day to prevent nocturia
- Instruct patient to take with food or milk if GI symptoms of nausea and anorexia occur
- Teach patient to maintain a weekly record of weight and notify prescriber of weight loss >5 lb
- Caution patient that this product causes a loss of potassium and that food rich in potassium should be added to the diet; refer to a dietitian for assistance in planning
- Caution patient to rise slowly from sitting or reclining positions, not to exercise in hot weather or stand for prolonged periods since orthostatic hypotension will be enhanced; lie down if dizziness occurs to prevent postural hypotension
- Teach patient not to use alcohol or any OTC medications without prescriber's approval; serious product reactions may occur
- Emphasize the need to contact prescriber immediately if muscle cramps, weakness, nausea, dizziness, or numbness occurs; rash
- Teach patient to take own B/P and pulse and record findings
- Teach patient to continue taking medication even if feeling better; this product controls symptoms but does not cure the condition
- Advise patient with hypertension to continue other medical treatment (exercise, weight loss, relaxation techniques, cessation of smoking)
- Teach patient to monitor weight and report changes to prescriber

- Discuss dietary potassium requirements
- Advise patient that follow-ups and routine lab tests will be required
- Teach patient how to take B/P, to continue with other medical regimens (weight loss, exercise)

### Evaluation

**Positive therapeutic outcome**

- Decreased edema
- Decreased B/P
- Increased diuresis

## TREATMENT OF OVERDOSE:

Lavage if taken orally, monitor electrolytes, administer dextrose in saline, monitor hydration, CV, renal status

**⚠ HIGH ALERT**

## HYDROcodone (Rx) REMS

(hye-droe-koe′done)

**Hycodan, Hysingla ER, Robidone, Zohydro ER**

## HYDROcodone/acetaminophen (Rx)

**Anexsia, NorCo**

## HYDROcodone/ibuprofen (Rx)

**Reprexain, Vicoprofen**

*Func. class.:* Antitussive opioid analgesic/nonopioid analgesic

**Controlled substance schedule II**

**Do not confuse:** HYDROcodone/hydrocortisone, oxyCODONE, Hycodan/Vicodin, Reprexain/ZyPREXA

## ACTION:

Acts directly on cough center in medulla to suppress cough; binds to opiate receptors in the CNS to reduce pain

**Therapeutic outcome:** Pain relief, decreased cough, decreased diarrhea

## USES:

Moderate/severe pain

## CONTRAINDICATIONS

Abrupt discontinuation, hypersensitivity to this product or benzyl, GI obstruction, status asthmaticus

**BLACK BOX WARNING:** Respiratory depression

**Precautions:** Pregnancy, breastfeeding, neonates, addictive personality, increased ICP, MI (acute), severe heart disease, respiratory, renal/hepatic disease, bowel impaction, urinary retention, viral infection, ulcerative colitis, seizures, sulfite hypersensitivity, psychosis, hypertension, hyperthyroidism

**BLACK BOX WARNING: Accidental exposure:** Neonatal opioid withdrawal syndrome, potential for overdose or poisoning, substance abuse, ethanol ingestion

## DOSAGES AND ROUTES

### HYDROcodone:

Extended release (Zohydro ER) 10, 15, 20, 30, 40, 50 mg; (Hysingla ER) 20, 30, 40, 60, 80, 100, 120 mg; syrup: 1 mg/ml

### For the treatment of chronic, severe pain in patients who require daily, around-the-clock, long-term opioid treatment

NOTE: Extended-release HYDROcodone should be reserved for patients in whom alternative treatment options (e.g., nonopioid analgesics or immediate-release opioids) are ineffective, not tolerated, or would be otherwise inadequate to provide sufficient management of pain. Discontinue all other around-the-clock opioid drugs upon initiation of HYDROcodone extended-release

NOTE: Single doses of HYDROcodone extended-release capsules >40 mg or a total daily dose >80 mg are for use in opioid-tolerant patients only. Daily doses of HYDROcodone extended-release tablets ≥ 80 mg are for use in opioid-tolerant patients only. Opioid-tolerant patients are defined as those taking, for a minimum of 1 wk, ≥ 60 mg oral morphine per day, ≥ 30 mg oral oxycodone per day, ≥ 8 mg oral hydromorphone per day, ≥ 25 mg oral oxymorphone per day, ≥ 25 mcg transdermal fentaNYL per hour, or an equivalent dose of another opioid

### For use as the first opioid analgesic or in patients who are not opioid tolerant (Zohydro ER Capsule ONLY)

**Adult:** 10 mg PO every 12 hr. Titrate dose by 10 mg every 12 hr as appropriate every 3-7 days

### For conversion from fentaNYL transdermal patch (Zohydro ER Capsule ONLY)

**Adult:** 10 mg PO every 12 hr for each 25 mcg/hr fentaNYL transdermal patch beginning 18 hr after removal of the fentaNYL patch. Titrate dose by 10 mg every 12 hr as appropriate every 3-7 days as needed

### For conversion from other oral opioid analgesics (Zohydro ER Capsule ONLY)

**Adult:** Calculate the total daily dose(s) of the prior opioid(s), then using conversion factor, determine total daily extended-release HYDROcodone dose. If regimen includes more than one opioid, sum converted totals. Divide the 24-hr HYDROcodone requirements into two equal doses given PO every 12 hr. Always round the dose down, if necessary, to the appropriate available strength of HYDROcodone extended-release capsules. Titrate dose by 10 mg every 12 hr as appropriate every 3-7 days. Use extreme caution when converting patients from methadone, as the ratio between methadone and other opioid agonists can vary widely

### For use as the first opioid analgesic or in patients who are not opioid tolerant (Hysingla ER Tablet ONLY)

**Adult:** 20 mg PO every 24 hr. Titrate dose by 10-20 mg as appropriate every 3-5 days

### For conversion from fentaNYL transdermal patch (Hysingla ER Tablet ONLY)

**Adult:** 20 mg PO every 24 hr for each 25 mcg/hr fentaNYL transdermal patch beginning 18 hr after removal of the fentaNYL patch. Titrate dose by 10-20 mg as appropriate every 3-5 days

### For conversion from buprenorphine transdermal patch (Hysingla ER Tablet ONLY)

**Adult:** 20 mg PO every 24 hr. Titrate dose by 10-20 mg as appropriate every 3-5 days

### For conversion from other oral opioid analgesics (Hysingla ER Tablet ONLY)

**Adult:** Calculate the total daily dose(s) of the prior opioid(s), then using conversion factor, determine total daily extended-release HYDROcodone dose. If regimen includes more than one opioid, sum converted totals. Reduce the calculated daily oral HYDROcodone dose by 25% and give the dose PO every 24 hr. Always round the dose down, if necessary, to the appropriate available strength of HYDROcodone extended-release tablets. Titrate dose by 10-20 mg as appropriate every 3-5 days. Use extreme caution when converting patients from methadone, as the ratio between methadone and other opioid agonists can vary widely

### Maximum dosage limits

**Adult:** Zohydro ER and Hysingla ER: There is no maximum dose of HYDROcodone; however, careful titration of HYDROcodone, especially in opioid-naive patients, is required until tolerance develops to some of the side effects (i.e., drowsiness and respiratory depression). Individualize dosage carefully

### Vantrela ER: Do not exceed a dose of 180 mg/day PO because of a potential risk of QT prolongation

**Geriatric:** Zohydro ER and Hysingla ER: There is no maximum dose of HYDROcodone; however, careful titration of HYDROcodone, especially in opioid-naive patients, is required until tolerance develops to some of the side effects (i.e., drowsiness and respiratory depression). Individualize dosage carefully

### Vantrela ER: Do not exceed a dose of 180 mg/day PO because of a potential risk of QT prolongation

**Adolescent:** Safety and efficacy have not been established

**Children:** Safety and efficacy have not been established

**Infant:** Safety and efficacy have not been established

**Neonate:** Safety and efficacy have not been established

### Patients with hepatic impairment dosing

*Mild or moderate hepatic impairment:* Monitor closely for respiratory depression and sedation

Zohydro ER and Hysingla ER: Use cautiously. No adjustment in starting dose is required

Vantrela ER: Initiate therapy with one half of the starting dose. Use alternative analgesics in patients who require doses less than 15 mg

*Severe hepatic impairment:* Monitor closely for respiratory depression and sedation

Zohydro ER: Initiate therapy at the lowest dose of 10 mg every 12 hr

Hysingla ER: Initiate therapy with one half of the starting dose

Vantrela ER: Use not recommended

### Patients with renal impairment dosing

*Mild renal impairment:* Monitor closely for respiratory depression and sedation

Zohydro ER: Initiate therapy with a low initial dose

Hysingla ER and Vantrela ER: No adjustment in starting dose is required

*Moderate to severe renal impairment, end-stage renal disease:* Monitor closely for respiratory depression and sedation

Zohydro ER: Initiate therapy with a low initial dose

Hysingla ER: Initiate therapy with one half of the starting dose
Vantrela ER: Initiate therapy with one half of the starting dose. Use alternative analgesics in patients who require doses less than 15 mg

## HYDROcodone/ibuprofen

### Oral dosage

**Adult and Adolescent 16 yr and older:** 1 tablet PO every 4 to 6 yr as needed. Lower the dose and/or increase the dosing frequency to determine the lowest effective drug exposure, especially in geriatric patients. Maximum dose is 5 tablets/day

**Available forms: HYDROcodone/acetaminophen:** 15 mg HYDROcodone/325 acetaminophen, 10 mg HYDROcodone/325 acetaminophen (Norco), **HYDROcodone/ibuprofen:** tabs 7.5 mg HYDROcodone/200 mg ibuprofen (Vico-profen), 2.5 mg HYDROcodone/200 mg ibuprofen, 5 mg HYDROcodone/ 200 mg ibuprofen, 10 mg HYDROcodone/200 mg ibuprofen

### Implementation

Check product carefully before using; fatalities have occurred by using wrong dose, wrong product

- Do not break, crush, or chew tabs; only scored tabs may be broken
- Give with antiemetic if nausea, vomiting occur
- Give when pain is beginning to return; determine dosage interval by patient response; continuous dosing of medication is more effective than given prn
- Medication should be slowly withdrawn after long-term use to prevent withdrawal symptoms

**BLACK BOX WARNING:** Max 4 g acetaminophen with combination product

- Store in light-resistant container at room temperature
- May be given with food or milk to lessen GI upset

**Extended release route**

- May need short- or rapid-acting opioid for breakthrough pain

## ADVERSE EFFECTS

**CNS:** *Drowsiness,* dizziness, light-headedness, confusion, headache, sedation, euphoria, dysphoria, weakness, hallucinations, disorientation, mood changes, dependence, seizures
**CV:** Palpitations, tachycardia, bradycardia, change in B/P, circulatory depression, syncope, cardiac arrest (child)
**EENT:** Tinnitus, blurred vision, miosis, diplopia
**GI:** *Nausea, vomiting, anorexia, constipation,* cramps, dry mouth, ulcers
**GU:** Increased urinary output, dysuria, urinary retention
**INTEG:** Rash, urticaria, flushing, pruritus
**RESP:** Respiratory depression, pulmonary edema, bronchopneumonia, respiratory arrest (child)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown; crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | 3½-4½ hr |

### Pharmacodynamics

| | PO (analgesic) | PO (antitussive) |
|---|---|---|
| **Onset** | 10-20 min | Unknown |
| **Peak** | 30-60 min | Unknown |
| **Duration** | 4-6 hr | 4-6 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression

**BLACK BOX WARNING:** CYP3A4 inhibitors (erythromycin, ketoconazole, nefazodone, protease inhibitors): Increase HYDROcodone effect

### Drug classifications

Antidepressants (tricyclics), CNS depressants, general anesthetics, opioids, phenothiazines, sedative/hypnotics, skeletal muscle relaxants: increased CNS depression
MAOIs: increased severe reactions
Decrease: HYDROcodone effect CYP3A4 inducers

### Drug/herb

Lavender, valerian: increased CNS depression

### Drug/lab test

Increased: amylase, lipase

## NURSING CONSIDERATIONS

### Assessment

- **Assess pain:** intensity, type, location, duration, precipitating factor before and 1 hr after giving product, titrate upward by 25%; assess need for pain medication, physical dependency
- Monitor VS after parenteral route; note muscle rigidity; product history; liver; renal function tests; cough; and respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min
- **Opioid addiction:** Identify opioid addiction or use before starting product, if product

has been used by snorting, fatal reactions have occurred
• **Monitor CNS changes:** dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
• Monitor allergic reactions: rash, urticaria

**BLACK BOX WARNING:** Neonatal opioid withdrawal syndrome: Monitor neonate for withdrawal (irritability, hyperactivity, abnormal sleep patterns, high-pitched crying, tremor, vomiting, diarrhea

• **Bowel status:** constipation; provide fluids, fiber in diet, may need stimulant laxative if opioid use exceeds 3 days

**BLACK BOX WARNING:** Respiratory depression: Do not use in those with respiratory depression; monitor for decreased respiratory rate, urge to breathe, sighing breathing pattern; carbon dioxide retention from respiratory depression may worsen sedation; an opioid antagonist may be needed

**BLACK BOX WARNING:** Ethanol ingestion: Warn patients use with ethanol can lead to serious overdose and death, do not use with other medications containing ethanol, unless directed by prescriber

**BLACK BOX WARNING:** Neonatal opioid withdrawal syndrome: Results from prolonged maternal use of long-acting opioids, can be fatal

• **Beers:** Avoid use in older adults, unless safer alternative is not available, may cause ataxia, impaired psychomotor function
• **Pregnancy/breastfeeding:** May affect fetus, crosses placental barrier, do not breastfeed

### Patient/family education
• Instruct patient to report any symptoms of CNS changes, allergic reactions; to avoid CNS depressants: alcohol, sedative/hypnotics for at least 24 hr after taking this product
• Teach patient that dizziness, drowsiness, and confusion are common and to avoid getting up without assistance, driving, or other hazardous activities
• Discuss in detail all aspects of the product

### Evaluation
**Positive therapeutic outcome**
• Decreased pain
• Decreased cough
• Teach patient to notify prescriber if pregnancy is planned or suspected
• Advise patient for dry mouth, use sugarless gum, frequent sips of water
• Advise patient to notify prescriber of relief of pain

**BLACK BOX WARNING:** Advise patient not to exceed 4000 mg in combination product with acetaminophen, check all other products that may contain acetaminophen

## TREATMENT OF OVERDOSE:
Naloxone HCl (Narcan) 0.2-0.8 **IV**, $O_2$, **IV** fluids, vasopressors

## hydrocortisone (Rx)
(hy-droh-kor'tih-sone)
**Cortef, Colocort, Cortena**
## hydrocortisone cypionate
**Cortef**
## hydrocortisone sodium succinate (Rx)
**A-hydroCort, Solu-Cortef**
*Func. class.:* Short-acting glucocorticoid
*Chem. class.:* Natural nonfluorinated, group IV potency (valerate), group VI potency (acetate and plain)

**Do not confuse:** hydrocortisone/HYDROcodone

**ACTION:** Decreases inflammation by suppressing migration of polymorphonuclear leukocytes and fibroblasts and reversing increased capillary permeability and lysosomal stabilization (systemic); antipruritic, antiinflammatory (topical)

**Therapeutic outcome:** Decreased inflammation

**USES:** Severe inflammation, septic shock, adrenal insufficiency, ulcerative colitis, collagen disorders, asthma, COPD, SLE, Stevens-Johnson syndrome, ulcerative colitis, TB

## CONTRAINDICATIONS
Hypersensitivity, fungal infections

**Precautions:** Pregnancy, breastfeeding, diabetes mellitus, glaucoma, osteoporosis, seizure disorders, ulcerative colitis, HF, myasthenia gravis, renal disease, esophagitis, peptic ulcer, metastatic carcinoma, septic shock, Cushing syndrome, hepatic disease, hypothyroidism, coagulopathy, thromboembolism, children <2 yr, psychosis, idiopathic thrombocytopenia (IM), acute glomerulonephritis, amebiasis, nonasthmatic bronchial disease, AIDS, TB, recent MI (associated with left-ventricular rupture)

## DOSAGE AND ROUTES

### Most disorders

**Adult:** PO 20-240 mg daily in divided doses; IM/**IV** 100-500 mg (succinate), may repeat q2-6hr, then 50-100 mg IM as needed

### Septic shock treatment

**Adult:** Cont IV 200 mg/day, taper when vasopressors are discontinued

### Adrenocortical insufficiency:

**Child:** PO 0.56 mg/kg/day (15-20 mg/m$^2$/day) as a single or divided dose; IM/IV 0.186-0.28 mg/kg/day (10-12 mg/m$^2$/day) in three divided doses
**Child:** PO 2-8 mg/kg/day (60-240 mg/m$^2$/day) as a single or divided dose; IM/IV 0.666-4 mg/kg (20-120 mg/m$^2$) q12-24hr

**Available forms: Hydrocortisone:** enema 100 mg/60 ml; tabs 5, 10, 20 mg; **acetate:** rectal suppository: 25, 30 mg: 10%; **cypionate:** tabs 5, 10, 20 mg; **succinate:** inj 100, 250, 500, 1000 mg vial

### Implementation

**PO route**

- Give with food or milk to decrease GI symptoms
- Do not use acetate or susp for IV, salts are not interchangeable

**Topical route**

- Apply only to affected areas; do not get in eyes
- Cleanse and dry area before applying medication, then cover with occlusive dressing (only if prescribed); seal to normal skin; change q12hr; systemic absorption may occur; use only on dermatoses; do not use on weeping, denuded, or infected area
- Use for a few days after area has cleared
- Store at room temperature

**Nasal route**

- Patient should clear nasal passages before administration; use decongestant if needed; shake inhaler, invert, tilt head backward, insert nozzle into nostril, away from septum; hold other nostril closed and depress activator, inhale through nose, exhale through mouth

**IM route**

- Give deeply in large muscle mass; rotate sites; avoid deltoid; use 21-gauge needle

**IV route**

- **Succinate: IV** in mix-o-vial or reconstitute 250 mg or less/2 ml bacteriostatic water for injection, mix gently; give direct IV over 1 min or more; may be further diluted in 100, 250, 500, or 1000 ml of $D_5W$, $D_5$/0.9% NaCl, 0.9% NaCl given over ordered rate

### Sodium succinate

**Y-site compatibilities:** Acetaminophen, acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, ampicillin, amphotericin B cholesteryl, inamrinone, amsacrine, atracurium, atropine, aztreonam, betamethasone, calcium gluconate, cefepime, cefmetazole, cephalothin, chlordiazePOXIDE, chlorproMAZINE, cisatracurium, cladribine, cyanocobalamin, cytarabine, dexamethasone, digoxin, diphenhydrAMINE, DOPamine, DOXOrubicin liposome, droperidol, edrophonium, enalaprilat, EPINEPHrine, esmolol, conjugated estrogens, ethacrynate, famotidine, fentaNYL, fentaNYL/droperidol, filgrastim, fludarabine, fluorouracil, foscarnet, furosemide, gallium, granisetron, heparin, hydrALAZINE, regular insulin, isoproterenol, kanamycin, lidocaine, LORazepam, magnesium sulfate, melphalan, menadiol, meperidine, methicillin, methoxamine, methylergonovine, minocycline, morphine, neostigmine, norepinephrine, ondansetron, oxacillin, oxytocin, PACLitaxel, pancuronium, penicillin G potassium, pentazocine, phytonadione, piperacillin/tazobactam, prednisoLONE, procainamide, prochlorperazine, propofol, propranolol, pyridostigmine, remifentanil, scopolamine, sodium bicarbonate, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, trimethaphan, trimethobenzamide, vecuronium, vinorelbine, zoledronic acid

**Y-site incompatibilities:** Diazepam, ergotamine tartrate, IDArubicin, phenytoin, sargramostim

## ADVERSE EFFECTS

**CNS:** Depression, flushing, sweating, headache, mood changes, pseudotumor cerebri, euphoria, insomnia, seizures
**CV:** Hypertension, circulatory collapse, thrombophlebitis, embolism, tachycardia, edema, heart failure
**EENT:** Fungal infections, increased intraocular pressure, blurred vision, cataracts, glaucoma
**GI:** Diarrhea, nausea, abdominal distention, GI hemorrhage, increased appetite, pancreatitis, vomiting
**HEMA:** Thrombocytopenia
**INTEG:** Acne, poor wound healing, ecchymosis, petechiae
**MISC:** Adrenal insufficiency (after stress/withdrawal)
**MS:** Fractures, osteoporosis, weakness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO); systemic (topical) |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidney |
| **Half-life** | 3-5 hr, adrenal suppression 3-4 days |

### Pharmacodynamics

| | PO | IM | IV | TOPICAL |
|---|---|---|---|---|
| **Onset** | 1-2 hr | 20 min | Rapid | Min to hr |
| **Peak** | 1 hr | 4-8 hr | 1-2 hr | Hr to days |
| **Duration** | 1½ days | 1½ days | 1½ days | Hr to days |

## INTERACTIONS

### Individual drugs

Alcohol, amphotericin B, cycloSPORINE, digoxin: increased side effects

Bosentan, carBAMazepine, cholestyramine, colestipol, ePHEDrine, phenytoin, rifampin, theophylline: decreased action of hydrocortisone

### Drug classifications

Acetaminophen, NSAIDs, salicylates: increased risk of GI bleeding

Anticoagulants, calcium supplements, toxoids, vaccines: decreased action of each specific drug

Anticonvulsants: decreased effects of anticonvulsant

Antidiabetics: decreased effects of antidiabetics

Barbiturates: decreased action of hydrocortisone

Diuretics: increased side effects

Live virus vaccines/toxoids: increased neurologic reactions

### Drug/herb

Ephedra: decreased hydrocortisone levels

### Drug/lab test

Increased: cholesterol, sodium, blood glucose, uric acid, calcium, urine glucose

Decreased: calcium, potassium, $T_4$, $T_3$, thyroid $^{131}I$ uptake test, urine 17-OHCS, 17-KS

False negative: skin allergy tests

## NURSING CONSIDERATIONS

### Assessment

- **Adrenal insufficiency (cushingoid symptoms):** nausea, anorexia, shortness of breath, moon face, fatigue, dizziness, weakness, joint pain before and during treatment; monitor plasma cortisol levels during long-term therapy (normal level is 138-635 nmol/L when obtained at 8 AM); check adrenal function periodically for hypothalamic-pituitary-adrenal axis suppression
- Monitor potassium, blood glucose, urine glucose while patient is on long-term therapy; hypokalemia and hyperglycemia may occur
- Monitor I&O ratio; be alert for decreasing urinary output and increasing edema; weigh daily; notify prescriber of weekly gain >5 lb or edema, hypertension, cardiac symptoms
- **Beers:** Avoid in older adults with or at high risk for delirium
- **Assess for infection:** increased temp, WBC even after withdrawal of medication; product masks infection symptoms; if fever develops, product should be discontinued
- Check for potassium depletion: paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness
- Assess mental status: affect, mood, behavioral changes, aggression
- Check nasal passages during long-term treatment for changes in mucus (nasal)
- Assess for systemic absorption: increased temp, inflammation, irritation (topical)
- GI effects: nausea, vomiting, anorexia or appetite stimulation, diarrhea, constipation, abdominal pain, hiccups, gastritis, pancreatitis, GI bleeding/perforation with long-term treatment

### Patient/family education

- Teach patient all aspects of product use, including cushingoid symptoms
- Advise patient to carry/wear emergency ID as corticosteroid user; not to discontinue abruptly; adrenal crisis can result
- Instruct patient to notify prescriber if therapeutic response decreases; dosage adjustment may be needed
- Instruct patient to notify prescriber of signs of infection
- Teach patient that product can mask infections and cause hyperglycemia (diabetic)
- Teach patient to avoid live-virus vaccines if using steroids long term
- Teach patient not to discontinue abruptly, adrenal crisis can result; product should be tapered
- Caution patient to avoid OTC products unless directed by prescriber: salicylates, alcohol in cough products, cold preparations
- **Teach patient symptoms of adrenal insufficiency:** nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain; and when to notify prescriber
- Advise patient that long-term therapy may be needed to resolve infection (1-2 mo depending on type of infection)
- Teach patient to report immediately abdominal pain, black tarry stools, as GI bleeding/perforation can occur; if received by epidural route, report immediately change in vision, severe headache, seizures, weakness (emergency response needed)
- Advise patient not to discontinue abruptly or adrenal crisis can result; product should be tapered

**Nasal route**

- Instruct patient to clear nasal passages if sneezing attack occurs, then repeat dose; to continue using product even if mild nasal bleeding occurs; bleeding is usually transient

• Teach method of instillation after providing written instruction from manufacturer on instillation
• **Epidural use:** Assess for vision changes, seizures, stroke, paralysis, brain edema and death may occur (rare)

### Evaluation

**Positive therapeutic outcome**
• Decrease in runny nose (nasal)
• Decreased inflammation
• Absence of severe itching, patches on skin, flaking (top)
• Decreased GI symptoms

## hydrocortisone topical

*See Appendix B*

**⚠ HIGH ALERT**

## HYDROmorphone (Rx) REMS

(hye-droe-mor'fone)
**Dilaudid, Dilaudid-HP, Exalgo, Hydromorph Contin, Jurnista**
*Func. class.:* Antitussive, opioid analgesic agonist
*Chem. class.:* Phenanthrene derivative, guaifenesin
**Controlled substance schedule II**

**Do not confuse:** HYDROmorphone/meperidine/morphine, Dilaudid/Demerol

**ACTION:** Inhibits ascending pain pathways in CNS, increases pain threshold, alters pain perception

**Therapeutic outcome:** Decreased cough, decreased pain

**USES:** As an antitussive to suppress cough; moderate to severe pain

## CONTRAINDICATIONS

Hypersensitivity to this product, sulfite, COPD, cor pulmonale, emphysema, GI obstruction, ileus, increased intracranial pressure, obstetric delivery, status asthmaticus

**BLACK BOX WARNING:** Respiratory depression, opioid-naive patients

**Precautions:** Pregnancy, breastfeeding, children <18 yr, increased ICP, addictive personality, renal/hepatic disease, MI (acute), abrupt discontinuation, adrenal insufficiency, angina, asthma, biliary tract disease, bladder obstruction, hypothyroidism, hypovolemia, hypoxemia, IBD, IV use, labor, latex hypersensitivity, myxedema, seizure disorders, sleep apnea

**BLACK BOX WARNING:** Substance abuse, accidental exposure, potential for overdose/poisoning, neonatal opioid withdrawal syndrome

## DOSAGE AND ROUTES

**Available forms:** Powder of injection 250 mg; inj 1, 2, 4, 10 mg/ml; tabs 2, 4, 8 mg; oral sol 5 mg/5 ml; supp 3 mg, ext rel tab 8, 12, 16, 32 mg

### Implementation

• Give with antiemetic if nausea, vomiting occur
• Give when pain is beginning to return; determine dosage interval by patient response; continuous dosing of medication is more effective given prn; explain analgesic effect
• Withdraw medication slowly after long-term use to prevent withdrawal symptoms
• Store in light-resistant container at room temperature

**PO route**
• May be given with food or milk to lessen GI upset

### Extended release

**BLACK BOX WARNING:** Do not use extended-release products in opioid-naive patients or with other extended-release opioids, do not use with other extended-release HYDROmorphone products, may be fatal

• **Converting from oral opioids;** conversion ratios are approximate; initiate ext rel tabs at 50% of calculated total daily equivalent dose of ext rel, give q24hr; max increase q2-3days, consider titration increases of 25%-50% in each step
• **Converting from transdermal patch (fentaNYL)** initiate ext rel tabs 18 hr after removal of patch; for each 25 mcg/hr dose of transdermal fentaNYL the dose is 12 mg q24hr, start dose at 50% of calculated HYDROmorphone ext rel dose q24hr; titrate no more often than q3-4days, consider dose increases of 25%-50% with each step; if more than 2 rescue doses are required in 24 hr, consider titration

**SUBCUT route**
• Do not give if sol is cloudy or a precipitate has formed; rotate inj sites
• Use short 30-G needle, make sure not to inject intradermally

**Direct IV route**
• Give after diluting with 5 ml or more of sterile water or 0.9% NaCl for inj
• Give slowly at 2 mg over 3-5 min or less through Y-connector or 3-way stopcock

**IV infusion route**
• Dilute each 0.1-1 mg/ml in 0.9% NaCl, deliver by opioid syringe infusion; may be diluted in $D_5W$, $D_5$/NaCl, 0.45% NaCl or 0.9% NaCl for larger amounts and through an infusion pump

**Y-site compatibilities:** Acyclovir, allopurinol, amifostine, amikacin, amsacrine, aztreonam, cefamandole, cefepime, cefoperazone, cefotaxime, cefOXitin, cefTAZidime, ceftizoxime, cefuroxime, chloramphenicol, CISplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, diltiazem, DOBUTamine, DOPamine, DOXOrubicin, doxycycline, EPINEPHrine, erythromycin lactobionate, famotidine, fentaNYL, filgrastim, fludarabine, foscarnet, furosemide, gentamicin, granisetron, heparin, kanamycin, labetalol, LORazepam, magnesium sulfate, melphalan, methotrexate, metroNIDAZOLE, midazolam, milrinone, morphine, nafcillin, niCARdipine, nitroglycerin, norepinephrine, ondansetron, oxacillin, PACLitaxel, penicillin G potassium, piperacillin, piperacillin/tazobactam, propofol, ranitidine, teniposide, thiotepa, ticarcillin, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, vinorelbine

**Y-site incompatibilities:** Ampicillin, diazepam, minocycline, PHENobarbital, phenytoin, sargramostim

**Solution compatibilities:** $D_5W$, $D_5$/0.45% NaCl, $D_5$/0.9% NaCl, $D_5$/LR, $D_5$/Ringer's, 0.45% NaCl, 0.9% NaCl, Ringer's, LR

## ADVERSE EFFECTS

**CNS:** Dizziness, drowsiness, *sedation, confusion,* headache, euphoria, mood changes, seizures
**CV:** *Hypotension, bradycardia,* palpitations, change in B/P, tachycardia, peripheral vasodilation
**EENT:** Miosis, diplopia, blurred vision, tinnitus
**GI:** *Nausea, constipation, vomiting, anorexia,* dry mouth, cramps, paralytic ileus
**GU:** Increased urinary output, dysuria, urinary retention
**INTEG:** Urticaria, rash, flushing, bruising, diaphoresis, pruritus
**RESP:** Respiratory depression, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO), complete (**IV**) |
| **Distribution** | Unknown; crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | Varied |

### Pharmacodynamics

| | PO/IM/SUBCUT | IV | RECT |
|---|---|---|---|
| **Onset** | 15-30 min | 10-15 min | 15-30 min |
| **Peak** | 30-60 min | 15-30 min | 30-90 min |
| **Duration** | 4-5 hr | 2-3 hr | 4-5 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased respiratory depression, hypotension, sedation

### Drug classifications

Antipsychotics, opiates, sedative/hypnotics, skeletal muscle relaxants: increased effects
MAOIs: increased severe reactions
Opiate antagonists: decreased HYDROmorphone effects

### Drug/herb

Chamomile, hops, kava, lavender, St. John's wort, valerian: increased action

### Drug/lab test

Increased: amylase

## NURSING CONSIDERATIONS

### Assessment

- **Assess pain control,** sedation by scoring on 0-10 scale; around-the-clock dosing is best for pain control
- Monitor VS after parenteral route; note muscle rigidity; product history

**BLACK BOX WARNING:** Respiratory dysfunction; respiratory depression; monitor character, rate, rhythm; notify prescriber if respirations are <10/min

**BLACK BOX WARNING:** Substance abuse: Assess for previous or current substance abuse, risk of abuse will be increased in these patients, assess for misuse of medication

- Monitor CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- Monitor allergic reactions: rash, urticaria; bowel function, constipation
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, neonatal opioid withdrawal syndrome can occur if used for prolonged periods in pregnancy, do not use in breastfeeding, excretion unknown
- **Beers:** Avoid in older adults unless safer alternative is unavailable, may cause ataxia, impaired psychomotor function

### Patient/family education

**BLACK BOX WARNING:** Substance abuse: Instruct patient to report any symptoms of CNS changes, allergic reactions; to avoid CNS depressants: alcohol, sedative-hypnotics for at least 24 hr after taking this product

- Advise patient that dizziness, drowsiness, and confusion are common and to avoid getting up

without assistance, driving, or other hazardous activities
• Discuss in detail all aspects of the product, to take with food if nausea occurs

**BLACK BOX WARNING:** Teach patient that extended-release products must be taken whole, not to use with alcohol, medications with alcohol content

### Evaluation
**Positive therapeutic outcome**
• Decreased pain
• Decreased cough

## TREATMENT OF OVERDOSE:
Naloxone HCl (Narcan) 0.2-0.8 **IV**, $O_2$, **IV** fluids, vasopressors

## hydroxocobalmin
*See vitamin B-12 products*

## hydroxychloroquine (Rx)
(hye-drox-ee-klor'oh-kwin)
**Apo-Hydroxyquine** ✱, **Plaquenil**
*Func. class.:* Antimalarial, antirheumatic (DMARDs)
*Chem. class.:* 4-Aminoquinoline derivative

## ACTION:
Impairs complement-dependent antigen-antibody reactions

**Therapeutic outcome:** Resolution of infection

## USES:
Malaria caused by *Plasmodium vivax, P. malariae, P. ovale, P. falciparum* (some strains); LE, rheumatoid arthritis

## CONTRAINDICATIONS
Hypersensitivity to this product or chloroquine, retinal field changes

**Precautions:** Pregnancy, breastfeeding, blood dyscrasias, severe GI disease, neurologic disease, alcoholism, hepatic disease, G6PD deficiency, psoriasis, eczema, children, ocular disease

**BLACK BOX WARNING:** Requires an experienced clinician

## DOSAGE AND ROUTES
### Malaria
**Adult:** PO **suppression or prevention** 400 mg qwk, begin 2 wk before travel to endemic area, continue 4 wk after returning; **treatment** 800 mg, then 400 mg after 6-8 hr, then 400 mg/day on 2nd and 3rd day, total dose 2 g

**Child:** PO **suppression or prevention** 6.4 mg/kg (5 mg/kg base) qwk, begin 2 wk before travel to endemic area, continue 4 wk after returning; **treatment** 10 mg/kg, 6.4 mg/kg (5 mg/kg base), at 6, 24, 48 hr after 1st dose

### Lupus erythematosus
**Adult:** PO 400 mg (310 mg base) daily-bid; length depends on patient response; **maintenance** 200-400 mg/day

### Rheumatoid arthritis
**Adult:** PO 400 mg/day for 4-12 wk; then 200-400 mg/day after good response

**Available forms:** Tabs 200 mg

### Implementation
**PO route**

**BLACK BOX WARNING:** Only to be prescribed by experienced clinician

• Give before or after meals with milk, at same time each day to maintain product level
• Tabs may be crushed and mixed with food, fluids
• Malaria prophylaxis should be started 2 wk prior to exposure and 4-6 wk after leaving exposure area
• Store in tight, light-resistant container at room temperature; keep inj in cool environment

## ADVERSE EFFECTS
**CNS:** Headache, stimulation, fatigue, irritability, seizures, bad dreams, dizziness, confusion, psychosis, decreased reflexes
**CV:** Hypotension, heart block, asystole with syncope
**EENT:** *Blurred vision, corneal changes, retinal changes, difficulty focusing*, tinnitus, vertigo, deafness, photophobia, corneal edema
**GI:** *Nausea, vomiting, anorexia,* diarrhea, cramps
**HEMA:** Thrombocytopenia, agranulocytosis, leukopenia, aplastic anemia
**INTEG:** Pruritus, pigmentation changes, skin eruptions, lichen planus–like eruptions, eczema, exfoliative dermatitis, alopecia, Stevens-Johnson syndrome, photosensitivity

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Urine/feces |
| **Half-life** | 3-5 day |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | 1-2 hr |
| **Duration** | Days-weeks |

## INTERACTIONS

### Individual products

Magnesium, aluminum products: decreased malarial action
Digoxin: increased levels
Methotrexate: decreased levels
Rabies vaccine: increased antibody titer

### Drug classifications

Live-virus vaccines, botulinum toxoids: decreased effects

## NURSING CONSIDERATIONS

### Assessment

- **Assess for lupus erythematosus, malaria symptoms** before treatment and daily
- **Assess for rheumatoid arthritis:** pain, swelling, ROM, temp of joints, for decreased reflexes: knee, ankle
- Assess ophthalmic exam baseline, q6mo if long-term treatment or product dosage >150 mg/day
- Assess hepatic studies qwk: AST, ALT, bilirubin
- **Bone marrow suppression:** Assess blood studies: CBC, platelets; WBC, RBC, platelets may be decreased; if severe, product should be discontinued; malaise, fever, bruising, bleeding (rare)
- Assess for decreased reflexes: knee, ankle
- Assess ECG during therapy
- Assess for depression of T waves, widening of QRS complex
- **Assess allergic reactions:** pruritus, rash, urticaria
- **Assess for ototoxicity** (tinnitus, vertigo, change in hearing); audiometric testing should be done before, after treatment
- **Assess for toxicity:** blurring vision, difficulty focusing, headache, dizziness, knee, ankle reflexes; product should be discontinued immediately
- **Pregnancy/breastfeeding:** Increased rate of birth defects in the literature, CDC recommends this product for pregnant women with malaria or those with lupus, cautious use in breastfeeding

### Patient/family education

- Teach patient to use sunglasses in bright sunlight to decrease photophobia
- Teach patient that urine may turn rust or brown
- Teach patient to report hearing, vision problems; fever, fatigue, bruising, bleeding, which may indicate blood dyscrasias

### Evaluation

**Positive therapeutic outcome**

- Decreased symptoms of malaria, LE, rheumatoid arthritis

## TREATMENT OF OVERDOSE:

Induce vomiting; gastric lavage; administer barbiturate (ultra–short-acting), vasopressor, ammonium chloride; tracheostomy may be necessary

## hydrOXYzine (Rx)

(hye-drox′i-zeen)
**Atarax, Vistaril**
*Func. class.:* Antianxiety, sedative, hypnotic, antihistamine, antiemetic
*Chem. class.:* Piperazine derivative

**Do not confuse:** hydrOXYzine/hydrALAZINE, Vistaril/Versed

**ACTION:** Depresses subcortical levels of CNS, including limbic system, reticular formation; anticholinergic, antiemetic, antihistaminic responses; competes with $H_1$-receptor sites

**Therapeutic outcome:** Absence of allergy symptoms, rhinitis, pruritus, absence of nausea/vomiting, sedation, absence of anxiety

**USES:** Anxiety preoperatively; postoperatively to prevent nausea, vomiting; to potentiate opioid analgesics; sedation; pruritus; prevention of alcohol withdrawal

## CONTRAINDICATIONS

Pregnancy (1st trimester), breastfeeding, acute asthma, hypersensitivity to this product or cetirizine

**Precautions:** Pregnancy (2nd/3rd trimesters), geriatric, debilitated patients, renal/hepatic disease, closed-angle glaucoma, COPD, prostatic hypertrophy, asthma

## DOSAGE AND ROUTES

### Anxiety

**Adult:** PO 25-100 mg tid-qid, max 400 mg/day; IM 50-100 mg q4-6hr
**Child ≥6 yr:** PO 50-100 mg/day in divided doses, max 100 mg/day or 2 mg/kg/day
**Child <6 yr:** PO 50 mg/day in divided doses, max 50 mg/day or 2 mg/kg/day

### Alcohol withdrawal

**Adult:** IM 50-100 mg, then q4-6hr

### Preoperatively/postoperatively (nausea/vomiting)

**Adult:** IM 25-100 mg q4-6hr
**Child:** IM 0.5-1.1 mg/kg as a single dose

### Pruritus
**Adult:** PO 25 mg tid-qid; IM 50-100 mg, then q4-6hr prn, switch to PO as soon as feasible
**Child ≥6 yr:** PO 50-100 mg/day in divided doses; IM 0.5-1 mg/kg/dose q4-6hr prn, use PO when possible
**Child <6 yr: PO** 50 mg/day in divided doses

### Renal dose
**Adult:** PO CCr <50 ml/min reduce dose by 50%

**Available forms:** Tabs 10, 25, 50 mg; caps 25, 50, 100 mg; oral sol 10 mg/5 ml; oral susp 25 mg/5 ml; inj 25, 50 mg/ml

### Implementation
**PO route**
- Give without regard to meals
- May crush tab if patient is unable to swallow whole
- Caps may be opened and product mixed with food/fluids for patients with swallowing difficulties
- Shake oral susp before giving

**IM route**
- Give IM inj in large muscle mass; aspirate to prevent **IV** administration; use Z-track method; severe necrosis can result with improper technique; never give **IV**/SUBCUT (HCL)

**Syringe incompatibilities:** Aminophylline, chloramphenicol, dimenhyDRINATE, heparin, penicillin G potassium, PENTobarbital, PHENobarbital, phenytoin

## ADVERSE EFFECTS
**CNS:** *Dizziness, drowsiness,* confusion, headache, tremors, fatigue, depression, seizures
**CV:** Hypotension
**GI:** Dry mouth, nausea, diarrhea, increased appetite, weight gain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Not known |
| **Metabolism** | Liver, completely |
| **Excretion** | Feces, urine, bile |
| **Half-life** | 3 hr |

### Pharmacodynamics

| | PO/IM |
|---|---|
| **Onset** | 15-60 min |
| **Peak** | 2-4 hr |
| **Duration** | 4-6 hr |

## INTERACTIONS
### Individual drugs
Alcohol: increased CNS depression
Atropine, disopyramide, haloperidol, quiNIDine: increased anticholinergic reactions

### Drug classifications
Analgesics, barbiturates, CNS depressants, opiates, sedative/hypnotics: increased CNS depression
Antidepressants, antihistamines, MAOIs, phenothiazines: increased anticholinergic reactions

### Drug/lab test
False negative: skin allergy testing
False increase: 17-hydroxycorticosteroids

## NURSING CONSIDERATIONS
### Assessment
- Anticholinergic effects: dry mouth, dizziness, confusion, hypotension, increased sedation; monitor B/P
- Assess respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness; provide fluids to 2 L/day to decrease secretion thickness
- Monitor I&O ratio: be alert for urinary retention, frequency, dysuria, especially in geriatric; product should be discontinued if these occur
- Observe for drowsiness, dizziness
- Assess cough characteristics including type, frequency, thickness of secretions; evaluate response to this medication if using for cough
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding
- **Beers:** Avoid use in older adults, anticholinergic effects, toxicity may occur

### Patient/family education
- Caution patient to avoid hazardous activities and activities requiring alertness, since dizziness may occur; instruct patient to request assistance with ambulation
- Advise patient to avoid alcohol, other CNS depressants including cough, cold preparations; CNS depression may occur
- Teach all aspects of product use; to notify prescriber if confusion, sedation, hypotension occur; to avoid driving and other hazardous activity if drowsiness occurs
- Caution patient not to exceed recommended dosage; dysrhythmias may occur
- Tell patient hard candy, gum, frequent rinsing of mouth may be used for dryness

### Evaluation
**Positive therapeutic outcome**
- Absence of nausea, vomiting
- Decreased anxiety

## TREATMENT OF OVERDOSE:
Lavage if orally ingested, VS, supportive care, **IV** norepinephrine for hypotension

## Hylan G-F 20
**Synvisc, Synvisc One**
*See Appendix A, Selected New Drugs*

halcinonide topical
haloperidol lactate (Rx)
hydrALAZINE (Rx)
HYDROcodone/acetaminophen (Rx)
hydrocortisone cypionate
HYDROmorphone (Rx) REMS
hydrOXYzine (Rx)
haloperidol (Rx)
heparin (Rx)
hydrochlorothiazide (Rx)
HYDROcodone/ibuprofen (Rx)
hydrocortisone sodium succinate (Rx)
hydroxocobalmin
Hylan G-F 20
haloperidol decanoate (Rx)
homatropine ophthalmic
HYDROcodone (Rx) REMS
hydrocortisone (Rx)
hydrocortisone topical
hydroxychloroquine (Rx)

## ibandronate (Rx)

(eye-ban′dro-nate)
**Boniva**
*Func. class.:* Bone-resorption inhibitor, electrolyte modifier
*Chem. class.:* Bisphosphonate

**ACTION:** Inhibits bone resorption, apparently without inhibiting bone formation and mineralization; absorbs calcium phosphate crystals in bone and may directly block dissolution of hydroxyapatite crystals of bone; more potent than other products

**Therapeutic outcome:** Increased bone mineral density

**USES:** Postmenopausal Osteoporosis and prophylaxis

**Unlabeled uses:** Hypercalcemia, osteolytic metastases, Paget's disease

## CONTRAINDICATIONS

Achalasia, esophageal stricture, hypocalcemia, intraarterial administration, renal failure, hypersensitivity to bisphosphonates, inability to stand or sit upright

**Precautions:** Pregnancy, breastfeeding, children, geriatric, anemia, chemotherapy, coagulopathy, dental disease, diabetes mellitus, dysphagia, GI/renal disease, GERD, hypertension, infection, multiple myeloma, phosphate hypersensitivity, vitamin D deficiency

## DOSAGE AND ROUTES

### Postmenopausal osteoporosis/ prophylaxis

**Adult:** PO 150 mg qmo; **IV** BOL 3 mg q3mo

### Paget's disease (unlabeled)

**Adult:** **IV** 2 mg as a single dose

### Bone metastases due to breast cancer (unlabeled)

**Adult:** **IV** 6 mg over 1 hr × 3 days, repeat q4wk

### Hypercalcemia of malignancy (unlabeled)

**Adult:** **IV** INF 2 mg over 15 min-2 hr q4wk, may give additional doses ≤6 mg (including first dose) if albumin-corrected serum calcium isn't normalized by day 4 after first dose

### Renal dose

**Adult:** PO CCr <30 ml/min, avoid use

**Available forms:** Tabs 2.5, 150 mg; sol for inj 3 mg/ml

### Implementation

**PO route**
- Give early AM with a glass of water; if qmo, give on same day of each month
- Patient to remain upright for ≥ 1 hr after taking
- Not to suck/chew, throat ulcers may occur
- Store at room temperature

**Direct IV route**
- Use single-dose prefilled syringe; discard unused portion; give over 15-30 sec
- Store at room temperature
- Do not use if discolored or if sol contains particulates

## ADVERSE EFFECTS

**CNS:** Fever, insomnia, dizziness, headache
**CV:** Hypertension, atrial fibrillation
**EENT:** Ocular pain/inflammation, uveitis, esophageal ulceration
**GI:** Constipation, nausea, vomiting, diarrhea, dyspepsia
**INTEG:** Rash, inj site reaction
**META:** *Hypomagnesemia, hypophosphatemia, hypocalcemia,* hypercholesterolemia
**MS:** Bone pain, myalgia, osteonecrosis of the jaw
**SYST:** Stevens-Johnson syndrome, erythema multiforme, dermatitis bullous

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poor |
| **Distribution** | Taken up primarily by bones, 91%-99% protein binding |
| **Metabolism** | Unknown |
| **Excretion** | Primarily by kidneys (60%) |
| **Half-life** | 4.5-25.5 hr |

### Pharmacodynamics

| | PO |
|---|---|
| **Onset** | Unknown |
| **Peak** | 0.5-2 hr |
| **Duration** | Up to 1 mo |

## INTERACTIONS

### Individual drugs

Calcium, vitamin D, iron, aluminum, magnesium salts: decreased ibandronate effect, separate by 1 hr
Increased: GI irritation: NSAIDs, salicylates

### Drug classifications

Aminoglycosides, NSAIDs, radiopaque contrast agents: possible increased neurotoxicity
Loop diuretics: increased hypocalcemia

### Drug/food
• Do not take with food, calcium, give product on empty stomach

### Drug/lab test
Decreased: alk phos, magnesium, calcium, phosphate
Increased: cholesterol

## NURSING CONSIDERATIONS
### Assessment
• Osteoporosis: before and during treatment; monitor DEXA scan for bone mineral density, correct electrolyte imbalances (calcium, magnesium, phosphate) before starting therapy
• **Anaphylaxis:** swelling of face, lips, mouth, rash, sweating, wheezing, trouble breathing, discontinue immediately, provide supportive treatment
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk
• Assess for blood studies: electrolytes, Ca, P, Mg; creatinine/BUN
• Assess for atrial fibrillation
• Assess dental health; before dental extraction, may require drug holiday for up to 2 mo; osteonecrosis of the jaw may occur
• Assess for bone pain; use analgesics; may begin within 24 hr, or even years after treatment, pain usually subsides after treatment is discontinued
• Esophageal irritation/ulceration: Assess for heart burn, painful swallowing, avoid use in those with swallowing difficulties

### Patient/family education
• **Teach patient to report hypercalcemic relapse:** nausea, vomiting, bone pain, thirst; unusual muscle twitching, muscle spasms, severe diarrhea, constipation
• Advise patient to continue with dietary recommendations, including calcium and vit D, calcium, alk phosphatase
• Instruct patient to obtain an analgesic from provider for bone pain that may occur rapidly or within months
• Advise patient that if nausea/vomiting occur, small, frequent meals may help
• Teach patient to report vision symptoms: blurred vision, edema, inflammation; report to prescriber
• Teach to report if pregnancy is planned or suspected or if planning to breastfeed, pregnancy
• Encourage to exercise regularly, to stop smoking, and decrease alcohol
• Advise to take in AM at least 60 min before other meds, food, beverages, to take monthly dose on same day; if IV dose is missed reschedule as soon as able, reschedule subsequent doses on new time schedule, not to receive IV dose more than once in 3 mo
• Teach to sit upright ≥60 min after PO dose, to swallow tab whole, not to chew or suck, to prevent irritation

### Evaluation
**Positive therapeutic outcome**
• Increased bone mineral density

**⚠ HIGH ALERT**

# ibrutinib
(eye-broo′ti-nib)
**Imbruvica**
*Func. class.:* Antineoplastic-biologic response modifier
*Chem. class.:* Signal transduction inhibitor (STI), kinase inhibitor

**ACTION:** Irreversible inhibitor of Bruton's tyrosine kinases in B cells responsible for tumor growth

**Therapeutic outcome:** Decrease in progression of disease

**USES:** Recurrent mantle cell lymphoma in patients who have received at least 1 prior treatment, Waldenstrom's macroglobulinemia/ chronic lymphocytic leukemia (CLL), or small lymphocytic lymphoma who have received at least one prior treatment

## CONTRAINDICATIONS
Pregnancy, breastfeeding, hypersensitivity

**Precautions:** Children, geriatric patients, active infections, anticoagulant therapy, bleeding, hepatic/renal disease, neutropenia, surgery

## DOSAGE AND ROUTES
**Mantle cell lymphoma who have received at least one prior treatment**
**Adult: PO** 560 mg (4×140 mg caps)/day
CLL, Waldenstrom's macroglobulinemia
**Adult:** PO 420 mg daily until disease progression

**Dosage adjustment for ≥ grade 3 nonhematologic toxicities, ≥ grade 3 neutropenia with infection or fever, or grade 4 hematologic toxicities**
Interrupt therapy; resume upon recovery to grade 1 or baseline as indicated here:
• **First occurrence:** resume dosing at original dose (daily dose = 560 mg/day)
• **Second occurrence:** reduce dose by 1 capsule (daily dose = 420 mg/day)
• **Third occurrence:** reduce dose by 2 capsules (daily dose = 280 mg/day)
• **Fourth occurrence:** discontinue

**Available forms:** Caps 140 mg

### Implementation

- Give at same time of day with water; if dose is missed, take as soon as possible on same day; do not double
- Do not open, break, chew cap
- Use safe handling procedures
- Store at room temperature, avoid moisture

## ADVERSE EFFECTS

**CNS:** Fatigue, fever
**CV:** Hypertension, atrial fibrillation, peripheral edema
**EENT:** Sinusitis
**GI:** Nausea, vomiting, dyspepsia, anorexia, abdominal pain, constipation, stomatitis, diarrhea, GI bleeding
**GU:** Increased serum creatinine, UTI, renal failure
**HEMA:** Neutropenia, thrombocytopenia, anemia, bleeding, epistaxis, transient lymphocytosis
**INTEG:** Rash, skin infections
**MS:** Pain, arthralgia, muscle cramps
**RESP:** Cough, dyspnea
**SYST:** Secondary malignancy, infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 97.3% |
| **Metabolism** | By CYP3A4/CYP2D6 |
| **Excretion** | Primarily in feces, small amount in urine |
| **Half-life** | Terminal 4-8 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Moderate or strong CYP3A4 inducers: decreased ibrutinib effect; avoid concurrent use
Moderate or strong CYP3A4 inhibitors (clarithromycin, indinavir, itraconazole, nelfinavir, posaconazole, ritonavir, saquinavir, voriconazole): increased ibrutinib effect; avoid concurrent use

### Drug/food

Grapefruit juice: increased plasma concentrations

### Drug/herb

St. John's wort: decreased SUNItinib concentration

## NURSING CONSIDERATIONS

### Assessment

#### Drug/lab test

- Increase: Lymphocytes, uric acid, creatinine
- **Secondary malignancies:** Monitor for new malignancies
- **Bleeding:** bruising, grade 3 or higher bleeding events may occur, may be fatal
- **Hypersensitivity:** Fever, itching, wheezing, swelling of face, lips, tongue, stop product immediately
- **Pregnancy:** Identify if pregnancy is planned or suspected, if breastfeeding, do not use in pregnancy, breastfeeding
- Monitor hepatic/renal function, signs/symptoms of infection
- Renal failure: Monitor for renal function (BUN, creatinine) maintain hydration, monitor for hyperuricemia
- **Infection:** Monitor for fever, sore throat malaise, infection may be fatal
- **Cardiac changes/hypertension:** Monitor B/P

#### Patient/family education

- Teach patient about reason for treatment, expected result
- Teach patient that many adverse reactions may occur: high B/P, bleeding, mouth swelling, trouble breathing
- Teach patient to avoid persons with known upper respiratory infections; that immunosuppression is common
- Teach patient to avoid grapefruit juice or medications, herbs; there are many interactions
- Teach patient to report if pregnancy is planned or suspected, if breastfeeding
- Teach patient to take with water at same time each day; do not open, break, or chew
- Teach patient to report immediately trouble breathing, fever, itching, wheezing, swelling of face, lips, tongue, stop product

#### Evaluation

**Positive therapeutic outcome**

- Decrease in progression of disease

## ibuprofen (OTC, Rx)

(eye-byoo-proe'fen)
**Advil, Caldolor, Ibuprohm, Ibutab, Midol, Motrin, Motrin IB, Pamprin IB, Profen, Tab-Profen**

## ibuprofen lysine (Rx)

**NeoProfen**

*Func. class.:* NSAID

**ACTION:** Inhibits COX-1, COX-2 by blocking arachidonate; analgesic, antiinflammatory, antipyretic

**Therapeutic outcome:** Decreased pain, inflammation, fever

**USES:** Rheumatoid arthritis, osteoarthritis, primary dysmenorrhea, dental pain, musculoskeletal disorders, fever, migraine, patent ductus arteriosus

## CONTRAINDICATIONS

Avoid pregnancy 3rd trimester, hypersensitivity to this product, NSAIDs, salicylates, asthma, severe renal/hepatic disease, Perioperative pain in CABG

**Precautions:** Pregnancy (1st and 2nd trimester), breastfeeding, children, geriatric, bleeding disorders, GI disorders, cardiac disorders, hypersensitivity to other antiinflammatory agents, HF, CCr <25 ml/min

**BLACK BOX WARNING:** GI bleeding, MI, stroke

## DOSAGE AND ROUTES

### Self-treatment of minor aches/pain

**Adult/adolescent:** PO (OTC product) 200 mg q4-6hr, may increase to 400 mg q4-6hr; max 1200 mg/day

### Analgesia

**Adult:** PO 200-400 mg q4-6hr; max 3.2 g/day; OTC use max 1200 mg/day
**Child:** PO 4-10 mg/kg/dose q6-8hr

### Moderate to severe pain (hospitalized patients) (Caldolor)

**Adult:** **IV** 400-800 mg q6hr as an adjunct to opiate agonist therapy

### Dysmenorrhea

**Adult:** PO 400 mg q4-6hr; max 1200 mg/day

### Antipyretic

**Child 6 mo-12 yr:** PO 5 mg/kg (temp <102.5° F or 39.2° C), 10 mg/kg (temp >102.5° F), may repeat q6-8hr; max 40 mg/kg/day

### Antiinflammatory

**Adult:** PO 400-800 mg tid-qid; max 3.2 g/day
**Child:** PO 30-40 mg/kg/day in 3-4 divided doses; max 50 mg/kg/day

### Juvenile arthritis

**Child:** PO 30-40 mg/kg/day (oral suspension) in 3-4 divided doses

### Patent ductus arteriosus (PDA) (Neoprofen)

**Premature neonate ≤32 wk gestation who weighs 500-1500 g:** **IV** 10 mg/kg initially, then if needed, 2 doses 5 mg/kg at 24 hr intervals; if oliguria occurs, hold dose

**Available forms:** caps 200 mg, Tabs 100, 200, 300, 400, 600, 800 mg; liqui-gel caps 200 mg; oral susp 40 mg/ml, 100 mg/5 ml; liquid 100 mg/5 ml; chew tabs 50, 100 mg; oral drops 50 mg/1.25 ml; inj 10 mg/ml (NeoProfen)

### Implementation

**PO route**

- Administer to patient crushed or whole; 800-mg tab may be dissolved in water
- Give with food or milk to decrease gastric symptoms; give 2 hr before or 30 min after meals; absorption may be slowed
- Shake susp well before use
- Store at room temperature
- Do not use in pregnancy after 30 wk gestation

**IV route**

- Must be well hydrated prior to administration
- Dilute to ≤4 mg/ml (0.9% NaCl, LR, $D_5W$); infuse over ≥30 min
- Discard unused portion

**Intermittent IV infusion route**

- Visually inspect for particulate
- Ibuprofen lysine: dilute with dextrose or saline to appropriate volume (10 mg/ml of ibuprofen is recommended) given within 30 min of preparation: give via port that is nearest insertion site; give over 15 min
- Check for extravasation; do not give in same line with TPN, interrupt TPN for 15 min before and after product administration

## ADVERSE EFFECTS

**CNS:** *Headache,* dizziness, drowsiness, fatigue, tremors, confusion, insomnia, anxiety, depression
**CV:** Tachycardia, peripheral edema, palpitations, dysrhythmias, CV thrombotic events, MI, stroke
**EENT:** Tinnitus, hearing loss, blurred vision
**GI:** *Nausea, anorexia,* vomiting, diarrhea, jaundice, hepatitis, constipation, flatulence, cramps, dry mouth, peptic ulcer, GI bleeding, ulceration, necrotizing enterocolitis, GI perforation
**GU:** Nephrotoxicity, dysuria, hematuria, oliguria, azotemia
**HEMA:** Blood dyscrasias, increased bleeding time
**INTEG:** Purpura, rash, pruritus, sweating, urticaria, necrotizing fasciitis, photosensitivity, photophobia
**META:** Hyperkalemia, hyperuricemia, hypoglycemia, hyponatremia
**SYST:** Anaphylaxis, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Not known; crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, unchanged (10%) |
| **Half-life** | 1.8-2 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½ hr |
| **Peak** | 1-2 hr |
| **Duration** | 4-6 hr |

## INTERACTIONS

### Individual drugs

Alcohol, aspirin: increased GI reactions
Aspirin: decreased ibuprofen action
CycloSPORINE, lithium, methotrexate: increased toxicity
Furosemide: decreased effect of furosemide
Radiation: increased risk of blood dyscrasias
Valproic acid, warfarin: increased risk of bleeding

### Drug classifications

Anticoagulants, antiplatelet agents, salicylates, SSRIs, thrombolytics: increased risk of bleeding
Anticoagulants (oral): increased toxicity
Antidiabetics (oral): increased hypoglycemia
Antihypertensives: decreased effect of antihypertensives
Antineoplastics: increased risk of blood dyscrasias
Corticosteroids, NSAIDs: increased GI reactions
Diuretics: decreased effectiveness of diuretics (thiazides)

### Drug/herb

Feverfew, garlic, ginger, ginkgo, ginseng *(Panax)*, horse chestnut, red clover: increased risk of bleeding

### Drug/lab test

Increased: BUN, creatinine, LFTs, potassium
Decreased: Hgb/Hct, blood glucose, WBC, platelets

## NURSING CONSIDERATIONS

### Assessment

- **Beers:** Avoid chronic use in older adults, unless other alternatives are not effective, increased risk of GI bleeding
- **Assess for infection;** may mask symptoms
- **Assess pain:** location, duration, type, intensity before dose, 1 hr after
- Assess musculoskeletal status: ROM before dose, 1 hr after
- Monitor liver function tests: AST, ALT, bilirubin, creatinine if patient is on long-term therapy, monitor electrolytes as needed, make sure patient is well hydrated
- **Perioperative pain in CABG:** MI and stroke can result for 10-14 days, can be fatal, those taking NSAIDs are at greater risk of MI and stroke, even in first few weeks of therapy
- **Serious skin disorders:** For skin rash, swelling of lips, face, tongue, discontinue immediately, provide supportive care
- **Nephrotoxicity:** Monitor renal function tests: BUN, urine creatinine if patient is on long-term therapy
- Assess cardiac status: edema (peripheral), tachycardia, palpitations; monitor B/P, pulse for character, quality, rhythm
- Monitor blood studies: CBC, Hct, Hgb, prothrombin time if patient is on long-term therapy
- Check I&O ratio; decreasing output may indicate renal failure if patient is on long-term therapy
- Assess for history of peptic ulcer disorder; asthma, aspirin, hypersensitivity, check closely for hypersensitivity reactions

> **BLACK BOX WARNING: GI bleeding/perforation:** chronic use can cause gastritis with or without bleeding; in those with a prior history of peptic ulcer disease or GI bleeding, initiate treatment at lower dose; geriatrics are at greater risk, as are those who consume >3 alcohol drinks/day

- **PDA closure:** Monitor for bleeding, oliguria, infection in preterm neonates, use only doses needed for ductus arteriosus closure
- **Dysmenorrhea:** Give at onset of menses
- **Assess for allergic reactions:** rash, urticaria; if these occur, product may have to be discontinued
- Assess for vision changes: blurring, halos; may indicate corneal, retinal damage
- Identify prior product history; there are many product interactions
- Identify fever: length of time in evidence and related symptoms
- **Pregnancy:** Identify if pregnancy is planned or suspected, if breastfeeding

### Patient/family education

- Teach patient to use sunscreen, sunglasses, and protective clothing to prevent photosensitivity, photophobia
- Advise patient to read label on other OTC products
- Inform patient that the therapeutic response takes 1 mo (arthritis)
- Teach patient to take with a full glass of water, sit upright for 30 min after use

- Caution patient to avoid alcohol ingestion, salicylates, NSAIDs; GI bleeding may occur
- Advise patient with allergies that allergic reactions may develop
- Advise patient to use sunscreen to prevent photosensitivity
- Advise patient to report use of this product to all health care providers
- **Nephrotoxicity:** advise to report change in urinary pattern, weight increase, edema, increased pain in joints, fever, blood in urine; monitor fluid status, BUN, creatinine
- **Pregnancy:** notify prescriber if pregnancy is planned or suspected; avoid during 3rd trimester; pregnancy IV after 30 wk
- Teach patient to avoid driving or other hazardous activities until effect is known

**BLACK BOX WARNING:** MI/stroke: Teach patient to report signs/symptoms of MI/stroke immediately and discontinue product, seek emergency medical treatment

### Evaluation

**Positive therapeutic outcome**

- Decreased pain
- Decreased inflammation
- Decreased fever
- Increased mobility

## TREATMENT OF OVERDOSE:

Lavage, induce diuresis

**⚠ HIGH ALERT**

# ibutilide (Rx)

(eye-byoo'te-lide)

**Corvert**

*Func. class.:* Antidysrhythmic (Class III)

*Chem. class.:* Methane sulfonamide

## ACTION:

Prolongs duration of action potential and effective refractory period

## USES:

For rapid conversion of atrial fibrillation/flutter occurring within 1 wk of coronary artery bypass or valve surgery

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children <18 yr; geriatric, sinus node dysfunction, 2nd- or 3rd-degree AV block, electrolyte imbalances, bradycardia, renal/hepatic disease, HF

**BLACK BOX WARNING:** QT prolongation, torsades de pointes, ventricular arrhythmias, ventricular tachycardia, cardiac dysrhythmias, atrial fibrillation

## DOSAGE AND ROUTES

### Atrial fibrillation/flutter

**Adult: IV** INF (≥60 kg) 1 vial (1 mg) given over 10 min, may repeat same dose in 10 min; **IV** INF (<60 kg) 0.01 mg/kg given over 10 min, may repeat same dose in 10 min

**Available forms:** Inj 1 mg/10 ml

### Implementation

**IV route**

- Give reduced dosage slowly with ECG monitoring only
- Give undiluted or diluted in 50 ml of 0.9% NaCl or $D_5W$ (0.017 mg/ml), give over 10 min
- Solution is stable for 48 hr refrigerated or 24 hr at room temperature
- Do not admix with other solution, products
- Ice compress after stopping inf for extravasation; remove tubing and attempt to aspirate product, elevate affected areas
- Stop infusion as soon as arrhythmia is stopped
- Do not use if discolored or if particulate is present

## ADVERSE EFFECTS

**CNS:** *Headache*

**CV:** *Hypotension, bradycardia,* sinus arrest, HF, dysrhythmias, hypertension, extrasystoles, ventricular tachycardia, bundle branch block, AV block, palpitations, supraventricular extrasystoles, syncope, prolonged QT interval, torsades de pointes

**GI:** Nausea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidney |
| **Half-life** | 6 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Digoxin: masking of cardiotoxicity

### Drug classifications

Antidepressants (tricyclics/tetracyclics): prodysrhythmia

Antihistamines, $H_2$-receptor antagonists, antidepressants, tetracyclines, tricyclics, phenothiazines: increased prodysrhythmia

Class Ia antidysrhythmics (disopyramide, quiNIDine, procainamide), class III agents (amiodarone, sotalol): do not use within 5 hr of ibutilide, QT prolongation may occur

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** ECG continuously for >4 hr to determine product effectiveness; measure PR, QRS, QT intervals, check for PVCs, other dysrhythmias; discontinue if atrial fibrillation/flutter ceases; continue until QT interval corrected for heart rate (QTc) returns to baseline; if used ≥2 days, anticoagulation must be adequate

- Monitor I&O ratio; monitor electrolytes: potassium, sodium, chloride
- Monitor liver function tests: AST, ALT
- Monitor for dehydration or hypovolemia
- Assess for CNS symptoms: confusion, psychosis, numbness, depression, involuntary movements; if these occur product should be discontinued
- Monitor cardiac rate, respiration; rate, rhythm, character, chest pain, ventricular tachycardia, supraventricular tachycardia or fibrillation
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, avoid breastfeeding, excretion unknown

### Patient/family education

- Instruct patient to report side effects immediately to prescriber
- About reason for medication

### Evaluation

**Positive therapeutic outcome**

- Decrease in atrial fibrillation/flutter

**⚠ HIGH ALERT**

## ifosfamide (Rx)

(i-foss′fa-mide)

**Ifex**

*Func. class.:* Antineoplastic alkylating agent

*Chem. class.:* Nitrogen mustard

**Do not confuse:** ifosfamide/cyclophosphamide

**ACTION:** Alkylates DNA, RNA; inhibits enzymes that allow synthesis of amino acids in proteins; also responsible for cross-linking DNA strands; activity is not cell cycle stage specific

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Testicular cancer

**Unlabeled uses:** Soft-tissue sarcoma, Ewing's sarcoma, thymic cancer, rhabdomyosarcoma

## CONTRAINDICATIONS

Pregnancy, hypersensitivity

**BLACK BOX WARNING:** Bone marrow suppression

**Precautions:** Renal/hepatic disease, breastfeeding, children, accidental exposure, dehydration, dental disease, infection, IM injection, ocular exposure, varicella

**BLACK BOX WARNING:** Coma, hemorrhagic cystitis

## DOSAGE AND ROUTES

### Germ Cell Testicular Cancer

**Adult: IV** 1.2-2 g/m$^2$/day × 5 days; repeat course q3wk; give with mesna, in combination with 1-2 other antineoplastic agents

### Renal dose

**Adult:** IV CCr 31-60 ml/min give 75% of dose; CCr 10-30 ml/min give 50% of dose; CCr <10 ml/min, do not give

**Available forms:** Inj 1, 3 g vials

### Implementation

- Administer antiemetic 30-60 min before product to prevent vomiting
- Visually inspect parenteral products for particulate matter and discoloration prior to use
- Store powder at room temperature

**IV route**

- Give as an intermittent infusion or continuous infusion
- Well hydrate with at least 2 L/day of oral or IV fluids should be given to prevent bladder toxicity
- Must be given in combination with mesna to prevent hemorrhagic cystitis
- Close hematologic monitoring is recommended. WBC count, platelet count, and hemoglobin should be obtained prior to each use and periodically thereafter
- A urinalysis should be performed prior to each dose to monitor for hematuria

**Reconstitution and further dilution**

- Reconstitute 1 or 3 g with 20 or 60 ml, respectively, of sterile water for injection or bacteriostatic water for injection containing parabens or benzyl alcohol to give IV solutions containing 50 mg/ml
- Solutions may be diluted further to achieve concentrations of 0.6-20 mg/ml in the following solutions: $D_5W$, NS, LR
- Infuse slowly over at least 30 min
- Diluted and reconstituted solutions refrigerated and used within 24 hours

**Y-site compatibilities:** Acyclovir, Alatrofloxacin, alemtuzumab, alfentanil, allopurinol, Amifostine, amikacin, Aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl (Amphotec), amphotericin B conventional colloidal, amphotericin B lipid complex (Abelcet), amphotericin B liposome (AmBisome), ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, Arsenic trioxide, atenolol, Atracurium, azithromycin, Aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, Butorphanol, Calcium chloride/gluconate, CARBOplatin, Caspofungin, ceFAZolin, Cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, cefTAZidime (L-arginine), ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin liposome, dexamethasone phosphate, dexmedetomidine, Dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, Doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, Ephedrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, Fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, Gallium nitrate, ganciclovir, gatifloxacin, gemcitabine, Gemtuzumab, gentamicin, granisetron, haloperidol, heparin, hydrocortisone phosphate/succinate, HYDROmorphone, hydrOXYzine, IDArubicin, imipenem-cilastatin, inamrinone, insulin, regular, Isoproterenol, ketorolac, labetalol, lansoprazole, lepirudin, leucovorin, levofloxacin, Levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, Mesna, Methohexital, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, Mivacurium, morphine, moxifloxacin, Nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PAClitaxel (solvent/surfactant), palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, PENTobarbital, Phenobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium acetate/chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, Quinupristin-Dalfopristin, ranitidine, Rapacuronium, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, Sufentanil, sulfamethoxazole-trimethoprim, tacrolimus, Teniposide, theophylline, Thiopental, Thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, topotecan, TPN (2-in-1), trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Additive compatibilities:** CARBOplatin, CISplatin, epirubicin, etoposide, fluorouracil, mesna

## ADVERSE EFFECTS

**CNS:** Facial paresthesia, fever, malaise, somnolence, confusion, depression, hallucinations, dizziness, disorientation, seizures, coma, cranial nerve dysfunction, encephalopathy

**GI:** Nausea, vomiting, anorexia, hepatotoxicity, stomatitis, constipation, diarrhea, dyslipidemia, hyperglycemia

**GU:** Hematuria, nephrotoxicity, hemorrhagic cystitis, dysuria, urinary frequency, retrograde ejaculation

**HEMA:** Thrombocytopenia, leukopenia, anemia

**INTEG:** Dermatitis, alopecia, pain at inj site, hyperpigmentation

**META:** Metabolic acidosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability |
| **Distribution** | Saturation at high dosages |
| **Metabolism** | Liver |
| **Excretion** | Breast milk |
| **Half-life** | 15 hr, depends on dose |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Allopurinol: increased toxicity
Radiation: increased bone marrow suppression

### Drug classifications

Anticoagulants, NSAIDs, salicylates, thrombolytics: increased bleeding risk
Antineoplastics: increased bone marrow suppression
CYP3A4 inducers, barbiturates: increased toxicity
CYP3A4 inhibitors: decreased ifosfamide effect
Live virus vaccines: decreased antibody response
Do not use within 24 hr of hematopoietic progenitor cells

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Bone Marrow Suppression:** Monitor CBC, differential, platelet count weekly; withhold product if WBC is $<2000$ mm$^3$ or platelet count is $<50,000$; notify prescriber of results if WBC $<10,000$/mm$^3$, platelets $<100,000$/mm$^3$, severe myelosuppression

- Monitor renal function studies: BUN, serum uric acid, urine CCr before, during therapy; I&O ratio; report fall in urine output of 30 ml/hr
- Monitor for cold, fever, sore throat (may indicate beginning of infection); identify edema in feet and joints, stomach pain, shaking; prescriber should be notified
- Monitor B/P, pulse respirations baseline and periodically during treatment
- Assess for bleeding: hematuria, guaiac, bruising or petechiae, mucosa or orifices; no rect temp, avoid IM injections

**BLACK BOX WARNING: Hemorrhagic cystitis:** I&O ratio; monitor for hematuria; hemorrhagic cystitis can occur; increase fluids to 3 L/day; urinalysis prior to each dose; do not give at night

- Monitor liver function tests before, during therapy (ALT, AST, LDH); jaundice of skin, sclera, dark urine, clay-colored stools, itching, abdominal pain, fever, diarrhea that may indicate liver involvement

**BLACK BOX WARNING: Neurotoxicity:** Assess for neurologic symptoms: Hallucinations, confusion, disorientation, coma; product should be discontinued

- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Teach patient to avoid use of products containing aspirin or NSAIDs, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
- Instruct patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath)
- Advise patient to report any changes in breathing or coughing even several mo after treatment; to avoid crowds and persons with respiratory tract or other infections
- Teach patient that hair loss is common; discuss the use of wigs or hairpieces; that hair may be a different texture when regrowth occurs
- Caution patient not to have any live virus vaccinations without the advice of the prescriber; serious reactions can occur for 3 months–1 yr, to discuss encephalopathy, neurotoxicity
- Teach patient to notify prescriber if pregnancy is planned or suspected, pregnancy
- Advise patient that contraception is needed during treatment and for several mo after completion of therapy
- Advise patient to report confusion, hallucinations, extreme drowsiness, numbness, tingling; avoid use of alcohol for $\geq 4$ months after treatment
- Teach patient to avoid driving, hazardous activities until reaction is known

**BLACK BOX WARNING:** Instruct patient to drink extra fluids in order to urinate often to prevent hemorrhagic cystitis, to report pink or red urine

### Evaluation

**Positive therapeutic outcome**

- Prevention of rapid division of malignant cells
- Absence of swelling at night
- Increased appetite, increased weight

## iloperidone (Rx)

(ill-o-pehr′ih-dohn)

**Fanapt**

*Func. class.:* Antipsychotic

*Chem. class. second-generation atypical:* Benzisoxazole derivative

**Do not confuse:** Fanapt/Xanax

**ACTION:** Unknown; may be mediated through both dopamine type 2 ($D_2$) and serotonin type 2 ($5\text{-}HT_2$) antagonism; high receptor binding affinity for norepinephrine (alpha 1)

**Therapeutic outcome:** Decreased signs/symptoms of schizophrenia

**USES:** Schizophrenia

## CONTRAINDICATIONS

Breastfeeding, hypersensitivity

**Precautions:** Pregnancy, children, geriatric patients, renal/hepatic disease, breast cancer, Parkinson's disease, dementia with Lewy bodies, seizure disorder, QT prolongation, bundle branch block, acute MI, ambient temperature

increase, AV block, stroke, substance abuse, suicidal ideation, tardive dyskinesia, torsades de pointes, blood dyscrasias, dysphagia

**BLACK BOX WARNING:** Increased mortality in elderly patients with dementia-related psychosis

## DOSAGE AND ROUTES

**Adult:** PO 1 mg bid, may increase to target dose of 6-12 mg bid with daily dose adjustment of max 2 mg bid; titrate slowly; max 24 mg/day in two divided doses; reduce dose by 50% in poor metabolizer of CYP2D6 or when used with strong CYP2D6/CYP3A4 inhibitors

**Available forms:** Tabs 1, 2, 4, 6, 8, 10, 12 mg; titration pack

### Implementation

- Give reduced dose in geriatric patients
- Give anticholinergic agent on order from prescriber, to be used for EPS
- Avoid use with CNS depressants
- Provide decreased stimulus by dimming lights, avoiding loud noises
- Provide supervised ambulation until patient is stabilized on medication; do not involve in strenuous exercise program because fainting is possible; patient should not stand still for a long time
- Give increased fluids to prevent constipation
- Provide sips of water, candy, gum for dry mouth
- Store in tight, light-resistant container (PO); store unopened vials in refrigerator; protect from light; do not freeze

## ADVERSE EFFECTS

**CNS:** *EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia; drowsiness,* seizures, neuroleptic malignant syndrome, dizziness, delirium, depression, paranoia, fatigue, hostility, lethargy, restlessness, vertigo, tremor, drowsiness
**CV:** Orthostatic hypotension, heart failure, AV block, QT prolongation, tachycardia
**EENT:** Blurred vision, cataracts, nystagmus, tinnitus
**GI:** *Nausea,* vomiting, *anorexia, constipation,* jaundice, weight gain/loss, abdominal pain, stomatitis, xerostomia
**GU:** Hyperprolactinemia, urinary retention/incontinence, testicular pain, renal failure
**MISC:** Renal artery occlusion
**HEMA:** Agranulocytosis, leukopenia, neutropenia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Extensively, liver (major metabolite) CYP2D6, CYP3A4 |
| **Excretion** | Urine |
| **Half-life** | Terminal 18 hr extensive metabolizers; 33 hr poor metabolizers |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased sedation
Chloroquine, clarithromycin, droperidol, erythromycin, haloperidol, methadone, pentamidine: increased QT prolongation

### Drug classifications

CYP2D6, CYP3A4 inducers (carBAMazepine, barbiturates, phenytoins, rifampin): decreased iloperidone action
CYP2D6, CYP3A4 inhibitors (delavirdine, indinavir, itraconazole, dalfopristin, ritonavir, tipranavir): increased iloperidone effect, decreased clearance, reduce dose
Class IA/ III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics: increased QT prolongation
Other CNS depressants: increased sedation
SSRIs, SNRIs, serotonin-agonists: increased serotonin syndrome, neuroleptic malignant syndrome

### Drug/lab test

Increased: prolactin levels, cholesterol, glucose, lipids, triglycerides
Decreased: potassium

## NURSING CONSIDERATIONS

### Assessment

- Assess AIMS assessment, lipid panel, blood glucose, CBC, glycosylated hemoglobin A1C, LFTs, neurologic function, pregnancy test, serum creatinine, electrolytes, prolactin, thyroid function studies, weight
- Assess affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- Monitor B/P standing and lying; also pulse, respirations; take these often during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes; QT prolongation may occur

• Assess for dizziness, faintness, palpitations, tachycardia on rising
• **Assess for EPS,** including akathisia, tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)
• **Beers:** Avoid in older adults except for schizophrenia, bipolar disorder or short-term use as an antiemetic during chemotherapy, increased risk of stroke

**BLACK BOX WARNING:** Assess for serious reactions in the geriatric patient: fatal pneumonia, heart failure, sudden death, not to be used in the elderly with dementia

• **Assess for neuroleptic malignant syndrome:** hyperthermia, increased CPK, altered mental status, muscle rigidity, seizures, diaphoresis, discontinue immediately, notify prescriber
• Assess for constipation, urinary retention daily; if these occur, increase bulk and water in diet
• Monitor weight gain, BMI, waist circumference, hyperglycemia, metabolic changes in diabetes
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, infant exposed to product during third trimester may exhibit extrapyramidal symptoms; do not breastfeed, excretion unknown

### Patient/family education

• Teach that orthostatic hypotension may occur and to rise from sitting or lying position gradually
• Advise to avoid hot tubs, hot showers, tub baths; hypotension may occur
• Teach to avoid abrupt withdrawal of this product; EPS may result; product should be withdrawn slowly; to review symptoms of neuroleptic malignant syndrome
• Teach to avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber; serious product interactions may occur; avoid use of alcohol; increased drowsiness may occur
• Advise to avoid hazardous activities if drowsy or dizzy
• Teach compliance with product regimen
• Teach to report impaired vision, tremors, muscle twitching
• Teach that heat stroke may occur in hot weather; take extra precautions to stay cool
• Advise to use contraception; inform prescriber if pregnancy is planned or suspected
• Advise patient to use gum, lozenges for dry mouth

### Evaluation

**Positive therapeutic outcome**
• Decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

## TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting*

**⚠ HIGH ALERT**

## imatinib (Rx)

(im-ah-tin'ib)
**Gleevec**
*Func. class.:* Antineoplastic—miscellaneous
*Chem. class.:* Protein-tyrosine kinase inhibitor

**ACTION:** Inhibits Bcr-Abl tyrosine kinase created in chronic myeloid leukemia (CML), also inhibits tyrosine kinases including EGF, FGF, PDGF, SCF, VEGF, NGF

**Therapeutic outcome:** Decreased tumor size, prevention of spread of cancer

**USES:** Treatment of chronic myeloid leukemia (CML), Philadelphia chromosome positive in blast cell crisis or chronic failure; gastrointestinal stromal tumors (GIST), positive for C-KIT; chronic eosinophilic leukemia, Philadelphia chromosome positive (PH+), acute lymphocytic leukemia, dermatofibrosarcoma protuberans, myelodysplastic syndrome, systemic mastocytosis

## CONTRAINDICATIONS

Pregnancy, hypersensitivity

**Precautions:** Breastfeeding, children, geriatric, cardiac/renal/hepatic/dental disease, GI bleeding, bone marrow suppression, infection, thrombocytopenia, neutropenia, immunosuppression

## DOSAGE AND ROUTES

**Treatment of Philadelphia chromosome positive (Ph+) chronic myelogenous leukemia (CML) chronic phase as initial therapy**

**Adult:** PO 400 mg/day, continue as long as is beneficial; may increase to 600 mg/day in the absence of severe adverse reactions and severe non-leukemia–related neutropenia or thrombocytopenia

**Adolescent/child >2 yr:** PO 340 mg/m$^2$/day, max 600 mg/day; daily dose may be given as a

single dose or split into 2 doses given once in the morning and once in the evening

### Adult patients with Ph+ CML in chronic phase after failure of interferon-alfa therapy

**Adult:** PO 400 mg/day; continue as long as is beneficial; may increase to 600 mg/day

### Pediatric patients with Ph+ CML in chronic phase whose disease has recurred after hematopoietic stem cell transplant or who are resistant to interferon-alfa therapy

**Adolescent/child >3 yr:** PO 260 mg/m²/day; may be given as single daily dose or may be divided and given once in the morning and once in the evening; may increase to 340 mg/m²/day

### Adult patients with Ph+ CML in accelerated phase or blast crisis

**Adult:** PO 600 mg/day, continue as long as is beneficial, may increase to 800 mg/day (400 mg bid)

### Adult patients with resistant or relapsed Ph+ acute lymphocytic leukemia (ALL)

**Adult:** PO 600 mg/day, continue as long as is beneficial

### Adult patients with *Kit* (CD117) positive unresectable and/or metastatic GIST

**Adult:** PO 400-600 mg/day, may increase to 400 mg bid

### Adjuvant treatment of *Kit* (CD117) positive GIST after complete gross resection

**Adult:** PO 400 mg/day

### Hypereosinophilic syndrome (HES) and/or chronic eosinophilic leukemia (CEL) who have the FIPL1L1-PDGFR alpha fusion kinase (mutational analysis or FISH demonstration of CHIC2 allele deletion) and for patients with HES and/or CEL who are FIPL1L-PDGFR alpha fusion kinase negative or unknown

**Adult:** PO 400 mg/day in those who are FIPL1L-PDGFR alpha fusion kinase negative or unknown; for HES/CEL patients with demonstrated FIP1L1-PDGFR alpha fusion kinase, 100 mg/day, may increase to 400 mg

### Myelodysplastic syndrome (MDS)/myeloproliferative disease (MPD) associated with the PDGFR (platelet-derived growth factor receptor) gene rearrangements

**Adult:** PO 400 mg/day

### Aggressive systemic mastocytosis (ASM) without D816V c-Kit mutation or with c-Kit mutation status unknown

**Adult:** PO 400 mg/day in those without the FIP1L1-PDGFR alpha c-Kit mutation. If c-Kit status is unknown or not available, give 400 mg/day

### Unresectable, recurrent, and/or metastatic dermatofibrosarcoma protuberans (DFSP)

**Adult:** PO 400 mg bid (800 mg/day)

### Hepatic dose

**Adult:** PO total bilirubin 1.5-3 × ULN and any AST, decrease initial dose to 400 mg/day; total bilirubin >3 × ULN and any AST, decrease initial dose to 300 mg/day

### Renal dose

**Adult:** PO CCr 40-59 ml/min, max 600 mg/day; CCr 20-39 ml/min decrease initial dose by 50%, max 400 mg/day; CCr <20 ml/min use with caution 100 mg/day

**Available forms:** Tabs 100, 400 mg

### Implementation

**PO route**

- Give with meal and large glass of water to decrease GI symptoms, doses of 800 mg should be given 400 mg bid
- Tab may be dispersed in a glass of water or apple juice, use 50 ml of liquid for 100 mg tab, 200 ml/400 mg
- Store at 25° C (77° F)
- Continue as long as is beneficial

## ADVERSE EFFECTS

**CNS:** CNS hemorrhage, headache, dizziness, insomnia, subdural hematoma
**CV:** Hemorrhage, heart failure, cardiac tamponade, cardiac toxicity
**EENT:** Blurred vision, conjunctivitis
**GI:** *Nausea,* hepatotoxicity, *vomiting, dyspepsia,* GI hemorrhage, *anorexia,* abdominal pain, GI perforation, diarrhea
**HEMA:** Neutropenia, thrombocytopenia, bleeding, hypereosinophilia
**INTEG:** *Rash, pruritus,* alopecia, photosensitivity, drug rash with eosinophilia and systemic symptoms (DRESS)
**META:** Edema, fluid retention, hypokalemia
**MISC:** Fatigue, epistaxis, pyrexia, night sweats, increased weight, flulike symptoms, hypothyroidism, tumor lysis syndrome
**MS:** Cramps, pain, arthralgia, myalgia
**RESP:** Cough, dyspnea, nasopharyngitis, pneumonia, URI, pleural effusion, edema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed; bound to plasma protein (98%) |
| **Distribution** | Unknown |
| **Metabolism** | Liver (metabolites) |
| **Excretion** | Feces, primarily (metabolites) |
| **Half-life** | 18-40 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | 24 hr (imatinib), 40 hr (metabolite) |

## INTERACTIONS

### Individual drugs

Acetaminophen: increased hepatotoxicity
Simvastatin: increased plasma concentrations
Warfarin: increased plasma concentration of warfarin; avoid coadministration; use low-molecular-weight anticoagulants instead

### Drug classifications

Calcium channel blockers, ergots: increased plasma concentrations
CYP3A4 inducers (carBAMazepine, dexamethasone, PHENobarbital, phenytoin, rifampin): decreased imatinib concentrations
CYP3A4 inhibitors (clarithromycin, erythromycin, ketoconazole, itraconazole): increased imatinib concentrations

### Drug/herb

St. John's wort: decreased imatinib concentration

### Drug/lab test

Increased: bilirubin, amylase, LFTs
Decreased: albumin, calcium, potassium, sodium, phosphate, platelets, neutrophils, leukocytes, lymphocytes

## NURSING CONSIDERATIONS

### Assessment

- **Bone marrow suppression:** Assess ANC and platelets; in chronic phase if ANC $<1 \times 10^9$/L and/or platelets $<50 \times 10^9$/L, stop until ANC $>1.5 \times 10^9$/L and platelets $>75 \times 10^9$/L; in accelerated phase/blast crisis if ANC $<0.5 \times 10^9$/L and/or platelets $<10 \times 10^9$/L, determine whether cytopenia is related to biopsy/aspirate; if not, reduce dose by 200 mg; if cytopenia continues, reduce dose by another 100 mg; if cytopenia continues for 4 wk, stop product until ANC $\geq 1 \times 10^9$/L
- **Assess for hepatotoxicity:** monitor liver function tests before treatment, and qmo, if line transaminases are $>5 \times$ IULN, withhold imatinib until transaminase levels return to $<2.5 \times$ IULN
- **Renal toxicity:** monitor bilirubin, if $>3 \times$ IULN, withhold imatinib until bilirubin levels return to $<1.5 \times$ IULN
- Assess GI symptoms: frequency of stools
- Assess signs of fluid retention, edema: weigh, monitor lung sounds, 50-ml fluid retention is dose dependent
- Monitor CBC for first month, biweekly next month, and periodically thereafter; neutropenia (2-3 wk), thrombocytopenia (3-4 wk) and anemia may occur, may need dosage decrease or discontinuation

### Patient/family education

- **Instruct patient to report adverse reactions immediately:** shortness of breath, swelling of extremities, bleeding
- Teach patient reason for treatment, expected result
- Instruct patient to eat a nutritious diet with iron, vit supplement, low fiber, few dairy products
- Teach patient not to stop or change dose; to avoid hazardous activities until response is known, dizziness may occur
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding
- Teach patient to take with food and water; for those unable to swallow tabs, to mix in liquid (30 ml for 100 mg or 200 ml for 400 mg); after dissolved, stir and consume, avoid grapefruit juice
- Advise patient to avoid OTC products unless approved by prescriber
- Teach patient to notify prescriber if pregnancy is planned or suspected, use effective contraception, do not breastfeed

### Evaluation

**Positive therapeutic outcome**

- Decrease in leukemic cells, size of tumors

## imipenem/cilastatin (Rx)

(i-me-pen'em sye-la-stat'in)
**Primaxin IM, Primaxin IV**
*Func. class.:* Antiinfective, miscellaneous penicillin
*Chem. class.:* Carbapenem

**Do not confuse:** imipenem/Omnipen, Primaxin/Premarin

**ACTION:** Interferes with cell wall replication of susceptible organisms; osmotically unstable cell wall swells and bursts from osmotic pressure; addition of cilastatin prevents renal

inactivation that occurs with high urinary concentrations of imipenem

**Therapeutic outcome:** Bactericidal action against the following: *Streptococcus pneumoniae,* group A β-hemolytic streptococci, *Staphylococcus aureus,* enterococcus; gram-negative organisms: *Klebsiella, Proteus, Escherichia coli, Acinetobacter, Serratia, Pseudomonas aeruginosa; Salmonella, Shigella, Haemophilus influenzae, Listeria* spp.

**USES:** Serious infections caused by gram-positive or gram-negative organisms

## CONTRAINDICATIONS

Hypersensitivity, IM hypersensitivity to local anesthetics of the amide type, or carbapenems, AV block, shock (IM)

**Precautions:** Pregnancy, breastfeeding, children, geriatric, hypersensitivity to cephalosporins, penicillins, seizure disorders, renal disease, head trauma, pseudomembranous colitis, ulcerative colitis, diabetes mellitus

## DOSAGE AND ROUTES

### Doses based on imipenem content

**Intraabdominal infections, gynecologic infections, lower respiratory tract infections, skin and skin structure infections, bone and joint infections, septicemia, endocarditis, febrile neutropenia (unlabeled), and polymicrobial infections for fully susceptible organisms including gram-positive/gram-negative aerobes and anaerobes**

**Adult ≥70 kg: IV** 250 mg q6hr (mild infections); 500 mg q6-8hr (moderate infections); 500 mg q6hr (severe life-threatening infections)

**Adult 60-<70 kg: IV** 250 mg q8hr (mild infections); 250 mg q6hr (moderate or severe life-threatening infections)

**Adult 50-<60 kg: IV** 125 mg q6hr (mild infections) 250 mg q6hr (moderate or severe life-threatening infections)

**Adult 40-<50 kg: IV** 125 mg q6hr (mild infections); 250 mg q6-8hr (moderate infections); 250 mg q6hr (severe life-threatening infections)

**Adult 30-<40 kg: IV** 125 mg q8hr (mild infections); 125 mg q6hr or 250 mg q8hr (moderate infections); 250 mg q8hr (severe life-threatening infections)

**Adolescent/child/infant ≥3 mo: IV** 15-25 mg/kg q6hr

**Infant 1-3 mo weighing ≥1500 g: IV** 25 mg/kg q6hr

**Neonate 1-4 wk weighing ≥1500 g: IV** 25 mg/kg q8hr

**Neonate <7 days weighing ≥1500 g: IV** 25 mg/kg q12hr

**Moderately susceptible organisms, primarily some strains of *P. aeruginosa***

**Adult ≥70 kg: IV** 500 mg q6hr (mild infections); 500 mg q6hr or 1 g q8hr (moderate infections); 1 g q6-8hr (life-threatening infections)

**Adult 60-≤70 kg: IV** 500 mg q8hr (mild infections); 500 mg q8hr or 750 mg q8hr (moderate infections); 0.75-1 g q8hr (life-threatening infections)

**Adult 50-≤60 kg: IV** 250 mg q6hr (mild infections); 250-500 mg q6hr (moderate infections); 500 mg q6hr or 750 mg q8hr (life-threatening infections)

**Adult 40-≤50 kg: IV** 250 mg q6hr (mild infections); 250 mg q6hr or 500 mg q8hr (moderate infections); 500 mg q6-8hr (life-threatening infections)

**Adult 30-≤40 kg: IV** 250 mg q8hr (mild infections); 250 mg q6-8hr; 250 mg q6hr or 500 mg q8hr (life-threatening infections)

**Adolescent/child/infant >3 mo: IV** 15-25 mg/kg q6hr

**Infant 1-3 mo weighing ≥1500 g: IV** 25 mg/kg q6hr

**Neonate 1-4 wk weighing ≥1500 g: IV** 25 mg/kg q8hr

**Neonate <7 days weighing ≥1500 g: IV** 25 mg/kg q12hr

**Mild to moderate lower respiratory tract, skin and skin structure, or gynecologic infections**

**Adult/adolescent/child ≥12 yr:** IM 500 or 750 mg q12hr, max 1.5 g/day

**Mild to moderate intraabdominal infections, including acute gangrenous or perforated appendicitis and appendicitis with peritonitis**

**Adult/adolescent/child ≥12 yr:** IM 750 mg q12hr, max 1.5 g/day

**Community-acquired pneumonia (CAP) in ICU patients with risk factors for *Pseudomonas* infection**

**Imipenem cilastatin in combination with ciprofloxacin or an aminoglycoside plus a respiratory fluoroquinolone or an advanced macrolide**

**Adult ≥70 kg: IV** 500 mg q6-8hr

**Adult 60-≤70 kg: IV** 250 mg q6hr

**Adult 50-≤60 kg: IV** 250 mg q6hr

**Adult 40-≤50 kg: IV** 250 mg q6-8hr

**Adult 30-≤40 kg: IV** 125 mg q6hr or 250 mg q8hr

## Imipenem renal dose

**Adults 70 kg or more:** IV If 70-kg dose is 1 g/day, reduce dose to: CCr 41 to 70 ml/min/1.73 $m^2$: 250 mg q 8 hr; CCr 6 to 40 ml/min/1.73 $m^2$: 250 mg q 12 hr; CCr 5 ml/min/1.73 $m^2$ or less: do not use unless hemodialysis is instituted within 48 hr; If 70-kg dose is 1.5 g/day reduce dose to: CCr 41 to 70 m/min/1.73 $m^2$: 250 mg q 6 hr; CCr 21 to 40 ml/min/1.73 $m^2$: 250 mg q 8 hr; CCr 6 to 20 ml/min/1.73 $m^2$: 250 mg q 12 hr; CCr 5 ml/min/1.73 $m^2$ or less: do not use unless hemodialysis is instituted within 48 hr; If 70-kg dose is 2 g/day, reduce dose to: CCr 41 to 70 ml/min/1.73 $m^2$: 500 mg q 8 hr; CCr 21 to 40 ml/min/1.73 $m^2$: 250 mg q 6 hr; CCr 6 to 20 ml/min/1.73 $m^2$: 250 mg q 12 hr; CCr 5 ml/min/1.73 $m^2$ or less: do not use unless hemodialysis is instituted within 48 hr; If 70-kg dose is 3 g/day, reduce dose to: CCr 41 to 70 ml/min/1.73 $m^2$: 500 mg q 6 hr; CCr 21 to 40 ml/min/1.73 $m^2$: 500 mg q 8 hr; CCr 6 to 20 ml/min/1.73 $m^2$: 500 mg q 12 hr; CCr 5 ml/min/1.73 $m^2$ or less: do not use unless hemodialysis is instituted within 48 hr; If 70-kg dose is 4 g/day, reduce dose to: CCr 41 to 70 ml/min/1.73 $m^2$: 750 mg q 8 hr; CCr 21 to 40 ml/min/1.73 $m^2$: 500 mg q 6 hr; CCr 6 to 20 ml/min/1.73 $m^2$: 500 mg q 12 hr; CCr 5 ml/min/1.73 $m^2$ or less: do not use unless hemodialysis is instituted within 48 hr

**Adult:** IV CCr 60 to 89 ml/min: adjust to 400 mg q6hr for starting dose of 500 mg q6hr; 500 mg q6hr for starting dose of 1 g q8hr; 750 mg q8hr for starting dose of 1 q6hr; CCr 30 to 59 ml/min: adjust to 300 mg q6hr for starting dose of 500 mg q6hr; 500 mg q8hr for starting dose of 1 g q8hr; 500 mg q6hr for starting dose of 1 g q6hr; CCr 15 to 29 ml/min: Adjust to 200 mg q6hr for starting dose of 500 mg q6hr; 500 mg q12hr for starting dose of 1 g q6hr or q8hr; CCr <15 m/min: Do not use unless hemodialysis is instituted within 48 hr

**Available forms:** Powder for inj sol 250, 500; powder for inj susp 500 mg

## Implementation

### IM route

- Reconstitute 500 mg/2 ml lidocaine without epiNEPHrine; shake well, withdraw and administer entire vial; give inj deep in large muscle mass, aspirate, product for IM is not for IV use

### Intermittent IV infusion route

- Reconstitute each 250 or 500 mg/10 ml of compatible diluent; shake well; transfer the resulting susp to ≥100 ml of compatible diluent; add 10 ml to each previously reconstituted vial and shake to ensure all medication is used; transfer the remaining contents of the vial to the inf container; do not administer susp by direct inj
- Give each 250- or 500-mg dose over 20-30 min, and each 1-g dose over 40-60 min; administer over 15-20 min for pediatric patients; do not administer direct **IV**; do not admix with other antibiotics

**Y-site compatibilities:** Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, anidulafungin, argatroban, ascorbic acid, atenolol, atracurium, atropine, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, CARBOplatin, caspofungin, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, ceftAZidime, ceftizone, cefuroxime, chloramphenicol, cimetidine, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, dexamethasone, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, dolasetron, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, famotidine, fludarabine, foscarnet, granisetron, IDArubicin, regular insulin, melphalan, methotrexate, ondansetron, propofol, tacrolimus, teniposide, thiotepa, vinorelbine, zidovudine

**Y-site incompatibilities:** Fluconazole, meperidine, sargramostim

## ADVERSE EFFECTS

**CNS:** Fever, somnolence, seizures, confusion, dizziness, weakness, myoclonus, drowsiness
**CV:** Hypotension, palpitations, tachycardia
**GI:** *Diarrhea, nausea, vomiting,* pseudomembranous colitis, hepatitis, glossitis, gastroenteritis, abdominal pain, jaundice
**GU:** Renal toxicity/failure
**HEMA:** Agranulocytosis, eosinophilia, neutropenia, decreased Hgb, Hct
**INTEG:** Rash, urticaria, pruritus, pain at inj site, phlebitis, erythema at inj site, erythema multiforme
**MISC:** Hearing loss, tinnitus, electrolyte abnormalities
**RESP:** Chest discomfort, dyspnea, hyperventilation
**SYST:** Anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability (**IV**) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, unchanged (70%-80%); breast milk |
| **Half-life** | 1 hr; increased in renal disease |

### Pharmacodynamics

| | IM | IV |
|---|---|---|
| **Onset** | Unknown | Rapid |
| **Peak** | Unknown | 20 min-1 hr |

## INTERACTIONS

### Individual drugs

Aminophylline, cycloSPORINE, ganciclovir, theophylline: increased risk of seizures
Probenecid: increased imipenem plasma levels
Valproic acid: decreased effect of valproic acid

### Drug classifications

β-Lactam antibiotics: increased antagonistic effect

### Drug/lab test

Increased: AST, ALT, LDH, BUN, alkaline phosphatase, bilirubin, creatinine, potassium, chloride
Decreased: sodium
False positive: direct Coombs' test

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous penicillin sensitivity reaction or sensitivity to other β-lactams, may have sensitivity to this product
- **Assess patient for signs and symptoms of infection,** including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, fever; obtain baseline information before, during treatment
- Complete C&S tests before beginning product therapy to identify if correct treatment has been initiated
- **Seizures:** Product decreases seizure threshold and may decrease effectiveness of seizure medications, monitor closely
- **Assess for allergic reactions, anaphylaxis:** rash, urticaria, pruritus, chills, wheezing, laryngeal edema, fever, joint pain; angioedema may occur a few days after therapy begins; epiNEPHrine, resuscitation equipment should be available for anaphylactic reaction
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also check for increased BUN, creatinine, electrolytes
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis
- **Monitor for bleeding:** ecchymosis, bleeding gums, hematuria, stool guaiac daily if patient is on long-term therapy
- Assess for overgrowth of infection: perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Advise patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection
- Advise patient to notify prescriber of diarrhea with blood or pus; may indicate pseudomembranous colitis
- Instruct patient to report seizures immediately

### Evaluation

**Positive therapeutic outcome**
